The membership of the Society increased from 300,000 in 1914 to 1,200,000 at the beginning of 1929. Its chief educational organ is the *National Geographic Magazine*, and it also sends weekly or daily bulletins to newspapers and other agencies; by 1928 it furnished about 35,000 school teachers with current geographic news. Upon request, it sends each year about 80 church and Sunday-school periodicals information about Biblical lands. In 1925 the Society undertook the preparation of a series of State maps of America. The president and editor-in-chief of the magazine in January, 1929, was Gilbert Grosvenor; vice president and associate editor, John Oliver LaGorce; treasurer, John Joy Edson; and secretary, O. P. Austin. Headquarters are at Washington, D. C.

**GEOLOGY.** Progress in this science since 1914 has been substantial. It depended upon widespread activities in the different branches carried on by many workers and supported in part by governmental subsidies. If anything may be described as distinctive in the general trend of studies, it was undoubtedly the emphasis on the practical phases, economic or political geology, for which the World War may be held responsible. This tendency still may be discerned in the output of most public surveys, which were inclined to give less attention to subjects of theoretical interest than they formerly

did and was further illustrated by the growing participation of geologists in industrial fields, chiefly oil and natural gas production and mining. The literature relating to mineral deposits has expanded tremendously in consequence. The economic phases now hold a dominant place in the science, so far as general interest is concerned.

Among recent works of broad scope may be named *Geology of the Earth*, to give the English title, now in course of preparation by an international body of experts under the leadership of the German geologist, Krenkel. So far the volumes relating to Africa and Europe have appeared (1925-28), and the one for North America will be ready at a near date. The general plan of the work is to present a comprehensive summary of present-day knowledge about the structure, stratigraphy, topography, and mineral resources of each continent.

**General Geology. GEOGNOSY.** The effects of radioactive energy on the cooling of the earth have been given a quantitative expression; they put a new aspect on estimates of geological time. The presence of radioactive substances in all the constituents of the crust may be regarded as definitely established by the work of Strutt and others. The heat given off in this way would appear to counterbalance almost completely the loss by conduction and radiation of the original stored heat; perhaps it exceeds such loss under certain conditions. The cooling process, anyway, is very slow. Lord Kelvin's classic studies, made before the discovery of radium, indicated a maximum of 40,000,000 years for the age of the earth; that is, the time required for it to have cooled to its existing state, an estimate which geologists for the most part accepted, even though a more liberal figure would have accorded better with their own data. On the new basis, the period of earth evolution would be lengthened to many times that amount, and 1,000,000,000 years is regarded as not improbable. Arthur Holmes calculated from the atomic disintegration of uranium, which proceeds at a known rate, that the oldest igneous rocks exposed at the surface, largely granites, probably originated 1,500,000,000 years ago. The fossiliferous rocks extending back to Cambrian time, which is the span of historic geology, were accumulated in a minimum of 550,000,000 and a maximum of 700,000,000 years, according to Barrell, who would assign a period of similar magnitude for the Pre-Cambrian formations.

That the earth as a whole has a high degree of rigidity comparable to steel, was deduced by Michelson from experimental observations of tidal movements in the solid rocks. The old theory of a thin envelope about a fluid body would appear untenable on a physical basis. It is probable that the interior is very hot, sufficiently so to melt any rock material under atmospheric conditions, but the pressure produces a degree of immobility approaching a solid for the body as a whole. Other indications of deep-seated conditions are found in the study of earthquake tremors, the heaviest of which are world-wide in their travels but do not pass directly through the earth in the shortest paths and appear to pursue a curved course. They indicate a zonal structure. Oldham inferred that three concentric layers exist, of which the crust or lithosphere is the thinnest, not more than 40 miles in depth. The next layer, asthenosphere, is possibly 2000

miles thick and is rigid under stress of short duration so as to transmit vibrations from distant sources. The innermost layer, the core, is likewise very thick and seems to effect tremors, indicative of a viscous condition rather than of a rigid solid. The temperature gradient calculated from observations made in deep shafts and borings affords a method of estimating the thickness of the crust. Daly collected data from Europe and America on which he based the conclusion that 40 kilometers (roundly, 25 miles) is the most likely figure for the outer layer. The later methods and points of view of geophysicists will be found in Joly's *The Surface-History of the Earth* (1925), and Gutenberg's *Lehrbuch der Geophysik*, the latter issued in installments of which the first appeared in 1928.

The thesis propounded by Wegener that the continents are subject to a slow horizontal displacement by the tidal action of the sun and moon has been examined by geologists but so far has found little favor. The main arguments for its support are the similarities of rock formations in Europe and North America, also of the stratified formations and their faunas in South Africa and South America. Such drift would imply that the continents are buoyed up on a heavy viscous layer, whereas the evidences already noted indicate a high degree of immobility for the outer earth zone.

Experimentation with mineral melts analogous in composition to some of the simpler igneous rocks has provided some new information about the crystallization of these materials. One of the problems that have been given attention is the cause of variation in igneous intrusions, the process of magmatic differentiation, so-called. An original mass of magma of uniform composition may split during consolidation into several types of variant textures and mineral ingredients. Bowen in *The Evolution of the Igneous Rocks* (1928), would explain these effects as a result of the crystallizing process, itself a natural inherent influence in all magmas. The process may be considered as occurring in two stages, an early stage when crystal settling is the main feature, and a later stage in which pressure acts to compress the crystal mass and to squeeze out the residual liquid which is later cooled to the crystallizing point. The one or the other agency, or their combined operation, serves to explain magmatic differentiation. From theoretical considerations purely, other writers have argued in favor of the effects of liquid immiscibility, convection currents, and melting of foreign materials; and it is recognized that the subject is still open to investigation.

The structure of coral reefs, about which Darwin's theories have been generally accepted as most satisfactory, was given renewed consideration by several geologists. Daly remarked certain features of atolls, for example the flat floors that characterize some of the basins enclosed by the rings of coral, which seem inconsistent with reefs built around subsiding volcanic islands. He suggested that the corals may have built upward on relatively flat platforms produced by wave cutting at a time when the sea was at a lower level than now. The water stored up in the form of ice during the Pleistocene period may have caused a lowering of tidal waters by as much as 150-300 feet, when waves could have eroded benches and platforms well below the present range of their activity. On

them, the corals started their operations anew as soon as the waters reached a favorable temperature.

According to Davis, whose *The Coral Reef Problem* (1928) represents the results of new investigations at first hand, the flat floors of atoll lagoons can be explained by the leveling effects of sedimentation in periods of intermittent subsidence of the islands; coral reefs also occur on many of the Pacific islands that bear no marks of a cessation of growth that would be expected if the seas had been lowered and cooled during Pleistocene time. Borings on the Funafuti atoll were interpreted by Skeats as evidencing a slow, progressive, upward growth, without any breaks in the succession of coral rock corresponding to the estimated position of a glacial platform. Most of the coral species found at depth still exist in the vicinity. The evidence from that locality supports Darwin's conclusions. In the West Indies and Florida, Vaughan found that all offshore reefs have grown on recently depressed platforms and that there are no instances of long-continued submergence of coral areas or of the development of barrier reefs from fringing reefs. The work of corals as constructional agents is not of first importance in that region; other organisms like bacteria, foraminifera, and mollusks contribute more to rock formation by abstraction of calcium carbonate from sea water.

**Dynamic Geology.** ISOSTASY has acquired rank as a working principle among most of the American geologists, apparently, who have given attention to the problem of slow crustal movements. The work of Haysford and later of Bowie, both of the United States Coast and Geodetic Survey, has given strong support to the theory. Accurate gravity determinations were assembled by Bowie from the United States, Canada, India, and other countries, representing all conditions of topographic relief, and they were found to fall in line with previous deductions. Isostasy, it may be explained, assumes that every variation of topographic relief is accompanied by a variation of density of the underlying rock column down to a uniform level, that of isostatic compensation. Thus, mountain areas are deficient in density, while oceanic depths are of relatively high rock density. Denudation of an elevated surface causes or is compensated for by a rising of the area, whereas loading of a depression is accompanied by sinking. Bowie regards the compensation as practically complete at a depth about 60 kilometers for the United States as a whole; in mountain regions the depth is greater, 95-111 kilometers. Compensation is effected by a flow of material at the mentioned depths, in accordance with the fluctuating load at the surface. The more recent developments in this field are included in the volume *Isostasy*, by Bowie (1927).

Exemplifications of the broad crustal swings both up and down that seem to call for explanation by the isostatic principle is to be found in the changes of level in northeastern North America during Pleistocene time. At the beginning of the ice invasion, the region was higher than it has been at any subsequent period, although the exact relation of the surface with reference to sea level can be stated only in general terms. Over this surface, which was perhaps from 1000 to 5000 feet higher than now, spread a thick mantle of ice which collected first in the Labrador and Laurentian highlands

and moved gradually to the south and south-west, finally covering an area of several hundred thousand square miles to an extreme depth of perhaps 5000 feet. Following the maximum ice accumulation, the land surface began to sink under the weight, the movement continuing until the ice had retreated from the southern part of the region and until a considerable area had been depressed nearly to sea-level and marine waters invaded a smaller portion of it. The general withdrawal of the ice from the whole region so lightened the crust that an adjustment by releveling took place. This last movement has reached a maximum, according to Fairchild, of 1000 feet in the area between the St. Lawrence River and James Bay, the measurement being based on the altitudes of marine deltas formed by streams that flowed into the sea at the time of maximum depression. The elevation increased from south to north.

The relation of folds and faults to isostatic adjustment remains an outstanding problem, about which opinion, as yet, has found little common ground. The view that they represent the effects of stored-up stresses finding sudden relief is in apparent conflict with the evidences for a relatively thin crust that responds easily to variations of load. Folds and overthrust faults represent the effort of the crust to adjust itself to a shrinking circumference. R. T. Chamberlin, in a study of the Colorado Rockies, found that the amount of shortening was 8 miles in a distance of 140 miles across the axis of the main uplift. The depth to which the rocks were affected by disturbance ranged from 13 miles minimum to 107 miles maximum. In the Coast and Sierra Nevada ranges, adjustments occurred mostly by faulting, according to Willis. The faults, which are high-angle thrusts, resulted from compression that brought about rotation of the mountain blocks along the fault planes. The cause of rotation was stress, set up by erosion and sedimentation, not sufficient to involve isostatic adjustment.

Kober explained mountain-making as an effect of comprehensive forces, which have their source in continued contraction of the earth. Adjustments have taken place by thrusting and folding in restricted zones, whereas the larger masses or plates of continental extent have behaved as rigid units. The zones of folding may receive an excess of material so as to be overloaded, when isostasy comes into play and the zones subside, possibly to an extent that brings them into the range of sedimentation. With a heavy accumulation of sediments, the isogeotherms eventually begin to rise, and the increase of temperature sets in play chemical reactions and causes expansion, thereby upsetting equilibrium, which leads to adjustment by folding or thrusting. Crustal movements, in the view of T. C. Chamberlin, have not effected widespread interchanges of land and sea. The continents and oceans are fixed in position, although migrations of shore-line have taken place frequently and are now in progress. Examples may be found of the engulfing of crustal blocks and folds, or of the upraising of the ocean floor into land, but they are isolated. The Antillean region, by its position between the two Americas and the two great ocean basins, has been particularly unstable, as instanced by the occurrence of deep-sea deposits on Barbados and other islands.

Metamorphism as an influence in the forma-

tion of mineral deposits is a subject to which practical students of geology have devoted much attention, with some important contributions to theory. One of the more significant results has been the broader recognition of the part played by igneous rocks in producing changes. Their field of operation, it is now regarded, may extend over such areas as are comparable to those of pressure or regional metamorphism, if, in fact, they have not been responsible for effects generally assigned in the past to the latter agency. Regions in which igneous rocks do not appear at the surface may still have been under their influence, for there is every reason to suppose that many deep-seated intrusions, like granite batholiths, are buried in the sedimentary layers out of sight. The heat, gases, and mineralizing solutions emanating from such bodies in the crystallizing stages would reach over extended zones, effecting those chemical and physical changes often ascribed to regional metamorphism. For the rôle of the igneous rocks in the formation of ores and valuable mineral deposits, see *Economic Geology*.

**Stratigraphic Geology.** The classification of the Pre-Cambrian formations in their order of sequence constitutes one of the outstanding problems of geology, about which a great deal of discussion has centred in late years, with many solutions proposed. Practically all students of the subject agree that the old idea of a dual division into Laurentian and Huronian or Archean and Algonkian, based on the thesis that there exists an earlier group of igneous rocks, chiefly granite, on which rests the altered sedimentary Algonkian or Huronian group, does not reflect the real conditions. Actually, the succession is much more complex than that, for sediments seem to have been laid down at recurrent intervals all through the Pre-Cambrian, and there are igneous formations of several different periods of intrusion. The sequence varies, also, between one region and another, and it is doubtful if any classification can be made, adapted to meet all conditions. The tendency now is to apply such methods and terminology as correspond best with the local features and not to attempt to correlate the formations of one area, like that of Lake Superior, for example, with the Pre-Cambrian of Great Britain or Scandinavia. For the arrangement given in the article *GEOLOGY*, in the second edition of the *New International Encyclopædia*, may be substituted the following scheme, which is fairly representative of the later research in the Pre-Cambrian areas of the eastern United States and Canada. The formations are named in the order of age, the oldest being at the bottom:

6. Keweenawan. Continental sediments and lavas.
5. Animikian. Marine sediments with important iron-bearing formations.
4. Huronian. Marine and continental beds.
3. Algoman. Later Laurentian granites.
2. Sudburyan. Marine deposits.
1. Archean, or basal complex. Includes Laurentian granites, Grenville schists and limestones, Keewatin iron formation and greenstones, and Couchiching schists. Sequence still undetermined.

There is evidence of widespread glacial climates during at least four periods; two of them occur in the Pre-Cambrian and two in later periods. In the lower part of the Huronian of

Canada are found slate conglomerates, which represent hardened boulder clays. In the later Pre-Cambrian, glacial conditions are indicated by the tillites of Norway and southern Australia. The Permian period contains evidences of extensive glaciation in the equatorial and south-temperate zones, notably in South Africa, Brazil, India, and other countries. The Pleistocene was the last of the great glacial periods. Changes of land surface are mainly responsible for the wide variations of climate; other causes are the variable supply of heat stored in the oceans and the fluctuating content of carbon dioxide in the atmosphere.

In many parts of America, the Cretaceous system shows no well-defined natural boundaries between the Jurassic system below and the Tertiary system above. It appears that no general unconformability reflecting a widespread earth movement exists at the close of the Jurassic, but sedimentation seems to have been continuous in one area or another. Thus, the Morrison formation of the Rocky Mountain region has been considered by some geologists to be of upper Jurassic age, by others, lower Cretaceous, and by still others, as containing members of each of the two systems. Correlation with the European Cretaceous is suggested by Osborn as the best method of settling the difficulty; he would place most value on the evidence of fossils. On the question of drawing a line between the Cretaceous and Tertiary systems, the consensus of opinion is to make the close of the Cretaceous coincident with the passing of the age of reptiles, indicated by the extinction of the great families of terrestrial dinosaurs. This view accords with the classification adopted by European geologists. As applied to the formations of the West, the plan is to draw the limits at the top of the Lance formation and to place the Puerco and Torrejon beds containing the remains of the oldest mammals in the Tertiary system.

**Structural Geology.** Can the varied elements of earth structure be fitted into a broad plan expressive of the origin and history of the separate features? This is the problem that underlies the more interesting or significant studies in the recent literature of structural geology, for which the notable contributions of Eduard Suess have been both incentive and guide. A later work is Kober's *Der Bau der Erde* (1921), which develops the theory that there are two fundamental units of crustal structure, great rigid plates serving as buttresses to movement and narrow elongated zones, separating the plates, of weak or labile nature. The latter serve for relief of deformative forces set up by the shrinkage of the crust; they define the position of geosynclines and of the great mountain systems, shifted somewhat in the course of geological time. Such zones, or orogens, are frequently defined by two parallel mountain systems with folds overturned away from each other toward the adjacent rigid plates. Between the parallel systems are broad intermontane regions of little folding. A cross-section of an orogen is more or less symmetrical, although each mountain system by itself has the asymmetrical structure so well described by Suess. The Pyrenees, Alps, Carpathians, Balkans, and Caucasus make up one parallel system, and the Apennines, Dinaric Alps, the Hellenic, Taurus, and Iranian mountains make up the other, the former overthrown to the north and the latter to the south. Kober believes a similar orogen may be found

in the Rocky Mountains on the one side and the Sierras and Coast ranges on the other; also in the Andes as the eastern member of a zone of which the western part has foundered and disappeared in the Pacific. The existence of westward overfolding in the Appalachians is regarded as indicative of an eastern submerged member, now a part of the continental shelf.

Detailed studies of the structure and history of the Appalachian and Rocky Mountain systems were presented before the Geological Society of America (*Bulletin*, June, 1923). Although written for the specialist, the papers contain summaries of interest to the general student.

Observations in regard to the levels of marine beaches in northeastern North America have practically demonstrated a widespread uplift of the land surface since glacial time. Fairchild found that the rise between the St. Lawrence River and James Bay amounted to as much as 1000 feet. There has been a differential warping of the surface, the elevation increasing from south to north, with an up-arching into a dome south of James Bay. Raised beaches on the west coast of Greenland and in Ellesmere Land, according to Ekblaw, may be assigned to a similar uplift since the glacial period, the maximum being about 650 feet.

**Economic Geology.** This department felt the effects of intensive activities in nearly all its branches, mining geology, oil geology, and underground waters and engineering phases of geology. One of the economic sequels of the World War was an increased public and national interest in mineral resources, and there was a general stock-taking in these possessions all over the world. The control of the undeveloped oil fields became a matter of especial concern among the larger nations, with the realization that they were certain to play a considerable part in future commercial and naval operations. The location and development of petroleum fields had become almost a distinct department of geology, with its own technic and practitioners, who had extended their operations into the remote corners of the globe.

Out of the great volume of contributions on economic subjects, a few only may be selected for mention in this review. In the group of general works may be named the *Atlas of Economic Geology* (1921), published by the United States Geological Survey. It is a study of the geographic distribution of the valuable minerals and brings out clearly the political aspects of the world's supplies. It will be noted that the United States is well endowed in most of the basic materials such as coal, iron ore, copper, lead, zinc, and oil, but still has no adequate resources of potash or nitrate and is absolutely dependent on other countries for nickel, platinum, and tin, and largely for manganese. Great Britain with its colonies and its strong commercial position in other countries controls the precious metals and in the future is likely to dominate the oil situation. *Political and Commercial Geology and the World's Mineral Resources* (1920) is a compendium of statistics and special articles on the important minerals, by American writers. In the same category is a series of short monographs by various British authorities, on the mineral resources of the Empire, which have appeared from time to time.

In the list of textbooks for students, prominent place should be given to the translation

of Beyschlag, Krusch, and Vogt's comprehensive treatise, of which the English version, *The Deposits of the Useful Minerals and Rocks: Their Origin, Form, and Content* (1916), was made by Truscott. Leith's *Economic Aspects of Geology* (1921) and Emmons's *General Economic Geology* (1922) also were intended for students. Grabau's *Principles of Salt Deposits* (1920) was the most important contribution of recent date on the salines; potash, soda, and magnesia salts. Lindgren's *Mineral Deposits* appeared in a third edition (1928). Works on oil geology include *American Petroleum Industry* (1916) by Bacon and Hamor, *Geology of Petroleum*, by Emmons (1921), and *Practical Oil Geology*, by Hager (1916). Both of these cover such technical matters as mapping, drilling, and oil production, as well as the study of the occurrence and distribution of petroleum.

The control of geological structure on the accumulation of oil-pools has been worked out so completely that it is now a well-established principle, which is directing the search in all new fields. Less is known about the motive force that impels the oil in its travels underground. Some geologists have sought to explain this by capillary action, on the basis that water has a greater capillary force in small openings than oil has and consequently drives the latter ahead of it into the larger openings, which are found under domes. Other geologists have sought explanation in hydrostatic pressure and in gravity; in any event it is well known that in most accumulations underground waters have an important bearing on the localization of the oil. Another direction pursued by recent investigation is the relation between the character of oil and the degree of alteration or metamorphism of the enclosing rocks. Strata that have been much altered by compression or heat have lost their oil. An indication of the possibilities in this regard may be obtained, according to David White, by estimation of the fixed carbon ratios in the shale or coal that overlies the oil horizon; if the ratio exceeds 75 per cent of the total carbon, there is little likelihood of a productive pool. Formations with a relatively high fixed carbon yield oils of the lowest gravity and most commercial value. Formations with lignitic beds are characterized by the lowest grade oils of all. It would appear that as organic matter is altered into substances having progressively higher carbon, through the elimination of oxygen, nitrogen, and a portion of the carbon, the distillates in the rocks become progressively higher in hydrogen.

For the study of ore deposits, the most significant feature in the contributions of the last decade has been the general trend toward the igneous or magnetic theories of vein origin, as opposed to the explanation by meteoric (atmospheric) waters which once received wide acceptance. Although nearly all writers are agreed that the intrusive rocks have supplied the materials out of which veins were formed, there is not the same unanimity of opinion about the methods by which the minerals have been transported and finally arranged in the veins and lodes. It is recognized, however, that certain kinds of ores, magnetic, for example, may originate by direct cleavage or differentiation of the igneous rock during the crystallizing stage. These occur in their original environment.

On the other hand, many deposits, such as those of gold, silver, copper, lead, and zinc, are

often found at some distance from any intrusion that can be regarded as source and in formations distinctly older than the deposits themselves. For such, it is obvious that the ores must have been transported in fluid or molten condition out of the parent magma. The agency may have been highly heated waters and gases evolved by the intrusion in cooling, the fluids passing upward and outward from regions of high pressure to those of low pressure; this is the view commonly accepted. With the gradual cooling and relief of pressure of the mineralized solutions as they move away from their source, the dissolved substances are deposited in the reverse order of solubility, and there results a general zonal arrangement which is frequently illustrated by the change of the mineral contents of veins in passing downward from the surface or outward from the igneous mass. A more detailed presentation will be found in the textbooks on mineral deposits already enumerated, and in the work of Spurr, *The Ore Magmas* (1923). See PHYSICS.

**GEORGE V** (GEORGE FREDERICK ERNEST ALBERT) (1865- ). King of Great Britain, Ireland, and the British Dominions beyond the Seas, Emperor of India, (see VOL. IX). During the World War, King George set an inspiring example by cutting down his personal expenses and by contributing freely from his private purse to relief work. In 1917 he renounced all German titles. On Feb. 9, 1927, it was announced that his title had been changed to the above from "King of the United Kingdom of Great Britain and Ireland, etc." in conformity with the status of the Irish Free State. He was critically ill with pneumonia during the winter of 1928-29 and six Counselors of State, among them the Prince of Wales, were appointed to take over his duties. By the following June he was able to perform the more important of his functions. A biography *King George V*, by Sir George Arthur was published in 1929.

**GEORGE, GRACE** (1880- ). An American actress (see VOL. IX). She established the Playhouse Company in repertoire in 1915 and starred in *The New York Idea*. Her later starring vehicles included *Major Barbara*, *The Earth*, *Captain Brassbound's Conversion* (1915-16), *Eve's Daughter* (1917), *L'Élévation* (1917-18), *She Would and She Did* (1919), *Quick Work* (1919), *The Ruined Lady* (1920), *The New Morality* (1921), *Marie Antoinette*, *To Love, The Exquisite Hour*, *All Alone Susie*, and *The Road to Rome* (1928).

**GEORGE, STEFAN** (1868- ). Germany's foremost poet of the neoclassical school who opposed the rising naturalistic movement in his periodical *Blätter für die Kunst* (1900-1919). His verse is distinguished for exquisite imagery and musical rhythm. His works are *Die Fabeln*, *Hymnen* (1890), *Pilgerfahrten* (1891), *Algalal* (1892), *Das Jahr der Seele* (1897), *Der Teppich des Lebens* (1899), *Lieder von Traum und Tod* (1899), *Der sieben Ring* (1907), *Der Stern des Bundes* (1914), *Der Krieg* (1917), and *Drei Gesänge* (1921). He edited *Deutsche Dichtung*, the works of Jean Paul and Goethe, and *Das Jahrhundert Goethes*, and translated Dante, Baudelaire, Verlaine, Verhaeren, Mallarmé, Rimbaud, de Regnier, Swinburne, Dowson, Jacobson, Kloos, de Verwey, d'Annunzio, and others.

**GEORGETOWN UNIVERSITY**. A Roman Catholic institution for the higher education of men at Washington, D. C., founded in

1789. The student enrollment increased from 1533 in the autumn of 1913 to 2509 in the autumn of 1928, the faculty from 175 members to about 350. The library in the former year contained about 150,000 volumes, while in 1928 the Riggs Memorial Library contained 162,476 volumes, the Hirst Library, 9123, and libraries maintained by various departments and professional schools many additional volumes. Additions to the plant during the period under review included: A dormitory accommodating 244 students, completed in 1926; an addition to the University Hospital in 1927; and improvements on the campus during 1927-28. During 1916 the university inaugurated a new course in banking and finance; in 1920 a Morgan endowment of \$30,000 was received for the Department of American History and in the same year a foreign service school was formed; scholarships were established in this school for all Latin-American countries in 1922, and the policy of sending students from the school to foreign countries was continued, 40 such students being sent to Mexico in the summer of 1922. In 1920 a gift of \$40,000, for the Riggs Building of the Georgetown University Hospital, was received from Francis and T. Laureson Riggs. In 1922 the entrance requirements for the law school were changed to one year of college work beginning in 1923, and two years beginning in 1925. President, the Rev. W. Coleman Nevils, S.J., Ph.D., D.D.

#### GEORGE WASHINGTON UNIVERSITY.

A nonsectarian institution for the higher education of men and women, at Washington, D. C.; founded in 1821. The enrollment increased from 1347 in 1913 to 5308 in the autumn of 1928, and the faculty from 234 in 1916 to 346. The summer session of 1928 had a total enrollment of 1416. The productive funds were increased during the period under review from \$104,670 to \$1,060,546, from which the income in 1928 was \$42,417, and the total income from all sources was \$921,367. The University Library, including the law and medical school libraries, contained 80,000 volumes in 1928. Among the developments at the University between 1914 and 1928 were the purchase and equipment of a law school building in 1920; the acquisition of considerable real estate in 1921 through a bequest from Gen. Maxwell Van Zandt Woodhull; the establishment in 1918 of a fund for the education of Filipinos by Mrs. Larz Anderson; the completion in 1925 of Stockton Hall, a law building; the acquisition of a new administration building through purchase; and a gift of \$1,000,000 in 1927 from the Supreme Council of the Scottish Rite Masons, Southern Jurisdiction, to establish a school of government, which opened in the autumn of 1928 with general courses in government and a foreign-service course. William Mather Lewis, A.M., LL.D., who became president in 1923, was succeeded in 1927 by Cloyd Heck Marvin, Ph.D., LL.D.

**GEORGIA.** The twentieth State in size (59,265 square miles) and the twelfth in population; capital, Atlanta. The population increased from 2,609,121 in 1910 to 2,895,832 in 1920, a gain of 11 per cent; estimated population, 1928, 3,203,000. The white population rose from 1,431,802 (1910) to 1,689,114 (1920); Negro, from 1,176,987 to 1,206,365; native white, from 1,416,730 to 1,672,928; foreign-born, from 15,072 to 16,186. The urban population increased from

538,650 to 727,859; the rural, from 2,070,471 to 2,167,973. The growth of the principal cities was as follows: Atlanta (q.v.), from 154,839 to 200,616; Savannah, from 65,064 to 83,252; Macon, from 40,665 to 52,995; and Augusta, from 41,040 to 52,548.

**Agriculture.** Georgia, one of the leading cotton-producing States, suffered the ravages of the boll weevil, but eventually in great part checked them. The pest had practically covered the State by 1916. Its effect is indicated by a comparison of acreage and production for various years during this period: in 1913, 5,318,000 acres and 2,317,000 bales; in 1917, 5,195,000 and 1,884,000; in 1921, 4,172,000 and 787,000; 1928, 3,719,000 and 1,020,000. In the southern part of the State, the yield in 1922 reached a record low mark. See the articles COTTON, and ENTOMOLOGY, ECONOMIC.

The number of farms decreased by 16.7 per cent, from 310,732 in 1920 to 249,095 in 1925. In 1925 the total acreage of land in farms was 21,945,496, as compared with 25,441,061 in 1920. The improved land in farms fell from 13,055,209 acres in 1920 to 10,695,817 in 1925, while the total of land in farms declined from 67.7 per cent in 1920 to 58.4 per cent in 1925. The total value of farm property in the State showed an apparent increase, from \$380,546,381 in 1910 to \$1,356,685,196 in 1920, but fell to \$686,673,248 in 1925; and the average value of farm property in those years, respectively, was \$1995, \$4366, and \$2757. In interpreting these values, the inflation of currency incident to the War is to be taken into consideration. Of the farms in 1925, 88,680 were operated by their owners, as compared with 98,628 in 1910; 1407, by managers, as compared with 1419; 159,008, by tenants, as compared with 190,980. The white farmers in 1925 numbered 165,018, as compared with 168,468 in 1910; colored farmers, almost entirely Negroes, 84,077, as compared with 122,590. Farms reported as under mortgage in 1925 numbered 24,083, as against 23,135 in 1920, and 18,257 in 1910. The number of dairy cows was: (1910) 405,710; (1920) 484,122; and (1924) 257,151; "beef" cows, 245,303, 282,067, 272,487; mules, 204,985, 406,351, and 343,659; while sheep decreased from 153,250 to 72,173, and 50,503. The number of swine rose from 1,836,246 in 1910 to 2,178,914 in 1920 (this increased production of pork being typical of a change to more diversified farming), but declined to 1,299,711 in 1924. The estimated production of the chief farm crop in 1928 was as follows: Corn, 38,010,000 bushels; wheat, 1,034,000; oats, 5,300,000; potatoes, 1,682,000; sweet potatoes, 10,234,000, peaches, 10,000,000; tobacco, 84,387,000 pounds; and hay, 521,000 tons. Comparative figures for 1913 are corn, 63,023,000 bushels; wheat, 1,708,000; oats, 9,240,000; potatoes, 972,000; hay 350,000 tons; and tobacco, 1,800,000 pounds.

**Mining.** Georgia is not important as a mineral-producing State. It has but little metal mining, and of the non-metals, the most important are clay products, stone, fuller's earth, and cement. There is also produced a small quantity of coal, a considerable amount of bauxite, mineral waters, barite, manganese ores, some iron ore, and mica. The course of early output of the clay products and other minerals will be seen in the following figures. In 1914: clay products \$2,263,034; stone, \$2,238,780; coal, 166,498 tons. In 1917: clay products

\$2,426,671; stone, \$1,797,098; coal, 119,028 tons. In 1920: clay products, \$5,572,909; stone, \$3-651,415; coal, 50,156 tons. In 1926: clay products, \$5,957,486; stone, \$5,470,561; coal, 59,869 tons. The total value of the mineral production in 1926 was \$17,479,967; in 1925, \$16,503,741; in 1921, \$8,650,003; in 1920, \$12,178,095; and \$5,704,856 in 1914.

**Manufactures.** Georgia has shown a steady increase in the value of its industrial products in the recent census periods. In 1919, 12 cities of more than 10,000 inhabitants, forming 18 per cent of the total population reported 45.7 per cent of the value of the State's manufactured products. There were in the State, in 1909, 4792 manufacturing establishments; in 1919, 4803; in 1925, 2876; and in 1927, 3175. The persons engaged in manufactories numbered 118,036, 141,012, 141,173, and 154,168, respectively; and the capital invested amounted to \$202,777,665 (1909), \$448,700,194 (1919). The value of the products rose from \$202,863,262 in 1909 to \$693,237,097 in 1919; in 1925 it was \$648,852,294, and in 1927 \$609,917,660; the increase in 1919 was in great measure due to changes in industrial conditions brought about by the War. The increase shown in the average number of wage earners, however, indicates a considerable growth in the manufacturing activity of the State. The most important industry in the point of value of products is the manufacture of cotton goods, the value of which in 1909 was \$48,037,000; 1919, \$192,186,000; 1925, \$193,424,000 and in 1927, \$180,509,344. Cottonseed oil and cake rank high with products, valued at \$23,641,000 in 1909; \$99,320,000 in 1919; \$21,925,257 in 1925, and in 1928, \$27,998,981. Fertilizers amounted to \$16,800,000 in 1909; \$47,480,000 in 1919; \$28,201,583 in 1925, and 22,093,003 in 1927. Lumber and timber products rose to second rank; they were \$24,632,000 in 1909; \$43,066,000 in 1919; \$36,705,327 in 1925, and \$30,786,387 in 1927. There were 483 manufacturing establishments in Atlanta in 1909, 423, in 1914; and 429, in 1925; with products valued at \$33,038,000, \$41,279,000, and \$31,230,952, respectively. Savannah, ranking second in industrial importance, had 135 establishments in 1909, with products valued at \$6,540,000; in 1914, 128, with \$6,343,000; and in 1925, 101, with \$15,118,938. In Macon, there were 79 establishments in 1909, 70 in 1914, and 74 in 1925, with products valued at \$10,052,000, \$18,867,000, and \$20,478,220 in those years.

**Education.** The development of education in the State has been considerable in recent years. The Legislature of 1918 passed an act codifying the school laws of the State; providing for a State Superintendent of Schools, a State Board of Education, and a State Board for Vocational Education. Laws for the consolidation of schools were passed by a later Legislature. In 1920 enactments provided for the physical training of pupils and for compulsory school attendance; and in the same year Federal assistance to the States for vocational education was accepted. The Legislature of 1922 conferred on several counties authority to levy taxes for vocational purposes; it provided teachers of agriculture and home economics in vocational high schools. The total enrollment in the elementary and secondary schools of the State in 1925-26 was 689,230. Of this number, 448,137 were white pupils, and 241,093 were colored, out of a school-age (5 to 17 years) population

of 575,401 white and 424,868 colored. In that year, the total number in the primary and elementary grades was 623,684. The colored enrollment was proportionately greater in the elementary and lower in the high-school grades than the white; it was: elementary, 235,476; secondary, 5617. Of both white and colored, the enrollment was: elementary, 623,684; secondary, 65,546. In 1919-20 according to the census of the Bureau of Education, there were enrolled in the elementary and kindergarten schools 645,700; in the secondary schools, 45,128. The percentage of illiteracy in the State decreased from 24.1 in 1910 to 18.4 in 1920; among the native white population, from 9.2 per cent to 6.7; among the foreign-born whites, from 5.9 to 5.6; among the colored, from 43.8 to 35.8.

**Finance.** State expenditures in the year ending Dec. 31, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$19,859,437 (of which \$8,191,503 was aid to local education); for interest on debt, \$308,832; for conducting public-service enterprises, \$6321; for permanent improvements, \$13,255,537; total, \$33,430,127 (of which \$15,138,307 was for highways, \$2,365,501 being for maintenance and 12,772,806 for construction). Revenues were \$20,262,206. Of this, the property and special taxes provided 24.3 per cent; departmental earnings and charges for officials' services, 8.1 per cent; sales of licenses and a tax on gasoline, 42 per cent. Property valuation was \$1,275,197,929; State taxation thereon, \$6,375,990. Net State debt was \$9,240,316.

**Political and Other Events.** Georgia remained strongly Democratic in politics even in 1928. In 1914, following the death of Senator Bacon, William S. West was appointed to serve out the unexpired term. It was necessary to elect two senators in 1914. Senator Smith was reelected and Thomas W. Hardwick was elected to fill the term of Senator Bacon. Nathaniel E. Harris was elected governor. Leo M. Frank, a manufacturer, was convicted in 1914 of the murder of a young girl in Atlanta. He was sentenced to be hanged on June 22; on appeal, the United States Supreme Court, refused to interfere. Petitions were circulated throughout the State and other parts of the country for commutation of sentence. The State Prison Commission declined to recommend the commutation of the death sentence. Nevertheless, Governor Slaton commuted Frank's sentence to life imprisonment. For several days, the governor's home was threatened by mobs. On June 26, he retired from office and was succeeded by Nathaniel E. Harris. On August 16, Frank was seized in prison by a band of men, carried to an isolated spot, and hanged. The Grand Jury carried on investigations, but no clew to the instigators of the deed was found. In 1916 Hugh M. Dorsey, who had acted as prosecutor in the case of Leo M. Frank, was elected governor. In the presidential election, Wilson received 125,831 votes and Hughes, 11,225 votes. The prohibition laws of the State were upheld by the court on Jan. 12, 1916, and went into effect. On Mar. 22, 1916, a serious fire swept over a large area in Augusta and destroyed many business blocks and residences. The loss was over \$5,000,000. In 1917 an investigation of the lynching evil was carried on by a commission appointed by the governor. The report of the commission declared that the number of lynch-

ings in the State was grossly exaggerated. On Mar. 21, 1917, a disastrous fire in Atlanta destroyed a considerable portion of the city and caused a property loss of about \$5,500,000. Senator Hardwick was defeated for renomination in 1918 by William J. Harris, who was elected. In the presidential voting of 1920, Cox received 107,162 votes and Harding, 42,730. In 1920 Hardwick was elected governor. In 1922 Governor Hardwick was defeated for the renomination by Clifford L. Walker, who was elected. On Oct. 3, 1922, Mrs. W. H. Felton was appointed United States senator to succeed Thomas E. Watson, deceased. She was the first woman to hold such a position. The appointment was honorary, as the election was held for senator within a few days, and Walter F. George, former judge of the State Supreme Court, was elected. For president in 1924, the vote of the state was: Davis (Democratic), 123,200; Coolidge (Republican), 30,300. L. G. Hardman was elected governor, 1926 and 1928. The presidential vote of Georgia in 1928 was: Smith (Democratic), 129,602; Hoover, (Republican), 99,369.

**Legislation.** In 1918 the Legislature of June 26 ratified the Federal Prohibition Amendment, authorized the codification of school laws, provided a budget system, and passed measures providing for aid to returned soldiers. Departments of warehouses and archives and history were created. In 1922 the Legislature amended the motor-vehicle law, increased the tax on gasoline to \$0.03, created a committee to consider tax measures, and amended the school laws to provide for Bible reading in the schools. A racial integrity act, for the recording of inhabitants' racial descent, as a means to prevent inter-racial marriages, was passed in 1927.

#### GEORGIA SCHOOL OF TECHNOLOGY.

An institution for the scientific and technical education of men founded in 1888 at Atlanta, Ga. The enrollment of the school increased from 1002 in 1914 to 2144 in 1928-29, in addition to which there was an enrollment of 544 in the 1928 summer session. The faculty increased from 62 to 157 members, and the library from 13,000 to 23,000 volumes. The endowment in 1928 amounted to \$200,000 and the income from appropriations and fees to \$553,000. A power station and engineering laboratory, and an addition to the mechanical engineering building were built in 1920; a building for the departments of physics and architecture was completed in 1923; a new structure to house the department of ceramics was completed in 1924; a \$100,000 addition to the chemistry building and Julius Brown Memorial Hall, a dormitory, were constructed in 1925, and in 1926 another dormitory, N. E. Harris Hall. Other developments during the period under review included a campaign in 1922 which netted over \$1,000,000 for the improvement of the school plant, and in 1924 the addition of a four-year course in ceramics engineering leading to the degree of bachelor of science. Marion Luther Brittain, LL.D., succeeded K. G. Matheson, LL.D., as president in 1922.

#### GEORGIA, SOCIALIST SOVIET REPUBLIC OF.

One of the three autonomous Transcaucasian republics that emerged in 1917. It is made up of the former Russian governments of Tiflis and Kutais and the districts of Batum and Artuin. Its boundaries enclose an area of 26,381 square miles; its population in 1926 was put at 2,660,963. The people are largely Christians and

belong to a distinct racial group called Georgian. The existence of this racial consciousness together with remnants of a certain political solidarity, whose inspiration centred in an eighteenth-century Georgian kingdom, made for an advanced cultural outlook. Georgians, speaking a common language and possessing a tradition, looked down on the Armenian traders of the towns and the unruly Tatar mountaineers to the north. The capital, Tiflis, has a population of 292,973 (1926). Other cities are Kutais Sukhum, and Batum. A university with six faculties was founded at Tiflis in 1918 and in 1926 had 1600 students.

**Industry and Trade.** Agriculture engages the attention of 90 per cent of the population, most of whom were a small peasantry as a result of the partition of the large estates. Corn is the most important crop, though other grains receive attention. Cotton, silk, tobacco, the vine, and fruits are other agricultural products. Because of the primitive means of tillage, the agricultural possibilities of the country are scarcely touched. After the Russian Revolution, the disorganized life of the country led to a great dearth of foodstuffs, so that in 1920 the estimated deficit was placed at 21,700,000 poods in Tiflis and Kutais alone. Its economic wealth, however, was established in its mineral deposits. The greatest manganese deposits in the world, producing 44 per cent of the world's supply in 1913, were to be found at Chiaturi in the basin of the Kuiril River. Production, which had been about 66,000,000 poods annually before the War, fell to 3,300,000 in 1919, but rose to 35,000,000 in 1927. Other minerals are naphtha, copper ore, coal, lead, and iron ore. It is estimated that the country has available for use in industry 4,000,000 horse power in its rivers. All the basic industries were nationalized by the Soviet régime and the following were used for purposes of exchange in foreign markets: manganese, timber, tobacco, silk, and copper. There are 570 miles of railways. A through line, extending across the country, connects Batum and Poti on the Black Sea with Baku on the Caspian Sea, by way of Tiflis. Branch lines ran to the coal mines of Tkhibuli, the manganese mines of Chiaturi, the mineral springs of Borjom, as well as to Signakh, Telavi, and the Armenian frontier. By way of Batum, communication is possible with the whole Caspian country, as well as Asia Minor and Central Asia. A pipe line connecting Batum with Baku brings Europe into contact with the rich oil fields of Azerbaijan.

**History.** After the Russian Revolution, representatives of the three Transcaucasian states gathered at Tiflis, Georgia, and there on Sept. 20, 1917, founded the federal republic of Transcaucasia. It was inevitable, however, that the three states should go their separate ways. Georgia's attempt to rule the destinies of the new state, Azerbaijan's essentially Islamic outlook, and Erivan's territorial ambitions, were the rocks on which the federal republic foundered. On May 26, 1918, with the Bolsheviks in Baku and the Turks in Batum, as a result of the Brest-Litovsk Treaty, the federal republic was dissolved. On the same day, the Georgian National Council proclaimed the independence of Georgia. Thenceforth, to the conclusion of the War, Georgia, because of a compact made with Germany, remained a dependency of the Central Powers, with its ports, mines, and rail-

ways in the possession of German and Turkish forces. By the Armistice of October 30, the country was cleared of German and Turkish troops, only to find itself policed by British. A British force entered Batum in December, and for presumably strategic reasons, seized the railways of the country. Control was not relinquished, and evacuation did not come until the summer of 1920.

From 1920 until 1922, affairs never remained peaceful for long. In 1919 Georgians had been menaced by General Denikin's forces; but with the passing of this peril, in the spring of 1920, a Russian Soviet army pushed its way into Transcaucasia. Baku fell and Tiflis must have yielded too, had it not been for the distraction which the opening of the Polish campaign afforded. Russia for the time granted Georgia peace, even promising the Batum region despite the claims of the Turkish Nationalists. But the necessity for a Turco-Russian understanding with respect to a common frontier again made the region the scene of military operations late in 1920. The Turks invaded Erivan and with much bloodshed subdued the population. The Bolsheviks, following soon after, overthrew the republican government and established a Soviet republic. The procedure in Georgia was very much the same. A Turkish army entered the country and occupied Batum against practically no resistance, while Russian Troops invaded from the opposite direction and fostered Bolshevik uprisings in the towns. On Jan. 27, 1921, Georgia received belated *de jure* recognition from the Allies. In the course of a few months, however, the Constituent Assembly was dispersed, the Social Democratic government headed by Jordania was in flight; and supported by Russian arms, a Soviet government, established by Mdivani in March, ruled the country. Batum was restored to Georgia by a Russo-Turkish treaty in March, 1921. In December, 1921, the young republic was incorporated with the Armenian and Azerbaijan Soviet republics into a Transcaucasian federation, with its capital at Tiflis, with Tiflis taking orders from Moscow. Thus by the end of 1921, Russia again dominated the political and economic life of her old Transcaucasian governments. This state of affairs received full legal sanction in the Treaty of Dec. 30, 1922, which was signed by Russia, the Ukraine, the three Transcaucasian Soviet republics, Bokhara and Khiva, and which set up the Union of Socialist Soviet Republics. With the treaty's promulgation, Georgia's history as an independent political state ended. See AZERBAIJAN, ARMENIA, RUSSIA.

**GEORGIA, UNIVERSITY OF.** A State co-educational institution at Athens, Ga., founded in 1785. The student enrollment increased from 632 in 1914 to 1736 in the autumn of 1928, with an additional registration of 2667 in the summer session of the later year, and the faculty in 1928-29 numbered 102 members. The endowment amounted to \$425,000 in 1928 and the income for the year from State and other sources was \$400,000. During the period from 1914 to 1924 about \$400,000 was spent on the erection of new buildings and the alumni subscribed more than \$1,000,000 for endowment and the building programme; in 1924 Memorial Hall, erected in memory of those alumni who fell and those who served in the World War, and a dormitory for men, were added to the plant of

the university; an athletics building was completed in 1926; and a commerce and journalism building in 1928. President, Charles M. Snelling, Sc.D.

**GÉRALDY**, zhér'ôl'dé, PAUL (1885- ). A French poet and playwright, most of whose plays were produced by the Comédie Française. His plays include *Les Spectateurs* (1906); *Le Préluce*; *Les noces d'argent* (1917), played in New York as *The Nest* (1922); *Aimer* (1921), also given in New York in 1922 (*To Love*); *Les grands garçons* (1922), and *Robert et Marianne* (1926). He also wrote *Toi et Moi*, a very popular book of poems, and *Le grand-père*, a poem about Joffre and the World War (1915).

**GERARD**, JAMES WATSON (1867- ). An American lawyer and diplomat (see VOL. IX). In 1917, on the declaration of war against Germany by the United States, he was recalled from his post of Minister at Berlin and took up the practice of law in New York City. He published *My Four Years in Germany* (1917) and *Face to Face with Kaiserism* (1918).

**GÉRARD**, ROSEMONDE. See ROSTAND, ROSEMONDE GÉRARD.

**GERMAN EAST AFRICA.** See TANGANYIKA TERRITORY.

**GERMAN LITERATURE.** The Armistice of 1918, which put an end to the bloodiest war in the history of mankind, was the prelude to a drama of political reconstruction which not only changed the map of Europe but led to the removal of social barriers and was accompanied by economic upheaval. The reaction upon the minds of the people directly concerned in this revolution was profound. In Central Europe the awakening from a dream of victory, conquest, and world power produced a state of mind not unlike what in the vernacular of those countries is called a "Katzenjammer." The youth that had gone through the purgatory of the War discarded old ethical ideals, scorned the æsthetic canons of the past and demanded a new social code and a new art. Frantically groping in the chaos of incalculable ideas for something strong and tangible, the young poets rushed into verse and stammered sibylline cryptic lines which to the uninitiated were little more than "words." The past had become a nightmare from which they madly hurried to escape by welcoming anything radically different. The condition was not limited to Germany and Austria; France was no little affected by this current of thought and even America was not spared this aftermath of the War in literature and on the stage.

Most interesting was this reaction in the work of the foremost writers of the period. Gerhart Hauptmann, poet, dramatist, and novelist, since over a quarter of a century considered the most dominant literary personality of his country, turned from the factual present to an imaginary Utopia in *Die Insel der grossen Mutter oder Das Wunder von Ile des Dames*. Then, he delved into German lore and cast the dramatic story of Wieland der Schmied into the form of a modern tragedy: *Veland*. A play in his earlier naturalistic style followed: *Dorothea Angermann*. In the mean time, he had worked upon what was to be the chief work of his life: *Till Eulenspiegel*, an epic poem, in which he invested with the spirit of the mediæval German hero a former aviator ace in the German Army, who had turned tramp, showman, magician, and commentator upon the life about him. His adventures, visions, and dreams presented as in his

magic mirror a picture of the post-war period, overcrowded at times with current events but powerful in its suggestion. After that work, he returned once more to his earliest manner in the novel *Wanda*.

While German drama and poetry groaned under the weight of the new ideas, fiction escaped comparatively lightly. Hermann Sudermann, who forty years before had been hailed as one of the protagonists of a new critical attitude toward antiquated social conventions, but had been promptly dropped by the young generation that forged ahead of him, remained popular and in *Der tolle Professor* presented a powerful picture of the Bismarck period. Thomas Mann, the Hanseatic patrician among German writers, after some contributions to war literature paid tribute to the new pseudo-art in the story *Kino*, to the pathological trend in *Der Zauberberg*, *The Magic Mountain*, a novel about consumptives in a sanitarium, and to the interest in criminal types in *Der Hochstapler Felix Krull*. Heinrich Mann, his brother, who had maintained a rather independent attitude during the War, startled his readers by the novel, *Der Kopf*, which voiced a protest against the modern hypertrophy of the brain, in *Mutter Marie* told a highly emotional story of a segment of Berlin post-war society, and in *Eugenie oder die Bürgerzeit* gave other evidence of his insight into human souls. Jacob Wassermann's *Fabian oder die verlorenen Jahre*, *Landin und die Seinen*, and *Der Aufruhr um den Junker Ernst* were followed by a novel which challenged German law and judicial practice, *Der Fall Mauritzius*, and like most of his recent works was translated into English.

Among the younger men who first appeared during the War, the most interesting figure is Franz Werfel. Poet, dramatist, and novelist, he made his debut with a slim volume of verse of strong individuality, and attracted attention by a novel with the startling title, *Nicht der Mörder, der Ermordete ist schuldig* and has continued to cultivate a pathological tendency in stories such as *Der Tod des Kleinbürgers*, *Geheimnis eines Menschen*, and the story of a youth, *Der Abituriententag* (*Graduation Day*), which is one of the strongest among the many stories of adolescence now being written in Germany. Frank Thiess seems exclusively to cultivate that theme, his *Thor des Lebens* and *Abschied vom Paradiese* being followed by *Narren*. While these novels deal mainly with the problems besetting the life of young men, there has been no lack of fiction about the adolescent woman, a notable example of which is Gabriele Reuter's *Töchter*. Clara Viebig, the most popular woman novelist of Germany, is the author of a school-teacher's novel, *Die mit den tausend Kindern*. Arnold Zweig's *Sergeant Grischa* inaugurated a flood of war fiction, widely varying in merit, but amazingly popular with American readers. Outstanding among these novels is Erich Maria Remarque's *Nichts Neues im Westen*, which was recently followed by Ludwig Renn's *Krieg*.

**German Drama.** This department of literature is still in the throes of a transition which may eventually bring forth a work of lasting value. The German stage—like the American—seems one vast laboratory, in which every writer experimenting with innovations may have his try-out. The much discussed protagonist of expressionism, Georg Kaiser, has since his excursion

into birth-control and Malthusianism in *Gats*, produced nothing to equal the success of his earlier works. Franz Werfel, by far the most talented of his generation, wrote, after his *Juarez und Maximilian* known in New York through the Theatre Guild, a dramatic legend, *Paulus unter den Juden*. Ernst Toller, who in his *Masse Mensch* seemed to open new vistas, has not kept the promise in his later works, among them *Hopl wir leben*, in which a man sentenced to death for revolutionary activity, is unexpectedly pardoned and becomes insane, *Der entfesselte Wotan* and the marionette play, *Die Rache des verhöhlten Liebhabers*. Fritz von Unruh's *Bonaparte*, recently translated into English, and his *Heinrich von Andernach* did not have the stage success as did some of his earlier plays. Interesting experiments by newcomers were Franz Theodor Czukor's *Die Stunde des Absterbens*, Hanns Johst's semi-historical *Thomas Paine*, Bruno Franck's *10,000* which made his admirers compare him with Schiller, Ernst Lisauer's first dramatic attempt: *Das Weib des Jephtha*, which was warmly received, Rudolph Lauckner's *Krisis*, which cleverly presents an individual marriage crisis against the background of a world crisis, Rudolf Fitzek's *Menschen des Untergangs*, a tragedy of defection and Paul Kalbeck's *Wir sagen uns Alles!*, an excellent comedy. Max Mell stands apart from all others by his religious dramas. Bert Brecht's *Im Dickicht der Städte*, a lurid play of Chicago's slums and vice dens may be true to life, but, like his other works, is hardly true to art.

Among the older playwrights, Ludwig Fulda burlesqued movie plays in his *Film-Romantik*; Wilhelm Schmidthoun presented *Der Pfarrer von Mainz*; Fritz Philippi, a penitentiary play, *Der Paragraphenteufel*; Hermann Bahr, a farce, *Altweibersommer*; Arthur Schnitzler, a poetic drama, *Der Gang zum Weiher*; and Hugo von Hofmannsthal, *Der Turm*. Karl Schönherr, the Austrian people's playwright, revived echoes of the War in *Die Hungerblockade* and *Der Armen-doktor*. Carl Sternheim wrote the play, *Oscar Wilde*; Alfred G. Nagel one on Strindberg, *Charfreitag*; and Bernhard Kellermann presented a dramatic picture of the Anabaptists, *Die Wiedertaucher von Münster*.

In recent poetry, the older poets reflected little of the new spirit seething in the younger generation. Heinrich Vierordt showed Persian influence in his *Garten der Ghasele*; Alfred Kerr's *Capriccios* reflected his whimsical humor; Christian Morgenstern covered the period 1887-1914 in *Mensch-Wanderer*; Alfons Parquet drew upon impressions of travel in *Amerika* and Hans Brandenburg published a book of poems, *Sonette*. The Swiss poets were little affected by the trend of the time, but Jacob Schaffner's *Der Kreislauf*, and especially Robert Faesi's *Der brennende Busch*, have a certain strength and warmth. Among the women, Isolde Kurz, always an interesting figure, added to her previous poetical works two poems on love and death: *Der Ruf des Pan*.

Among the newcomers, Johann Brecher has been the most widely discussed. A true product of the revolutionary spirit of the period, his poem, *Der Leichnam auf dem Thron*, was suppressed and even the recitation of extracts was penalized. His *Maschinenrhythmus* vibrates with the pulse of our mechanistic time. Others cling to the old forms, as did Josef Ponten, whose *Römiches Idyll*, a lyric epic, has a rare

distinction; Alfred Doeblin's *Manassis* also merits respect. Ina Seidel is of the new generation, though her *Gedichte* differ little in form and spirit from those of her poetical ancestors.

As the German people adjusted their life to the new regime, the scholars resumed their task of collecting, compiling, and classifying documents and data, and the works of history, biography, literature, and criticism are as numerous as ever. Albert Soergel brought down his monumental history of contemporary German literature to date by the volume, *Im Banne des Expressionismus*, since succeeded by another, covering the last decade. Oscar Walzel's *Deutsche Dichtung der Gegenwart* and Friedrich von der Leyen's *Geschichte der deutschen Literatur* are ably supplemented by Emil Ermatinger's *Deutsche Lyrik seit Herder und Krisen und Probleme der neuen deutschen Dichtung*, and Walter Rehm's *Geschichte des deutschen Romans*. Hermann Köster's *Geschichte der deutschen Jugendliteratur* is proof of the new interest in the intellectual development of youth. Heinrich Spiro's *Die Heilandsgestalt in der deutschen Dichtung* is an interesting study. Goethe literature was enriched by Walter Jablonsky's *Vom Sinne der Goethe'schen Naturforschung*, Heine received a unique tribute in H. W. Houben's *Gespräche mit Heine*. Carl Bleibtreu wrote *Geschichte der englischen Literatur*.

Since psychoanalysis entered literature some years ago in the *Tragische Motive* of Fritz Wittels, not a few studies of writers and their works show the influence of Freud and his disciples. Alfred Winderstein's *Der Ursprung der Tragödie* contains the results of his psychoanalytic study of Greek drama. The number of books in which psychological analysis of a character dominates the biographical material is multiplying, and there have been produced some very interesting works, foremost among them Stefan Zweig's three-volume attempt at a "typology of the mind" under the collective title *Baumeister der Welt*. The first volume presented Balzac, Dickens and Dostoevski who "in the cosmos of their novels set a second reality beside the one already existing"; the second showed Hölderlin, Kleist, and Nietzsche driven by a demonic power beyond themselves and reality toward the infinite; and the third, entitled *Drei Dichter ihres Lebens*, treated Casanova, Stendhal, and Tolstoy as three manifestations of the same creative function, self-reflection, Casanova being the purely material and naïve, Stendhal the psychological, analytical, and Tolstoy the religious and ethical. Ernst Heilborn's study of that most fascinating embodiment of versatility, *Ernst Theodor Hofmann*, Anton Bettelheim's *Balzac*, Julius Bah's *Shaw*, Julius Meyer Graefe's *Dostojewsky*, Dr. Harry Mayne's *Conrad Ferdinand Meyer*, Otto Strohl's *Richard Wagner*, partake of this subtle quality which differentiates them from mere "lives."

Memories of a man who mystified and agitated German readers some thirty-five years ago were revived by the appearance of the first biography of *Julius Langbehn* by the only man who knew him intimately, Benedikt Momme Nissen, followed by Cornelius Gurlitt's *Langbehn, der Rembrandt-deutsche*. Emil Felden's *Eines Menschen Weg*, dealing with the life of Ebert, recalled the first stormy days of the German Republic. Interest in the great spiritual teachers is evident in Georg Ellinger's book on the Silesian mystic, *Angelus Silesius* and in Christoph Schrempf's

life of the Danish philosopher, *Søren Kierkegaard*. The scholarly Emil Lucka delved into the history of the Spanish Inquisition in his *Torquemada*. Dr. Karl Federn, the prolific writer of biographical and critical studies, wrote *Richelieu*. Stefan Zweig is the author of a most sympathetic study of the tragic life of the French poetess, *Marcelline Desbordes-Valmore*. Upon René Filop-Miller's *Lenin and Gandhi* followed his *Dostojewsky*, *Tolstoy*, and *Rasputin*. Among other Tolstoy lives, that of Witkop stands out. Georg Hirschfeld, poet and novelist, presented another life, *Lord Byron*. The tragic history of *Charlotte von Mexiko* was retold by Curt Elwenspoek.

The new books by Emil Ludwig on *Bismarck*, *Goethe*, and *Napoleon*, based on his earlier works on those subjects, are those of an able journalist rather than serious biographer, and their success in America surprised German critics. His latest work is *Der Menschensohn—The Son of Man*. Contributions to the biography of contemporary German literature are Arthur Kutschner's *Frank Wedekind*, Hugo Ball's *Hermann Hesse*, and Willibald Kohler's *Hermann Stehr*. Autobiographical are Hermann Bahr's *Die Liebe der Lebenden*, O. A. K. Schmitz's *Der Meister des Hauses*, and *Damon Welt* and Ernst Toller's *Justiz*.

Letters have appeared in great numbers. Close upon the fascinating book of Alfons Mathes on *Frau Aja*, Goethe's mother, followed Fritz Bergemann's *Bettina's Leben und Correspondenz mit Goethe*, and Flodoard von Biedermann's *Correspondenz Joseph Unger's mit Goethe*. Ernst Haekkel's *Himmelhoch jauchzend*, edited by his friend Heinrich Schmidt, offered an intimate picture of the great scientist's emotional life. Even more interesting were new letters in *Hans von Bülow*, among them those addressed to Cosima before and after the separation, and many to his daughter Daniela, which bring out the nobility of his character. *Am Anfang war die Liebe* is the title of letters of Malvida von Meysenbug, author of the *Memoiren einer Idealistin*, to Mme Monod, daughter of the Russian revolutionist of 1848, Alexander Herzen, and widow of the French historian Gabriel Monod. New letters in *Ferdinand Lassalle* cover his period of labor propaganda. The correspondence of the historian in *Niebuhr* and that in *Varnhagen von Ense* are of interest to special students, while that in *Walter Rathenau* is valuable as commentary upon recent history.

The flood of books dealing with the War was slow in subsiding. Among them are Carl Bleibtreu's *Geschichte des Weltkriegs*, Hans Delbrück's *Vor und nach dem Weltkrieg*, Hermann Oncken's *Die Rheinpolitik Napoleons III. und der Ursprung des Weltkriegs*, Ludendorff's *Die Schuld der überstaatlichen Mächte am Zusammenbruch*, Erich Brandenburg's *Von Bismarck zum Weltkrieg*, Maximilian Harden's *Von Versailles zu Versailles*, Wahl's *Von der Reichsgründung bis zum Weltkrieg*, Herre's *Weltgeschichte der neuesten Zeit*, Hammann's *Deutsche Weltpolitik*, Walter Rathenau's *Gesammelte Schriften und Reden*, and many others. Nevertheless, German scholars soon turned to the past and delved with gusto in its archives. Hans von Helmolt's *Friedrich der Grosse und sein Preussen* stimulated interest in the history of his period. Upon Friedrich Kircheisen's *Napoleon in Ägypten* followed his two volume biography: *Napoleon*, his

*Memoiren, Lord Nelson, Die Bastille, and Die grosse französische Revolution.* Ricarda Huch's *Freiherr von Stein* portrayed a commanding figure among Prussian diplomats of the Napoleonic period. Professor Troeltsch's *Deutscher Geist in West-Europa* and *Geistesgeschichte und Religionssoziologie*, followed *Die Bedeutung des Protestantismus für die Entstehung der modernen Welt*. An interesting attempt at correlating folklore and history was made by Heinz Hungerland in *Die Volkskunde eine Hilfswissenschaft der Geschichte—ihr Wesen und ihre Erziehungswerte*. Ricarda Huch returned to her special field, Italy, in her book on *Garibaldi*. Dombrowski, a young writer of Polish descent, attracted attention by his *Köpfe der Gegenwart und Neue Köpfe*.

That the philosophers of the country should join in the interpretation and explanation of Germany's war policy was to be expected. Bruno Bauch's *Fichte und der deutsche Staatsgedanke*, *Die Idee*, and *Der Geist von Potsdam und von Weimar* follow that trend of thought. But the number of works that do not refer to the political upheaval of the past years is far greater. Among them are H. A. Dingler's *Der Zusammenbruch der Wissenschaft und der Primatur der Philosophie*, Ernst Cassirer's *Individuum und Kosmos in der Philosophie der Renaissance*, Johannes Volkelt's *Phänomenologie und Metaphysik der Zeit*, Müller-Freienfels's *Metaphysik des Irrationalismus*, and H. A. Driesch, whose *Orisis in Psychology and The Possibilities of Metaphysics* were published in English. Müller Freienfels also wrote *Erziehung zur Kunst und Die Seele des Alltags* and Ernst Cassirer: *Sprache und Mythos*. Wilhelm Bölsche, that unique interpreter of nature who combines the scientist's knowledge with a poet-philosopher's vision, has given us *Von Drachen und Zauberkünsten*, *Im Bernsteinwald*, *Lichtglaube*, and *Die Abstammung der Kunst*.

Hermann A. Keyserling's symposium on marriage, *Das Ehebuch*, and *Die neuentstehende Welt*, like some earlier works have become popular in English translations; his latest work is *Menschen als Sinnbilder*. Rudolf Steiner, the founder of anthroposophy, left some posthumously published works, among them: *Friedrich Nietzsche, ein Kämpfer gegen seine Zeit*, and *Goethe's Geistesart in ihrer Offenbarung durch seinen Faust und durch das Märchen von der Schlange und der Lilie*. A most valuable addition to Nietzsche literature is *Nietzsche und sein Werk*, by Elisabeth Forster-Nietzsche and Henri Lichtenberger. Dr. Karl Joel's *Wandlungen der Weltanschauung*, Dr. Karl Federn's *Das ästhetische Problem*, and Wilhelm Giese's *Psycho-technik*, deserve mention. Among the works on political economy which have multiplied amazingly are Lujo Brentano's *Konkrete Grundbedingungen der Volkswirtschaft*, Georg Max Jahn's *Sozialpolitik und Studienplan der Nationalökonomie*, and Sartorius von Waltershausen's *Die Weltwirtschaft und das staatlich geordnete Verkehrswesen*, and *Weltwirtschaft und Weltanschauung*.

Innumerable books of essays on various subjects have come from the printing presses of the country. Among them are Hans Brandenburg's *Vom schaffenden Leben und Das neue Theater*, Max von Boehn's *Empire, Wallenstein*, and *Po-licei und Mode*, Eugen Kalkschmidt's *Das alte Dresden*, S. Perzynski's *Japanische Masken*, Alexander von Gleichen-Russwurm's *Von Art und*

*Unart—ein Zeitspiegel des guten Tons*, Dix's *Gemütsleben in der frühen Kindheit und Die Reifezeit*, Arthur Schurig's *Kleiner Katechismus der Lebenskunst*, Alfred Kerr's *Es sei wie es wolle, es war doch so schön*, etc. Books on religious problems came from Deissmann, *De Profundis*; Martin Dibelius, *Geschichte der übergeschichtlichen Religionen im Christentum und Geschichte der urschristlichen Literatur*; Dr. Joseph Engert's *Studien zur theologischen Erkenntnislehre* and *Das neue Leben*, and Carl Stange's, *Unser Glaube und Dogmatik*.

A redeeming result of the War is the fact that it brought America into closer literary relations with Germany. Works of fiction, drama, biography, and philosophy have been published in translations of varying merit and are likely to promote not only interest in German literature but assist in the understanding of the German mind. Among them are novels by Jacob Wassermann, Thomas Mann, Arnold Zweig, Franz Werfel and Arthur Schnitzler, whose plays were already known to the American stage, as well as the works of those radical newcomers, Ernst Toller and Franz Werfel, biographies by Emil Ludwig and René Fulop-Miller, the philosophical works of Count Hermann A. Keyserling, books by Felix Salten, Woldemar Bonsels, etc.

**GERMAN NEW GUINEA.** A former territory of the German Empire in the western Pacific. It fell to Australian troops on Sept. 12, 1914. The Treaty of Versailles partitioned the islands of the territory as follows: those north of the equator, the Caroline, Marshall, Pelew, and Ladrone Islands, with the exception of Guam, to Japan under mandate; those south of the equator, the Bismarck Archipelago, the German Solomon Islands, and Kaiser Wilhelmsland (on New Guinea) to Australia; and German Samoa to New Zealand. See **PACIFIC OCEAN ISLANDS AND NEW GUINEA**.

**GERMAN SOUTHWEST AFRICA.** Formerly the oldest German colony in Africa, but since 1920 a British mandate territory, administered under the name of the Southwest Africa Protectorate, by the Union of South Africa. Under General Botha, leader of the Union of South Africa forces, the German administration was compelled to flee the country, so that by July, 1915, the British occupation was complete. Germany renounced her sovereignty in the Treaty of Versailles with the result that in May, 1919, the Supreme Council assigned the territory under a mandate to the Union. On Dec. 17, 1920, the League Council approved the transfer. See **WORLD WAR**, and **SOUTHWEST AFRICA PROTECTORATE**.

**GERMANY.** A federal republic organized under the constitution of Aug. 11, 1919, embracing territory in Central Europe between France, Belgium, and Holland on the west, and Poland on the east. The Treaty of Versailles redefined Germany's territorial limits and assigned the provinces of Alsace and Lorraine to France, a small district comprising the towns of Eupen and Malmédy to Belgium, North Schleswig to Denmark, and a large block of territory to Poland, including parts of East and of West Prussia which were made into the Danzig corridor, and some parts of the territory of Upper Silesia, which were ceded to Poland in accordance with the decisions of a committee appointed by the League of Nations after a plebiscite held in the district in 1922. The Saar Basin was handed over to the administration of a commis-

sion appointed by the League of Nations, and a plebiscite to be held at the end of 15 years was provided for to decide the sovereignty of the territory. See separate articles on the above-mentioned localities, in which political and economic developments are discussed.

The following table gives the area of Germany before and after the War with a comparison of the population at the census of 1910 and June 16, 1925:

AREA AND POPULATION (BASIS, PERSONS PRESENT), BY STATES

State	Area, square miles	Population	
		1910	1925
Prussia (Preussen):			
Present area	112,626	35,000,830	38,206,092
Former area	134,664	40,165,219	.....
Bavaria (Bayern):			
Present area	29,342	6,882,237	7,411,589
Former area	29,510	6,962,109	.....
Saxony (Sachsen)	5,789	4,806,661	4,979,912
Württemberg	7,532	2,437,574	2,595,114
Baden	5,819	2,142,833	2,336,498
Thuringen	4,527	1,510,538	1,628,398
Hessen	2,970	1,282,051	1,358,445
Hamburg	160	1,014,664	1,128,788
Mecklenburg-Schwerin	5,068	639,958	687,599
Oldenburg	2,480	483,042	553,670
Brunswick (Braunschweig)	1,418	494,339	509,660
Anhalt	888	331,128	351,692
Bremen	99	299,526	332,547
Lippe	469	150,937	166,038
Lubeck	115	115,599	127,540
Mecklenburg-Strelitz	1,131	108,442	112,052
Waldeck <sup>a</sup>	408	52,358	59,281
Schaumburg-Lippe	131	46,652	48,660
Total:			
Present area	180,972	57,798,369	62,592,575
Former area	208,825	64,925,993	.....
Saar Basin	737	651,984	770,000 <sup>b</sup>
Total with Saar, present area	181,709	58,450,353	63,362,575

<sup>a</sup> Waldeck was absorbed by Prussia April 1, 1929.  
<sup>b</sup> Estimated.

Overseas emigration from Germany via German and foreign ports was as follows: 1918, 25,843; 1920, 8548; 1921, 23,451; 1922, 36,527; 1927, 61,379. In pre-war years the rapid industrial expansion tended to prevent the large emigration which had characterized the early part of the nineteenth century. Recent figures would seem to indicate a revival of emigration from Germany, the number exceeding a maximum of 115,416 in 1923. This emigration was of particular significance as an indication of living conditions within the country. According to the occupation census of 1907, the total number of wage earners was 30,232,000, of whom 27,274,000 were in the post-war territory. This included all persons engaged in any kind of occupation and those living on their own means, such as pensioners, pupils, institutional inmates, etc. The number of workers in agriculture and forestry for the post-war territory of Germany was 8,554,000; in mining and industry, 10,451,000; in trade and transportation, 3,229,000; in personal services, 431,000; in government employ, 1,511,000. The number of workers of 1927 in agriculture and forestry was about identical with that of 1907; that in mining and industry increased by about 20 per cent, and in trade and transportation, by 20 per cent. A decrease took place in the number of government employees through the abolition of compulsory military service, thus decreasing the army from 800,000 to 100,000 men. The total number of

persons occupied in Germany was, in 1927, about 35,000,000, of whom 17,500,000 were workmen.

**Agriculture.** The total area in 1914 was 54,109,836 hectares. The area of the ceded territories amounted to 7,021,287 hectares, leaving a post-war area of 47,008,549. The 1928 area, inclusive of the Saar Basin, was divided as follows: arable soil, 51,556,972 acres; grass meadows and pasture, 20,165,876; vineyards, 204,575.

The following indicates live stock before and after the War:

Animals	Dec. 1, 1913	Dec. 1, 1928
Horses	4,558,329	3,710,500
Cattle	20,994,344	18,386,200
Swine	25,659,140	20,072,300
Sheep	5,520,737	3,625,600
Goats	3,548,484	2,885,100

The accompanying table gives the area and production of the principal crops of Germany in 1913 and 1927:

Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1913 <sup>a</sup>	1927	1913 <sup>a</sup>	1927
Wheat	4,143	4,321	148,555	120,521
Rye	12,995	11,610	398,874	269,030
Barley	3,413 <sup>b</sup>	3,653	139,639 <sup>b</sup>	125,754
Oats	9,698	8,589	593,773	437,251
Potatoes	6,924	6,918	1,617,386	1,379,707
Sugar beets	1,153	1,073	13,986 <sup>c</sup>	10,854 <sup>c</sup>
Hay, alfalfa, and clover	17,773	18,781	36,843 <sup>c</sup>	35,407 <sup>c</sup>

<sup>a</sup> Present boundaries.

<sup>b</sup> Spring barley only.

<sup>c</sup> Unit, metric ton.

**Unemployment.** The number of unemployed and part-time workers drawing government benefits in the unoccupied territory of Germany on Dec. 31, 1927, was 1,188,274 as compared with 1,748,579 at the end of 1926.

**Industry.** The following table gives the essential mineral and industrial production for the pre-war and post-war periods. It will be ap-

MINERAL AND INDUSTRIAL PRODUCTION  
 (Thousands of Metric Tons)

Product	1913 <sup>a</sup>	1925	1926	1927
Coal	140,753	132,622	145,296	153,599

Crude steel	11,768	12,051	12,228	16,310
Rolling-mill products	9,520	9,308	9,017	12,872
Shipbuilding <sup>c</sup>	465,226	402,713	171,572	265,554

<sup>a</sup> Present boundaries.

<sup>b</sup> Metal content of ore.

<sup>c</sup> Gross tons launched.

The coal output for 1928 was 150,876,000 metric tons.

parent from these statistics that Germany has made substantial progress in practically every field of industry.

There were 23,292 breweries in 1913 producing 99,200,000 hectolitres of beer, or 103 litres per head of the population. In 1927 breweries produced 51,608,000 hectolitres. In 1913, 133 factories produced 1,083,000 bottles of fruit wine.

In 1926, 115 factories produced 1,300,000 bottles of fruit wine. In 1913, 157 factories produced 11,808,000 bottles of sparkling grape wine; in 1926, 127 factories produced 14,781,000 bottles of sparkling grape wine. In 1927 the wine yield from a total of 181,872 acres of vines was 31,407,018 gallons. There were 378 factories in 1913, producing 2,716,000 tons of sugar; in 1928, 249 factories produced 1,646,379 tons. Cigarettes numbering 12,412,000,000 were produced in 1913 and 31,934,129,000 in the year ending Mar. 31, 1928. According to the industrial census of 1925, there were in Germany 1,852,737 industrial establishments, with 12,704,135 workers.

The value of German exports for 1928 increased by more than 1,250,000,000 marks over 1927, with the result that the adverse trade balance of 3,345,800,000 marks incurred in 1927 was reduced to 1,992,500,000 marks for 1928. Over 78 per cent of the increase in exports was attributed to greater sales of finished goods. The economic condition of the country during 1928 was, on the whole, not satisfactory. Labor difficulties, inadequate support for the domestic market, and increasing unemployment had a depressing influence. The export trade was benefited by generally improved conditions in other European countries. Another development in the economic situation was an improved foodstuffs balance for 1928, the 1927 deficit being reduced by more than 300,000,000 marks. Trade in raw materials remained practically unchanged.

**Communications.** The government railroads are managed and administered by the German Railways Co., but remain the property of the state. In addition to the State Railways, there were 2277 miles of normal-gauge line in 1920, which belonged to private companies.

## STATE RAILWAYS

		1913 *	1925	1927
Length of line	miles	31,529	33,120	33,320

\* Present boundaries.

<sup>b</sup> Figures for rolling stock are for railways of pre-war Germany.

<sup>c</sup> Including miscellaneous receipts not shown separately.

A combination air-and-rail passenger service was inaugurated in 1929 by the Deutsche Luft Hansa, effective throughout the German Federation. Passengers may change from airship to train, or vice versa, without additional expense or excessive negotiation.

The German mercantile marine, including steam and motor vessels, amounted in 1914 to 2090 ships with 5,134,720 registered gross tons. On June 30, 1928, it totaled 3,777,251 registered gross tons. The number of seagoing vessels en-

tering German ports in 1913 under all flags was 115,966, of which 26,637 were under foreign flags. The total tonnage was 34,772,177, of which that under foreign flags amounted to 13,540,835. Vessels clearing amounted to 117,375, of which 26,919 were under foreign flags. The tonnage was 34,921,806, of which foreign flags accounted for 13,645,219. In 1927 vessels entering German ports numbered 86,080, of which foreign flags amounted to 19,636. Tonnage was 39,912,430, of which 19,459,529 were under foreign flags. Vessels clearing in 1927 were 89,173, of which foreign flags were 19,277. Tonnage was 39,659,776, of which foreign flags amounted to 19,179,601. The total sea-borne traffic at the seven leading German ports during 1928 showed an increase of 4.3 per cent over 1927 and of 29 per cent over 1925. The tonnage figures for 1928 are inward, 32,660,000; outward, 16,366,000. During the calendar year 1927, 53,711 merchant vessels, aggregating 19,912,006 net tons, passed through the Kiel Canal.

## GERMAN IMPORTS AND EXPORTS

1913 AND 1928

(In millions of gold marks)

	Imports		Exports	
	1913	1928	1913	1928 <sup>a</sup>
Live animals	289.7	145.3	7.4	18.7
Food stuffs and beverages	2,807.8	4,195.5	1,069.5	630.6
Raw material and semi-manufactured articles	6,280.0	7,246.4	2,274.1	2,703.6
Manufactured articles	1,392.2	2,458.1	6,746.2	8,700.0
Gold and silver	436.4	238.3 <sup>b</sup>	101.4	21.9 <sup>b</sup>
Total	11,206.1	14,283.7	10,198.6	11,474.8

<sup>a</sup> Including deliveries in kind under Reparations.

<sup>b</sup> 1927 figure.

**Commerce.** In 1913 the value of all German imports was 11,200,100,000, gold marks and the value of all exports was 10,198,600,000 gold marks. After the World War, the value of imports in gold marks dropped to 9,693,800,000 in 1925 and to 8,521,700,000 in 1926, rising in 1927 to 11,658,600,000 and in 1928 to 15,012,200,000. The value of exports fell to 6,994,700,000 gold marks in 1925 and rose to 7,880,700,000 in 1926, to 8,100,000,000 in 1927, and to 12,184,800,000 in 1928. These figures include deliveries in kind under Reparations; also gold and silver.

**Currency and Credit.** The circulation of paper money in 1913 amounted to 2,100,000,000 paper marks in Reichsbank notes, 110,000,000 in currency notes, and 140,000,000 in private bank notes, a total of 2,400,000,000 marks. Specie in circulation totaled 3,700,000,000 marks; a grand total of specie and paper money of 6,100,000,000 marks was in circulation. On Jan. 31, 1928, the number of Reichsbank notes in circulation was 4,237,200,000. Private bank notes in circulation were 176,300,000 marks and notes of the Rentenbank, 625,700,000 marks, making a total of paper money in circulation of 5,039,200,000 marks. The circulation of stable currency in Germany on Jan. 31, 1928, expressed in gold marks, was 5,922,300,000.

The following tables from the U. S. *Commerce Year Book* give the results of recent German budgets and the status of the public debt:

## GOVERNMENT RECEIPTS AND EXPENDITURES

(Thousands of Reichsmarks)

PUBLIC DEBT  
(Thousands of Reichsmarks)

The table does not include reparations obligations but does include, for the first time, the item "Government bonds," which covers the old paper mark debt, revalorized under the law of July 16, 1925 (provisional), and that part of the new 5 per cent loan which was paid in by March 31, 1927. The amount to be paid against the revalorized debt during 1927-28 is budgeted at 356,800,000 marks.

	Mar 31, 1924	Mar 31, 1925	Mar 31, 1926	Mar 31, 1927
Government bonds, internal	.....	.....	1,753,632	2,106,077

Equivalent (\$1000), at par	573,103	665,889	980,021	1,036,459

For the year ending Mar. 31, 1928, the total revenue was 10,412.7 million Reichsmarks and the expenditures 10,195.8 million Reichsmarks. Estimates for the year ending Mar. 31, 1929, placed the total revenue at 10,634.9 million Reichsmarks and total expenditures at 10,631.2 Reichsmarks.

**History.** As long as the War was only imminent, there were immense popular peace demonstrations, organized by the Socialists; but once it had become an established fact, it swept the German people into an orgy of patriotism and war enthusiasm which increased with every new victory reported. The belief of the great majority of the Germans that the War was a struggle for national existence was strengthened by official manifestos. Even the great Social Democratic Party supported the War and voted, on Aug. 4, 1914, for the first war credits and, on September 2, for the second, condemning the anti-war activities of the International Socialist Bureau. This undivided support of the Government continued until spring of 1915. In March of that year, the Socialists, Liebknecht and Rühle, in the Reichstag refused to vote for the budget and others criticized the General Staff, and in August, during the debate on war credits, the Socialist leader demanded democratic reforms and expressed the hope for an early peace. In December Scheidemann, the Socialist leader, in-

terpellated the Government in the Reichstag on possible peace terms, the Socialist majority protested against annexation, and 18 Socialists voted against the war credits. It was evident that a feeling was becoming widespread that a moderate peace should be made as soon as possible. Believers in the "defensive war" were apprehensive at the growing Nationalist appetite for annexations, and expected internal reforms were not forthcoming.

But the most potent factor in the slackening of war enthusiasm was the food situation which daily grew more unsatisfactory. Dependent on imports for most of her raw materials and much of her food, Germany was reduced by the Allies' ever-tightening sea blockade to the point where stringent measures alone kept the army supplied with sufficient war materials and saved civilians from starvation. See BLOCKADE, ALLIED. The Government set up a rigid system of centralized economic control. Food prices continued to rise in spite of the fixing of maximum prices, and drastic action was necessary to check extravagant consumption and speculation. Early in 1915, bread was rationed and similar measures were put in force in the same year, while steps were taken to increase cultivation and to curb profiteering. On May 22, 1915, the War Food Office was created and meat and milk were later rationed. In July, 1916, the War Clothing Office

was opened. The policy of meeting the ever-mounting cost of the War through a series of long-term loans brought the total debt finally to 161,000,000,000 marks and by 1918 German finances were approaching hopeless disorder. Only in 1916 and 1917 did the Reichstag impose new taxes and these were quite inadequate.

The demand for ever-increasing sacrifices gradually destroyed the early patriotic harmony. In March, 1916, a Socialist minority of 18 under Haase dissented from their party's support of the U-boat resolution and formed the Social Democratic Labor Union, which henceforth uncompromisingly opposed the War. Late in 1916, Bethmann-Hollweg showed his disagreement with the military war aims and methods, especially as to unrestricted submarine warfare, but finally allowed the military leaders to dominate him. Von Hindenburg and von Ludendorff, who had become chief of the general staff and quartermaster general, respectively, at the close of August, 1916, with increasing frequency assumed the right to dictate governmental policies; indeed, Ludendorff was little less than military dictator of Germany from 1916 to 1918, and his influence was constantly exerted in favor of annexationist war aims and political reaction.

In the Reichstag, a majority consisting of the Centre, the Progressives, and the Social Democrats supported the Chancellor's policy of moderation in opposition to the Conservatives and National Liberals on the Right and a small group of ultra-radical Socialists on the Left. At the end of 1916, the food situation had become so serious that further restrictions were laid on many articles, and substitutes, too often ineffective, were introduced. The year's harvest was bad. On Dec. 2, 1916, the Auxiliary Service Law was passed, putting all males between 17 and 60 to work. The stranglehold of the blockade induced a civilian state of mind which gave to the military demand for more drastic methods of warfare, especially the unrestricted submarine warfare, a powerful appeal.

Few Germans at this time had any clear conception of the possible effects of America's entrance into the War. Thus, public opinion drifted more and more into a spirit of desperate recklessness and swung over to the viewpoint of the General Staff. When the Chancellor, on Feb. 1, 1917, announced unrestricted submarine warfare, the parties voiced little definite opposition. However, distrust of the Government and desire for peace continued, and were clearly manifest in the great debate on war aims in May, 1917. This sentiment came even more strongly to the foreground during the following months because of the disappointing results of the submarine campaign, the energetic participation of the United States in the War, the feeling that Germany was facing overwhelming odds, and the reluctance of the Government to grant electoral reforms.

On July 16, 1917, Erzberger, leader of the Centre and the majority, repudiated submarine warfare and demanded immediate steps toward peace. The majority parties were now in full opposition to the Chancellor, who, on the other hand, was equally opposed by the parties of the Right for his moderation. He was forced to resign, on July 14, 1917, and was succeeded by Dr. Michaelis, who also soon found himself in difficulties. On July 19, the Left carried by 90 votes a resolution calling for peace by agreement, no forced annexations, and no policy of

coercion after the War, but declaring that, if such a peace could not be obtained, the Germans would stand together and fight as one man. By autumn, the hostility to Michaelis had become so strong that all parties except the Conservatives agreed that he was impossible. He resigned October 28 and was succeeded by von Hertling, Bavarian Prime Minister, who accepted the Peace Resolution as the basis of his policy, but proved his bureaucratic spirit by introducing into the Prussian Diet a franchise bill which was but a tardy step in the direction of electoral reform.

By the opening of the year 1918, milk, meat, and fat had become luxuries, profiteering had grown apace, town and country were increasingly antagonized, fuel, textiles, and other materials had grown scarce, and the system of central bureaucratic control was beginning to break. The spring military successes and the benefits accruing from the Bolshevik Revolution temporarily revived the annexation spirit, but only checked the war-weariness arising from the economic distress. Great strikes in January, 1918, evinced the dissatisfaction with the Government, which was enhanced by the behavior of the military leaders in the negotiations with Soviet Russia and the failure of the Russian and Rumanian peace treaties to lead to a general peace. Erzberger became increasingly hostile to the Government. Germany's military strength had thus far enabled the government to restrain the peace movement, but in the summer of 1918, military reverses presaged an internal crisis. On June 21, Foreign Secretary Kühlmann declared in the Reichstag that it was no longer possible to attain peace by force of arms, but the Chancellor repudiated his statement and he was forced to resign.

During the following month came the final offensive of the Allies on the western front, and with it the movement for peace in Germany entered its last stage. With the defection of Bulgaria, the Hertling cabinet was forced out of office, and Prince Max of Baden formed a new government on the basis of President Wilson's Fourteen Points. The grim course of events made short work of his plans. After four years of hardship and sacrifice, the spirit of revolution had gripped the German people, and in the face of the impending Allied military victory, their former discipline had given way to panic and to a naïve confidence that, by complete surrender, a just peace could be obtained. At the same time, the Chancellor received frantic requests from the German General Staff that immediate application be made for an armistice, since only the cessation of hostilities could save the German Army from military disaster. Events followed each other in rapid succession. The revolution broke out in Kiel in the first days of November. A series of mutinies occurred in the navy, and the Republic was proclaimed in the principal seaports. In Munich Kurt Eisner set up a red republic on November 7. Two days later, the revolution had spread to Berlin, and Prince Max turned the Government over to Ebert, leader of the Socialists. The Emperor fled to Holland on the following day, but did not sign the abdication document until November 28. For the account of the course of the diplomacy of the Central Powers during 1914-18, see *AUSTRIA-HUNGARY and WAR DIPLOMACY*.

The revolution was now in full swing. In Berlin, the overthrow of the Imperial government took place without armed resistance from

the monarchists. Although the revolutionary movement had been actually engineered by the Independent Socialists, and the Majority Socialists had not taken part until the revolution was an established fact, the latter now assumed full charge of it and steered it into rather moderate channels to forestall the establishment of a Soviet republic. A provisional government was formed in Berlin under the title of the People's Commissaries, which immediately appointed a cabinet consisting almost entirely of non-Socialists. Thus, the machinery of government was started running and Germany was helped over the dangerous period of disorder which otherwise would have led to the establishment of an ultra-radical government. Meanwhile revolutionary Workmen's and Soldiers' Councils had sprung up and assumed power everywhere in the Reich. The chief element of opposition to the provisional government was the Workmen's Council in Berlin, which claimed supreme legislative authority for the whole Reich.

In the full realization of this serious situation, the government called a congress of delegates from all the councils. At this congress, held in Berlin on Dec. 16, 1918, executive power was delegated to the six People's Commissaries, who thereupon issued at once a call for elections for a National Assembly. Thus the Berlin Council as the chief element of opposition was definitely eliminated. Foiled in their designs, the ultra-radicals, under the leadership of Karl Liebknecht and Rosa Luxemburg, organized the Spartacus League and attempted by force of arms to seize power and to set up a dictatorship of the proletariat. After minor disturbances, the Spartacus Sailors' Division started a revolt in Berlin, on Dec. 23, 1918, which was subdued by the Government by means of regular troops on the following day. Primarily as a result of this drastic action of the Government, the three Independent Socialist members in the Council of Commissaries, who favored a more revolutionary policy, resigned during the last days of December and were replaced by Majority Socialists. In January, 1919, a new and more vigorous Spartacist insurrection occurred which was put down by Noske, the Majority Socialist Minister of National Defense, only after sanguinary fighting in the streets of Berlin. Renewed uprisings in Berlin during March and in various other cities during April were quelled by the Reichswehr. With the close of these revolts, the Majority Socialist government had weathered the threatening danger from the Left for the time being.

The elections to the National Assembly in January, 1919, showed a great increase in the Socialist vote, although the recruiting strength of the Socialist parties had suffered considerably from their internecine strife. The combined Socialist vote was 13,750,000, against 16,000,000 votes for the bourgeois parties, and the two Socialist parties secured 185 seats in the Assembly out of a total of 421. The revolutionary transformation which had occurred in Germany, and, paradoxically, the continuity of the new republican régime with the old order, were significantly exemplified in the metamorphosis of the political parties which entered the National Assembly. The German National People's Party (popularly, the Nationalists), with their 42 delegates, were simply representatives of the old parties of the Right, i.e., the Conservatives

and Free Conservatives; they were opposed to democracy, to Socialists and Jews, and to the Treaty; they represented monarchist and militarist reaction. The German People's Party, with 21 delegates, was the emaciated but influential successor of the old National Liberal Party, the party of big business, and soon became almost a personal faction representing the coal and iron king, Hugo Stinnes. The Christian People's Party, with 88 representatives, was so clearly recognizable as the quondam Catholic Centre that the old name was used more frequently than the new. The Democratic Party, heir to the old Progressive Party, showed surprising strength, with its 75 representatives and distinguished leaders, one of whom was to draft the new constitution. With the addition of 10 independents, these bourgeois parties mustered 236 votes in the new Assembly, as against 163 moderate Social Democrats, i.e., Majority Socialists, and 22 more radical Independent Socialists. These returns showed clearly that the revolution, begun by admirers of Russian Bolshevism, had taken a nonsocialist turn, but the danger of social revolution was not wholly averted.

Fearing revolutionary upheavals in the capital, the new Parliament assembled on Feb. 6, 1919, in Weimar instead of Berlin, and elected on February 11 the Socialist Ebert as President of the Reich. Immediately afterward, a coalition cabinet consisting of Majority Socialists, Centrists, and Democrats was formed by Scheidemann. The Right, composed of the Nationalists and the People's Party, and the extreme Left or Independent Socialists opposed the new government and did their best to block its measures. It was the ratification of the Treaty of Versailles, however, which caused the first cabinet crisis in Republican Germany. Scheidemann, who by previous statements had committed himself to non-ratification of the Treaty, resigned with his cabinet on June 21, in order to leave the President free to take the necessary steps for ratification. After some difficulties, the Majority Socialist, Bauer, formed a new cabinet of Centrists and Socialists. A majority in the Reichstag, consisting of the Majority Socialists, the Independent Socialists, the Centre, and some of the Democrats, thereupon authorized the Government, on June 23, to sign the Treaty. On June 28, the German representatives duly affixed their signatures, and the Reichstag approved the Treaty on July 9.

On July 31, 1919, the new constitution, drafted chiefly by Professor Preuss, was adopted in the Reichstag by 262 votes against 75. While it contained all the characteristic juridical features of any modern constitution, it applied the democratic principle of equal rights with an almost unprecedented thoroughness and included a number of educational, economic, and social provisions which were distinctly novel. It was divided into two parts: the composition of the Reich, and the fundamental rights and duties of Germans. The German Reich was declared to be a republic whose sovereignty was to be vested in the people. It was provided that each state should have a liberal constitution and a parliament elected by universal, equal, and secret suffrage. All citizens over 20 years of age were to receive the vote, women as well as men. To avoid any inequality, elections were to accord with the principle of proportional representation, and the same democratic franchise was

to govern elections to every German diet and municipality. The Reichstag was to be elected for four years. The President, elected for seven years by a direct vote of the people, was to have power to conclude treaties, receive ambassadors, etc., but declarations of war and peace were to be issued by the Reichstag, and treaties with foreign states were to be ratified by it. The Chancellor and the ministry were to be nominated by the President, and the former was to direct the foreign policy and to be responsible for the cabinet. The Imperial Council was to be composed of the representatives of the states, each of which was to have at least one vote; the votes of the large states were to be proportionate to their populations. The laws were to be submitted to a plebiscite if the President desired.

Article 18, permitting the alteration of state boundaries by the national government with the consent of the population of the regions concerned, was one of many examples of the strongly national and centralized nature of the new government, as contrasted with the federal constitution of the defunct Empire. This article was later taken advantage of to consolidate eight Thuringian duchies and principalities (Saxe-Weimar, Saxe-Meiningen, Saxe-Altenburg, Saxe-Gotha, Schwarzburg-Rudolstadt, Schwarzburg-Sonderhausen, and the two principalities of Reuss) into a unified state of Thuringia and to unite Saxe-Coburg with Bavaria, thus reducing the number of states in the Reich from 25 to 17.

The most important feature of the second part of the constitution was the article providing for the establishment of a system of industrial democracy through works councils and an economic parliament for the Reich. The latter, the Economic Council, was to give an opinion on all bills of an economic and social character and was also to have power to propose such measures. The Council, however, was not to be a legislative organ. Important also was the opening provision of article 151: "The ordering of economic life must reconcile the principle of economic justice with the aim of a civilized life for everybody." The most unusual clause, in many respects, provided that in the schools of the Reich every effort must be made to inculcate a spirit of conciliation with the other peoples of the world.

In September, 1919, the cabinet was enlarged by the reëntance of the Democrats. At the same time, the Works Councils Bill was passed by the Reichstag. As adopted, the bill represented a compromise and did not by any means embody the radical principles which had been originally proposed, nor was it applied without further moderating compromises, bitterly as the Socialists protested. Another important event of the legislative session was the Socialization Law with reference to the mining industry. Republican Germany had taken over a cheerless economic heritage from the imperial system. After the revolution, conditions had become more desperate month by month. The debt had risen to 220,000,000,000 marks, the budget amounted to 15,000,000,000 of ordinary expenditure and to 41,000,000,000 of extraordinary expenditure. New sources of revenue had to be found, and with this end in view, Minister of Finance Erzberger proposed an "emergency contribution" which amounted to a partial confiscation of wealth. The measure was passed by the Reichstag on Nov. 17, 1919, by 238 votes against 43.

The application of the Peace Treaty, which went into effect on Jan. 10, 1920, caused universal discontent in Germany. The Allies' demands for the extradition of the war criminals, including the foremost military leaders of Germany, and for the reduction of the German Army in accordance with the Treaty, were especially potent in arousing national feeling which reacted against the republican government. The impotence of the latter in the face of relentless pressure from the victors served to weaken the Republic, which had been none too secure from the beginning. Under the leadership of Dr. von Kapp and General von Lüttwitz, a counter-revolution broke out in March, 1920. They seized Berlin on March 13, but the republican government issued from Stuttgart an appeal to the workers to call a general strike, and, when the entire trade-union movement of Germany responded, the counter-revolutionists were forced to evacuate the capital after five days of power.

The Kapp Putsch revealed the weakness of the republican government, but showed also the strength of republican sentiment among the masses. Unable to satisfy the demands of the trade union for far-reaching reforms, the Bauer government fell from power on March 26 and was replaced by a new coalition government under Hermann Müller. The Putsch had indirect consequences more serious than the movement itself. In the Ruhr, the workers organized a proletarian army against the monarchists, defeated them, and took possession of the towns and the mines. Berlin sent troops who with some bloodshed restored order. In Bavaria, the March insurrection led to the complete consolidation of the reaction, which had been steadily marshaling its forces since the overthrow of the Soviet government, in April, 1919. Meanwhile, France had become alarmed at the large bodies of troops in the Ruhr and had occupied Frankfurt and the Maingau. Germany appealed to the League of Nations, but without avail. At San Remo in April, 1920, the French agreed to withdraw as soon as the German troops in the Ruhr had been reduced to the required strength.

The elections for the first German Reichstag on June 6, 1920, were unfavorable to the coalition. They resulted as follows: Majority Socialists, 110; Independent Socialists, 80; Centrists, 67; Nationalists, 65; German People's party, 61; Democrats, 45; Christian Federalists, 21; minor parties, 11. A new coalition cabinet was formed by the Centrist, Fehrenbach, consisting of Centrists, Democrats, and members of the People's Party. It was faced with coercive measures by the Allies, including reparations demands, the award to Poland of a small part of the plebiscite area of East Prussia which had almost unanimously declared for Germany, and the disarmament of German civilians. In the latter part of the year, nationalization of the mines was abandoned for the time being when the joint committee of the Economic Council and the Coal Council adopted a plan favoring the mine owners, one of two proposed by the Socialization Commission.

Between the Armistice and the end of 1920, the internal situation of the Reich had changed very materially. The revolution had mainly spent its force, but had replaced the old aristocracy with a new ruling plutocratic class and impoverished the workers and the middle class. With political power directed by democratic and socialistic principles, the real power was wielded by a few captains of industry. Large numbers

were going to the extreme Right or Left, both opposed to the Republic. Nationalist feeling gained day by day and Communism became more and more a factor to be dealt with. Late in 1920, the majority of the Independent Socialists embraced the doctrine of the Third International and with the Communists formed the United Communist Party of Germany, which instigated serious uprising in Central Germany in March, 1921. Meanwhile, the reparations policy of the Allies took its course with fateful consequences for the German political and industrial situation. When the German statesmen refused to accept the severe demands of the conference of Paris, Jan. 24-29, 1921, and of London in February, the Allies imposed their sanctions. At a third conference in London, May 1-5, the Allies presented an ultimatum which forced the Fehrenbach government out of office.

The new government under Dr. Wirth, consisting of Centrists, Socialists, and Democrats, undertook the fulfillment of the Allies' demands. In this spirit, Walter Rathenau, the German Minister of Reconstruction, concluded with Louis Loucheur, the French Minister of Reconstruction, the so-called Wiesbaden Agreement providing for the delivery to France of German materials to be credited to the reparations account. The policy of fulfillment, and especially the Wiesbaden Agreement, met with bitter criticism from the Nationalists, particularly when the expected results were ultimately not forthcoming. The Government's efforts to pay were seriously impeded by the cataclysmic fall of the mark, and for this reason the subject of reparations came up again. The position of the Government was injured still further through the remonstrances of the Allies concerning disarmament, the disbanding of secret military organizations, and the inadequacy of the verdicts rendered by German courts against the so-called war criminals. The intensity of Nationalist feeling at this time became clearly apparent through the murder of Erzberger by a Nationalist zealot, Aug. 26, 1921.

The worst blow of the year, however, and the factor which more than any other since 1918 decreased the industrial strength of Germany and at the same time served to fan Nationalist feeling to white heat, was the partition of Upper Silesia. The plebiscite of Mar. 20, 1921, had resulted in a two-thirds vote for Germany, whereupon the Poles, perhaps fearing a decision unfavorable to them, started an insurrection. Allied troops interfered only when the German population had been given full opportunity to realize that it was at the mercy of the victor. The final award of the Supreme Council, which was based on the report by a commission of the League of Nations, gave the greater and most valuable part of the Upper Silesian industrial district to Poland. On the official publication of the verdict, the Wirth government resigned, but it resumed office again after a reorganization of the coalition cabinet. For a full discussion of the problem, see SILESIA, UPPER.

The reparations problem, the cause of all unrest and anxiety, was acute once more at the end of 1921 and assumed an even graver aspect during the following year. The Conference of Genoa in April, 1922, lost much of its significance because France agreed to participate only on the condition that reparations should not be officially discussed. On Easter Sunday, Apr. 16, 1922, the German and Russian delegates

concluded at Rapallo a treaty whereby peace was reestablished between their countries, and both sides waived all claims arising from the War. This pact aroused a storm of indignation at the conference, which no assurance of good faith on the part of the Germans could pacify. Both Germans and Russians denied that the treaty contained any secret clauses working to the prejudice of the Allies.

In May a moratorium for the year 1922 was granted to Germany by the Reparations Commission, in return for which the Wirth government promised to take measures toward balancing the budget, provided that an international loan was arranged in due time. Subsequently, a loan committee, of which the American banker J. P. Morgan was a member, was formed to study the German finances. Any constructive work on the part of the committee was blocked by the refusal of the French government to make a loan dependent on the modification of the French demands.

While the reparations problem was thus hanging over Germany like the sword of Damocles, the country was sinking ever deeper into the abyss of political hatred and financial and economic disorder. In the summer of 1922, Nationalist conspirators made attempts to murder Scheidemann and Harden and succeeded in assassinating Walter Rathenau, the Foreign Minister. This crime created a violent outburst of popular indignation throughout the Reich, and since it was evidently intended to be a blow at the Republic—Rathenau being the outstanding figure in German political life—a law for the protection of the Republic was enacted. The murder showed clearly the depths of political dissension in Germany. The foes of the Republic made the revolution and republicanism responsible for all the misery which had descended on Germany.

Meanwhile, the mark had begun its spectacular downward movement, and in October, 1922, the dollar exchange had mounted to 3000. The depreciation of the currency provoked confusion in public finances and a complete revolution in prices with all its disastrous consequences. Wages and salaries could not keep pace with prices, and terrible suffering befell the population, particularly the middle classes. The only people who profited by this lamentable situation were the industrialists, the profiteers, and the farmers. The Wirth government tried vainly to stabilize the mark, and conditions continued to grow worse as the year advanced. At the same time, changes had occurred in the parliamentary situation which brought about a cabinet crisis. The Majority and Independent Socialists had re-united at the Unity Conference of Nuremberg, and as a result the United Socialist Party had taken a turn to the Left. Chancellor Wirth sought to reconstruct the coalition government by the inclusion of the German People's Party. To this, the United Socialists would not assent, because, not without justification, they regarded the latter party as officially republican, but unofficially and in sentiment as thoroughly monarchist and reactionary. The Wirth government fell thereupon and was succeeded by a business cabinet under Dr. Cuno. This was composed entirely of bourgeois politicians; the German People's Party was its driving force.

Although the Cuno government pursued the same reparations policy as its predecessor, a

deadlock soon appeared between the Reparation Commission and Germany over a comparatively small default in the delivery of coal, and as a result, the French and Belgians, in January, 1923, occupied the Ruhr industrial district. This action aroused the most bitter resentment and denunciation throughout the Reich. The occupation and the passive resistance of the local population, which was encouraged and actively supported by the German government and people, led to a revival of patriotic ardor and monarchist activity. A still more fateful consequence was the rapid aggravation of the economic and financial situation. When the Ruhr, the chief centre of Germany's economic life, ceased work, production all over the Reich was seriously impeded, and there was an unprecedented increase in unemployment. Moreover, inflation continued without interruption, because the enormous cost of passive resistance in the Ruhr necessitated an ever-increasing output of paper money.

On May 31, 1923, the mark sank below the Austrian crown and collapsed completely during the following months, in spite of all efforts at stabilization. The rapidity of the mark's decline was equaled only by that of the rise of prices, with which wholesale increase in salaries and wages could not keep pace. With the growing depreciation of the mark, the food situation became more alarming, since the farmers were very reluctant to exchange their products for worthless paper money. All faith in the mark vanished completely during the summer and fall, and business and labor began to make loud demands for real money. It seemed indeed as if Germany were headed for the final breakup. All these internal factors brought about the fall of the Cuno cabinet on Aug. 12, 1923; the immediate cause was the withdrawal of Socialist support in the Reichstag. Stresemann, the leader of the German People's Party, formed a new coalition from members of his own party, the Centrists, the Socialists, and the Democrats.

The new government assumed office with the promise of taking immediate and drastic steps to untangle the complicated foreign and domestic problems, and with this end in view acknowledged defeat in the Ruhr by abandoning passive resistance. Likewise, vigorous action was taken in regard to the critical problems of taxation and finance, and for a brief period hope was revived; but the measures adopted led to renewed difficulties with the Nationalists, industrialists, and Communists. By means of a modified form of martial law, serious outbreaks of the extreme Right and Left were narrowly averted, but the steady pressure of the moderate Right, which objected primarily to the drastic financial reforms of the radical Socialist Minister of Finance, Hilferding, forced the resignation of the Stresemann cabinet on October 3. Since no other chancellor was available at this particular time, the Stresemann coalition resumed office after Hilferding had been replaced by a Centrist. In order to render the government more stable in the face of the extraordinary internal situation, a bill was passed by the Reichstag on October 13 suspending certain constitutional rights and liberties and vesting the government with extraordinary power to issue such decrees relative to the financial, economic, and social conditions as might be warranted by the situation.

Such drastic measures seemed necessary, indeed, for the misfortunes of the year culminated in November in a series of events which came near disrupting the fragile structure of the Republic. In October, the Rhenish separatist movement (see RHINELAND) had come to a head, and in the closing months of the year the separatists in the Rhineland and the Palatinate, who were comparatively few in number and recruited for the most part from the dregs of the population, succeeded (with the connivance of the French and Belgian authorities it is charged) in gaining possession of a number of towns. The local population, worn out by the long period of occupation, was cowed by French and Belgian military force. But once the armies of occupation, under pressure from the English and influenced by international public opinion, withdrew their support, the flimsy structure of the "Rhenish Republic" fell to pieces; and the movement petered out in the early months of 1924.

Another danger lay in the rising tide of extreme nationalism, which had found a safe haven in reactionary and monarchist Bavaria. On November 8, the extreme monarchists in Munich under the leadership of Ludendorff and Hitler executed an abortive coup, commonly called the Beer Hall Putsch. Although the coup was easily frustrated and was in itself a rather childish affair, it served to show the extent and boldness of the extreme Nationalist movement. At the trial of the conspirators, which began Feb. 26, 1924, Ludendorff was acquitted but Hitler and three other leaders received short sentences. More serious was the constant friction between the republican government of the Reich and the reactionary government in Munich. It was only through a policy of diplomacy and forbearance that Belin succeeded in preventing an open break between the Reich and Bavaria.

While proceeding in the delicate Bavarian situation with the utmost caution, the Government used coercion against the recalcitrant Communist and radical Socialist governments of Saxony and Thuringia which were removed by use of the federal military and replaced by moderate Socialist governments. The summary action against "Red Saxony" and the forbearance of the Government against monarchist Bavaria caused the Socialists to withdraw from the cabinet. These developments, together with Stresemann's announcement of the abandonment of all assistance to the people in the occupied regions, resulted in a vote of no confidence in the Reichstag and consequently the resignation of the government on Nov. 23, 1923. After a whole week of fruitless endeavor, a new coalition government, consisting of the Centre, the Democrats, the German People's Party, and the Bavarian People's Party, was formed with Dr. Wilhelm Marx as Chancellor. At the request of the new Chancellor, the Reichstag, by a vote of 313 to 18, gave the Government plenary powers without parliamentary sanction for an indefinite period. The chief purpose of this act was to empower the Government to take drastic action in regard to the critical social and economic situation.

Late in 1923, currency reforms were inaugurated whereby a Rentenbank was established which issued a new currency token, the Rentenmark, to be covered by a hypothecation of the entire wealth of Germany. Alongside it, the old paper mark and the mark of the gold loan in August were temporarily to remain legal tender. When the Rentenmark, which was worth some-

what less than a quarter of a dollar, came into circulation it was worth exactly 1,000,000,000 paper marks, but with its appearances the inflation of the paper mark came to a halt. As a result of the introduction of a fixed-value currency, prices early in 1924 were put definitely on a gold basis and general confidence in the currency began to return. At the same time the food situation and the condition of the middle and working classes became worse for several reasons, chiefly the fall in wages and the lengthening of working hours. While the stabilization of the currency had thus been attained through the issue of the Rentenmark, the balancing of the budget remained an open problem.

Meanwhile, the Dawes Committee of experts had begun its investigation of German finances, and under its indirect influence an important step was taken in the direction of budget reform in January, 1924; this was the temporary repudiation of the public debt until after payment of reparations. Further measures aiming at improvement of the financial situation were introduced in the spring of 1924, and as a result, there was a continued recovery of Germany during the first half of the year, not only in regard to finances, but also in a general economic sense. While the food situation was still grave and there was by no means cause for rejoicing, yet it was felt that the worst was over. This feeling was strengthened by the Dawes Report (see REPARATIONS) and by the results of the French elections in May, 1924. The Dawes Report was regarded by most Germans as acceptable in the main, not because of its satisfactory conditions, but because it seemed to supply a basis on which in due time an ultimate accord on reparations might be reached, especially as it was backed by the prestige of the United States. Even the Nationalists were not outspoken in their opposition to it.

The mild form of martial law was ended early in 1924, and two weeks later, on March 13, the Reichstag, which had been in session for four years, was dissolved. New elections were held on May 4. The results were approximately as follows: Socialists, 100; German National Party, 90; Centrists, 62; Communists, 62; German People's Party, 44; People's Freedom Party, 32; Democrats, 25; Bavarian People's Party, 16; minor parties, 28. The outstanding feature of this election was the strengthening of the extreme Right and Left at the expense of the middle parties supporting the Republic. It is true that much larger inroads on the republican majority had been expected; yet the coalition upholding the Republic had been only a narrow working majority. At the same time, the German People's Party, the parliamentary tool of the great industrialists, although nominally a member of the republican coalition, was in spirit thoroughly monarchist. Thus, the Republic rested on a more precarious basis than at any other time since its creation, if the line-up of the political parties may be taken as a criterion. As a matter of fact, matters were even worse than the parliamentary situation indicated, for many Germans who had Nationalist and monarchist sympathies voted for republican parties chiefly out of consideration for the Dawes Report. Ever since 1919 there had been an uninterrupted swing to the Right and the Left. After the Armistice, the Republic was looked on by the great majority of the German people as

established, and the monarchy was to all intents and purposes dead; but the Peace Treaty and all its dismal consequences, reparations, the Ruhr occupation, the never-ending national humiliation, and the resulting economic misery, had almost destroyed faith in the Republic and induced Germans increasingly to seek salvation in monarchism or communism.

In view of the large Nationalist representation, the Marx cabinet resigned after the election, and President Ebert turned to the Nationalists for the formation of a new coalition government, but the latter, who were perhaps not overanxious to assume office at this particular time, advanced such extreme conditions, such as the nomination of Admiral Tirpitz as chancellor, that President Ebert fell back on ex-Chancellor Marx. The latter resumed office for the time being with a coalition, consisting of the Centre, the Democrats, the German People's Party, and the Bavarian People's Party. With the support of the Socialists, this government had a slight majority in the Reichstag. The attitude of the Nationalists was due primarily to their unwillingness to take a definite stand for or against the Dawes Report. Early in June, 1924, the Reichstag by a majority of 64 voted in favor of acceptance of the Dawes Report, and immediately steps were taken to draft the laws required under the plan.

On June 30, 1924, the government of the Reich accepted the demands of the Allies made in March for an investigation of military conditions in Germany, reorganization of her police force, etc., at the same time denying emphatically that Germany was building up a secret military organization. With Germany's acceptance of the Dawes Plan, Premiers MacDonald and Herriot arranged for a conference in London to formulate plans for putting it into effect. This meeting opened on July 16, with representatives of the Allied Powers in attendance. On August 5, the German delegates entered the conference, the occasion marking the first time since the War that the Germans had negotiated on a footing of equality with the Allies. They immediately began pressing for an evacuation of the Ruhr. Premier Herriot finally consented to a complete evacuation within a year and an economic evacuation to begin at once, provided the Germans faithfully fulfilled their obligations, and the Germans accepted. Other agreements were quickly arrived at, and Chancellor Marx returned to Germany to face the task of obtaining ratification of them by the Reichstag.

The difficulty was increased by the necessity, under the Constitution, of obtaining a two-thirds vote to pass the bill denationalizing the railways. In the voting on this measure, the Nationalists, who had strongly opposed the Dawes Plan as a party, had the balance of power and thus held the fate of the whole plan in their hands, since it had to be taken as a whole or not at all. Faced with this responsibility, they hesitated, and finally left the decision to their individual members. Enough of these supported the bill to ensure its passage. With an American, Owen D. Young, as Agent for Reparations, the Dawes Plan was put into effect at once, Germany making her first payment of 20,000,000 gold marks on September 1. Shortly thereafter, Mr. Young was succeeded by another American, S. Parker Gilbert.

With the reparation difficulty thus temporarily adjusted, the Ruhr in the process of being

liberated, a dependable currency in use, and an international loan floated with surprising ease, economic conditions in Germany showed a marked improvement and the general prospect became brighter than for many years. But the opposition of the Nationalists to the Dawes Plan agreements had been placated only at the price of a promise of participation in the government. When other parties firmly refused to accept this arrangement, a dissolution of the Reichstag was forced and elections were set for December 7. They resulted in a strengthening of the centre parties and a turning away from both the Communists and the extreme nationalists. But the new line-up made the task of forming a coalition cabinet difficult and Chancellor Marx resigned December 11 rather than accept Nationalists into his cabinet. It was not until Jan. 15, 1925, that a new ministry was formed.

The event had more than the usual significance attaching to a cabinet change. Supported by the two Nationalist parties and the Centre Party, the new government marked a distinct turn toward the position of the conservatives in domestic affairs and that of the advocates of an assertive nationalism in foreign affairs. To a degree, it thus reflected popular sentiment, in which a distinct revival of national spirit was evidenced. The opponents of the ministry even charged it with a desire for a return of the monarchy, but the new Chancellor, Dr. Luther, vigorously refuted the idea in his first speech to the Reichstag and promised to combat any movement that might be directed toward the overthrow of the Republic.

With the Nationalists to the front, there was much apprehension as to the effect on Germany's relations with other countries; but it was somewhat allayed when Dr. Luther made it clear that he supported the policies of Dr. Stresemann, who remained as Foreign Minister. These policies comprised a far-reaching programme characterized by a consistent effort to reach an accord with the victors in the late War and to reinstate Germany in a strong position through conciliatory rather than intransigent measures. The adoption of the Dawes Plan and the evacuation of the Ruhr constituted one major step in the working out of this programme. Stresemann now looked forward to the entrance of Germany into the League of Nations and the framing of a pact with France for a mutual guarantee of security as the next big steps. To accomplish these ends, he needed a foundation of domestic support which the advent of the Nationalists threatened to destroy. Dr. Luther, leaving to Stresemann the task of carrying on foreign negotiations, took upon himself the responsibility for preserving his Reichstag majority by putting through various desired measures of internal interest.

Before much could be done in either direction, the attention of the whole country was diverted for a while from specific issues by the death of President Ebert on February 28 and the political ferment that followed. Although berated by extremists of both Right and Left almost up to the moment of his death, the first President of the Republic had come to be highly regarded and even beloved by the masses of the people for the steady strength with which he held the nation on its course through the stormy post-war years. The high honors paid to him by the whole nation were a very genuine testimonial to his worth.

Chancellor Luther acted as President until March 6 when Dr. Walter Simons, president of the highest court, took over the duties pending the choice of a new President. After a bitter campaign, the elections were held on March 29. They resulted indecisively, with no candidate receiving the required majority. Jarres, the Nationalist candidate, led in the voting with 10,408,000, followed by Braun, Socialist, with 7,798,000; Marx, Centrist, with 3,885,000; Thälmann, Communist, with 1,871,000; and others with smaller totals. Further elections, in which a plurality of votes would decide the choice, were thus made necessary. The parties of the Right concentrated on Marshal von Hindenburg, the aged popular hero of the War, and the Left on ex-Chancellor Marx. The elections held on April 26 gave von Hindenburg 14,856,000 votes, Marx 13,752,000, and Thälmann 1,931,000. When the former leader of the German Armies took the oath of office on May 12, he professed entire loyalty to "the common welfare of the German people," and neither then nor later gave any support to the newly awakened hopes of the monarchists.

The general result of the whole two months of political strife was to confirm the strength of the hold which the republican form of government had upon the German masses. In the Reichstag, a number of important measures were enacted. Bills for raising revenue included a comprehensive tax bill, raising the rates of excise taxes on beer and tobacco but continuing from the previous year a gradual reduction of the sales or turnover tax, lowering it from 1½ per cent, the rate applying since Jan. 1, 1925, to 1 per cent, as of Oct. 1, 1925. The income tax was likewise cut by 25 per cent. A new tariff law was passed, partly for raising revenue, partly for protection, and partly for bargaining purposes in dealing with other countries. The new rates took the country back practically to the position of 1903. The so-called "revaluation bill" provided for a measure of compensation for holders of government and industrial bonds, owners of mortgages, etc., who had seen the values of these possessions wiped out by inflation. Political prisoners were freed by an amnesty bill and a number of proposed commercial treaties were acted upon, including one with the United States.

In following through his plans for more cordial relations with the Allied Powers, Dr. Stresemann was particularly fortunate in having radical or liberally inclined foreign ministers to deal with in both France and England. The agreements of the London Conference had been made possible by the presence of Ramsay MacDonald at the helm in Great Britain and Herriot in France, both eager for a more harmonious European concert. Briand likewise made a conciliatory attitude the central feature of his direction of French foreign affairs both as Premier and as Foreign Minister. The Council of Ambassadors, however, introduced a harsh note when, in December, 1924, it was announced that the investigation of Germany's military affairs had disclosed certain unsatisfactory conditions, and that, as a consequence, the evacuation of the Cologne area due under the Treaty on Jan. 10, 1925, provided Germany had lived up to the Treaty terms, would be postponed.

It was not until June 4 that Germany was apprised of the particulars in which she had offended. A note of that date from the Allies

demand, among other things, the abolition of the German general staff, the military police organization, secret military training of German youths, and experiments with poison gas; reduction of the security police; destruction of machinery for making war supplies, etc. The Germans agreed to all these demands in a note Nov. 11, 1925, and the evacuation of Cologne and other districts was accordingly ordered.

Early in the year 1925, Stresemann formally advanced the idea of a "security pact" to the Powers. It bore fruit finally in the Locarno Conference of October 5, which both Stresemann and Luther attended, and in the treaties agreed to there, which have been universally recognized as a landmark in European diplomatic history; but gratifying as the result might be to an impartial observer of European politics, the reaction among the Nationalists in Germany was one of intense opposition. The more chauvinistic of the Germans could not lightly give up the thought of redeeming German losses eventually through force of arms. Three Nationalist cabinet members resigned and the party went on record as opposed to the agreements, but the Socialists rallied to the support of the Government and on November 27 the treaties were ratified. On December 1, they were signed in London. Four days later, the Luther ministry resigned, as the Socialists refused to continue in its support. Once again there was a long interregnum between cabinets. On Jan. 19, 1926, Luther succeeded in forming a cabinet, but the jockeying for positions in it among the parties was so drawn out that President Hindenburg, with patience exhausted, issued a four-hour ultimatum to them to settle their differences with hints of a dictatorship if they failed.

Among the serious domestic questions with which the Government was called upon to deal was that of unemployment, which had reached large proportions. On Jan. 30, 1926, the evacuation of the Cologne district was finally completed and was celebrated by a tour of the region some weeks later by President Hindenburg. Although Germany's entrance into the League of Nations was a part of the Locarno understanding, the League was slow to act on her application for membership on February 8. The proposal to assign to Poland a permanent seat on the League Council when Germany was accorded that honor surprised the Germans, who refused to enter if that should be done. On April 26 a treaty between Germany and Russia was announced. Based on the Treaty of Rapallo, it provided that in case either country should be attacked by a third power or group of powers, the other would remain neutral, and also that neither would participate in an economic boycott against the other; but the point was expressly made that the agreement was not in conflict with Germany's obligations to be assumed when she entered the League of Nations. There was considerable objection to the treaty for a while among other European nations. By the time of the meeting of the League in September, all differences had been adjusted and Germany took her place as a member of the League with a permanent seat on the Council. See LEAGUE OF NATIONS.

The great success of the Locarno and League policies of Stresemann caused the opposition of the Nationalists to them and to the Government largely to subside; but the Luther cabinet nevertheless lived a precarious life and was

finally forced to resign, on May 12, because it had ordered that the old imperialist colors black, white, and red should be displayed by German representatives abroad beside the black, red, and gold of the Republic. With the Nationalists refraining from voting, this action was condemned in the Reichstag by a vote of 176 to 146. On May 17, Dr. Marx again became chancellor, retaining the whole Luther cabinet aside from the position of premier. The flag question was referred to a special commission, but continued for a long while to be a source of bitter contention. The issue that caused the greatest political upheaval in 1926, however, was whether the estates of Germany's former ruling houses should be confiscated for government uses. The question for years had been argued over in the courts, which for the most part had decided in favor of the royal owners. Early in 1926, a number of organizations united to force a national referendum, which under the constitution must be held if one-tenth of the qualified voters should demand it. Some 12,000,000 signatures, three times the necessary number, were obtained and after much delay the referendum was ordered for June 20. An exciting campaign was climaxed by a letter from President Hindenburg opposing confiscation. Although 14,441,000 votes were cast for confiscation and only 585,000 against, the measure was lost because the total vote fell short by nearly 5,000,000 of the necessary 50 per cent of the total registered vote.

On December 17, the Marx cabinet found itself in a minority in the Reichstag and resigned. The issues which brought about its downfall were the activities of Defense Minister Gessler and Minister of the Interior Külz. Gessler had long been bitterly opposed by the Socialists, who charged that he was secretly training a big military force behind the mask of "athletic clubs" and like organizations with the object of restoring the monarchy and again challenging the Allies on the battlefield. Külz was opposed because of the drastic manner in which he enforced the censorship law. Once more President Hindenburg was confronted with a political crisis over the year's-end. He took a decided stand, demanding that a cabinet should be formed which could be assured of parliamentary support, and which, moreover, would carry on the Stresemann foreign policies. He suggested a Centre coalition, but the cabinet as eventually formed by Dr. Marx was a combination of Centre and Right elements, with Gessler remaining as Minister of Defense. The four Nationalists included in it, although bound by a preliminary understanding that they would accept the Republic and the foreign policy of conciliation, caused many difficulties by utterances breathing the spirit of a combative German assertiveness.

The year 1927, however, proved a quiet one both at home and abroad. Some important legislation was passed, including a bill restricting overtime labor and another establishing labor courts. The most stirring event of political import was the sharp memorandum to the German government delivered on October 20 by Agent General Gilbert of the Dawes Plan Commission. In it, he stated that while he believed the Government was earnestly trying to meet its reparations obligations, economic disaster and the failure of the Dawes Plan were threatened unless the large unnecessary expenditures of the Government and the free negotiating of loans and ex-

pansion of credit were curbed. In its reply, the Government defended certain of the expenditures such as the increase of civil salaries, but confessed that the criticism of federal grants to the states was well founded. The note resulted in reforms looking toward greater economy, which Mr. Gilbert noted in his report for the year. He also recommended in his report the setting of a definite amount of reparations and the ultimate removal of outside financial supervision such as he was exercising. Germany made her reparations payment promptly in 1927, partly from loan and partly from current revenues, and likewise in 1928.

Early in 1928, it became growingly evident that the cabinet did not reflect the changed state of public opinion and that its usefulness as a governing body was almost nullified by internal disagreement. The only change made, however, was the substitution of Lieutenant General Wilhelm Groener for Dr. Otto Gessler, who had served continuously since 1919, as Minister of Defense. The government's support in the Reichstag grew ever weaker. On March 31, the President dissolved that body and elections were held on May 20. They resulted as was generally predicted, in a victory for the Left, but the extent of the swing in that direction came as a surprise. The Socialists gained 21 seats and led all other parties with 152, the Communists increased their number from 45 to 54, and the Nationalists dropped from 111 to 73. The result was taken as an emphatic indorsement of the Stresemann conciliation policy in foreign affairs, as that was the important issue in the election.

In accordance with this shift in public opinion, the Marx cabinet handed in its resignation on June 12 and the Socialist leader, Hermann Müller, finally succeeded in getting together a ministry to take its place. Five parties, the Socialists, the Democrats, the People's Party, the Bavarian People's Party, and the Centre, were represented. The cabinet, however, was admittedly a provisional one, intended to function while a stronger coalition among the republican parties was being cemented. The Reichstag passed a bill reducing income taxes, a general amnesty bill, and other measures of varying importance. Trade agreements were concluded in 1928 with South Africa, China, and several other countries.

On August 11, the tenth anniversary of the adoption of the Weimar constitution was celebrated with great enthusiasm. The year was marked by a falling off in trade and industrial activity, which brought in its train labor disturbances including a dock-workers' strike lasting for months, and in the latter part of the year a lockout of 250,000 metal workers in the Ruhr. The latter action was caused by a refusal of the employers to accept an arbitral award increasing wages. The Reichstag appropriated 20,000,000 marks for the relief of the workers, who finally returned to work on the basis of former hours and wages when both sides agreed to accept the decision of the Minister of the Interior, Dr. Severing. His award, announced December 21, was in the nature of a compromise, giving the workers increases of 1 to 6 pennings an hour and cutting down their working time by three hours a week.

Following the formation of the Müller government in the middle of 1928, the projected replacement by a strong coalition proved ex-

tremely difficult to effect. Continual antagonism between the parties concerned prevented a union on any political programme. In the meanwhile, the provisional cabinet became daily weaker in prestige and authority, even the Socialists themselves voting against their Chancellor on the question of building a new 9000-ton cruiser.

In the early months of 1928, the endless quarrels between parties brought the Government face to face with a crisis of a most serious nature. Of the four parties which were to form the coalition, the Socialists, Democrats, People's Party, and Centrists, the latter two, particularly the Centrists, seemed immovably recalcitrant. The Centrist representative in the cabinet was withdrawn on February 5 and the party later refused to meet the other three in a conference called by the Chancellor. The People's Party also, despite the pleas of its most prominent leader, Stresemann, refused to join the coalition unless its specific demands were met. There were many warnings, including one from the Chancellor himself, that the breakdown of parliamentary government was imminent, to be followed inevitably by the setting up of a dictatorship and the eclipse of Liberalism. Following a February crisis, however, the situation grew somewhat less tense and the Chancellor continued to govern with a "cabinet of personalities." During May 1-3 Berlin was agitated by May Day Communist riots in three different sections, in which the police fired on groups of rioters and other civilians. Twenty-four people were killed. It was freely charged that the action of the police was needlessly harsh and the danger of an uprising exaggerated.

The final settlement of Germany's most galling troubles, the reparations obligation and the occupation of German territory by Allied troops, was brought markedly nearer in the first part of 1929 by the conference at Paris of experts on reparations. Germany had never ceased to press, intermittently but urgently, for the liberation of the occupied regions. In 1928 she had been met by plain intimations that the question was tied up closely with that of reparations. With regard to the latter, Mr. Gilbert's statement that the total amount which Germany was to be called upon to pay should be definitely fixed came more and more to represent responsible opinion, and at the September meeting of the League a conference of experts to try to arrive at such a result was proposed. The Paris conference, meeting in February, 1929, ensued and after four months of labor, with success in doubt almost to the last, succeeded in framing an agreement. For Germany, it was considered a most auspicious event, and the harassed country could at last look forward to a time of release from the most hampering of the restrictions on her national life yet remaining from the Allied victory. This was followed by the conference of The Hague.

GEROULD, GORDON HALL (1877- ). An American philologist, born in Goffstown, N. H. He was a member of the faculty of Bryn Mawr College and after 1916 was professor of English language and literature at Princeton University. He is the author of *The North England Homily Collection* (1902), *Sir Guy of Warwick* (1905),

*Selected Essays of Fielding* (1905), *The Grateful Dead: The History of a Folk Story* (1908), *Saints' Legends* (1916), *Peter Sanders, Retired*, a novel (1917), *Youth in Harley*, a novel (1920), *Filibuster* (1924), *A Midsummer Mystery* (1925), and other works. In 1918 he was a captain in the United States Army.

**GEROULD, JOHN HIRAM** (1898- ). An American zoölogist, born at Stoddard N. H., and educated at Dartmouth College and at Harvard. He was instructor in zoölogy at Dartmouth (1894-1915), assistant professor (1915-1918) and professor (1918- ). Professor Gerould published articles in zoölogical journals on the development of sipunculids and holothurians, and on the genetics of butterflies and moths. He was joint editor of the *Journal of Morphology and Physiology*.

**GEROULD, KATHARINE FULLERTON** (1879- ). An American writer, born at Brockton, Mass., and educated at Radcliffe College. She was a reader in English at Bryn Mawr, 1901-10. In addition to many articles in magazines, she published *Vain Oblations* (1914), *The Great Tradition* (1915), *Hawaii, Scenes and Impressions* (1916), *A Change of Air* (1917), *Modes and Morals* (1919), a collection of essays; *Valiant Dust* (1923), a collection of short stories; *Conquistador* (1923), *The Aristocratic West* (1925), and other volumes. She was a frequent contributor to magazines.

**GERRY, PETER GOELET** (1879- ). A United States Senator, born in New York City, who was graduated from Harvard in 1901. He was admitted to the Rhode Island bar in 1906, was a delegate from Rhode Island to the Democratic National Conventions of 1912 and 1916, and was a member of Congress for the Second Rhode Island District in 1913-15. He was elected U. S. Senator for the two terms (1917-29).

**GEST, MORRIS** (1881- ). A theatrical producer born in Vilna, Russia. He came to the United States in 1893 and was educated in the public schools of Boston. He began his theatrical business in Boston and since 1905 has been a member of the firm of F. Ray Comstock & Morris Gest in New York. This firm has produced more than 50 plays. Among its most notable successes are *Experience* (1914), *The Wanderer* (1917), *Chu Chin Chow* (1918), *Aphrodite* (1919), and *Mecca* (1920). Balieff and his Chauve-Souris artists were presented to the American public by this management (1922), the Moscow Art Theatre (1923), and the Freiburg Passion Play (1929). During the 1923-24 season, it produced *The Miracle* under Max Reinhardt's direction and plays starring Eleonora Duse, and Sir John Harvey. In 1926 the firm contracted with the United Artists to produce one motion picture annually for six years, beginning with Belasco's *The Darling of the Gods*.

"GESTALT" PSYCHOLOGY. See PERCEPTION; PSYCHOLOGY.

**GHENT, gent.** A seaport and manufacturing city of Belgium. The population in 1927 was 103,207. A network of canals form of the city a second Venice, the 26 islands being connected by 60 bridges. The commerce of Ghent is mostly with England, North America, and South America, the city being connected with the seaports of Ostend and Zeebrugge by one of the largest canals in the world. In 1922, 1658 vessels of 1,308,197 tonnage were cleared. Ghent is the principal centre of the Belgian textile industry.

The factories, however, are confined to the suburbs and are not allowed to settle in the city. One of the most important unions is the socialist coöperative society, *De Vooruit*, which corresponds to the powerful guilds of the fourteenth and fifteenth centuries. Ghent is also a horticultural centre, and its flower shows, which are held every five years, have an international reputation. The University of Ghent is a state institution. In 1923 a law was passed declaring that the instruction in the faculties of philosophy and letters, law, science, and medicine should be in both French and Flemish. The Germans, during their occupation of Ghent from October, 1914 to November, 1918, professedly sympathized with the Flemings and, as part of their propaganda in achieving a partition of Belgium, urged the conversion of the university into a Flemish institution.

**GHÉON, gā'ôn, HENRI** (1875- ). Pseudonym of Henri-Léon Vangeon, a French poet and playwright born at Bray-sur-Seine, near Provins. His pre-war plays, *Le Pain* and *L'Eau de Vie*, were produced in Paris, and his other works include *Algérie*, poems, and *Nos directions*, criticisms. He described his conversion to Catholicism during the World War in *L'Homme né de la Guerre*, (4 ed., 1919). After the War, he founded the Compagnons de Notre Dame to present miracle and religious plays. Ghéon wrote or adapted the plays, which included *Les Trois Miracles de Sainte Cécile* (1918); *Le Pauvre sous l'escalier* (1919); *Les Aventures de Gilles, ou le Saint Malgré Lui* (1921); *La Bergère au Pays des Loups* (1922); *La Merveilleuse Histoire du Bernard de Menthon*, played at the Chateau de Menthon in Savoy (1923); *Le Triomphe de Saint Thomas d'Aquin* (1925); *La Vie profonde de Saint François d'Assise* (1926), and *Les trois Sages du vieux Wang* (1927).

**GIBBONS, FLOYD (PHILLIPS)** (1887- ). An American journalist and war correspondent, born at Washington, D. C., and educated at Gonzala College and Georgetown University. In 1907 he entered the newspaper field as a staff member of the Minneapolis *Daily News*, later joining the staff of the Milwaukee *Free Press* and the Minneapolis *Tribune*. In 1912 he joined the Chicago *Tribune*. In 1917 he was London correspondent for the Chicago *Tribune* and a year later went as war correspondent to France, where he was wounded in the Battle of Château-Thierry. He was awarded the French and Italian Croix de Guerre. After the Armistice, he became foreign director of the Chicago *Tribune* and editor of the European edition published in Paris.

**GIBBONS, HERBERT ADAMS** (1880- ). An American author, born at Annapolis, Md., and educated at the William Penn Charter School in Philadelphia, the University of Pennsylvania, and Princeton Theological Seminary. He was ordained in the Presbyterian ministry in 1908, and until 1919 was correspondent in Turkey and in Europe for various American periodicals. From 1910 to 1913, he was professor of history and political economy in Robert College, Constantinople, and in 1919 was named honorary associate professor in the Army War College, Washington D. C. His publications include *The New Map of Europe* (1914); *The Foundation of the Ottoman Empire* (1915, 1921); *The New Map of Africa* (1916); *Reconstruction of Poland and the Near East* (1917);

*The New Map of Asia* (1919); *Venizelos* (1920, 1923); *Bases of Anglo-Saxon Solidarity* (1921); *Lithuanian Recognition* (with W. G. McAdoo; 1921); *An Introduction to World Politics* (1922); *Europe Since 1918* (1923); *America's Place in the World* (1924); *A Selected Bibliography of the World War* (1924); *Ports of France* (1926); *Life of John Wanamaker* (1926); *Europe of To-day* (1927).

**GIBBS, SIR PHILIP** (1877- ). An English writer and newspaper correspondent, who was educated privately. After four years of editorial work, he entered journalism (1902), acting first as literary editor for various papers, and then special correspondent for the *Daily Chronicle*. He served as war correspondent with the Bulgarian Army (1912), with the French and Belgian armies (1914), and with the British Armies in France (1915-18), where he reported field operations. In 1920 he was knighted, and from 1921 to 1922, he edited the *Review of Reviews*. He frequently visited and lectured in the United States. His writings include the novels *Oliver's Kind Women* (1912), *Back to Life* (1920), *Venetian Lovers* (1922), *The Middle of the Road* (1922), *Heirs Apparent* (1923), *The Reckless Lady* (1925), *Young Anarchy* (1926), *Out of the Ruins* (1927), and *The Age of Reason* (1928); the historical works, *Men and Women of the French Revolution* (1906), *George Villiers, First Duke of Buckingham, and Some Men and Women of the Stuart Court* (1908), *King's Favorite* (1909), *Adventures of War with Cross and Crescent* (1912), *The Soul of War* (1915), *The Battles of the Somme* (1917), *People of Destiny; Americans as I saw them at Home and Abroad* (1920), *Now it Can be Told* (1920), and *More That Must be Told* (1921); and the essays *The Eighth Year* (1913), *The New Man; a Portrait Study of the Latest Type* (1913), *Adventures in Journalism* (1923), *Ten Years After: a Reminder* (1924), *Knowledge is Power; a Guide to Personal Culture* (1925), and *The Day After To-morrow; What is Going to Happen to the World?* (1928).

**GIBNEY, VIRGIL PENDLETON** (1847-1927). An American pioneer orthopaedic surgeon, born in Jessamine County, Kentucky. He received his degree in arts at the University of Kentucky (1868) and in medicine at Bellevue Hospital Medical College (1871). He entered the Hospital for Ruptured and Crippled, New York, as resident house surgeon, becoming chief surgeon in 1887. He was professor of orthopaedic surgery at the New York Polyclinic (1882-1894) and during the rest of his career taught the same subject at the medical department of Columbia University, where he was successively clinical lecturer, clinical professor, and full professor. He resigned in 1917. He was the first president of the American Orthopaedic Association and his textbook on *The Hip and Its Diseases* (1884) went through numerous editions.

**GIBSON, CHARLES DANA** (1867- ). An American illustrator (see VOL. IX). During the World War, he did some notable work as cartoonist. Later, he purchased a controlling interest in *Life*, of which he assumed entire charge in April, 1920.

**GIBSON, HUGH** (1883- ). An American diplomat, born at Los Angeles, Calif., and educated for the diplomatic service at the École Libre des Sciences Politiques at Paris. Between 1908 and 1919, he held various diplomatic posts in Central America, England, Belgium, and

France, and was a member of special committees or missions in Washington, Santo Domingo, and the countries of the former Austro-Hungarian Empire. In 1918-19 he served with Herbert Hoover in European relief work. In the latter year, he was named first Minister to Poland. He was Minister to Switzerland, 1924-27, and became Ambassador to Belgium in 1927. In 1926-27 and in May, 1929, he was chairman of the American delegation to the preparatory commission for the Disarmament Conferences at Geneva. He was also chairman of the American delegation to the Conference for the Limitation of Armament in 1927 and chairman of the conference. He published *A Journal from Our Legation in Belgium* (1917).

**GIDE, zhéd, ANDRÉ** (1869- ). One of the leading French writers of the twentieth century, born in Paris and educated in the École Alsacienne and the Lycée Henri IV. He began publishing in his twenty-first year. When he wrote his *Nourritures Terrestres* (1897), a collection of prose poems, he was acclaimed as an intellectual poet of the first order. As a novelist and an intellectual essayist, Gide showed himself a master of psychological observation, in many ways resembling Dostoevski. After the World War, he was among the first to demand the resumption of intellectual relations with Germany and engaged in a polemic against nationalistic writers like Barrès and Maurras. His works include: *Philoctète* (1890); *Cahiers d'André Walter* (1891); *Poésies d'André Walter* (1892); *La tentative amoureuse* (1893); *Paludes* (1895); *Prétextes, essays* (1895); *Saül* (1898), played at the Théâtre du Vieux Colom-bier in 1922; *Prométhée mal enchaîné* (1899); *L'Immoraliste* (1902); *Amyntas, travel in Algeria* (1906); *Le retour de l'enfant prodigue* (1907); *Dostoevski* (1908); *La porte étroite*, translated as *Straight is the Gate* in 1924 (1909); *Oscar Wilde* (1910); *Nouveaux prétextes* (1911); *Les caves du Vatican* (1914); *La symphonie pastorale* (1919); *Morceaux choisis* (1922); *Incidences, essays* (1924); *Les fau-monnayeurs* (1925); *Numquid est tu?*, miscellany (1926); *Voyage au Congo* (1927); and *Le retour du Tchad* (1928). He translated *Gitanjali* (L'offrande lyrique) of Tagore (1913), Shakespeare's *Antony and Cleopatra* (1921), and Blake's *Marriage of Heaven and Hell* (1923). Consult *Bibliographie de l'œuvre d'André Gide, 1891-1924*, by Raoul Simonson (1924); *Portraits and Sketches*, by Edmund Gosse (1912); "The novels of André Gide," by Francis Bickley in *Life and Letters* (London) vol. ii, p. 83-90 (1924), and *André Gide, son œuvre* by G. Gaboury (1924).

**GIDE, CHARLES** (1847- ). A French political economist (see VOL. IX), a professor at the Collège de France. An independent thinker on economic questions, Gide stimulated interest in economics as an art of social administration rather than as a science of the status quo. His *Histoire des Doctrines Économiques* (1909-22), written with M. Rist, contained a penetrating criticism of the communist experiment in Russia. His later works include *Premières Notions d'Économie Politique* (1921); *De l'intervention des pouvoirs publics pour la réalisation du juste prix* (1922); *La Russie soviétique* (1924); *Les douze vertus de la coopération* (1925), and *Fouquier, précurseur de la coopération* (1925). He also published many of his lecture courses at the Collège de France.

**GIESE**, gŕzē, WILHELM OSKAR FRITZ (1890- ). A German psychologist and author. He studied philosophy, psychology, and medicine and is connected with a sanitarium near Halle. Among his principal recent works are *Kulturwende* (1916), *Der Romantische Charakter* (1919), *Psychologisches Wörterbuch* (1920), *Psychologische Normung* (1920), *Wesen und Ziele der Psychotechnik* (1920), *Das ausserpersönliche Unbewusste* (1924), *Körperseele* (1924), *Geist im Sport* (1925), and *Die Frau als Atmosphärenwert* (1926).

**GIESEKING**, WALTER (1805- ). A German pianist, born at Lyon, France, and trained at the Hanover Conservatory. After winning recognition as an excellent interpreter of the classics, he espoused the cause of the modernists. Since 1926 he has been on concert tours with great success in the United States.

**GIGLI**, BENIAMINO (1890- ). A celebrated Italian dramatic tenor, born at Recanati. After completing his studies under Enrico Rosati at the Liceo Santa Cecilia, in Rome, he made his debut as Enzo in *La Gioconda*, at Rovigo (Oct. 15, 1915), with striking success, so that within the next three years he won triumph after triumph at the principal Italian opera houses. Then followed tours of Central and South America. On Nov. 26, 1920, he was heard at the Metropolitan Opera House, in New York, as Faust, and since then he has been a regular member and prime favorite there, succeeding to many of the principal roles of Caruso after the latter's death in 1921.

**GIL**, PORTES. President of Mexico, see **PORTES GIL**.

**GILBERT**, ARTHUR WITTER (1882- ). An American agronomist, born at West Brookfield, Mass., and educated at the Massachusetts Agricultural College and Boston University. He was instructor and assistant professor of agronomy at the University of Maine, 1905-07, assistant professor and professor of plant breeding at Cornell, 1909-17, agricultural secretary to the Boston Chamber of Commerce, 1917-19, and Commissioner of Agriculture of Massachusetts, 1919- . He is the author of *Plant Breeding*, with L. H. Bailey (1914), and *The Potato* (1917). He edited *Food Supply of New England* (1923).

**GILBERT**, SEYMOUR PARKER (1892- ). An American lawyer who served as Agent General for Reparation Payments. He was born at Bloomfield, N. J., was graduated at Rutgers College (1912), and obtained the degree of LL.B., *cum laude*, from Harvard in 1915. He practiced law in New York City for three years. During and after the World War, he was a member of the war-loan staff in the office of the Secretary of the Treasury. He became Assistant Secretary of the Treasury, in charge of fiscal affairs, in 1920 and was reappointed in March, 1921, with the change of administration. From July 1, 1921, to Nov. 17, 1923, he was Under-Secretary of the Treasury, but resigned to reënter law practice with the firm of Cravath, Henderson & de Gersdorff in New York. From 1924 to 1929, he was Agent General for Reparation Payments of Germany under the Dawes Plan. In 1927 he issued a warning to Germany on the rise of military expenditures, which had a pronounced effect in determining the national budget and facilitating reparation payments to the Allies during the operation of the Dawes Plan. See **REPARATIONS**.

**GILBERT AND ELLICE ISLANDS COLONY**. See **PACIFIC ISLANDS**.

**GILBRETH**, FRANK BUNKER (1808-1924). An American consulting engineer (see Vol. IX). In July, 1917, he became commanding major of engineers, and in December of the same year was on duty at the General Staff College in Washington. Among his later writings are *Applied Motion Study* (1917), *Motion Study for the Handicapped* (1919), and papers on the re-education of the crippled soldiers.

**GILES**, jilz, HERBERT ALLEN (1845- ). An English Orientalist (see Vol. IX), professor of Chinese at Cambridge University. In 1924 he was elected to the French Academy, and received the honorary Litt.D. from Oxford. Besides works on the Chinese language, he wrote "China," in *History of the Nations* (1913); *Adversaria Sinica* (1914-15); *Confucianism and Its Rivals* (1915); *The Travels of Fa-hsien* (1923); *Some Truths about Opium* (1923); *Chinese Poetry in English Verse* (1898, enlarged ed., 1923); *Chaos in China* (1924); *The Hsi Yuan Lu* (Chinese Instructions to Coroners, 1924), and *Quips from a Chinese Jest-Book* (1925).

**GILLETT**, FREDERICK HUNTINGTON (1851- ). An American Congressman and United States Senator, born at Westfield, Mass., and educated at Amherst College and the Harvard Law School. He began the practice of law in Springfield in 1877. He was assistant attorney general of Massachusetts, 1879-82. For two terms he was representative in the Massachusetts House, and from 1893 to 1925 served as Representative in Congress. In 1914 he favored the Panama Canal Tolls Repeal Bill and was distinctly opposed to the Government's Mexican policy. In May, 1919, he was elected Speaker of the House and served in this capacity until 1925, when he was elected United States Senator for the term 1925-31.

**GILLOUIN**, RENÉ CHARLES AUGUSTE (1881- ). A French philosophical writer who was born at Aouste, Drôme, and educated at the École Normale Supérieure. He entered the municipal administration of Paris and was attached to the cabinet of the president of the city council. As a writer, his affinities were with the nationalist Catholic school and the ideology of Bergson and LeRoy. His works include *Ars et Vita, Études Littéraires et Philosophiques, La Philosophie de M. Henri Bergson* (1911); *Idées et figures d'aujourd'hui*, and *Une nouvelle philosophie de l'histoire moderne et française*. Three of these received the prizes of the French Academy for literature and criticism. He was editor of *Politica*, a library of works on political thought and action.

**GILSON**, ÉTIENNE HENRY (1884- ). A French professor and philosophical writer, born in Paris and educated at the Sorbonne. He taught in the lycées of Bourg, Tours, and Angers, and in the universities of Lisie, Strasbourg, Harvard, and Paris, and edited *Études de philosophie médiévale*, and *Archives d'histoire doctrinale et littéraire du moyen âge* (1926-27). As a scholar, Gilson was best known by his researches in mediæval philosophy. His writings include a doctoral dissertation on *La Liberté chez Descartes et la Théologie* (1912); *Études de philosophie médiévale* (1921); *La Philosophie au Moyen Âge*, 2 vols. (1922); *Le Thomisme* (1923); and *La Philosophie de Saint Bonaventure* (1924).

**GINZKEY, FRANZ KARL** (1871- ). An Austrian author, born at Pola in Istria, and educated at the Marine Academy and Cadet School. After serving as officer in various Austrian towns, he was appointed technical director of the Military-Geographical Institute in Vienna. Later, he went to Salzburg and devoted himself to writing. In 1906 and 1920, he was awarded the Bauernfeld Prize. His later works include *Von wunderlichen Wegen*, stories, (1921); *Rositta*, a novel, (1922); *Vom Gastmahl des Lebens*, poems, (1922); *Es war einmal*, ballads (1922); *Balladen aus dem alten Wien* (1922); *Die Reise nach Konakuku*, stories, (1923); *Der Weg zu Oswalds*, story, (1924); *Brigitte und Regine*, poem, (1924); *Der seltsame Soldat* (1925); *Der Kater Ypsilon* (1926); *Der Gott und die Schauspielerin*, stories, (1927). He edited *Die Romantik der Weltliteratur*.

**GIOLITTI, jò-lét'tè, GIOVANNI** (1842-1928). An Italian statesman (see VOL. IX). When the World War broke out, he was in favor of strict neutrality, and when the question of Italian participation arose in 1915, he attempted unsuccessfully to overthrow the Salandra cabinet. Throughout the course of the War, he was looked on as a "defeatist." After the Armistice, he again returned to the premiership (May, 1920-April, 1921). His foreign policy was successful, but his internal programme was dominated first by the Socialists and later by the Fascists. He was a moderate opponent of the Fascist regime, favoring Parliamentary government. In 1922 he published *Memoires of My Life* in 2 vols. See ITALY, under *History*.

**GIRAUDOUX, zhër'òdoo', HIPPOLYTE JEAN** (1882- ). A French man of letters, born at Bellac (Haute-Vienne), educated at the École Normale Supérieure. Following his graduation, he devoted himself in turn to teaching journalism, and to diplomacy. In the meantime, he began his literary career as a writer of poems in prose, and his first book, *Les Provinciales* (1909) won immediate recognition. His *Lectures pour une Ombre* (1917) was one of the few war books and of literary merit, *Siegfried et le Limousin* (1922), a war story of shell shock and amnesia, was one of the books awarded the Grand Prix Balzac. His other works include; *Simon le païhélique* (1918); *Amica America* (1918); *Elpénor*; *Adorable Olio* (1920); *Suzanne et le Pacifique* (1921); *Finale de Siegfried et le Limousin* (1922); *Juliette au pays des hommes* (1924); *Bella* (1926); *Églantine* (1927), and *Siegfried*, a dramatization of *Siegfried et le Limousin*, (1928).

**GIRL SCOUTS.** A national organization for girls, founded in 1912, to develop initiative, self-control, self-reliance, and service to others, and to meet a fundamental need for recreation and education in the lives of young girls. The unit of the organization is the troop which is composed of one or more patrols, each consisting of six to eight girls. The activities of the troop are directed through the patrol system, and the Court of Honor which is made up of the patrol leaders, the captain, and lieutenants. Membership is open to girls between 10 and 18 years who are willing to subscribe to the Girl Scout Promise and Laws and who have passed the necessary test. During the World War, the Girl Scouts entered into and initiated many forms of war service. No records were kept of their activities in the first two Liberty Loan campaigns, but in the third, they sold 12,742

bonds, amounting to \$3,151,000, and in the fourth campaign they practically doubled this figure, in the sale of 39,987 bonds, valued at \$6,123,550. The War over, they turned to peace-time activities, such as home-making, the underlying idea of which is to develop beauty and simplicity, as well as utility, in the home, and to raise the standards and ideals of the American homes of the future. Twelve national summer training schools for leaders were established, to train girls for leadership work, through the Laura Spelman Rockefeller Memorial, by a contribution from the Julius Rosenwald Fund. Training in leadership was also given in more than 30 colleges throughout the country, and summer camps were conducted for younger girls to train them in the habits necessary for later life and to give them an opportunity for out-of-door living. The total active membership of the organization, according to the annual report of Dec. 31, 1928, was 190,309, or 22,384 more than in the previous year, and there were 22,622 volunteer leaders.

**GISH, DOROTHY** (1898- ). An American motion-picture actress, born in Dayton, Ohio, sister of Lillian Gish. She appeared on the stage from childhood. Her best-known pictures are *Old Heidelberg*, *Stage Struck*, *The Little Yankee*, *Children of the Feud*, *That Colby Girl*, *Hearts of the World*, *Battling Jane*, *The Hope Chest*, *Orphans of the Storm*, *Romola*, *Nell Gwyn*, and *Madam Pompadour*. In 1920 she married James Rennie, an actor.

**GISH, LILIAN** (1896- ). An American motion-picture actress, sister of Dorothy Gish, born in Springfield, Ohio. She appeared on the legitimate stage at the age of five and after 1913 played in motion pictures. Her best characterizations were in *The Birth of a Nation*, *A House Built on the Sand*, *Souls Triumphant*, *Hearts of the World*, *The Greatest Thing in Life*, *Broken Blossoms*, *Way Down East*, *Orphans of the Storm*, *The White Sister*, *Scarlet Letter*, *Annie Laurie*, *The Wind*, and *The Enemy*.

**GLACIAL CONDITIONS.** See GEOLOGY.

**GLACKENS, WILLIAM J.** (1870- ). An American painter and illustrator (see VOL. X). At the Panama-Pacific International Exposition, 1915, he was awarded a bronze medal and in 1924 he was awarded the Temple Gold Medal. In his later work, continuing his interest in the more colorful aspects of life, he maintained his reputation as a remarkable colorist.

**GLAND.** See SECRETIONS, INTERNAL; ZOOLOGY, under *Physiology*.

**GLASGOW.** The principal commercial centre of Scotland. The population rose from 784,496 in 1911 to 1,034,174 in 1921; in 1928 the estimated population was 1,160,500. The municipal area is 29,511 acres. The city is governed by a town council of 113 members and sends 15 members to Parliament. Glasgow's trade in 1924 was valued at £85,302,000. In 1926 the tonnage of ships entering was 6,677,722 and of ships cleared, 6,568,831. The work in connection with the raising of the level of Loch Katrine, so as to augment the city's water supply, was in progress for several years. At the end of 1926, the structural works at the outlet dam at the Trossachs end of Loch Katrine and also at the inlet basins to the two aqueducts were completed, and the water was raised to a level of 14 feet 6 inches. More than £5,000,000 has been expended on this service. In 1923 the corporation purchased the Glasgow Subway Railway, opened by private enterprise in 1896, for £385,000 and has spent a large sum

of money on substituting electric for cable traction. In 1923 an extension was added to the municipal building, and in 1927 the George V Bridge was opened so as to meet the demands of traffic. The People's Palace, combining a winter garden, art gallery, museum, and concert hall, was built by the corporation in the east end of the city. The city meets most of its expenses out of a fund known as the Common Good Fund, which has been accumulating for 350 years. The assets of this fund amount to more than £10,000,000. It is largely used to further municipal culture, education, and charity.

**GLASGOW, ELLEN ANDERSON GHOLSON** (1874- ). An American novelist (see Vol. X). Her later works included *Life and Gabriella* (1916); *The Builders* (1919); *One Man in His Time* (1922); *The Shadowy Third* (1923); *Barren Ground* (1925); *The Romantic Comedians* (1926); *They Stooped to Folly* (1929).

**GLASPELL, SUSAN** (Mrs. GEORGE CRAM COOK) (1882- ). An American author (see Vol. X). She wrote *Fidelity* (1915); *Trifles*, with George Cram Cook (1917); *Suppressed Desires* (1917); *Plays*, a collection including "Bernice" (1920); *Inheritors* (1921); *Verge* (1922); *The Road to the Temple* (1926); *The Comic Artist* (Collaboration, 1927); and *Brook Evans* (1928).

**GLASS.** See CHEMISTRY, APPLIED.

**GLASS, CARTER** (1858- ). A United States Senator, born at Lynchburg, Va., and educated at public and private schools there. For eight years, he worked in a printing office and subsequently became owner of the *Daily News* and the *Daily Advance* of his native town. He served in the Virginia Senate from 1899 to 1903, and in the latter year, on the death of P. J. Olney, he became a member of the United States Congress, to which he was continuously reelected until 1918, when he resigned to become Secretary of the Treasury in President Wilson's cabinet. Here he was active in floating the Victory Loan. He resigned a year later (November, 1919), and was appointed and later elected to fill the unexpired term of Senator Thomas S. Martin, deceased. He was reelected for the term 1925-31. Although an advocate of prohibition, he supported Alfred E. Smith in the Presidential campaign of 1928, in which Virginia went Republican. In 1920 he was chairman of the committee on resolutions at the Democratic National Convention. As chairman of the House banking commission, he sponsored and was largely responsible for the Federal Reserve Act.

**GLASS, MONTAGUE (MARSDEN)** (1877- ). An American author, born at Manchester, England, and educated at the College of the City of New York and New York University. Among other works, he is the author of *Potash and Perlmutter* (1913), a successful farce, written in collaboration with Charles Klein. With J. E. Goodman (q.v.) he wrote: *Object: Matrimony* (1916); *Business before Pleasure* (1917); *Why Worry?* (1918); *His Honor, Abe Potash* (1919). Other plays are *Potash and Perlmutter—Detectives* (1926), and *Lucky Numbers* (1927).

**GLAZEBROOK, SIR RICHARD TETLEY** (1854- ). An English physicist (see Vol. X). He was Zaharoff professor of aviation and director of the department of aeronautics in the Imperial College of Technology (1920-23) and after 1926 foreign secretary to the Royal Society. He added to his works *Science and Industry* (1917).

Knighted in 1917, he was made a Knight Commander of the Bath in 1920.

**GLEAVES, ALBERT** (1858- ). An American naval officer, born in Nashville, Tenn., and educated at the United States Naval Academy. During the Spanish-American War, he commanded the torpedo boat *Oushing* and from 1904 to 1908 he was in charge of the torpedo station at Newport, R. I. In 1915 he took command of the destroyer force of the Atlantic fleet. In 1917 he had charge of convoy operations on the Atlantic and conveyed the first contingent of the American Expeditionary Force to France. From 1917 to 1919, he commanded the cruiser and transport force of the Atlantic fleet, and from 1919 to 1921, commanded the Asiatic station, and in 1922 the First Naval District and the Navy Yard in Boston. He was retired by operation of law in 1922. He was appointed rear admiral in 1915, vice admiral in 1918, and admiral in 1919. He wrote *Capt. James Lawrence, U. S. N.* (1904), *History of the Cruiser and Transport Force* (1921), *Life of an American Sailor—William Hemsley Emory* (1923), and *Life and Letters of Rear Admiral S. B. Luce, U. S. N.* (1925).

**GLENN, MARY WILLCOX** (Mrs. JOHN M. GLENN) (1869- ). An American social worker, born in Baltimore, Md. From 1897 to 1900, she was executive secretary of the Henry Watson Children's Aid Society of Baltimore. In 1900 and 1901 she served as general secretary of the Charity Organization Society of Baltimore and in 1915 was appointed president of the National Conference of Charities and Corrections. In July, 1928, she was chairman of Section III on social case work of the International Conference on Social Work at Paris. She was president and director in many other social organizations and was the author of *Development of Thrift* (1899).

**GLENN, OLIVER EDMUNDS** (1878- ). An American mathematician and educator, born in Moorefield, Ind., and educated at Indiana and Pennsylvania universities. In 1902-03 he served as instructor at the University of Indiana and afterward was acting professor of mathematics at Drury College. In 1906 he was a member of the faculty of the University of Pennsylvania as instructor in mathematics, assistant professor, and after 1914, professor. He was a member of several scientific societies and the author of *A Treatise on the Theory of Invariants* (1915) and mathematical memoirs.

**GLENO DAM FAILURE.** See DAMS.

**GLIDERS.** See AERONAUTICS.

**GLOVES.** See LEATHER.

**GOBLET D'ALVIELLA, gó'blá' dál-vyél'lá,** COUNT EUGÈNE (1846-1925). A Belgian legislator, writer, and minister of state (see Vol. X). During the World War, he was a member of the Belgian cabinet. He published *The True and the False Pacifism* (1917). He was killed in an automobile accident. His will founded the Prix Goblet d'Alviella to be given every five years to the Belgian who wrote the best scientific work on the history of religions.

**GOBLOT, gó'bló', EDMOND** (1858- ). A French logician and philosopher of science, a member of the Lyons Faculty of Letters. In his *Essai sur la classification des sciences* (1898), he sought to continue the tradition of positive rationalism inherited from Comte and Cournot. This project he carried out more fully in his later works, *Traité de Logique* (1918) and *Le*

*Système des Sciences: le Vrai, l'Intelligible, et le Réel* (1922). The rationalism expounded in these works was in direct contrast to the tendency of the school of Bergson toward æsthetic mysticism. Goblot was also the author of *Vocabulaire Philosophique* (1901), *Les Théories d'Einstein* (1922), and *La logique des jugements de valeur* (1927).

**GODDARD, HENRY HERBERT** (1866- ). An American psychologist known for his research in feeble-mindedness. He was born in Vassalboro, Me., and educated at Haverford College. After a period of school-teaching, he was appointed professor of psychology at the State Normal School of Pennsylvania. In 1906 he resigned to take charge of the bureau of research in the Training School for the Feeble-minded at Vineland, N. J. After 12 years in this capacity, he was made director of the State Bureau of Juvenile Research, of Ohio, and in 1922 he became professor of abnormal and clinical psychology in the Ohio State University. His major publications comprise *The Kallikak Family* (1912); *Feeble-mindedness: Its Causes and Consequences* (1914); *The Criminal Imbecile* (1915); *Psychology of the Normal and Subnormal* (1919); *Human Efficiency* (1920); *Juvenile Delinquency* (1921); *Two Souls in one Body?* (1927), and *The School Training of Gifted Children* (1927).

**GODFREY, HOLLIS** (1874- ). An American educator and engineer, born in Lynn, Mass., and educated at Tufts College and Harvard University. From 1898 to 1905, he was engaged in teaching and from 1906 to 1910 was head of the department of science of the School of Practical Arts in Boston. He was consulting engineer for several cities and corporations and was research worker for the New York State Commission on Hygiene from 1910 to 1917. He was president of the Drexel Institute in Philadelphia from 1913 to 1921, and after 1921 was president of the Engineering Economics Foundation. He wrote *The Man Who Ended War* (1908); *The Health of the City* (1910); *Dave Morrell's Battery* (1912), and *Creating Wealth* (1927), as well as contributions to periodicals.

**GOETHALS, gøthals, GEORGE WASHINGTON** (1858-1928). An American civil and military engineer (see Vol. X). He resigned from the post of Civil Governor of the Canal Zone in 1916 and was made chairman of the board of inquiry in regard to the Adamson Eight-hour Railway Labor Law. He was State engineer of New Jersey in 1917 and in the same year was made general manager of the Emergency Fleet Corporation. Because of his lack of faith in the wooden fleet, he resigned after three months. He was then appointed acting quartermaster general of the United States Army. In 1918 he was made chief of the division of storage and traffic of the general staff (in February) and chief of the division of purchase, storage, and traffic (in April). He was also a member of the War Industries Board. At his own request, he was relieved from active service in March, 1919, and later headed an engineering and construction company. He retired from this work several months before his death. General Goethals was associated with the Port of New York Authority for several years, and had much to do with the planning of the Holland tubes under the Hudson River between New York and Jersey City, and with plans for the bridge between New York and Fort Lee, N. J. In 1915 the Congress of the

United States thanked him formally, in behalf of the nation, for "distinguished service in constructing the Panama Canal," and he received the Distinguished Service Medal in 1918 for "especially meritorious and conspicuous service" in reorganizing the quartermaster department. In 1919 France made him a commander of the Legion of Honor.

**GOITRE.** Examination of United States recruits during the World War showed a considerable percentage of cases of this affection. In one group of 20,000, no less than 6 per cent showed simple goitre in a considerable degree. It also became evident that this affection is endemic in certain areas, such as the belt which runs south of the Great Lakes. It is here that most of the intensive study and attempts at prevention have taken place. Thus in the school children of Akron, Ohio, goitre is known to develop in a considerable number, and it was learned that the addition of a few milligrams of iodine to the daily diet was a preventive. At Rochester, N. Y., the city water supply was medicated with iodine with the desired result of preventing the development of the disease.

The problem of prevention is complicated in France, Switzerland, and India, where the disease has been endemic for centuries with a high incidence. Here other factors may be at work in determining the disease, and the mere addition of a little iodine to the food or water may be insufficient for prevention. The iodine ingested by the patient may not be absorbed as a result of an abnormal condition of the intestine. Similarly, there may be some irregularity in regard to the metabolism of iodine, or it may be too rapidly eliminated. The preventive action of iodine has, however, been demonstrated in school children in Switzerland, and it has been shown likewise that regions of high altitudes, remote from the ocean, may not contain enough iodine in their plant foods and water to prevent the development of the disease. Simple goitre must not be confused with toxic goitre or Graves's disease. In this form, there is not much enlargement of the thyroid, but the patient is an invalid who suffers much from rapid pulse and nervousness.

The First International Congress on Goitre was held at Berne Aug. 24-26, 1927, and, while practically all countries sent delegates, some of the leading authorities on the disease failed to attend. The very large number of exhibits are to be used as the nucleus for a future goitre museum. It is difficult to sum up the results of the Congress, but there is evidently a great lack of standardization and uniformity in various aspects of the disease including the nomenclature. It is by no means certain that the problem of goitre is the same in different localities. Lack of iodine as a causal element seems to recede despite its use in prevention. The preventive campaign as carried out in the United States is being carried out in a number of European countries consisting chiefly in the use of iodine but too much should not be expected of it as a cure. Mild cases may disappear but the severe forms are merely improved and we should not look forward to eradicating the disease in this simple manner. See **FOOD** and **NUTRITION**.

**GOLD.** The World War, with its intensive economic changes and dislocation of values, produced a depression in the gold-mining industry that had not been completely overcome 10 years after the signing of the Armistice. Subsequent

to the war period, certain mines, such as those in South Africa and Australia, were able to produce gold with considerable advantage, as they received a virtual premium on their output; but, with the strengthening of sterling exchange, their position became less satisfactory. In the United States, there has been no such advantage. The increased costs of labor and supplies has been ac-

1925	389,251,000
1926	398,557,000
1927	402,844,000
1928	408,808,256

companied by a reduction in the grade of ore at many of the primary gold producers. This condition has resulted in numerous requests for government assistance in the form of the establishment of a bounty on production or an excise tax to be based on gold used in the arts. However, no action was taken on these suggestions. In the United States, gold mining has been discouraged by the maintenance of the high commodity price level and the failure of the Government to offer legislative assistance. Consequently, an increasing proportion of the gold produced in the United States is secured as a by-product from the production of the more important non-ferrous metals, particularly copper.

PRODUCTION OF GOLD IN THE UNITED STATES

1928	2,194,295	45,360,100

In 1915 the United States gold production was valued at \$101,035,700 which constituted 21.5 per cent of the world's output. In 1923 domestic production was but 14 per cent of the total; in 1927 it was only 11 per cent. This reduced output proportion may be expected to continue as there are only a few primary gold-producing mines of importance now operating in the United States and their output is not increasing. Until some downward revision in the general commodity price level takes place, or governmental aid

of some sort is tendered to the gold producers, it appears probable that an increasing proportion of the United States gold output is to come as a by-product from the copper, lead, and zinc mines which may be expected to operate at a high rate for many years.

In 1914 the United States exported some \$222,616,156 of gold and imported \$57,387,741, a balance of \$165,000,000 in excess of exports over imports. With the exception of 1919, when \$368,185,248 of gold was exported and \$76,534,046 was imported; in 1925 when \$262,639,790 was exported and \$128,273,172 was imported; and 1928 when \$560,759,000 was exported and \$108,897,000 imported; the imports were in excess of the exports, because of the extremely heavy excess of merchandise exports over merchandise imports. The gold imported into the United States up to the close of 1921, and possibly for a short while afterward, was used to cancel indebtedness earlier incurred to Federal Reserve Banks by member banks. After that time, the net gold imports were employed to build up the cash reserves of member banks with the reserve banks and to enable them approximately to increase the deposit liabilities of the member banks several times over without increasing their reliance on advances from the central banks. (On June 30, 1928, the gold reserve in the United States was valued at \$2,780,173,216.

UNITED STATES GOLD MOVEMENTS

	Imports	Exports
1913	\$63,704,832	\$91,798,610
1914	57,387,741	222,616,156
1915	451,954,590	31,425,918
1916	685,990,234	155,792,927
1917	552,454,374	371,883,884

1923	322,716,812	28,643,417
1924	319,720,918	61,648,313
1925	128,273,172	262,639,790
1926	213,504,000	115,708,000
1927	207,525,000	201,455,000
1928	168,897,000	560,759,000

Since 1918 the gold production of Canada has steadily increased. Canada's 1928 gold production was valued at \$38,047,000 as compared with a \$14,463,689 output in 1918. The increasing importance of Canada's annual gold production

and the gradually declining importance of the industry in the United States indicate that in time Canada will supersede its southern neighbor as the second most important gold producer in the world.

The trend of gold production in Mexico has been downward since 1924. Several of the older gold mines of primary importance have been closed down in recent years because of the exhaustion of ore reserves and the generally unsatisfactory political and economic conditions under which the companies find it necessary to operate.

South African production continues to increase and the production record of the Transvaal was broken for the fifth consecutive year in 1928. Mining costs in 1928, however, were slightly higher and it is not improbable that this upward tendency of operating costs will continue, particularly when consideration is given to the increasingly adverse operating conditions encountered in the deep mines of the Transvaal. The outlook for the world gold industry of the future is none too promising and it appears inevitable that unless the relative value of gold is to increase, the world output must surely decline in future years.

According to an official estimate, the gold holdings of the 40 principal countries of the world at the close of 1928 amounted to \$9,981,000,000, of which the U. S. Treasury and Federal Reserve Banks held 37.6 per cent. The percentage was reduced from 41.8 at the end of 1927.

"The decrease is chiefly the result of the loss of \$231,000,000 from central gold holdings of the United States, but it is also attributable to the fact that the reported gold holdings of all central banks and governments were \$446,000,000 larger at the end of 1928 than at the end of 1927," the Federal Reserve Board said.

The increase was greater than the total amount of new gold mined during the year, about \$405,000,000, notwithstanding the fact that over \$80,000,000 of gold was absorbed by India and an unknown amount taken for industrial consumption, according to the board.

The unusual growth of monetary gold was accounted for largely by the return of gold by the French public to the Bank of France and the shipment of gold to England and Germany by Russia, in excess of the production of the Russian mines and the loss of gold by the State Bank.

Attention was called to the fact that the Bank of the Nation in Argentina, although not an institution of issue, holds a substantial part of the monetary gold reserves of that country.

Figures given by the board represent physical gold held either at home or abroad by central banks and public treasuries. They do not include items that are understood to represent or include holdings of foreign assets other than earmarked gold; nor do they include gold technically known as "in circulation," that is, gold held by commercial banks, business concerns, and private individuals. The board explained that figures for gold in circulation are difficult to obtain.

At the end of 1928, the gold held by national banks in the United States amounted to \$17,000,000; by the commercial banks of Australia, \$126,000,000; by the Argentine banks, other than the Bank of the Nation, \$11,000,000; and by Canadian banks, \$77,000,000.

Holdings at the end of the year as compared with 1927 were given as follows: United States, \$3,977,000,000; Canada, \$152,000,000, decrease of

\$38,000,000; Spain, \$502,000,000, decrease of \$8,000,000; Russia, \$97,000,000, decrease of \$5,000,000; France, \$954,000,000, increase of \$299,000,000; Germany, \$444,000,000, increase of \$206,000,000; Argentina, \$529,000,000 increase of \$78,000,000; Brazil, \$101,000,000, increase of \$48,000,000; Italy, \$239,000,000, increase of \$27,000,000; Belgium, \$100,000,000, increase of \$26,000,000; Netherlands, \$161,000,000, increase of \$14,000,000; Austria, \$12,000,000, increase of \$12,000,000; Poland, \$58,000,000, increase of \$12,000,000; Uruguay, \$59,000,000, increase of \$9,000,000; England, \$742,000,000 increase of \$8,000,000; and India, \$119,000,000, increase of \$5,000,000.

**GOLDBERGER, JOSEPH** (1874- ). An American physician, born in Austria-Hungary. He obtained his education in arts at the City College of New York and his degree in medicine from Bellevue Hospital Medical College, New York, in 1895. After a short term of private practice at Wilkes-Barre, Pa., he entered the U. S. Public Health Service, becoming past assistant surgeon in 1904 and surgeon in 1912. The earlier part of his government service was devoted to preventive medicine and later he was made director of field nutrition investigation. Although he has studied many of the transmissible diseases, he is best known for his persistent investigation of pellagra over many years and for his experiments, carried out at times on his own person, with pellagra-producing diets.

**GOLD COAST.** A British colony of West Africa which includes within its administrative area Ashanti and the protectorate of the Northern Territories. Total area, 80,000 square miles; population, census of 1911, 1,503,386; increased by 1921 to 2,078,043. In 1915 there were 2206 Europeans, and in 1921, 2165. Chief towns are Accra (38,000), Secondee (10,000), and Cape Coast Castle (15,000). Education, encouraged by the Government and by foreign missions, made great strides. There were 22 government schools and 234 government-aided schools with an average attendance of 29,640 in 1927. The staple products and exports are cocoa, palm oil, kola nuts, palm kernels, india rubber, and manganese. Exports in 1913, and 1927 were valued at £5,427,106, and £14,350,355. Imports for the same years were £4,952,494 and £13,770,542. Shipping entered and cleared, 4,814,436 tons. Chief imports in 1927 were cotton goods, machinery, provisions, apparel, hardware, and building materials. The growing importance of the United States in the Gold Coast foreign trade may be gauged from the following: imports for 1927 from the United Kingdom, £7,940,917; from the United States, £1,632,867; exports to the United Kingdom, £4,334,135; to the United States, £3,484,756. Cocoa, the chief source of the economic well-being of the native population, continues to gain steadily. Exports in 1913 were 50,554 tons; in 1928, 230,840 tons. Gold, the leading product of the Ashanti, declined. In 1912 the production was 352,957 ounces; in 1927, only 9545. Government accounts for 1913 and 1926 showed in revenues and expenditures £1,301,566 and £4,365,321, and £2,856,347 and £4,328,159. Railroad building continues; a line was completed from Accra to Anyinam (85 miles), and an extension was completed from this line to Coomassie. In 1928, 394 miles of railway were open to traffic, and 98 under construction. During the World War, the Gold Coast regiment aided in the reduction of

German Togoland, where administration was conducted by British Gold Coast officials until the surrender of the territory to the French in 1919 under a League of Nations mandate.

**GOLDEN, JOHN** (1874- ). An American playwright and producer, born in New York City. He played in stock and repertoire and was successively comic journalist, student of music, and song writer. He has composed more than 1000 songs, written many short plays, and designed scenery and costumes and composed the music for about a dozen musical comedies. His best known serious song is *Poor Butterfly*. The best plays with which he has been identified include *Turn to the Right, Lightnin', Three Wise Fools, Thunder, Dear Me, The First Year, The Wheel, Spite Corner, and Thank U*. Of a number of big shows at the Hippodrome, his best were *Hip-Hip Hoarway, Cheer Up, and Everything* (1918-19).

**GOLDFORB, ABRAHAM JULES** (1881- ). An American zoölogist, born in London, England, and educated at the College of the City of New York and Columbia University. He was tutor in biology (1910-11), instructor in natural history (1911-13), assistant professor (1913-20), associate professor (1920-26), and professor (1926- ); at the College of the City of New York. He published articles on experimental zoölogy and embryology.

**GOLDMAN, EMMA** (1869- ). An American anarchist (see Vol. X). She was arrested and deported to Russia in 1919. In 1920 she was reported to have said that she wanted to come back to the United States, but she was not allowed to return. On promising to abstain from propaganda, she was allowed to live in Germany, but in 1924 she held a protest meeting in Berlin, in behalf of the non-Communist revolutionaries in Russia, which was broken up by the police. She wrote *My Disillusionment in Russia* (1923-24).

**GOLDSMITH, ROBERT** (1882-1924). An American writer and lecturer, born at Kingston, N. Y., and educated at Phillips Academy in Andover, Mass. In 1907-08, he engaged in publishing, and at intervals from 1909 to 1916 he was active in the Congregational ministry. From 1916 on, he held editorial or administrative positions with the Russell Sage Foundation, the League to Enforce Peace, the Rockefeller Foundation, the Interchurch World Movement, the New York World, the Bureau of Political Research, and the Democratic national committee. He was the author of *A League to Enforce Peace* (1917).

**GOLDWYN, SAMUEL** (1882- ). An American motion-picture producer born in Warsaw, Poland. He organized the Jesse Lasky Feature Photoplay Company, the Goldwyn Pictures Corporation, the Eminent Authors' Pictures, Inc., and the Madison Productions, Inc., and was a pioneer in inducing American authors to work actively for the motion pictures. Among the stars he introduced to the screen were Mary Garden, Pauline Frederick, and Geraldine Farrar. He has published a volume of reminiscences.

**GOLF.** Golf undoubtedly has the largest following of any of the sports. The nature of the pastime makes it impossible for any great number of spectators to witness important matches, but their progress is closely watched by countless thousands through the medium of the press. The leading newspapers in every large country

devote more space to golf happenings than to any other branch of sport. Not only are international, national, and sectional tournaments thoroughly described, but even the outcomes of myriad local club competitions are carefully summarized. The principal New York City dailies, for example, contain as much as three columns of golf news Sundays and Mondays giving the results of the week-end contests throughout the Metropolitan District.

The United States, Great Britain, and France lead the way in golfing enthusiasm and it is natural therefore that the outstanding performers on the links should be found in those countries. The question of age does not enter so largely in this sport as it does in other forms of athletic recreation and competition, when it comes to proficiency, and the same little coterie of star players may hold sway for a decade or more. Among the veteran players who have succeeded long and gloriously and still figure prominently in any championship test they enter are Walter C. Hagen, James Barnes, Francis Ouimet, Jock Hutchison and Gene Sarazen of the United States and Abe Mitchell, George Duncan and Cyril Tolley of Great Britain. Other preëminent competitors are Robert T. Jones, Jesse Sweetser, Thomas Armour, William MacFarlane, George Von Elm, Leo Diegel, Johnny Farrell, and Horton Smith of the United States along with T. P. Perkins, Dr. W. Tweddell, Roger Wethered, and E. W. Holderness of Great Britain.

The widespread popularity of golf is due in considerable measure to the appeal it has for womankind. So keen has been feminine interest in this sport that several women have established course records but little higher than those set by men. Miss Joyce Wethered and Miss Cecil Leitch of England and Miss Glenna Collett of the United States are two whose golf play has been especially brilliant. Mlles. S. LaChauve and L. Le Blan of France also deserve mention.

Walter C. Hagen is perhaps the most remarkable golf player in the history of the game. Back in 1914, Hagen captured his first important championship by winning the U. S. National Open tournament. Defying the passing years, this same player gained the British Open title in 1922, again in 1924, and more amazing still, both in 1928 and 1929.

Among the younger players, Robert T. Jones is conspicuous. Jones won the U. S. National Open tournament in 1923, the U. S. Amateur in 1924-25-27-28, and the British Open Tournament in 1926 and 1927.

The triumphant sweep of golf has not ignored the college world. In the United States, various groups of institutions in the several sections of the country hold annual tournaments, while dual golf meets between colleges are rapidly increasing in number each year. The preparatory and public schools also have their tourneys.

**GOLLANCZ, gół'ánk, SIR ISRAEL** (1863- ). An English scholar (see Vol. X), professor of English Language and Literature in the University of London, and Leofric lecturer in Old English at University College, Exeter. He was knighted in 1919. Besides critical editions of numerous alliterative poems, he wrote the *Book of Homage to Shakespeare* (1916), *The Sources of Hamlet* (1926), and *The Caedmon Manuscript of Anglo-Saxon Biblical Poetry* (1927).

**GOMEZ, gō'más, JUAN VICENTE** (1859- ). A Venezuelan President (see VOL. X). In 1913 ex President Castro attempted to regain power, and on August 3, President Gomez took command of the army to restore public order. On Jan. 1, 1914, he returned to Caracas and resumed the presidency. His term ended on Apr. 19, 1914, and on that day the Venezuelan Congress elected him commander-in-chief of the national army. On May 3, 1915, he was reelected president, but remained commander of the army until 1918, while former President Bustillos acted as provisional President. On May 3, 1922, on the expiration of his term, he was reelected for the term 1922-29. Reelected again in 1929, he declined the Presidency and assumed the post of commander-in-chief of the army instead. A number of revolutionary outbreaks were subdued during his last term as President.

**GOMPERS, SAMUEL** (1850-1924). An American labor leader (see VOL. X). On the entrance of the United States into the World War, he was appointed a member of the Advisory Commission of the Council of National Defense (1917-19); and in 1918-19, he was a representative of the American Federation of Labor at the Paris Peace Conference. He was president of the international commission on labor legislation at the Peace Congress; chairman of the delegates from the American Federation of Labor to the convention of the International Federation of Trades Unions at Amsterdam (1919); a member of the President's first industrial conference (1919), of the President's unemployment conference (1921), and of the President's advisory disarmament commission (1921-24). In addition, he held the presidency of the Pan-American Federation of Labor. In 1921 he was elected president of the American Federation of Labor for the fortieth time.

**GONADS.** See SECRECTIONS, INTERNAL.

**GONZALEZ VIQUEZ, CLETO.** See VIQUEZ, CLETO GONZALEZ.

**GONZIA AND GRADISCA.** See FIUME-ADRIATIC CONTROVERSY.

**GOOCH, GEORGE PEABODY** (1873- ). An eminent British historian, a Fellow of the British Academy, who was educated at King's College, London; Trinity College, Cambridge, and in Berlin and Paris. A Liberal, he represented Bath in Parliament from 1906 to 1910. He was joint editor of the *Contemporary Review*, of the *British Documents on the Origins of the War*, (Vol. IV, The Anglo-Russian Rapprochement, 1903-07) and of the *Cambridge History of British Foreign Policy, 1783-1919* (3 vols., 1922-23), and he edited *The Later Correspondence of Lord John Russell, 1840-1878*. (1925). His writings include *English Democratic Ideas in the Seventeenth Century* (1898); *Annals of Politics and Culture* (1901); *History of Our Time* (1911); *History and Historians of the Nineteenth Century* (1913); *Political Ideas from Bacon to Halifax* (1914-15); *Germany and the French Revolution* (1920); *Life of Lord Courtney* (1920); *Nationalism* (1920); *History of Modern Europe, 1878-1919* (1923); *Franco-German Relations, 1871-1914* (1923); *Germany* (1925), and *Recent Revelations of European Diplomacy* (1927 and 1928).

**GOOD, JAMES WILLIAM** (1866- ). An American cabinet official. He was born at Cedar Rapids, Iowa, and was graduated at Coe College in 1892. After obtaining the degree of LL.B. at the University of Michigan, he practiced at Cedar

Rapids, where he served three years as City Attorney. He was elected to Congress as a Republican by the Fifth Iowa District for seven successive terms (1909-23), becoming chairman of the House Committee on Appropriations and the select committee on the budget in the 66th and 67th Congresses. He resigned his seat in 1921 and engaged in the practice of law in Chicago. On Mar. 4, 1929, he entered President Hoover's Cabinet as Secretary of War.

**GOODALE, HUBERT DANA** (1879- ). An American zoologist, born at Troy, N. Y., and educated at Trinity College, in Connecticut, and Columbia University. He was resident investigator at the Station for Experimental Evolution, Cold Spring Harbor, N. Y. (1911-13) and research biologist in poultry husbandry at the Massachusetts Experiment Station (1913-22). Since 1922 he has been engaged in research work at Mt. Hope Farm, Williamstown, Mass. Professor Goodale's publications have been on heredity, mainly in connection with domestic fowl.

**GOODING, FRANK R.** (1859-1928). A United States Senator, who was born in England and taken by his parents to the United States in 1867. At the age of fifteen, he went to California and six years later to Idaho (then a Territory). He was a contractor for mining companies and later operated large farms and sheep ranches. He was a member of the Idaho State Senate, chairman of the Republican State Central Committee, and Governor of Idaho (1905-07). In 1921 he was appointed a U. S. Senator to fill an unexpired term and was elected for two terms (1921-33). In the Senate, he served on the Interstate Commerce Committee. He died in the second year of his second term.

**GOODMAN, JULES ECKERT** (1876- ). An American dramatist, born in Gervais, Oreg., and educated at Harvard and Columbia Universities. He was prominent in magazine work for years as managing editor of *Current Literature* and with the *Dramatic Mirror* and *Outing*. His writings include, in collaboration with Montague Glass, *The Man Who Came Back* (1916); *Object: Matrimony* (1916); *Business before Pleasure* (1917); *Why Worry?* (1918); *His Honor Abe Potash* (1919). He also wrote *The Silent Voice* (1914) and *Pietro* (1919), in both of which Otis Skinner was starred; *The Dreamer* (1920); *The Law Breaker* (1921); *Chains* (1923), renamed *Morals* when performed in England, (1924); *Simon Called Peter* (1924); *Treasure Island* (1926).

**GOODNOW, FRANK JOHNSON** (1859- ). An American legal scholar and university president (see VOL. X). He was president of Johns Hopkins University, 1914-29, resigning in the latter year. He published *Principles of Constitutional Government* (1916), and *China, an Analysis* (1926).

**GOOSSENS, EUGENE** (1893- ). A British composer and conductor, born in London. He began his musical studies at the Conservatory in Bruges in 1903 and entered the Liverpool College of Music in 1906. In 1907 he won a scholarship at the Royal College of Music in London, where he spent the next four years under Rivarde (violin) and Stanford (composition). From 1911 to 1915, he was a violinist in the Queen's Hall Orchestra and appeared occasionally as conductor of his own works. In 1915 Beecham engaged him for his opera company, to conduct Stanford's *The Orlino*; of this task the young man acquitted

himself so successfully that he remained as regular conductor until the dissolution of the enterprise in 1920, when he was engaged by the British National Opera Company. In the meantime, frequent appearances as guest-conductor with several orchestras in the provinces and in London had established his reputation as one of the foremost of British conductors. In 1923 he appeared in the United States as guest-conductor of the Rochester Philharmonic Orchestra for the first half of the season. Since then, he has spent a considerable portion of every musical season in the United States, appearing as guest-conductor of several of the leading symphony orchestras. During the summer of 1926, he was conductor of Diaghilev's Russian Ballet in London and, in the fall of that year, he began his duties as conductor of the Rochester Opera Company. As a composer, he is very prolific and won recognition from the beginning. He is an uncompromising exponent of ultramodern tendencies. Among his works are two symphonic poems, *Percus* and *The Eternal Rhythm*; *Symphonic Prelude* to a poem by Ossian; an orchestral scherzo, *Tam O'Shanter*; *Variations on a Chinese Theme* for orchestra; *Poem* for violin and orchestra; *Miniature Fantasy* for string orchestra; *Fantasy Set* for strings, commissioned for the Berkshire Festival, 1923; a great deal of chamber music; piano pieces and songs; an overture and incidental music to Verhaeren's *Philip II* and to Somerset Maugham's play *East of Suez*; and a one-act opera, *Judith* (London, 1929).

**GORDON, CHARLES WILLIAM** (1860- ). A Canadian author (see VOL. X). In 1915 he was chaplain with the Canadian forces in France. He served on a special commission for the Imperial government and the Canadian government in the United States (1917) and on a special commission for the Canadian government to Great Britain (1918) and was appointed chairman of the Council of Industry for the Province of Manitoba by the provincial government (1920). He was Moderator of the General Assembly of the Presbyterian Church of Canada in 1921. Among his later publications are *The Major* (1917), *The Sky Pilot in No Man's Land* (1919), *To Him That Hath* (1921), *The Gaspards of Pine Croft* (1923), *Treading the Wine Press* (1925), and *The Friendly Four* (1927). He wrote under the name of "Ralph Connor."

**GORDON, WALTER HENRY** (1863-1924). An American army officer, born in Wilkinson County, Mass. He graduated from the United States Military Academy in 1886, served in the Spanish-American War and the Philippines and was appointed colonel of the 31st Infantry in 1916, and brigadier general in the National Army in 1917. He served as commander of the 154th Depot Brigade at Camp Meade, Md., in 1917, and in the same year was transferred to the 10th Infantry Brigade, 5th Division, Camp Forrest, Ga. In 1918 he was appointed major general commanding the 6th Division. In 1918-19 he was in service in France and was with the Army of Occupation in Germany in 1919. In 1920 he was appointed commandant of the Infantry School at Camp Benning, Ga. He was honorably discharged as major general in 1919, and was appointed brigadier general of the Regular Army in 1921. He was promoted to major general in 1923 and retired in January, 1924. In the following April he died.

**GORE, THE RT. REV. CHARLES** (1853- ). An English theologian and prelate (see VOL. X). In 1919 he resigned the bishopric of Oxford, which he had held since 1911. He settled in London and identified himself with the Christian Socialists. Among his later works were *The Religion of the Church* (1916); *The Epistle of St. John* (1920); *Christian Moral Principles* (1921), *Belief in God* (1921), *The Duty of Christ* (1922), *Belief in Christ* (1922), *The Holy Spirit and the Church* (1924), *Can We Then Believe?* (1926), and *Christ and Society* (1928). He edited *A New Commentary on Holy Scriptures, including the Apocrypha* (1928).

**GOREMYKIN, gör'e-mik'in, IVAN LONGOVITCH** (1839-1917). A Russian statesman (see VOL. X) again premier from 1914 to February, 1916. His opposition to the liberal aims of the Duma led to his resignation. After the Revolution, he was arrested and confined for a short time in the Fortress of St. Peter and St. Paul. With his wife and brother-in-law, he was murdered in the Caucasus in December, 1917.

**GORGAS, WILLIAM CRAWFORD** (1854-1920). An American sanitarian, and U. S. Army Surgeon General (see VOL. X). He was raised to the rank of major general in 1915. He died in London, Eng., on July 4, 1920, and his funeral was held in St. Paul's Cathedral. A laboratory for the Gorgas Memorial Institute of Tropical Research and Preventive Medicine, for which funds were provided by the United States and several Latin-American governments, was dedicated at Panama on Apr. 2, 1929.

**GORKY, gör'kë, MAXIM** (1868- ). The pseudonym of ALEXEI MAXIMOVITCH PÉSHKOV, a Russian author (see VOL. X). At the outbreak of the World War, he returned to Russia. At first he was opposed to the Bolsheviks, but later became reconciled to their régime; in 1920, however, he went to Sorrento, Italy, to live. His later works include three autobiographical volumes *My Childhood* (1915), *In the World* (1917), and *My University Days* (1923); *About the Devil*; *Comrades*; *Reminiscences of L. N. Tolstoy* (1920); *The Note-Book of Anton Chekhov* (1921); *Reminiscences of Anton Chekhov*, with Bunin and Kuprin (1921); *Through Russia*, stories (1922); *Écrits de Révolution* (1922); *The Judge*, a play (1924); *Fragments from my Diary* (1924); *Lénine*; *et Le Paysan russe* (1925); *The Story of a Novel and Other Stories* (1925); *Sur les Chemins de ma vie* (1926); *Decadence*, a novel (1927); *Les Artamomov*, a novel (1928), *Reminiscences of Leonid Andreyev* (1928); *The Bystander* (1927), the first volume of a novel, *The End and the Beginning*.

**GORMAN, JAMES EDWARD** (1863- ). An American railway official, born in Chicago. He began his railroad career with the Chicago, Burlington & Quincy road, in 1877. He occupied important positions in several companies and was with the Atchison, Topeka & Santa Fe in various capacities from 1895 to 1917. In the latter year, he became president of the C. R. I. and P. R. R. and was Federal manager of this road from 1918 to 1920, when he again became its president.

**GOSSE, gös, SIR EDMUND (WILLIAM)** (1849-1928). An English poet, critic, and biographer (see VOL. X). He was chairman of the board of Scandinavian studies at University College in London (1917-1928) and president of the

English Association (1921). Many honors were bestowed on him, and in 1925 he was knighted. His later works include *Collected Poems* (1911), *Inter Arma* (1916), *The Life of Algernon Charles Swinburne* (1917), *Three French Moralists* (1918), *Diversions of a Man of Letters* (1919), *Malherbe* (1920), *Books on the Table* (1921), *Aspects and Impressions* (1922), *More Books on the Table* (1923), *Silhouettes* (1925), *Leaves and Fruit* (1927), and *Thomas Lovell Beddoes*, edited with a new memoir by Gosse (1928).

**GOTCH, JOHN ALFRED** (1852- ) An English architect and author. He attended the University of Zurich, and, articulated to R. W. Johnson of Melton Mowbray, he began the practice of architecture in 1878. He was a member of the Royal Fine Arts Commission and was president of the Royal Institute of British Architects in 1923-25. He was also a corresponding member of the American Institute of Architects. His books include *Architecture of the Renaissance in England* (1894); *Early Renaissance Architecture in England* (1901); *The Growth of the English House* (1909); *The Original Drawings for the Palace at Whitehall, attributed to Inigo Jones* (1912); *The English Home from Charles I to George IV* (1918); and *Old English Houses* (1925).

**GÖTEBORG, gō'tēbōr', GOTHENBURG, or GOTTENBURG.** The principal port, manufacturing centre, and second city of Sweden. The population in 1928 was estimated to be 233,303. Göteborg is the home port for several passenger steamers, maintaining services to the United States, Australia, and England; it is a terminal for some of the most important railway-lines in Sweden, such as the newly electrified line from Stockholm to Göteborg; and it is an important junction on the international air-lines of Europe, its aerodrome being situated at Torslanda. The Harbor of Göteborg, part of which is a free port, is 15 kilometers (9.32 miles) long and is divided into two portions, the upper portion accommodating inland shipping and the lower one being used by coastal and seagoing vessels. The harbor facilities have been greatly improved; several shipyards and repair docks are located in the harbor district, including a new floating drydock of 20,000 tons lifting capacity. At the beginning of 1928, 281 vessels of 522,312 gross tonnage were entered and cleared. The new post office is one of the finest in Europe, and the Lorensberg Theatre is the leading playhouse of Scandinavia.

Among the principal attractions of Göteborg are its highly specialized museum collections, ranging from South American Indian antiquities and Oriental specimens, collected in the days when trade flourished with the East Indies, to native handicrafts and modernistic art. The sociological-historical and ethnographical collections are housed in buildings that were once the offices and warehouses of the East-India Company, while a new building has been erected in Slottsskogen, the most famous of Göteborg's many beautiful parks, for the natural history collections. The Röhss Art and Handicraft Museum has a complete collection of book-bindings and printings, Chinese art, textiles, and other hand-wrought wares. The collection of pictures in the Art Gallery affords a complete representation of modern Swedish painting, and the exhibits are regarded as among the best arranged and most valuable in Europe. Göteborg is distinguished for its many large and well-

organized charities and benevolent institutions, donations for humanitarian and cultural purposes having been made by its citizens on a larger scale than in any other city of Sweden. It was also the first city in Scandinavia to establish modern workmen's dwellings. From May 8 to September 30, 1923, a jubilee exposition was held to celebrate Göteborg's 300th birthday and to show the progress which Swedes have made in manufacture and commerce, education and music, arts and sciences, at home and in foreign lands.

**GOTHENBURG, gō't'en-burk.** See GÖTEBORG.

**GÖTZINGER, gō'ts'ing-ēr, GUSTAV** (1880- ). An Austrian geologist at the Geological Institute, Vienna, born in Neu-Serowitz, Moravia, and educated at the Gymnasium and the University of Vienna. He was editor of the *Geographische Jahresbericht aus Österreich*. In 1906-11 he was oceanographer of the Society for the Investigation of the Adriatic and in 1912 he was appointed section geologist of the Geological Institute at Vienna. He is the author of numerous works, dealing especially with glacial and marine geology, including *Oceanographische Beobachtungen Nordlicher Adria* (1910); *Geomorphologie der Lunzer Seen, Geologie und Morphologie Dinara, Morphologie des Ostlichen Kalkhochplateaus* (1912); *Gletschervermessung der Alpen* (1906); *Nordisches Diluvium West-Schlesiens* (1914, 1915); *Erzgebirge, Österreichische Alpenseeforschung* (1916); *Eis der Lunzer Seen* (1917); *Phosphathöhle von Csaklovina* (1919); *Denkmalpflanzen und Naturdenkmale* (1921); *Alpenrundgeologie* (1923), and *Rutschender Grasberg* (1923).

**GOUCHER COLLEGE.** A nonsectarian college for women at Baltimore, Md., founded in 1885. The student enrollment increased from 386 in 1913-14 to 1053 in 1927-28. The faculty was enlarged from 29 to 103 members (in 1928), and the library from 12,000 to 40,500 volumes during the same period. The endowment fund, begun during the period under review amounted to \$1,500,000 in 1924 and to \$2,386,980 in 1928. A site was purchased in 1921 at Towson, Md., and a campaign inaugurated to collect \$6,000,000, of which \$5,000,000 was to be used to move the college from Baltimore to Towson. The remaining \$1,000,000 was to be added to the permanent endowment fund, to which the General Board in New York pledged \$400,000 in 1921 and paid an additional \$40,000 in cash. The Board also gave \$250,000 to the endowment fund of the college in 1917. President, William Westley Guth, Ph.D., LL.D.

**GOULD, EDWIN** (1866- ). An American railway official (see VOL. X). In 1917-18 he served with Squadron A, New York National Guard, and in the latter year was major of ordnance in the 1st Brigade.

**GOURAUD, gōr'ō', HENRI JOSEPH ÉTIENNE** (1867- ). A French general who was born in Paris, trained at St. Cyr, and served in Africa from 1894 to 1914. In 1912 he became general of brigade, and in 1914 a general of division. During the World War, he served first in the Argonne, where he commanded the 10th Division (1914), then in command of the 1st Corps of the Colonial Army (1915), and from May to June, 1915, he led the expeditionary corps in the Dardanelles, until he was wounded and lost his right arm. He commanded the 4th Army from December, 1915, until September, 1919, with

an interim of six months in 1916-17 when he was resident general of Morocco. In September, 1919, he was Governor of Strassburg, and in November of that year became commander-in-chief of the Army of the Levant and high-commissioner for France in Syria and Cilicia (retired in 1923). In 1922 he was appointed a member of the Higher War Council, and in the following year he became Military Governor of Paris. He visited the United States in 1929 to attend the reunion of the Rainbow Division, A. E. F., at Baltimore, as representative of the French government.

**GOYAU**, gōy'ō', **PIERRE LOUIS THÉOPHILE GEORGES** (1869- ). A French religious historian who was born at Orléans and was educated at the École Normale Supérieure and taught at the École Française in Rome. As one of the editors of the powerful *Revue des Deux Mondes* and *Figaro* he wielded an influence in behalf of conservatism and Catholicism. His writings reflected the social Catholic tradition of Joseph de Maistre. He was elected a member of the French Academy in 1922. A partial list of his writings includes *Le Pape, les Catholiques, et la question Sociale* (1893); *Le Vatican* (1895); *Autour du catholicisme social* (15 series: 1897, 1901, 1907, 1910, and 1913); *L'Allemagne Religieuse: Le Protestantisme*, Prix Bordin of the French Academy (1898); *L'Idée de Patrie et l'humanitarisme* (1901); *L'Allemagne religieuse: le Catholicisme* (4 vols., 1905, 1908); *Bismarck et l'Eglise* (4 vols., 1910-13); *Le Cardinal Mercier* (1917); *La pensée religieuse de Joseph de Maistre* (1921); *St. Jeanne d'Arc* (1921); *Histoire religieuse de la nation française* (1922); *Une Épopée mystique* (1924); *Le Cardinal Lavigne* (1925); *Frédéric Ozanam* (1926); *Le Visage de Rome chrétienne* (1927); and *Saint Louis* (1928).

**GRABAR**, IGOR E. (1871- ). A Russian landscape painter, one of the leaders of the Moscow group who, in reaction against the realism of the Wanderers, depict Russian scenes in an impressionistic style, Grabar himself being a pointillist. He is also a writer on art. See **PAINTING**, under *Russia*.

**GRABAU**, MARY ANTIN. See **ANTIN**, MARY.

**GRAFF**, KASIMIR ROMUALD (1878- ). A German astronomer, born at Prochnowo, Posen, and educated at the Gymnasium and at Friedrich-Wilhelm University in Berlin. In 1900 he became a member of the board of directors of the Urania Observatory in Berlin. In 1909 he transferred to the Hamburg observatory, where he became a professor in 1917. He wrote *Grundriss der Geographischen Ortsbestimmung* (1914); a German adaptation of Fabre, *Der Sternhimmel* (3d ed., 1921); an adaptation of Newcomb, *Astronomie für Jedermann* (4th ed., 1922); *Astrophysik*, with Scheiner (1922), and *Gründer der Astrophysik* (1927).

**GRAFLY**, CHARLES (1862-1929). An American sculptor (see Vol. X). In 1915 he served on the International Jury of Awards at the Panama-Pacific International Exposition. In 1917 he became instructor in the Boston Museum of Fine Arts. Among his awards during the period were the Watrous Gold Medal of the National Academy of Design, 1918, the Potter Palmer Gold Medal, 1921, and the medal of honor of the Concord Art Association, 1922.

**GRAHAM**, EVARTS AMBROSE (1883- ). An American surgeon and discoverer of the radio-diagnostic resource of cholecystography, who was

born in Chicago. He received the degrees of A.B. from Princeton in 1904 and of M.D. from Rush Medical College in 1907. From 1908 until the outbreak of the World War, he taught and did original research work in surgery at Rush College. During the War, he served with the rank of captain and major, was active in the School of Neurological Surgery in Chicago, and as member of the Empyema Commission at Baltimore made original researches on empyema which were recorded in a monograph. He was mustered out of the army in 1919 and became professor of surgery in the Washington University School of Medicine, St. Louis, and surgeon in chief to the Barnes Hospital. In 1925 with several associates, he published his first reports of the method discovered by him of visualization of the gall-bladder which was at once popularized throughout the world and has revolutionized knowledge of this organ and its diseases and greatly enlarged the sphere of diagnosis. He was awarded numerous honors including the gold medal and certificate of merit from the St. Louis Medical Society, 1927, for his work in cholecystography.

**GRAHAM**, STEPHEN (1884- ). An English writer (see Vol. X). During the World War, he served as a private in the Scots Guards (1917-18) and afterward he continued his life of wandering. His later works include *With Poor Emigrants to America* (1914); *Russia and the World* (1915); *The Way of Martha and the Way of Mary* (1915); *Through Russian Central Asia* (1916); *Russia in 1916* (1917); *Priest of the Ideal* (1917); *Quest of the Face* (1918); *Private in the Guards* (1919); *Children of the Slaves* (1920); *The Challenge of the Dead* (1921); *Europe—Whither Bound?* (1921); *Tramping with a Poet in the Rockies* (1922); *Under-London* (1923); *In Quest of Eldorado* (1924); *Life and Last Words of Wilfred Ewart* (1924); *Russia in Division* (1925); *London Nights* (1925); *Midsummer Music* (1926); *the Gentle Art of Tramping* (1927); *New York Nights* (1928); *The Lay Confessor* (1928); and *Peter the Great* (1929).

**GRAHAM**, THE RT. HON. WILLIAM (1887- ). A British public official and labor leader, who was educated in private schools and at Edinburgh University. He was a member of numerous national and local public bodies including the Edinburgh Town Council and was elected to Parliament in 1918. He was Financial Secretary to the Treasury in the Labor Government of 1924. He was named president of the Board of Trade in the Labor Cabinet formed June 7, 1929. He wrote *The Wages of Labor* (1921) and has contributed articles on social, industrial, and political questions to newspapers and periodicals.

**GRAHAME-WHITE**, CLAUDE (1879- ). An English aviator, writer, and aeronautical engineer (see Vol. X). He was a flight commander in 1914, but resigned to supervise the filling of British government aeroplane contracts. His London aerodrome and factory at Hendon were acquired by the Government in 1925. Among his later books are *Learning to Fly* (1914); *Aircraft in the Great War* (1915); *Air Power—Naval, Military, and Commercial* (1917); *Our First Airways, Their Organization, Equipment, and Finance* (1918); and *Heroes of the Flying Corps* (1919).

**GRAIN**. See **AGRICULTURE**; **W-EAT**.

**GRAINGER**, PERCY (ALDRIDGE) (1882- ). A British composer and pianist, born at

Brighton, Melbourne, Australia. He received his first instruction on the piano from his mother, continued with J. Kwast in Frankfort (1894-1900), and was for a short time with Busoni. After a most successful début in London, in 1900, he toured Great Britain, New Zealand, Australia, and South Africa. Returning to Europe in 1906, he made tours of the Continent until 1915, when he visited the United States and settled there permanently. He served in the American Army during the World War and was afterward naturalized. In August, 1928, he married in Los Angeles the Swedish sculptress, Ella Viola Strom. As a composer, he became known first in 1912, when he conducted his *Mock Morris* at one of Gardiner's concerts in London. Almost without exception, his compositions are based on folk music, of which he is not only a profound student but also an ardent collector; he has taken more than 500 records of folk melodies of all the countries he has visited. His choral works with orchestra include *Father and Daughter*, *Sir Eglamore*, *The Bride's Tragedy*, and *Marching Song of Democracy* (for the Worcester Festival, 1916). He also has written *In a Nutshell*, suite for piano and orchestra; for orchestra, *Molly on the Shore*, *English Dance*, *Colonial Song*, *Shepherd's Hey*; numerous pieces for piano, and a few songs. Consult D. C. Parker's *P. A. Grainger: A Study* (New York, 1918).

**GRAIN STANDARDS.** See **WHEAT**.

**GRAND ARMY OF THE REPUBLIC, THE.** An order formed in 1866 among a number of former soldiers who had served in the Civil War. Auxiliary orders are the Woman's Relief Corps, Ladies of the G. A. R., Sons and Daughters of Union Veterans, and their auxiliaries. A national encampment is held in September, department encampments in June. Delegates to the national body are chosen by the Department of Encampments, and those to the Department Encampments by the Posts. The 62d National Encampment was held at Denver, Colo., September, 1928, while the 63d National Encampment was held at Portland, Me., in 1929. The successive encampments have had a smaller attendance each year due to the heavy mortality and the aged veterans are transported in motor vehicles in the processions that have been features of these gatherings.

**GRAND RAPIDS.** A city of Michigan, at the head of navigation on the Grand River. The population rose from 112,571 in 1910 to 137,634 in 1920 and to 164,200 in 1928 by estimate of the Bureau of the Census. The population of greater Grand Rapids, according to local estimates, is 192,256. The area is 23.4 square miles, or 14,985 acres. Of this acreage, 250 acres constitute the area of Grand River within the city's limits. A charter providing that Grand Rapids be governed by a commission of seven members and a city manager went into effect in 1917. In 1920 active city-planning work was begun, and since 1923 Grand Rapids has had a zoning ordinance which limits the height of buildings and the portion of land area they may occupy and sets aside sections to be used for residence, business, and industry. Grand Rapids ranks second among the larger cities of the United States as to percentage of home ownership, 50.2 per cent of the houses being owned by the families occupying them. Building permits increased from \$3,618,119 in 1914 to \$10,204,795 in 1923; in 1927 their value was \$8,222,090. During the

period a municipal tuberculosis hospital costing \$605,000, a high school costing \$600,000, grade schools, a theatre costing \$750,000, hotels, churches, a Roman Catholic seminary, and an academy were built. The William H. Dean Bridge, constructed in 1927 at a cost of \$435,000, is a memorial to a private who, during the Spanish American War, volunteered himself to the medical corps for experiments in seeking to conquer yellow fever. The assessed valuation of property in Grand Rapids in 1928 was \$203,425,606; the net debt was \$13,521,294.

Grand Rapids is the furniture-manufacturing centre of the United States. It has 68 factories which employ 13,000 artists and craftsmen and which produce furniture valued at \$60,000,000 annually. The 102d semi-annual furniture market, attended by 4000 buyers and salesmen from all parts of the United States, was held in November, 1928. Grand Rapids has the largest of all carpet-sweeper, school-seat, window-sash, pulley, excelsior, show-case, and refrigerator factories in the United States. Employees in all factories number more than 30,000. Grand Rapids is also a large producer of gypsum products, the mines being to the south and west of the city. There are within the city limits 403.28 miles of streets, 389.70 miles of public sewers, and 342.14 miles of water mains. The cost of street improvements completed in 1927 was \$1,063,503; of sewers completed in 1927, \$882,330; of water mains, \$237,865; of permanent improvements, \$2,618,698, which includes 50 miles of assessment storm and sanitary sewers constructed by the sanitary engineering division which also expended \$746,537 in bond-issue projects, making a grand total of \$3,365,235. The city has invested \$981,012 in flood protection, not including buildings and equipment. Grand Rapids with an absolutely pure water supply taken from Grand River and treated in a modern filtration plant is one of the most healthful cities in the United States. It was on the 1927 honor roll of 43 cities with a typhoid death rate per 100,000 of 0.0 to 1.9 per cent. The Grand Rapids airport, one of the finest in the United States, is on county-owned property and is under lease of the Grand Rapids Flying Club.

**GRÄNER, PAUL** (1873- ). A German composer, born in Berlin. After a varied career as operatic conductor in several German cities, he went to London in 1896 as conductor at the Haymarket Theatre and taught several years at the Royal Academy of Music. From 1902 to 1909, he taught at the Neues Konservatorium in Vienna and, from 1910 to 1913, was director of the Mozarteum at Salzburg. He then lived in Munich until 1920 and devoted himself chiefly to composition. In 1920 he accepted the professorship of composition at the Leipzig Conservatory, succeeding Reger. This position he resigned in 1925 and since then he has devoted his entire time to composition. He is the originator of *Kammermusikdichtung*, employing the usual combinations of instruments heretofore used only in pure chamber music for the purpose of interpreting a literary programme, as Raabe's *Hungerpastor* by means of a piano trio, or *Sehnsucht an das Meer* by means of a piano quintet. Among his other works are a symphony in D Minor, *Sinfonietta*, *Musik am Abend* for orchestra, and the operas, *Das Narrengericht* (Vienna, 1913), *Don Juans Letztes Abenteuer* (Leipzig, 1914), *Theophano* (Munich, 1918, rewritten as *Byzans*, Leipzig, 1922),

*Schirin und Gertraude* (Dresden, 1920), and *Hanneles Himmelfahrt* (Dresden, 1927). Consult G. Gräner's volume, *Paul Gräner* (Leipzig, 1922).

**GRANT, PERCY STICKNEY** (1860-1927). An American clergyman (see VOL. X). He continued, until 1924, as rector of the Church of the Ascension, New York City. Here he maintained a forum in which advocates of all political and social doctrines were permitted to speak freely. This was widely criticized and finally, in 1923, following action taken by Bishop William T. Manning, the forum was greatly modified in its character. The rector also came in controversy with Bishop Manning on the question of divorce. After the latter had refused to authorize his contemplated marriage to a divorcee, in June, 1924, he resigned his rectorship. His later books include *Fair Play for the Worker* (1918); *Essays and Poems* (1922); and *The Religion of Main Street* (1923).

**GRANT-SMITH, ULYSSES** (1870- ). An American diplomat, who was born at Washington, Pa., and graduated from Washington and Jefferson College (1894). After graduate studies at Harvard, he was made director and military instructor at Trinity Hall School. In 1903 he entered the American diplomatic service as second secretary of the legation at Constantinople. He became third secretary of the embassy at London (1906-08), secretary of the legation at Santiago, Chile (1908-09), at Brussels, Belgium (1909-12), counselor of the embassy at Vienna (1912-17), counselor of the legation at Copenhagen, and chargé d'affaires (1917-19), U. S. Commissioner in Hungary (1919-21), negotiating the American-Hungarian Treaty of Peace; Minister to Albania (1922-25), and Minister to Uruguay since 1925.

**GRANVILLE-BARKER, HARLEY.** See BARKER, HARLEY GRANVILLE.

**GRAPHITE.** Graphite is extensively consumed in the United States for various industrial purposes. The natural product, both in its crystalline and amorphous forms, entered into consumption, together with the manufactured product, which is made in the electric furnace. In addition to the native supply, the crystalline graphite used in the United States is produced in Ceylon, Madagascar, Japan, Austria, Bavaria, and Czechoslovakia, as indicated in the accompanying table. It is used mostly in making crucibles and as the metallurgical activities of the War led to extensive mining, there was abnormal production which was gradually later being absorbed.

The crystalline product, in the form of lump, chip, or dust, comes mainly from Ceylon, while most of the imported crystalline flake comes from Madagascar and Canada. The amorphous graphite is used mainly for foundry facings and paint, and while some is mined in Rhode Island, the greater part is imported from Chosen (Korea) and Mexico.

During the period from 1913 to 1928, the use of graphite in the United States underwent radical changes. Before the War, more than one-half of the supply was consumed in the manufacture of crucibles, whereas by 1924 only 13 per cent of the graphite used in the manufacture of finished products was utilized in the manufacture of crucibles. A corresponding shift occurred in the manufacture of foundry facings for which only 10 per cent of the graphite supply was consumed in 1913, as compared with 44

per cent in 1923, and 52 per cent in 1924. The use of graphite in the manufacture of pigments and paints, pencils and crayons, commutator brushes, stove polish, and lubricants, was likewise of minor importance before the War, but of considerable importance subsequent to 1918.

In the United States, Alabama was one of the most productive states during the War, but following the War its output declined to almost insignificant proportions. In 1926 the Alabama industry experienced a revival and in 1927 three Alabama operators reported sales of 3,474,000 pounds of crystalline graphite or two-thirds of the total output for the United States. The producing States in 1928 were Alabama, Georgia, Michigan, Nevada, Rhode Island, and Texas. Imports of graphite into the United States in 1928 totaled 17,569 tons, valued at \$801,559, as compared with 16,166 tons valued at \$921,233 in 1926, an increase of 8 per cent in quantity but a decrease of 21 per cent in value.

#### DOMESTIC NATURAL GRAPHITE SOLD IN THE UNITED STATES 1914-1927

Year	Amorphous		Crystalline	
	Short tons	Value	Pounds	Value
1914	1,725	\$38,750	5,220,539	\$285,368
1915	1,181	12,358	7,074,370	417,273
1916	2,622	20,728	10,931,989	914,748
1917	8,301	73,481	10,584,080	1,094,398
1918	6,560	69,455	12,861,839	1,454,799
1919	3,379	47,716	8,086,191	731,141
1920	4,694	49,758	9,632,360	576,444

\* Bureau of Mines not at liberty to publish value.

**GRASTY, CHARLES HENRY** (1863-1924). An American journalist, born at Fincastle, Va., and educated at the University of Missouri and Washington and Lee University. He was managing editor of the *Kansas City Times* (1884-89); editor and proprietor of the *Baltimore Evening News* (1892-08); director of the Associated Press (1900-10); editor and controlling owner of the *St. Paul Dispatch* and the *Pioneer Press* (1908-09), and of the *Baltimore Sun* (1910-14); war correspondent for the Associated Press, *New York Times*, and *Kansas City Star* in Europe (1915); and treasurer of the *New York Times* (1916-20). During the World War, he was on the editorial staff of the *New York Times* (1916-21) and was widely recognized as an independent writer on war and political situations in Europe.

**GRAVES, CHARLES L.** (1856- ). An Irish author (see VOL. X). Among his later works are *War's Surprises* (1917), *Lauds and Libels* (1918), *Mr. Punch's History of the Great War* (1919); *Horace's Odes, Book V*, an English version with Rudyard Kipling (1920), *New Times and Old Rhymes* (1921), *Punch's History of Modern England* (4 vols. 1921, 1922), *More Lauds and Libels* (1925), *Hubert Parry; his Life and Works* (2 vols., 1926), *Eulogies and Elegies* (1927), and, with E. V. Lucas, *Husled History*, etc.

**GRAVES, FRANK PIERREPONT** (1869- ). An American educator, born in New York City, and educated at Columbia University. From 1891 to 1893, he was assistant professor of Greek, and immediately afterward, professor of classical philology in Tufts College. In 1896-

98, he was president of the University of Wyoming; in 1898-1903, president of the University of Washington, and in 1904-21, professor of education or dean in Missouri, Ohio, Wisconsin, Chicago, Pennsylvania, and Columbia universities. In 1921 he became president of the University of the State of New York and Commissioner of Education. He was editor of the *Educational Review*, 1920-24. In 1927 he was awarded the Butler Medal for educational administration. His publications include *Burial Customs of the Ancient Greeks* (1891); *The Philoctetes of Sophocles* (1893); *The State University Ideal* (1897); *A History of Education before the Middle Ages* (1909); *A History of Education during the Middle Ages and the Transition to Modern Times* (1910); *Great Educators of Three Centuries* (1911); *Peter Ramus and the Educational Reformation of the Sixteenth Century* (1912); *A History of Education in Modern Times* (1913); *What Did Jesus Teach?* (1919). He also published *Addresses and Papers* (1921-26).

**GRAVES, HENRY SOLON** (1871- ). An American forester, born at Marietta, Ohio, and educated at Yale, Harvard, and the University of Munich. From 1900 to 1910, he was professor of forestry and director of the Forestry School at Yale, and from the latter date to 1920, chief of the United States Forest Service. Since 1922 he has been dean of the Yale Forestry School. He was provost of Yale University in 1923-27. He was a member of many American and foreign societies and wrote *Forest Mensuration* (1906), and *Principles of Handling Woodlands* (1911). During the World War, he was lieutenant colonel in the corps of engineers, serving in France.

**GRAVES, ROBERT RANKE** (1895- ). A British poet and critic who was born in London and educated at the Charterhouse and St. John's College, Oxford. In 1923 he and William Nicholson edited *The Owl*, and in 1926 he was professor of English Literature in the Egyptian University. His earlier poems were vivid, but the later ones became more and more intellectual and detached. His verse was collected in *Poems, 1914-1927* (1927) and in *Collected Poems* (1929). His prose writings include *On English Poetry* (1921); *The Meaning of Dreams* (1924); *Poetic Unreason and Other Studies* (1925); *My Head! My Head!* (1925); *John Kemp's Wager*, a ballad opera (1925); *The English Ballad* (1926); *Lars Porsena or "The Future of Swearing"* (1927); *Lawrence and the Arabs* (1927), and *John Skelton* (1927). With Laura Riding, he wrote *A Survey of Modern Poetry* (1927) and *A Pamphlet Against Anthologies* (1928).

**GRAVING DOCKS.** See **DOCKS**.

**GRAVITATION, IN LIGHT OF MODERN THEORY.** See **PHYSICS**.

**GRAY, ALEXANDER** (1882-1921). An American engineer, born in Edinburgh, Scotland, and educated at Edinburgh and McGill universities. Until 1904 he was engaged in engineering work in Edinburgh, and from 1910 to 1915 was assistant professor of electrical engineering at McGill University. In the latter year, he became head of the electrical engineering department at Cornell. He wrote *Electrical Machine Design* (1913) and *Principles and Practice of Electrical Engineering* (1914). He was also the author of a section of the *Standard Handbook for Electrical Engineers*.

**GRAY, GEORGE** (1840-1925). An American jurist and legislator (see **VOL. X**). He was appointed peace commissioner to Great Britain in 1915, and in the same year he was chairman of the United States delegation to the Pan-American Scientific Congress. President Wilson appointed him a member of the American-Mexican Commission in 1916.

**GRAY, LOUIS HERBERT** (1875- ). An American orientalist (see **VOL. X**). He was associate editor of the Hastings *Encyclopædia of Religion and Ethics* (Edinburgh 1905-15), editor of *Mythology of all Races* (1915-18), associate professor of philosophy at the University of Nebraska, 1921-23, and professor of comparative philology and Oriental languages at Columbia University after 1923. He was in the service of the American commission to negotiate peace in Paris (1918) and attaché to the American Embassy (1920). He edited George Louis Beer's posthumous *African Questions at the Paris Peace Conference* (1923).

**GRAYSON, CARY TRAVERS** (1878- ). An American physician, born in Culpepper County, Va., and educated at William and Mary College and the University of the South. In 1904 he graduated from the United States Naval Medical School. After service as assistant surgeon of the United States Navy, he was appointed medical director, with the rank of rear admiral, in 1910. He was the personal physician of Presidents Roosevelt, Taft, and Wilson. During the World War, he was a member of many important commissions and was also connected with the staff of several hospitals in Washington and elsewhere. He resigned from the Navy in 1928 and became president of the newly established Gorgas Institute.

**GRAZIE, grät'si-ä, MARIE EUGENE DELLE** (1864- ). An Austrian poet, dramatist, and novelist (see **VOL. X**). She published *Das Buch des Lebens und Zwei Wittwen* (1914); *Die blonde Frau Tina*, *Das Buch des Lebens*, *O Jugend!* and *Eines Lebens Stern* (1916); *Homo, Donaukind, Der Liebe und des Ruhmes Kränze*, and *Die Blume der Acazia* (1921), all fiction. Her later works include *Die blonde Frau Tina und andere Geschichten* (1921); *Die weissen Schmetterlinge von Claircaux*, stories (1925); *Unsichtbare Strassen*, a novel, (1926); and the play *Die Schwelle des Lebens* (1926).

**GREAT BRITAIN.** The United Kingdom of Great Britain and Northern Ireland, and the Irish Free State. The former is a constitutional monarchy; the Irish Free State, a self-governing dominion. The capital of the United Kingdom is London, and Dublin is the capital of the Irish Free State. The term Great Britain is applicable literally to England, Scotland, and Wales; the term United Kingdom to Great Britain, Northern Ireland, the Isle of Man, and the Channel Islands; and the term British Isles to the United Kingdom and the Irish Free State. The United Kingdom with all its possessions and dependencies, including the self-governing dominions, crown colonies, protectorates, mandates, and other territories subject to the control of Parliament, constitutes the British Empire. See **BRITISH EMPIRE**.

**Area and Population.** The total area of the British Isles is 121,633 square miles, of which 88,745 square miles make up Great Britain, 27,155 square miles the Irish Free State, 5431 square miles Northern Ireland, and 302 square miles the Isle of Man and the Channel

Islands. The total population of the British Isles in 1921, exclusive of navy, army, and merchant seamen abroad, was 47,307,601, an increase of 1,937,071 over 1911. No census was taken in Ireland in 1921: so the 1911 figure was used in both years. The number of persons per square mile was, in 1911: England and Wales, 618.3; Scotland, 156.6; Northern Ireland, 230.3; Irish Free State, 115.6. In 1921 it was: England and Wales, 649.4; Scotland, 160.6. During 1928 there were 660,267 births in England and Wales with an estimated population of 39,482,000 on June 30, 1928, and 96,815 in Scotland with an estimated population of 4,893,182 on the same date; there were 460,440 deaths in England and Wales and 65,263 in Scotland. In 1921 there were 90,720 births in Ireland and 63,838 deaths. The population of Greater London was estimated at 7,766,353 in 1927 and 7,251,358 in 1911. The population of the Administrative County of London and City of London was 4,483,523 in 1921, as compared with 4,521,685 in 1911. The largest cities in the United Kingdom are:

\* Irish Census of 1911.

The total movement of travelers from the British Isles to non-European countries was 270,720 in 1928 and 701,691 in 1913, and the inward movement was 276,705 in 1928 and 372,618 in 1913. Of the outward passengers, 22,345 went to the United States; 54,709 to British North America; 28,714 to Australia, and 7095 to British South Africa.

Education. Elementary education is under the control in England and Wales of the Board of Education, in Scotland under the Committee of Council on Education, and in Ireland under the Commissioners for National Education. Elementary education is free and compulsory from 5 to 14 years. According to the census of 1921, there were 21,584 elementary schools in England and Wales with 7,150,000 pupils and 165,010 teachers, an increase over 1913,

when there were only 6,046,500 pupils and 164,152 teachers. In 1927-28 there were 20,684 total ordinary public elementary schools with accommodations for 7,063,578 pupils. In addition, in 1927-28 there were 576 schools for the blind and defective with an enrollment of 47,966 pupils, as compared with 25,704 pupils in 347 such schools in 1913. In 1928 there were 1329 secondary schools with 21,102 teachers and 449,800 pupils, while in 1913 there were only 1010 such schools with 13,790 teachers and 174,423 pupils. A similar increase was recorded in teachers' training colleges, of which there were 86 in 1913 with 11,876 pupils, and in 1921, 92 with 15,451 pupils. In 1928 there were 4542 evening schools with 771,291 pupils, as compared with 6876 in 1913 with 798,881 pupils. In Scotland, there were 3426 public schools with 21,986 teachers and 860,984 pupils in 1913, and in 1926 there were 3403 schools with 24,630 teachers and 824,589 pupils.

The 10 leading universities in England are Oxford, Cambridge, Durham, London, Manchester, Birmingham, Liverpool, Leeds, Sheffield, Bristol, and Reading. In Scotland, St. Andrews, Glasgow, Aberdeen, and Edinburgh were the four leading Universities, and in Ireland, Trinity College (Dublin), Queens University (Belfast), University College (Cork), University College (Galway), and University College (Dublin), were the five leading institutions of higher education. The enrollment in such schools in the British Isles in the years 1913-14 and 1927-28 was as follows:

	Professors		Students	
	1913-14	1927-28	1913-14	1927-28
England	2,533	3,730	24,010	33,295
Wales	156	378	1,140	2,814
Scotland	564	898	7,550	11,557
Ireland	532	325	2,475	3,150 *
Total	3,785	5,108	35,175	50,615

\* Irish Free State.

Agriculture. In 1928 there were in the United Kingdom (excluding Northern Ireland) 13,320,000 acres of arable land, or about 24 per cent of the total area; 16,961,000 acres of permanent grass and pasture, much of it highly productive; and 14,923,000 acres of rough grazing land. Stock raising, including even sheep raising, is carried on by intensive methods. In 1928 there were 7,488,588 cattle, 3,166,547 swine, 23,968,314 sheep, and 1,204,198 horses in England, Scotland, and Wales. The production of wool in the United Kingdom, including Northern Ireland, amounted to 104,821,000 pounds in 1920 and 117,676,000 pounds in 1927. The greater part of the food supply is imported. The following table gives the leading items in pre-war and post-war agricultural pursuits.

Crop	CROPS: AREA, PRODUCTION, AND YIELD PER ACRE (ENTIRE UNITED KINGDOM)									
	Area (thousands of acres)				Production (thousands of units—bushels, except as indicated)				Yield per acre (bushels)	
	1909-1913	1921-1925	1926	1927	1909-1913	1921-1925	1926	1927	1921-1925	1927

\* Unit, long ton.

<sup>b</sup> England and Wales.<sup>c</sup> Unit, pound.<sup>d</sup> Northern Ireland only; very little is raised in Great Britain.

**Mineral Production.** The principal economic resource of the United Kingdom is coal, which serves as fuel not only for industry, but also for the British merchant marine and as a return cargo for vessels entering British ports. It was one of the principal articles in export trade, for production was in excess of home consumption. Recent years have been difficult because of the war demands and the subsequent period of depression. The record year for production of coal was 1913; from then a gradual decline was recorded until 1918, which was followed by two years of slight increase, but in 1921, because of the strike which lasted 88 days, a very low record of production was shown. The years 1922 and 1923 showed decided improvement; 1923 was the second highest year on record. Employment in the mines followed somewhat similar lines, except that the lowest number employed was in 1915 and the greatest in 1920. The year 1921 was difficult for miners; they were out on strike for nearly three months because of wage disputes. The trouble finally ended in an agreement to base wages on the cost-of-living index and the volume of business. In January, 1924, general dissatisfaction with this wage agreement resulted in ballot vote by the miners to serve the required three months' notice of termination. In 1926 there was a general strike which severely restricted domestic and foreign commerce. See below, under *History*. The year 1927, opening with great mining activity and remunerative trade, was marked later by intense competition, declining price levels, increasing unemployment, and general depression. The closing months of 1927 and the first part of 1928 witnessed a tendency toward basic reorganization of the industry, with centralized control of production, sales, and price levels.

The accompanying table gives a comparison of industrial production in the United Kingdom before and after the World War:

INDUSTRIAL PRODUCTION							
Product		1913	1923	1924	1925	1926	1927
Coal	1000 long tons	287,430	276,001	267,118	243,176	126,279	255,417

\* China clay only.

<sup>b</sup> Years ended July 31.

\* Figures for Great Britain and Isle of Man.

Industrial productivity was greatest in the first and—except in food, drink and tobacco—the last quarters of 1928. The output of manufacturing plants, mines, and quarries was slightly less than in 1927.

**Textile Industry.** The cotton and woolen industries of Great Britain are located near the coal fields, the linen industry mainly at Belfast and Dundee, the lace industry at Nottingham, Derby, and Kilmarnock, and hosiery factories at Derby, Leicester, and Nottingham. The cotton industry depends entirely on imports of raw materials, while the woolen industry has to import two-thirds its wool, and the linen industry has to import one-half its flax. The cotton industry suffered more serious disorganization by reason of the World War than any other industry. A large part of the cotton spinning and manufacturing machinery of France and Belgium was in the zone of hostilities, while the cotton factories of Russia were ruined in the early months of the revolution, and England suffered a lack of raw material because of the submarine danger. Following the Armistice, England, with all her machinery intact, enjoyed a period of prosperity. Toward the close of 1920, the boom ended, and a serious depression set in, from which the industry had not recovered by 1929. During 1923 the short crop in America, plus the increased consumption by American mills, helped to cause a rapid rise in prices of raw materials. Economic disturbances in the chief markets of British cloth, i.e., China and India, caused them to cut down their purchases. In July, 1929, nearly 2000 cotton mills in the Lancashire district were shut down as a result of the walkout of 500,000 employees who refused to accept a wage reduction of 12½ per cent.

**Shipping and Shipbuilding.** The shipping and shipbuilding trades were prosperous during the War. After the signing of the Armistice, this abnormal demand ceased, and an excess of tonnage was the immediate result. The lack of

demand for tonnage caused rates to fall, which, added to the fluctuating exchanges and unsettled economic conditions, caused considerable hardship to shipowners. The excess tonnage was further augmented by the tendency to convert many old vessels to the Diesel type, which gave more cargo space and less fuel space. The United Kingdom leads the world in size of merchant marine, which in 1913 consisted of 8514 steam vessels of 18,273,944 tons and 700 sailing vessels of 422,203 tons, or a total of 9214 vessels (over 100 tons) of 18,696,237 tons; and in 1927 it was made up of 8216 vessels (of over 100 tons), totaling 19,309,022 net tons. During the War, there were lost through enemy attack 2197 vessels of 7,638,020 tons. In 1928 there were launched 830 vessels of 2,661,405 gross tons as compared to 728 vessels of 2,237,506 gross tons in 1927. The table shows the entrances and clearances at ports in the United Kingdom for 1913 and 1927:

	Entrances		Clearances	
	1913	1927	1913	1927
Number of vessels	78,620	76,440	76,648	76,312
Capacity (1000 net registered tons)				
Total	82,149	90,442	82,661	91,297
With cargo	49,064	60,590	67,819	63,500
In ballast	33,085	29,852	14,842	27,797

\* Figures for 1926

The total net tonnage of entrances at ports of the United Kingdom with cargoes during 1928 was 60,330,721; total clearances were 64,448,551 net tons.

**Railways.** The railroads of Great Britain are divided into four systems, all privately owned. The statistics for these are given in the accompanying table. In addition, there are 765 miles of line in Northern Ireland not covered by the table.

The number of passengers carried in 1928 was 1,190,420,000. During the year, the railways fell £9,057,732 short of earning the standard revenue fixed by the Railway Rates Tribunal under the Railway Act of 1921.

Gross receipts for the year were £205,726,461 as compared to £214,785,989 for 1927. Total expenditures dropped to £168,876,915 in 1928 from £175,888,185 in 1927. The total net income was £41,000,115 in 1928 and £42,622,190 in 1927. The decreases in revenue were attributed to motor competition and the freight shortage resulting from industrial depression.

**Commerce.** The outstanding feature of the overseas trade of the United Kingdom in 1928 was the continued improvement in the visible adverse merchandise balance. As a result of decreased imports and increased exports of British goods, the total adverse merchandise balance for the year was £353,160,000, a decline of £33,148,000 from the 1927 figures and the lowest since 1924. The annual net excess of visible imports over visible exports is a common and expected characteristic of British overseas trade. The trend of United Kingdom imports, exports, and reexports, and the net balance of visible trade, with movements of bullion and specie omitted, may be seen from the accompanying table.

Imports into the United Kingdom are grouped into five classes, in which the value figures for 1928 show declines from 1927 in imports of food, drink, and tobacco, raw materials, and manufactured goods, but increases in the receipts of parcel-post goods and of animals not for food. When compared with 1924, the new base year for trade and industry comparisons in the United Kingdom, marked declines are shown in the first two classes, while increases equally marked are shown in the remaining classes.

#### C. I. F. VALUE OF IMPORTS INTO THE UNITED KINGDOM BY CLASSES

Class	1924	1927	1928
Food, drink, and tobacco	£571,085,943	£538,526,021	£531,912,557
Raw materials and articles mainly unmanufactured	400,019,414	851,739,719	334,819,690
Articles wholly or mainly manufactured	299,773,852	322,412,540	318,016,455
Animals, not for food	2,569,834	2,853,196	3,064,520
Parcel post (non-dutiable articles)	3,990,101	3,009,074	9,127,132

The principal countries supplying the 1927 import requirements of the United Kingdom, with the preliminary valuation for each in comparison with the revised figures for 1925 and 1927, are listed in the accompanying table:

£307,000,000, as compared to only £19,000,000 in 1913-14. The budget was balanced at approximately £200,000,000 in 1913, but due to heavy war charges it was balanced at £1,000,000,000 in 1921, at £900,000,000 in 1922, at £800,000,000

## PRINCIPAL SOURCES OF IMPORTS INTO THE UNITED KINGDOM

The real increase in British exports over 1927 is somewhat more than is apparent in the total figures, owing to a further slight reduction in wholesale prices.

in 1923 and at approximately £756,083,000 in 1920.

The table on page 662 shows total receipts and expenditures. Prior to 1928-29, the accounts

## F. O. B. VALUE OF EXPORTS OF UNITED KINGDOM GOODS

Class	1924	1927	1928
Food, drink, and tobacco	£ 56,957,520	£ 52,273,502	£ 54,271,761
Raw materials and articles mainly unmanufactured	108,481,725	76,352,169	70,168,592
Articles wholly or mainly manufactured	618,855,491	563,913,782	578,628,519
Animals, not for food	2,299,325	1,898,016	1,995,383
Parcel post	16,372,776	14,638,794	18,363,310

The direction of British export trade is indicated by the following table, showing the countries figuring most conspicuously as markets for British goods:

included gross receipts and expenditures for posts, telegraphs, and telephones, the only large income-producing service, which normally shows a net surplus; they also included the revenue

**Finance.** One of the most striking achievements of the British government after the Armistice was the very large reduction in government expenditures and the balancing of the budget. In contrasting the large post-war expenditure of the British government with the pre-war rate, it should be borne in mind that the annual debt charge was, by 1924, about

from motor-vehicle duties and its expenditure on the road fund. The 1928-29 budget estimates show only the net receipts for posts, telegraphs, and telephones and only the exchequer share of motor-vehicle duties, deducting the road fund. Educational expenditure is mainly for grants in aid to local education. "Payments to local taxation accounts" include certain liquor and

other licenses and a share in the estate taxes assigned for local use. Conversions to dollars have been made at par.

insurance, and unemployment "doles" for workers, labor exchanges, an extension of workmen's compensation, practical abolition of plural vot-

For the fiscal year ended Mar. 31, 1928, the external debt of Great Britain amounted to £1,095,232,000 and the internal debt to £6,432,340,000, making a total of £7,527,570,000 as compared with £7,554,618,000, at the end of the previous fiscal year. The total floating debt, at £689,000,000 on Mar. 31, 1928, marked the lowest point reached since the War.

### HISTORY

**The Coming of the War.** So vitally important to the British Empire were the many changes of the World War and immediate post-war years that they may rightly be considered as comprising one of the most significant periods in British history. Not only was the Empire itself saved from disruption by a hair's-breadth but great constitutional changes which in times of peace would have required generations were effected almost at a stroke. The enfranchisement of women, the granting of Irish home rule, the advent of a socialist Labor government, the transformation of the empire into a "commonwealth of nations," the strides toward nationalism in India and Egypt, were changes sufficient to make any epoch memorable. With all these liberal developments, the War at the same time brought gratification to the imperialists by greatly extending the area of British rule and raising the name and prestige of Britain to the highest point it had ever reached.

Most of the internal changes were indeed presaged by the semi-revolutionary character of events in the decade preceding the War. The Liberals were in power during the whole of that period, first under Campbell-Bannerman and then under Asquith, with a parliamentary backing (1910) of 270 Liberals, 84 Irish Nationalists, and 42 Laborites as opposed by 274 Unionists. They had passed an Irish Home Rule Bill through the Commons three times by 1914, drastically altered the Constitution by curbing the House of Lords, enacted a land reform measure aimed at the very basis of the traditional aristocratic social system, provided for old-age pensions, a minimum wage for miners, sickness

services and tax collection

ing, and other social and political reforms. But all these changes had not been effected without stirring British society to its depths.

By July, 1914, just before the war clouds broke, the political atmosphere of Britain was tense and electric. Suffragettes were attempting to win the franchise by violent demonstrations; London was in the throes of a building trades strike; titled landlords were nervously preparing for the final conflict over land reform; the stalwarts of the House of Lords were predicting dire civic convulsions if the cabinet should carry out its announced intention of promulgating the Irish Home Rule Bill and the Welsh Church Disestablishment Bill, which, having passed the Commons a third time by the spring of 1914, could now, under the Parliament Act, be presented for royal signature regardless of the Lords' opposition; high army officers had virtually mutinied rather than accept responsibility for maintaining order in Ulster; and in Ireland unlawfully organized volunteer armies, representing respectively the Ulster Unionists and the Irish Nationalists, were arming themselves with smuggled rifles for an apparently inevitable civil war. Indeed, blood had already been spilled in Dublin in a clash between soldiers and National Volunteers. Like leaves before a hurricane, these issues were swept into the background by the tempest which rose in the Balkan storm centre in midsummer, 1914.

**Entry into the War.** There is now hardly any question that the British Secretary of State for Foreign Affairs, Sir Edward Grey, sincerely desired to avert the catastrophe of 1914. But it seems also well established that, through secret understandings with France (1904, 1906, and 1912) and Russia (1907 and 1908) he had so tied his hands as to make British intervention in any general war virtually inevitable. Whether he could have preserved peace by taking a position more openly and unreservedly either for or against France and Russia is debatable. Though he had been warned by the German Ambassador as early as July 6 that the Serajevo incident might produce an Austro-Russian crisis, Grey waited, inertly hopeful, until July 23,

when he asked the Austrian Ambassador what action Vienna intended to take against Serbia. Although disinterested in the merits of the Austro-Serbian dispute, Grey feared Austro-Russian complications, and on July 24 proposed mediation by the four other Great Powers. While the British fleet, which had assembled on July 16 for practice manoeuvres, was ordered by the ever-watchful Churchill on July 26 to remain mobilized, Grey continued during the next nerve-racking week to urge mediation, while he urged the cabinet to decide for intervention or neutrality in the coming struggle; if neutrality, he added, some other man must be given his portfolio. But the cabinet, almost equally divided, could make no decision, and Grey was able neither to offer unqualified pledges to France nor to make unreserved threats to Germany. In fact, as late as July 29 he told the French Ambassador, Cambon, that Britain's course was still undecided; to the German Lichnowsky he issued the famous warning that "if the issue did become such that we thought British interests required us to intervene, we must intervene at once." When the German government, taking alarm, offered a pledge not to annex French territory (not including French colonies), Grey heatedly refused to "bargain away" his loyalty to France or his interest in the neutrality of Belgium. If Germany made any "reasonable" pacific proposal, and France and Russia rejected it, Britain would stand aloof, he later informed Germany; otherwise "we should be drawn in." Even on July 31, while Russia and Austria were mobilizing, while Unionist journals in England were urging intervention and the Liberal press was advocating neutrality, while Poincaré and Cambon were pleading for a definite promise of aid, Grey was still endeavoring to keep a "free hand." To a German offer to respect Belgian neutrality and the French colonies, Grey still reiterated, "We must keep our hands free." On August 2, however, Unionist leaders, Lord Landsdowne and Bonar Law, sent a letter to the Premier stating their opinion that to hesitate in supporting France and Russia "would be fatal to the honor and security of the United Kingdom." With this letter before them, the cabinet ministers authorized a promise to defend France against hostile action of the German fleet. Four ministers, strongly opposed to intervention, offered their resignations, but only two, Burns and Lord Morley, insisted on withdrawing from a government which they felt was now committed to war.

Meanwhile, the German ultimatum had been presented to Belgium, August 2, and Belgium appealed to England for "diplomatic intervention," August 3. Such was the situation on the day when Grey made his celebrated speech before Parliament in revelation of the secret Grey-Cambon correspondence of 1912 and his promise of August 2 to defend the French coast; he discussed the menace to Belgium and lightly declared, "If we are engaged in war, we shall suffer but little more than if we stand aside." Bonar Law pledged support; John Redmond, the Irish Nationalist leader, offered Ireland's loyalty; only the Labor leader, Ramsay MacDonald, seemed unconvinced. Assured of Parliamentary backing, the Government on August 4 instructed Sir Edward Goschen, British Ambassador in Berlin, to demand from Germany before midnight a pledge to respect Belgian neutrality. As expected, Germany refused, and on August 5 Pre-

mier Asquith informed the Commons that Great Britain was at war with Germany, "to fulfill a solemn international obligation" (to Belgium) and "to vindicate the principle that small nationalities are not to be crushed, in defiance of international good faith, by the arbitrary will of a strong and overmastering Power." Such undoubtedly was the feeling of many Englishmen, but it is certainly not less true that England's entanglement in the Triple Entente through imperialist bargains with France (1904) and Russia (1907) was also so strong a reason for intervening that Grey had favored intervention even before he knew that Belgium's neutrality would be violated.

Navy and army alike were prepared for the crisis. Under Admiral Sir John Jellicoe, the navy steamed forthwith to its war stations in the North Sea. When the army's small Expeditionary Force of four infantry and one cavalry divisions, which Lord Haldane, War Minister, had organized along with the Home Defence Force, was ordered to France under Sir John French in August, it was ready "down to the last gaiter button." Lord Kitchener took charge of the War Office and began to organize the volunteer "Kitchener's Army," predicting that the war would last three years. Parliament voted a war credit of £100,000,000, an army increase of 100,000 men, a navy increase of 67,000 men, government control of railways and war insurance of trade, restriction of liquor traffic, a moratorium, and other emergency measures.

Before adjourning on September 19, Parliament also passed the controversial Welsh Church and Irish Home Rule Bills, together with a suspensory act postponing their operation. Despite the latter act, Mr. Redmond in a manifesto exhorted Ireland to contribute its share of recruits for Kitchener's Army. As for the Labor Party, the pacifist MacDonald was replaced by the patriot Arthur Henderson as chairman and only a minority continued to condemn the War. Re-assembling in November, Parliament granted an additional war credit of £225,000,000, a 100 per cent increase in the income tax as well as increased taxes on tea and beer, and an addition of 1,000,000 men to the army. Continuing to give the Government full control, Parliament acquiesced when in November the management of military and naval affairs was transferred to the War Council composed of Asquith, Lord Kitchener, and Churchill, who with the aid of technical experts decided major questions of war policy. Even so, there was much blundering and more negligence by overburdened ministers, Lord Kitchener particularly insisting on bearing a load of War Office routine which bowed even his broad shoulders. The "party truce" did not prevent the Unionists entirely from pointing out the ministry's shortcomings.

With the beginning of 1915, the Government drew increasingly the fire of the critics. Failure to provide adequate munitions was particularly censured, but there were many other grievances. Inflamed by German submarine outrages in the spring of 1915 and by the Bryce Committee's report on German atrocities in Belgium, the war spirit now burned so fiercely that it demanded more severe measures against enemy aliens and a more drastic blockade of Germany. Consumers were beginning to demand rigorous price control to curb the food profiteers, and the press was restive under the censorship imposed by Sir Stanley Buckmaster's Press Bureau. Com-

plaints were made that the voluntary enlistment plan was inadequate and drew experts into the army who were indispensable in industry, while shirkers escaped.

Above all, two military fiascoes brought the cabinet under fire. The Dardanelles campaign in the spring of 1915 apparently offered a possibility of decisive strategic gains and was eagerly sponsored by First Lord of the Admiralty Churchill, but according to his later contention was stultified by the vacillation and preoccupation with the western front on the part of Lord Kitchener, who had approved the plan, and by the opposition of Lord Fisher (First Sea Lord), the commanding admiral, and other naval officials. The failure at Gallipoli, so tragically short of success, not only evoked bitter criticism from the public but caused a serious rift in the War Council itself. This crisis coincided with a stormy public discussion of the shortage of munitions, provoked by the disastrous battle of Neuve Chapelle (March, 1915), in which the General Staff's hope of blasting a breach through the enemy lines was frustrated by a shortage of high explosive shells, as reported to the *Times* in May, although this report was denied by Asquith.

Up to March, 1915, the whole record of the War Office, under Kitchener's direction, with respect to the production of munitions was not a fortunate one. He had failed to organize the munitions industry effectively, to curb profiteers, to evolve a policy which would prevent strikes, to keep skilled workers from enlisting in the army. The Government's authority to take over munitions plants, granted in the Defence of the Realm Act passed in the spring of 1915, remained virtually a dead letter. In April, however, he did permit the organization of a committee to control munitions contracts, headed by Lloyd George; but a much more thorough-going change was necessary, and under pressure from the energetic Welshman, combined with the Opposition's demand and the Churchill crisis, Asquith finally consented to the formation of a coalition cabinet with a new Ministry of Munitions of which Lloyd George was appointed the head.

**The Coalition Cabinet.** The new cabinet took office in May, 1915. It contained eight Unionists, including Bonar Law in the Colonial Office, Balfour in the Admiralty (Churchill becoming Chancellor of the Duchy of Lancaster), and Austen Chamberlain in the India Office. Arthur Henderson accepted the portfolio of Education, and Sir Edward Carson became Attorney General. With characteristic vehemence, Lloyd George threw his whole dynamic personality into the task of persuading, cajoling, and coercing, if need be, employers, workers, and officials to collaborate in the supreme task of preparing the means of victory. By a Munitions of War Act (July 2), he forbade strikes and lock-outs, obtained authority to regulate wages and profits in "controlled" munitions plants, provided for the recall of skilled workers from the army, and suspended restrictive trade union rules. It was his personal influence which kept labor in line and secured the aid of experts and organizers, so that by the end of July 100,000 munitions volunteers were enrolled and 20 national factories established. In the face of criticism, he vastly expanded the output of heavy guns and other supplies and was soon vindicated, for in the later months of 1916

British artillery in France was firing as many tons of munitions in an hour as it had fired in a day during the first year.

It was Lloyd George also to whom Asquith turned in 1916, following the Easter Rebellion in Ireland, to form a plan for putting the Home Rule Act immediately into force. He proposed that six Ulster Counties should be excluded from the workings of the act during the War and that Irish representation at Westminster should be preserved only through the War period. But the Unionists denatured the proposal and the resulting failure and the repressive Irish measures which followed enabled the Sinn Fein movement to win the masses from the more moderate Nationalist tactics.

In dealing with the man-power question, the Asquith Coalition was hardly less inept. Vainly attempting the impossible task of pleasing both the conscriptionist Northcliffe press and the anti-conscriptionist trade unions, Asquith compromised at first on a National Registration Bill; then induced Lord Derby in October, 1915, to conduct a spirited voluntary recruiting campaign, reinforced with a threat to apply compulsion if this failed; then, early in 1916, put through a Compulsory Service Act, applying merely to bachelors and childless widowers between 18 and 40, excluding Ireland, and exempting clergymen, necessary war workers, sole supporters of families, conscientious objectors, and the physically unfit. Both the jingo press and the trade unions were displeased, for opposite reasons. Assailed by prominent critics in both Houses of Parliament, the Premier had to plead for the life of the Cabinet, and prepare a new compromise in April, going a step further toward universal conscription, but still with many reservations. This was so coldly received that at length, on May 3, 1916, the Government produced a Universal Military Service Bill applying to all men between 18 and 41; Ireland was still excluded, and exemptions were so numerous that the Asquith government received little applause for its tardy and hesitant conversion to universal service.

During its term of office, from May, 1915, to December, 1916, the Asquith Coalition dealt with numerous other matters. Parliament should have terminated in December, 1915, under the Parliament Act, but it prolonged itself by statute, without elections. The blockade of Germany was tightened by increasing the list of contraband commodities and finally by abandoning the Declaration of London, in June, 1916. The Joint Air Board, representing army and navy interests, was set up in May, 1916, to stimulate production of airplanes. Huge votes of credit were granted; the cost of the war increased from £2,700,000 to £3,500,000 a day in the half year from March to September, 1915, and to £5,000,000 a day in November. By March, 1916, the votes of credit for the War reached a total of £1,782,000,000. Most of this expenditure was covered by war loans, but the income tax, doubled by Lloyd George, was raised 40 per cent more by his successor, McKenna, in September, 1915; an excess-profits tax of 50 per cent was applied to war profiteers; duties on sugar, tea, tobacco, etc., were increased, and heavy taxes levied on imported motor cars, films, and other luxuries. In April, 1916, McKenna again raised the income tax, to a maximum of 5 shillings on the pound, the excess-profits tax to 60 per cent, and other taxes proportionally. In coura-

geous self-taxation during the War, Great Britain was unique and financially prudent.

The Coalition Cabinet suffered more than one defection before it finally collapsed. Sir John Simon, Home Secretary, resigned as a protest against conscription; Sir Edward Carson, in November, 1915, because of the Government's bungling Balkan policy; Winston Churchill, because he was excluded from the War Committee of the Cabinet which was formed on Nov. 11, 1915. Lord Kitchener, en route to Russia, was lost when his ship struck a mine, in June, 1916, and was replaced as War Minister by the indefatigable Lloyd George. Sir Edward Grey accepted the title of Viscount Grey of Falloden and entered the House of Lords, retaining the portfolio of Foreign Affairs, but leaving defense of the Coalition's conduct, in the Commons, to his able under-secretary, Lord Robert Cecil.

**The Lloyd George Government, 1916-18.** The fall of the Asquith cabinet was caused by the long accumulation of ineptitudes, compromises, hesitations, vacillations, some of which have been chronicled above. It was precipitated by demands for a small war cabinet instead of merely the war committee of the cabinet consisting of Asquith, Balfour, Bonar Law, Lloyd George, and McKenna which had been created in the autumn of 1915. In December, 1916, Lloyd George, backed by the *Times*, demanded supreme responsibility for a committee to consist of himself, Sir Edward Carson, Bonar Law, and a representative of Labor. Asquith refused, a cabinet crisis ensued, and Lloyd George resigned. Bonar Law, invited by the King to form a government, recommended the War Minister instead, and Lloyd George accordingly headed a new Coalition Cabinet in December, 1916. He at once created a small war cabinet of five members, to sit daily, and to have absolute control of Britain's war effort. The Premier himself, Lord Milner of South African fame, and Arthur Henderson were the controlling triumvirate, with Lord Curzon, leader of the House of Lords, and Bonar Law, leader of the Lower House and Chancellor of the Exchequer, also members but more or less preoccupied with other duties. Five new ministries were created in the larger cabinet, Shipping Control, Food Control, Air, Labor, and Pensions. Balfour took Grey's place in the Foreign Office, Sir Edward Carson the Admiralty, and Lord Derby the War Office. Other places, contrary to tradition, were filled with experts, particularly business experts, rather than politicians.

Of the Lloyd George government, great things were expected, for the name of its premier had become a synonym for patriotic energy. As budget-maker, then as Munitions Minister, then as War Minister, he had exhibited unsurpassed vigor and enthusiasm; he had stirred the Allied world by his ringing, if inelegant, declaration that the fight with Germany "must be to a finish," to "a knockout." To him, Englishmen now looked for miracles. Of these, there was none, but of vigor there was much. The German peace offer made in December, 1916, was rejected. During the remainder of the War, new conscription laws were passed, raising the age limit, combining over the supposedly exempt and unfit, and culminating in the 1918 law which drafted men up to 55 years of age and which for the first time included Ireland.

To defeat the aim of the German submarine campaign of 1917, the Government assumed con-

trol of British shipping and built new tonnage with desperate haste. For zeal in this matter there was indeed necessity, for in 1917 some 4,009,537 tons of British shipping, out of a total of 20,000,000, were sunk, as compared with only 1,163,474 built; and in the first nine months of 1918, the Germans succeeded in sinking only 1,925,512, as compared with 1,310,741 constructed. The submarine campaign, by lessening the cargo space available for food imports, threatened England with slow starvation; to avert this peril, the Government not only established food-rationing and price-regulation, but also offered bounties for domestic grain production and fixed a minimum wage of 25 shillings for agricultural labor. When reproached for not doing more, Bonar Law declared that in 1917, while putting 820,600 additional men into the army, the Government had brought 1,000,000 more acres under the plow, producing 850,000 tons of grain and 3,000,000 tons of potatoes, and had built over 1,000,000 tons of shipping, as compared with about 500,000 the previous year. Furthermore, mines, textiles, railways, and the liquor traffic were brought under governmental control, for reasons dictated by war necessity. Votes of credit, of course, became larger and more frequent as the cost of the War rose to almost £7,000,000 sterling per diem in 1917-18. The total credits granted for the War were brought by appropriations in 1918 to the stupendous total of £8,742,000,000, of which about £1,465,000,000 was lent to other Allies.

As before, the bulk of the burden was passed on in the form of debt to future generations, but Great Britain in the years 1917-18 taxed herself unflinchingly. The normal income-tax was raised to 6 shillings in the pound, with supertaxes running up to 4s. 6d.; increases were put on liquor, tea, sugar, tobacco, luxuries, postal rates, etc. Of the many measures adopted to preserve the morale of labor and industry under the stress of war, perhaps the most significant was the Whitley Reconstruction Committee's Report, June, 1917, proposing the establishment of Joint Industrial Councils representing capital and labor in each industry, to settle disputes amicably, and, more important, to nip misunderstandings and controversies in the bud. The proposal was only a recommendation, not a compulsory law, but it was voluntarily adopted in some trades, and it bore witness to the Government's desire to build for a future beyond the anticipated military victory.

Another of the Lloyd George cabinet's war measures, of far less importance in the long run, was the wholesale Anglicization of the royal family, by substituting good English names for hereditary surnames of too Teutonic a flavor; in July, 1918, the reigning dynasty, the house of Saxe-Coburg and Gotha, became the house of Windsor; a month earlier, the Prince of Teck had been ordered to change his family name to Cambridge, and the Battenbergs translated themselves into Mountbattens.

**Important Reforms.** Constitutional and political reforms of far-reaching significance were adopted in the midst of frenzied efforts to win the War, during the years 1917-18. Probably the most remarkable of these was the Representation of the People Act of January, 1918. The desire for reform of the franchise had been bruited before Asquith's fall, particularly by the suffragettes, but the Asquith cabinet, divided against itself, had been unable to

take any decided stand on the issue. The Lloyd George government took action on the basis of a report from a Speaker's committee representing all parties, and in May, 1917, presented a bill embodying the committee's proposals and allowing the Commons to do as they pleased regarding the controversial questions of woman suffrage and proportional representation. By 214 to 17, the House incorporated woman suffrage; but proportional representation it rejected, excepting for university elections. The vote was given not to all women, but to women over 30 years of age, who were qualified as local government electors by occupying land or premises of the yearly value of not less than £5, or of a dwelling house, or whose husbands occupied such property; moreover, women over 30, graduates of universities, were entitled to votes for their university representatives in Parliament. Later in the same year, a bill was passed enabling women to sit in Parliament, and in 1922 three women were elected. The complicated existing franchises for men were swept away and replaced by a simple six months' residence requirement for all males over 21 (except conscientious objectors) and sailors and soldiers (who were included at the age of 19). Plural voting was restricted; a citizen could vote for his place of business or for his university as well as his residence, but not in more than two constituencies as of old. The registration period was reduced from 12 to six months. Also all polls were to be held on the same day, in a general election. Finally, the membership of the House of Commons was increased from 670 to 707, the seats being distributed one for each 70,000 inhabitants in Great Britain, and one for each 43,000 in Ireland. It is hardly an exaggeration to describe this as the greatest of England's historic Reform Bills, for it enfranchised about 2,000,000 men and 6,000,000 women; and since only about 8,350,000 had been previously qualified to vote, the Act of 1918 almost exactly doubled the electorate.

Other reforms were brought about by the passage of the Fisher Education Bills of 1917 and 1918 for compulsory education of children, limitation on child labor in mills, free elementary and continuation public schools, pay increases for teachers, and subsidies for secondary schools. In the same busy period, Lloyd George also endeavored to solve the Irish problem, submitting in May, 1917, a plan for immediate Home Rule in southern Ireland, or as an alternative the calling of a convention to frame a better plan. Such a convention met in Dublin July 25, but the Sinn Fein refused to participate and its report was ignored by the British government, as well as the Irish parties themselves.

**Imperial Conferences.** The broader aspects of imperial statesmanship likewise challenged attention. On the invitation of the Lloyd George cabinet, the so-called Imperial War Cabinet was formed, comprising the premiers of Canada, South Africa, Australia, New Zealand, and Newfoundland, the Secretary of State for India, and the British War Cabinet. The series of sessions from March to May, 1917, were so successful that Lloyd George proposed to make them an annual affair, and a second session was called for the summer of 1918. Side by side with the Imperial War Cabinet in 1917 and 1918, an Imperial Conference met in London, embracing a wider colonial representation. The effect of these conferences was not only to knit more

closely the bonds of imperial political loyalty, but also to reinforce the tendency toward imperial economic solidarity, involving, for the mother country, abandonment of the traditional free trade dogmas. As early as February, 1917, a commercial committee headed by Lord Balfour of Burleigh had recommended additional customs duties, with colonial preference and artificial stimulation of colonial production. The Conference of 1918 recommended control of raw materials, especially minerals, and the safeguarding of essential industries, and the Unionists boasted that the principle of imperial preference was at last established. With Unionists predominating in the cabinet and in the Commons, the defense of the Liberal free trade principle against protectionism was at least made difficult. To conciliate India, the Lloyd George government permitted India to participate nominally in the Imperial War Cabinet and the Imperial Conference, permitted her to establish a protective customs duty on cotton, and permitted officials to draft a scheme for self government which from the standpoint of Downing Street was scarcely less than revolutionary. See INDIA.

Among many other ministerial changes in the 1917-18 period were the resignation of Austen Chamberlain as Secretary for India because of mismanagement by the Indian government of the Mesopotamia campaign and his later appointment as Chancellor of the Exchequer; assumption of the office of Food Controller by Lord Rhondda, in midsummer, 1917, and on his death in 1918, by a Laborite, Clynes; the recall in July, 1917, of Churchill from his services in the field as major in the Grenadier Guards to become Minister of Munitions; appointment of General Smuts of South Africa, a statesman of recognized imperial calibre, to the War Cabinet; and in April, 1918, when the Germans were making their supreme effort in France, the assumption of the War portfolio by the able Lord Milner, whose seat in the War Cabinet was taken by Austen Chamberlain.

**Victory and Diplomacy.** Meanwhile, the exhausting conflict was being pushed to a successful conclusion, thanks in no small part to the energy of the British people. Although at the outset Great Britain had sent only five divisions to France, during the entire War the United Kingdom enlisted 6,211,427 men, of whom 743,702 were killed and 1,603,262 wounded; the other parts of the Empire had supplied 3,284,943 men, of whom 202,321 were killed and 428,644 wounded. For the United Kingdom alone, the percentage of men mobilized of the total population was 13.6, as compared with 17.9 for France, 11.3 for Italy, and 5.2 for the United States. British expenditures during the War amounted to about £9,000,000,000 sterling, of which £2,730,000,000 were obtained by heroic self-taxation, about £1,360,000,000 by foreign borrowing, mainly from the United States, and the remainder, more than half, by floating war loans at home. Some £453,000,000 had been loaned to France, £382,000,000 to Italy, £659,000,000 to other Allies, and £150,000,000 to British dominions. The British national debt was over £7,000,000,000 sterling at the close of the War, 10 times its amount in 1914. Furthermore, while British Armies fought in Picardy and Flanders, in Gallipoli and Macedonia, in Palestine and Mesopotamia, and in Africa, the British Navy had policed the high seas, safeguarding supplies of troops and matériel, and

slowly starving the enemy. British propaganda and diplomacy had been influential in bringing the United States and other neutrals into the War and in preserving Allied solidarity. No statesman of the Entente was more determined than Lloyd George to fight "to the finish," and to coördinate the military efforts of the Allies.

At the Rapallo Conference in 1917, Lloyd George succeeded in having the Supreme War Council of the Allies established, but even this was insufficient, as he said in his sensational luncheon speech at Paris in November. After Clémenceau, a kindred spirit, became French Premier, he and Lloyd George were able to strengthen the Council, including staff officers in its membership, despite the opposition of Sir William Robertson, British chief of Staff, who resigned in protest. The credit of achieving a united command and making Marshal Foch generalissimo has been claimed for Clémenceau, Painlevé, Milner, Haig, and others, but to the English Premier certainly a large share must be assigned when all the evidence has been taken.

Hardly had the booming of the great guns at the front ceased when the opening salvos of an electoral campaign were fired in England. The War Parliament, elected in December, 1910, should normally have expired in December, 1915, but it had been kept alive by successive prolongations during the emergency, until a general election could be held in peace; it dissolved a fortnight after the Armistice. At last, on Dec. 14, 1918, the long-postponed election was held; a "khaki election" it was called, because, occurring a month after the Armistice, while millions were still in uniform, it was essentially a war election in spirit. The Prime Minister, hoping to obtain an overwhelming nonpartisan backing on the issue of patriotism before he entered the Peace Conference, joined with the Unionist leader, Bonar Law, in an appeal for electoral support of the Coalition and preservation of national unity in the peace negotiations. Their electoral promises, official and quasi-official, were lavish: to hang the Kaiser, obtain a bounteous indemnity (a figure exceeding \$100,000,000,000 was popularly mentioned), create a League of Nations, reduce armaments, foster agriculture, care for veterans, give tariff preference to colonies, protect "key industries," solve the Irish question without coercing Ulster, grant partial self-government to India, and reform the House of Lords. On this platform the Coalition won a sweeping victory; 478 loyal supporters were elected to sit on the Government side of the House, against a heterogeneous Opposition of 229 members.

The Labor Party, having seceded from the Coalition and increased its strength from 42 (in December, 1910) to 63, became the official Opposition. Asquith's forlorn contingent of 28 "Independent Liberals" also opposed the Government and hoped for better times. From Ireland came 25 Unionists and only seven Nationalists, since 73 seats, almost three-quarters of the Irish quota, had been captured by Sinn Féin irreconcilables, who refused to sit in the Westminster Parliament (see IRELAND). On the morrow of the elections, the Premier reorganized his ministry by transferring the Exchequer from Bonar Law to Austen Chamberlain, the Colonial Office to the indispensable Lord Milner, the Admiralty to Walter Long, War and Air to Churchill, who was still criticized for the Dardanelles disaster, Labor to Sir Robert Horne, Supply (previously

Munitions) to Lord Inverforth (formerly Andrew Weir), Ways and Communications to Sir Eric Geddes, and the post of Attorney General to Lord Birkenhead (Sir Frederick Smith). The normal practice of full cabinet sittings was not resumed until October, 1919, after the Peace Treaty was signed.

Strong in the knowledge of his secure majority—nay, spurred on by his ultra-patriotic parliamentary supporters—Premier Lloyd George entered the Paris Peace Conference of 1919 prepared to obtain Britain's full share of the fruits of victory. Forgotten now was his celebrated war-aims declaration of Jan. 5, 1918, in which, largely to conciliate Labor, he had promised that self-determination would be applied to the German colonies, and "their exploitation for the benefit of European capitalists or governments" prevented; that "reparation" should not cover an attempt to recover war costs; that the European settlement should be based on consent of the governed; that an international organization should be established to limit armaments and prevent wars. At Paris in 1919, his primary concern was to gratify the demand of British imperialists for a major share of German colonies, the demand of British taxpayers for a generous indemnity, and the demand of the British Admiralty for unrestricted sea power. After these interests were secured, he could afford to play the rôle of disinterested mediator between the French policy of *vœ victis* and the Wilsonian "Fourteen Points" (so strikingly similar to his own war aims of Jan. 5, 1918). With him he took to Paris some 200 "experts" and assistants, with as many typists and clerks, a staff sufficient to fill five hotels. His own will dominating the British delegation, strictly subordinate rôles were assigned to the other British plenipotentiaries: Bonar Law, Viscount Milner, Balfour, and Barnes. (The dominions and India were separately represented. See BRITISH EMPIRE.) As the history of the Peace Conference is told elsewhere (see PEACE CONFERENCE AND TREATIES), suffice it here to summarize the successes and failures of the British delegation.

The British Premier's warning that any peace ignoring Russia must be inadequate, his desire to effect an immediate limitation of armaments, his insistence on Germany's immediate or at least early entry into the League, his demand for punishment of the Kaiser and German war criminals, his proposal for an Anglo-American guarantee of French security, his belief that Germany should have "full access to raw materials and markets of the world" (inconsistent with his own earlier pronouncements) and be "put upon her legs once more"—all were either disregarded or balked. On the other hand, the British representatives did succeed in somewhat restricting French designs on the left bank of the Rhine; Lloyd George himself was responsible for the plebiscite on Upper Silesia; the mandate system, along with several other features of the League, was of British origin; the British dominions and India obtained separate votes in the Assembly, and an Englishman was appointed first Secretary General of the League.

As regards special British interests, Wilson was persuaded to drop the freedom of the seas from his "Fourteen Points"; reinforced by a strong telegram in April from 370 Members of Parliament, demanding reparation for Britain, the British delegation inserted marine losses and

pensions into the reparation account; by dramatic appeals from the Dominion delegates, Mr. Lloyd George frustrated President Wilson's aim of entrusting the German colonies to small powers, and obtained for South Africa a mandate over German Southwest Africa; for Australia, German Papua; for New Zealand, German Samoa; for the Empire, the phosphate island of Nauru; and for the mother country, Mesopotamia, Palestine, full ownership of Egypt and Cyprus, most of German East Africa, and parts of Togoland and Cameroon. Persia (q.v.), moreover, and the Hedjaz (q.v.), by arrangements independent of the Peace Treaty, had become practically British protectorates. If Disraeli could boast in 1878 that he brought home peace with honor, the fiery Welshman might well have vaunted a greater victory and richer spoils in 1919.

Signature of the peace treaties brought no surcease of international problems, but the contrary. After Premier Lloyd George had returned to London in 1919, there began a series of frequent meetings of the Supreme Council and conferences with French premiers, conferences which enabled the versatile Lloyd George to display his statesmanship at many a European spa—San Remo, Boulogne-sur-Mer, Cannes, Spa, Lucerne, besides London, Paris, Genoa, Brussels. Toward Germany, Lloyd George took a more lenient attitude than pleased French chauvinists; his desire to fix the reparation total at a moderate figure and his willingness to accept diminution or postponement of scheduled payments brought him into continual conflict with France; likewise in reopening relations with Russia and endeavoring to restrain the eastward course of Polish territorial greed, he collided with the pro-Polish and anti-Bolshevik Quai d'Orsay; the same Anglo-French divergence was seen in the difficult negotiations over Upper Silesia, the cession of which to Poland was urged by Paris and opposed by London; and again in the Near East the two western Powers were at odds, Britain backing the Greek adventure in Anatolia (see GREECE and TURKEY), while France covertly encouraged the Turkish Nationalists against exasperated remonstrances from London. When Premier Lloyd George in September, 1922, indiscreetly allowed publication of a manifesto not approved by his Foreign Minister (Lord Curzon), proclaiming his intention of resisting by force any attempt of Kemal's Nationalist Army to occupy the Straits zone or invade Europe, the rift in the Entente was painfully clear, for France ordered her troops to offer no resistance. Great Britain seemed about to face the Turks alone, and although an armistice was soon arranged, the British Premier's precipitate and perhaps high-handed action was resented not only across the Channel, but still more keenly in England, where it was seized on by his critics as a major reason for a change of ministry.

There were other discouragements. Persia (q.v.) refused to ratify the Anglo-Persian Treaty and turned to America for advice and capital. Mesopotamia proved rebellious and so surprisingly expensive that it became a byword in Parliament. Afghanistan (q.v.) shook off British control, negotiated with Soviet Russia, and terrified British imperialism by spreading anti-British propaganda in Asia. India, led by Gandhi, met the Montagu-Chelmsford "reform" with "passive resistance," while actual rebellion in Egypt necessitated a promise of independence.

Opposition by the dominions to a renewal of the Anglo-Japanese Alliance and by British taxpayers to the cost of naval competition with the United States, was dexterously dodged by encouraging the latter nation to take the initiative, at the Disarmament Conference in Washington in 1921-22, in proposing naval ratios and a broader Pacific pact, but a satisfactory arrangement was achieved only at the cost of abandoning Japan, accepting, nominally at least, a naval ratio on a par with the United States, promising to restore Wei-hai-wei to China, and admitting failure to curb military, air, and submarine armaments, of France particularly. Even so, the success of this conference tempted Lloyd George to sponsor a more ambitious assembly, the Genoa Conference, in the spring of 1922, whose declared aim was the economic reconstruction of Europe. But, as the uncompromising Poincaré had just become French Premier, superseding the more pliable Briand and repudiating the Anglo-French alliance project which the latter had drafted with Lloyd George, French policy at Genoa was so resolutely guided in anti-British, anti-German, and anti-Bolshevik channels that the Welshman's grandiose plans of international reconciliation and reconstruction went on the rocks, and no one except Lloyd George himself could regard the conference as more than a disheartening fiasco. The breach in the Entente Cordiale seemed irreparable at the time, and one of the arguments which ultimately overthrew the Lloyd George government was that by ill-considered opposition and by undue charity toward an undeserving Germany, the Premier had transformed a cordial understanding into irritable antagonism.

**Reconstruction Problems.** The four years following the Armistice presented domestic problems hardly less grave than the international questions which have been described. The cost of living soared in the first post-Armistice year to 225 per cent of its pre-war level: reaching its peak, 276 per cent, in October, 1920, it subsided only gradually to 195 per cent in November, 1921, and 181 per cent in April, 1922. The percentage of trade-union members unemployed was 2.4 at the beginning of 1919, but instead of decreasing, it rose to 6 before the end of 1920, attained the alarming level of 23.1 in June, 1921, and was still over 16 at the beginning of 1922. The actual number unemployed in January, 1921, was 1,060,000; in July, 1921, it was 2,170,000, plus 988,000 on short time; in March, 1923, it was 1,300,000. If figures can ever be eloquent, these must tell a tragic story of privation and hunger, of silent factories and bankrupt industrialists, of idle workmen and pauperized families losing their morale with their hope. A palliative, not a remedy, was provided by the Unemployment Insurance Bill which the Lloyd George government introduced in December, 1919, and promulgated the following August, extending previous laws and granting benefits of 15 shillings a week for involuntarily unemployed men, 12 shillings for women, for a maximum of 15 weeks a year. The very genuine hardships of unemployment and high prices made industrial unrest inevitable; and the stimulus which the Russian Revolution and Socialist parliamentary victories on the Continent gave to all labor movements was not without effect in England. In vain the Government conceded an eight-hour

day to railwaymen; in vain it enacted a law restoring trade practices; in vain it convened an Industrial Conference (February, 1919) of employers and workers, and set the Sankey Commission to investigating coal-miners' grievances. In Parliament, the Labor Opposition was inplacable; outside Parliament, strikes multiplied. A railway strike in the fall of 1919, ominous though it appeared, was settled in 10 days. Of longer duration and graver import were the coal strikes. After the Armistice, the miners demanded a six-hour day, a 30 per cent wage increase, and nationalization of the mines. Though the Sankey Commission effected a truce, wage increases being granted and a Department of Mines established, the miners by a fortnight's strike in October, 1920, gained a further increase, and again went on strike for three months in the spring of 1921. The government survived these and similar disturbances, but more than once there seemed a likelihood that by direct action the so-called "Triple Alliance" of miners', railwaymen's, and transport workers' unions would use their control of vital industries as a weapon with which to coerce the Government and enforce the demand of radicals for nationalization of mines and communications.

The increased wages of government employees, the staggering burden of unemployment insurance, the costly endeavors of the administration to relieve the grave housing shortage, the miscellaneous measures of social legislation designed to ease the pains of reconstruction, and the continuance of huge military and naval expenditures made it necessary to increase rather than diminish the weight of war taxation in 1919 and 1920, and though some reductions were made in 1921-22, taxpayers yearned for relief, and many hoped that a less ambitious Premier might also be less extravagant.

While the storm clouds of political opposition were gathering on Lloyd George's horizon, he accomplished one more of the feats of political dexterity which had earned him the not altogether complimentary soubriquet of "Welsh wizard." His earlier attempts to solve the Irish question during the War had simply made matters worse in that distracted island. Sinn Fein, having won the 1918 elections, had proclaimed an independent republic and inaugurated a guerrilla war against the British Army of occupation. As repressive decrees and reprisals seemed but to add fuel to the conflagration, the Lloyd George government in February, 1920, introduced, and in December carried, a Home Rule Bill to create two parliaments, one at Dublin and the other at Belfast, and a joint council for Ireland, with decidedly limited powers of self-government. Regardless of Sinn Fein indignation, Lloyd George endeavored in 1921 to put this law into effect, and succeeded easily in establishing the Belfast Parliament, but utterly failed in southern Ireland. Undismayed by this check, he now suddenly altered his tactics, invited the Sinn Fein leaders and the Ulster Premier to a three-cornered peace conference in London, and on Dec. 6, 1921, signed an epoch-making treaty with them, for the creation of an Irish Free State with dominion status. (See IRELAND.) This political *coup de main* will probably go down in history as one of the outstanding achievements of the long Lloyd George administration; certainly it put a new complexion on the Irish problem and

left critics breathless with surprise, if not admiration. But it did not long save the cabinet.

**The Unionists in Power.** As war-time passions cooled and the lustre of Premier Lloyd George's war services was dimmed with passing years, the Coalition cabinet, resting on the "khaki elections" of 1918, began to totter. In by-elections up to the end of 1921, the Coalition suffered a net loss of 13 seats. The Labor Opposition grew bolder, and Asquith began to tax the Government with reckless extravagance. The Near Eastern crisis and the rift in the Entente Cordiale were set down to the Premier's imprudence. But the *coup de grâce* was administered by the Unionist Party leaders who voted, in a caucus at the Carlton Club on Oct. 19, 1922, to withdraw from the Coalition. Lloyd George immediately, and somewhat indignantly, resigned his office in favor of Andrew Bonar Law, who proceeded to form a Unionist cabinet on party lines, including the Marquis of Salisbury, Viscount Cave, Stanley Baldwin (Chancellor of the Exchequer), Marquis Curzon (Foreign Affairs), the Duke of Devonshire (Colonies), Viscount Peel (India), the Earl of Derby (War), and other less known Unionists. Parliament was of course dissolved, October 26, as the Unionists had only a plurality in the Commons, and new elections were held on November 15. With their campaign slogans of "tranquillity and stability" (an English version of the American "normalcy"), economy, conciliation of France, and abhorrence of one-man government, the Unionists polled 5,300,000 votes and returned 344 members to Parliament, a safe majority. Lloyd George, heading his own faction of National Liberals with a few Unionists who were personally loyal to him, pointed with pride to his war record, scoffed at the desire for less vigorous statesmanship, promised economy and peace, and delivered philippics against the menace of socialism, but returned to Parliament with only 56 supporters. The Asquith Liberals, adhering to traditional policies and emphasizing free trade and economy, won 60 seats. Labor, *enfant terrible* of British politics, had scandalized and terrorized the older parties by advocating a socialistic capital levy, taxation of land values, nationalization of mines and railways, increased old-age pensions and unemployment doles, and a radical foreign policy; to the confusion of overly sanguine prophets, Labor failed to win a majority, although it did increase its delegation to 138 and polled 4,102,000 votes (as many as the two Liberal factions combined). It will be noted that, with the addition of minor groups, the total is only 615; to this figure the Commons was reduced in 1922, by excluding representatives from Southern Ireland, but retaining 15 from Northern Ireland.

With a safe majority of more than 100 votes (including some National Liberals), the Unionist government proceeded first to fulfill a campaign pledge, the enactment of a Constituent Act and the Consequent Provision Act, giving effect to Lloyd George's Irish Treaty (see IRELAND); their promulgation on Dec. 5, 1922, accomplished England's part of the bargain. When, after the holiday recess, Parliament reassembled in February, 1923, Liberal and Labor opposition relative to the Ruhr and to Mesopotamia was crushed by the ministerial steam-roller, and Parliament was plunged into budgetary calculations, made more acceptable by a

reduction of sixpence in the pound on the income tax and by other tax cuts all along the line. Business was interrupted in May by Premier Bonar Law's resignation, occasioned by sickness which soon afterward caused his death (Oct. 30, 1923). His successor, Stanley Baldwin, a former business man, had earned golden opinions by his tactful negotiations in Washington for deferred payment of the British debt to the United States at reduced interest, and by his conduct of the exchequer in the preceding cabinet. Moreover, he was known to hold opinions unfavorable to French policy in the Ruhr. Retaining most of the old cabinet, Baldwin entrusted the Privy Seal to Lord Robert Cecil, who had attracted favorable attention by his statesmanlike activity in the League of Nations; Sir Samuel Hoare became Air Minister; Sir William Joynson-Hicks, Financial Secretary to the Treasury; and Sir Laming Worthington-Evans, Postmaster General. Subsequently, the Exchequer was offered to Reginald McKenna, refused by him, and given to Neville Chamberlain, in August. Baldwin as Premier found himself face to face with three major problems, all closely related. The "unemployment crisis," with 1,250,000 persons out of work five years after the Armistice, was no longer a crisis, but a chronic malady demanding remedy. The Ruhr crisis, if it could be so solved as to permit recovery of the German market, might help solve the unemployment problem, but Poincaré was adamant to Baldwin's arguments. The third problem, preferential tariff protection, was proposed by the Imperial Conference of October, 1923 (see BRITISH EMPIRE), as a remedy for industrial depression, but it proved Premier Baldwin's undoing. As Law had pledged his cabinet not to tamper with the tariff before the next election, Baldwin honorably but imprudently dissolved Parliament, Nov. 16, 1923, and ordered general elections, December 6. His party, fighting for tariff reform, polled as many votes as in 1922 but elected only 259 members. The reunited Liberals, defending Free Trade, polled 4,217,000 votes and increased their representation from 117 to 155. Labor, opposing protectionism and proposing a modified capital levy, along with other moderately socialist measures, increased its poll to 4,338,000 votes and its parliamentary representation to 191. Thus, no party commanded a majority. Instead of resigning at once, in response to the adverse referendum, Premier Baldwin waited for the new Parliament, which assembled in January, 1924, to oust him. His fate was decided by Asquith, who as leader of the reunited Liberals held the balance of power, and who concluded that the uncertainties of a Labor government were preferable to the "confusion, vacillation, and impotence" of the Unionists. Joining forces with Labor, then, he helped vote Baldwin out, the vote being 328 to 256.

**Labor in Power.** James Ramsay MacDonald, veteran Labor leader, ostracized as a pacifist in the War but welcomed back to the fold in less patriotic post-bellum days, now formed a Labor cabinet, in which he took the difficult portfolio of foreign affairs, and in which were included J. R. Clynes, former textile worker, as Lord Privy Seal and leader of the Commons; Philip Snowden, former clerk, ardent pacifist and moderate socialist, as Chancellor of the Exchequer; Arthur Henderson, former iron worker, as Home Secretary; J. H. Thomas, a Welsh trade-union-

ist, as Colonial Secretary; William Adamson, a miner, as Secretary for Scotland; Stephen Walsh, coal miner, as War Secretary; Noel Buxton, an ex-Liberal of private fortune, as Minister of Agriculture; Sir Sidney Oliver, former colonial official and Fabian Socialist, as Secretary for India, with a peerage; Brig. Gen. C. B. Thomson, one of the ablest and youngest generals, a recent convert to Labor, as Secretary for Air, with a peerage; Sidney Webb, eminent historian of trade-unionism, as President of the Board of Trade; Lord Parmoor, as President of the Council; Viscount Chelmsford, Conservative, for the Admiralty; John Wheatley, Health; C. P. Trevelyan, ex-Liberal, pacifist, recent convert to Labor, son of the distinguished historian, as President of the Board of Education; Thomas Shaw, prominent socialist, as Minister of Labor; Col. Josiah Wedgwood, for the duchy; and F. W. Jowett, for Works. Though a few opponents, notably Winston Churchill, vainly endeavored to arouse the country to the peril of a Socialist ministry, Premier MacDonald showed no inclination toward revolutionary fanaticism, but, rather, accepting the traditions of office, amiably visited the King, respected venerable ceremonies, and conducted his policy with irreproachable sobriety. His plans for more generous unemployment relief (which had cost the exchequer £170,000,000 since the Armistice) and for construction of 200,000 houses a year, to rent at 9 shillings a week each, were but extensions of established policies. The capital levy, Labor's most radical campaign proposal, was practically dropped; indeed, Premier MacDonald calmly permitted the bourgeois parties on April 1 to pass, by 325 to 160 votes, a resolution condemning the principle. In the budget presented by the Socialist Chancellor of the Exchequer, April 20, there was provision for a reduction of £40,000,000, lowered duties on tea, sugar, and coffee, discontinuance of duties on imported automobiles and films, repeal of the corporation tax, and inhabited house taxes; but not even Churchill could make social revolution out of these items. In foreign affairs, Premier MacDonald displayed a refreshing candor, coupled with frank pacifism and confessed regard for British interests. With Poincaré, he exchanged letters which on his side uttered bluntly England's objections to French armament and Ruhr policies, but also expressed a transparently sincere desire for reconciliation and cooperation. He abruptly granted recognition to Soviet Russia, February 2, for commercial reasons, as he said, though Bolshevism was repugnant to him. He announced on March 18 that he would stop fortification of the Singapore naval base, as a pacific gesture; but he insisted on customary naval appropriations. All treaties, his government promised, were henceforth to be submitted publicly to Parliament. Zaghlul Pasha's demands for the abandonment of vital points of British authority in Egypt and the Sudan received no encouragement, while in Mexico the British representative was vigorously supported in protecting British citizens. In short, his was a moderately radical, conservatively pacifist, course of action, dictated by evolutionary socialism rather than revolutionary communism, and scarcely more perturbing to "tranquillity and stability" than the pre-war social reforms of an Asquith cabinet, for all its tremulous dignity, or the dazzling political legerdemain of a

Welsh wizard, or the quietist *fainéance* of a Bonar Law, or the disconcerting protectionism of a Baldwin "business" government, all of which had been tried and found wanting in 10 memorable years.

Perhaps the chief item in Ramsay MacDonald's success in the conduct of foreign affairs was the reestablishment of the cordial understanding with France, which Curzon and Poincaré between them had almost entirely dissipated, together with the easing of Allied pressure on Germany. Through the Dawes Plan, a method had been worked out by which Germany could pay reasonable annual installments on the reparations account. But international agreement was necessary before the method could be applied. In his efforts to effect this, Mr. MacDonald found a ready coworker in Herriot, out of whose visit to London in June, 1924, grew the London Conference in the following month. Not only did this conference set the official stamp of approval on the Dawes proposals, but it led directly to the French evacuation of the Ruhr during the succeeding year and thus helped incalculably in restoring a measure of harmony to international relations. In September, Mr. MacDonald visited the League of Nations, meeting at Geneva, as a delegate. He was one of many Prime Ministers and Foreign Secretaries to attend, thus greatly increasing League prestige. The Geneva Protocol for disarmament, arbitration, and security guarantees which was adopted at this meeting grew out of an informal understanding between MacDonald and Herriot preceding the London Conference. On the question of the changing Dominion status, the Labor government preserved an open mind, but during its tenure of office, the autonomous position of the Dominions was still further emphasized by several incidents. Canada for a while held up the ratification of the Lausanne Treaty because she had had no hand in shaping it. She also insisted on separate representation at the London Conference. Ireland's request for a diplomatic representative of her own at Washington met with no opposition on the part of the Government since Canada had already claimed and received official assent to such representation. Imperial preference was defeated through the support of the Government by the Liberals, who opposed it because of its protectionist character; but the vote was very close, one provision being lost by a majority of only six. As a symbol of a continued sense of imperial unity, the great British Empire Exhibition which opened at Wembley in April was noteworthy. It was so successful that it was reopened in 1925. The imperial conference, however, was not held in the fall as scheduled, apparently because of the indifference of the Australian Premier.

In midsummer of 1924, the dying embers of the old Irish controversy were once more stirred into life by the Government's bill to create a Boundary Commission to delimit the boundaries between Ulster and the Irish Free State, Ulster having refused to appoint a member of the commission already set up in accordance with the Irish Treaty. The Unionists strenuously opposed the bill and the question was put over until autumn, when the legislation was passed by a large majority. In this as in other important matters, the support of the Liberals was constantly the deciding factor. As long as the Government held to a moderately Liberal course, it was reasonably assured of this support; but the

situation was precarious and obviously unenduring. It was the Russian question which finally brought Liberals and Laborites to the parting of the ways. Following the recognition of the Soviet government, a Russian commission visited London to arrange for future commercial relations and adjust outstanding differences, particularly that over the payment of Czarist debts to British bondholders.

Negotiations lasting for months finally resulted in a treaty, which was signed by the Prime Minister August 7. Among other provisions, this treaty paved the way for the guaranteeing by the British government of a future loan to the Soviet government. At this, the Liberals balked. It was evident that they would have combined with the Conservatives to defeat the Government on a vote on the treaty; but as it happened the break really came over a much more trivial matter, the dismissal by the Government of the case against the editor of the Communist *Workers' Weekly*, who had been indicted for sedition for an article urging the army to refuse to fight the workers of their own or other countries. The Conservatives introduced a motion of censure, which failed, but they supported a Liberal substitute calling for a commission of inquiry, and when the MacDonald government chose to make a stand on this issue it was defeated, on October 8, by a vote of 364 to 198. Mr. MacDonald recommended a dissolution of Parliament, and elections were set for October 29.

In the campaign which followed, the real underlying issue was whether the attitude of the Labor government was too sympathetic toward the Russian Communist régime. The Labor Party at its annual meeting early in October declared emphatically that it had nothing in common with the Communists; but public opinion on the whole seemed none too favorable to the party, and five days before the election it was given a decisive turn by the publication of the famous "Zinoviev letter." This letter was purported to have been written by Zinoviev, head of the Third International at Moscow, and other officials of that body, to British Communists urging a campaign of violence and sedition, the formation of a Red army, and other measures in preparation for a workers' revolution. The MacDonald government sent a sharp protest to the Soviet authorities, who immediately branded the letter as an "impudent forgery," and later investigation has left little doubt that it was such; but it had its calculated effect on the campaign, and when the votes were counted Labor was found to have been swept out of office by large majorities while the Conservatives registered an overwhelming victory. Their popular vote, 7,864,000, showed a gain of more than two millions over that of the previous election. It was significant, however, that the Labor vote also gained heavily, while the Liberals lost much ground. In Parliament, the Conservatives held 413 seats, the Laborites 151, the Liberals 40, and others 11. The MacDonald ministry immediately resigned and was succeeded by a Conservative cabinet under Stanley Baldwin, with Winston Churchill, a recent convert from the Liberal ranks, as Chancellor of the Exchequer.

**Baldwin Ministry.** The new government proceeded at once to give a distinctly Conservative stamp to national policies. The Anglo-Russian Treaty was summarily rejected. The Zinoviev letter was declared to be authentic. When Sir Lee Stack, Governor General of the Sudan and Sirdar of the Egyptian Army, was

assassinated in Cairo on November 20, the British government made the affair the occasion for tightening the British hold on Egypt and the Sudan and suppressing nationalistic agitation in Egypt. Under the term "safeguarding of industry," the Government, as charged by its opponents, began edging toward protectionism in spite of an election pledge by Mr. Baldwin that protectionism would find no place in his programme. Work was at once resumed on the naval base at Singapore. Direct participation by the government in elaborate programmes of house construction was largely withdrawn.

In the spring of 1925, Austen Chamberlain, Foreign Secretary, in positive terms rejected the Geneva Protocol. On the other hand, Mr. Baldwin in his speeches repeatedly evinced a strong desire to bring capital and labor together, and lived up to his words by restraining the extremists of his party, notably when they attempted to put through a bill prohibiting levies on trade-union members for political purposes. Within the Conservative ranks, this attitude induced a strong current of opposition, but his leadership was not seriously endangered. Meanwhile, the other two parties were likewise having their difficulties. The Liberals, following the disastrous set-back in the elections, were reduced to a small and ineffective group in Parliament. They preserved their party organization, however, electing Mr. Asquith leader despite the fact that he had been defeated for the House of Commons and had entered the House of Lords as the Earl of Oxford and Asquith. Lloyd George professed to be quite willing to serve under his leadership, but the Welshman's position in the House, his personal prestige, and especially his control of a political "war chest" of \$5,000,000 assured him of a loyal following for himself in Parliament and in the party. Late in 1925, he advanced a new land policy, consisting in effect of the nationalization of the country's arable land; but it aroused little enthusiasm either in the party or in the nation at large.

The Labor Party continued loyal to MacDonald's leadership, although the extremists for a while were in revolt. At a party conference held from September 29 to October 2, it strongly reasserted its aversion to communism. On the whole, however, the year 1925 was one of comparative political quiet. In the spring of that year, the Conservatives lost by death two men who had for decades been outstanding figures in the nation's life. On March 20, Lord Curzon, leader of the House of Lords and president of the Council, died; and on May 13, Lord Milner's full career in political life came to a close.

Among other notable events of 1925 were the return to the gold standard, announced April 28; the trial and conviction for seditious conspiracy, in November, of twelve Communists under an ancient and long moribund law; the settlement of the Irish boundary difficulty through agreement on December 3; and most important of all, the signing of the Locarno Treaties in London on December 1. The achievement of this near-epochal international agreement greatly enhanced the prestige of Austen Chamberlain, Foreign Secretary, and the King, in recognition of his services and those of Mrs. Chamberlain, made the former a Knight of the Garter and the latter a Dame of the Grand Cross. His popularity, however, suffered a severe setback in the following spring. At the March meeting of the League of Nations, called especially to admit Germany to

the League and assign her a permanent seat on the Council, Poland, backed by France, demanded a like privilege and other nations immediately set up similar claims. Germany refused membership on such terms. A long and bitter dispute ensued which even endangered the life of the League. Apparently bound by previous promises, Sir Austen Chamberlain gave his support to France and Poland and thereby brought down a storm of criticism on his head from the British public. Neither he nor the Baldwin government thought it necessary to make concessions and Parliament as usual supported them, but there was a definite loss in popular confidence in the Government's foreign policy which was never quite regained.

**Coal Strike.** In spite of the uneventfulness in domestic matters of the first year or so of the new Baldwin ministry, there was a feeling of foreboding in the air, due to the continued prevalence of unemployment and to the extremely unsound condition of the coal industry. It was the inevitable readjustment in coal mining which finally brought on one of the most dangerous crises in Britain's history and carried the country to the brink of revolution. In 1924 the coal miners refused to renew a wage agreement due to expire on April 17, and after intervention by the Government, owners and workers formed a new agreement, to run until May 1, 1925, by which the minimum wage scale was considerably raised. The higher rates of wages, however, proved to be more than the industry could stand and a joint inquiry was instituted by both parties to seek a remedy. This it quite failed to find, and in the spring and early summer of 1925, more and more mines closed down. The owners finally gave notice that the minimum wage agreement would be discontinued, and that on July 31 a new schedule of lower wages and longer hours would go into effect. The workers, through their Miners' Federation, resolutely refused to accept the proposed changes, and were supported in their stand by the trade unions and the Labor Party.

On July 25, the railway men agreed that they would not transport coal in case of a lockout after July 31. Three days later a government Court of Inquiry made a report which in many ways supported the position of the workers. With a national crisis but a few hours away, Mr. Baldwin on July 31 saved the situation temporarily by offering government subsidy to the industry to enable it to continue the prevailing hours and wages, at the same time proposing to appoint a commission to make exhaustive inquiry into the whole subject of the coal-mining industry. The amount of the subsidy as eventually provided was £19,000,000. The commission, headed by Sir Herbert Samuel, spent some five months in its investigation, and made its final report on Mar. 10, 1926. It recommended that the subsidy should be abandoned on April 30, that the 1924 addition of a minimum percentage to the basic wage should be revised downward, that a certain reduction of wages, particularly in the better-paid grades, should be effected, that existing hours of work should not be altered, that miners and owners should negotiate on a national basis, that owners' royalties, unproved coal, and coal too deep for present working should be acquired by the state, that the industry should be reorganized by amalgamations, etc., that it should continue in the hands of private enterprise.

While disagreeing with some of the recommendations, the Government on March 24 promised to put the report into effect if it should be accepted by both parties. During the ensuing month, a number of meetings and conferences were held in an attempt to arrive at a basis of settlement, but to no avail. The owners insisted on district rather than national settlements, while the miners took their stand on the three-fold platform of no increase in hours, no decrease in wages, and a national agreement. On April 15, the mine owners announced that the existing wage agreement would be terminated on May 1. The situation was made far more ominous by the manner in which other big trade unions rallied to the support of the miners. As in the year before, railway and transport workers made common cause with them and indeed went much farther than in 1925 and agreed to go out on a nation-wide sympathetic strike. They were joined by other unions whose membership was so large and whose work was so essential that the nation faced a paralysis of its whole economic life. For the workers' negotiations were carried on by the Industrial Committee of the General Council of the Trades Union Congress, to which latter body the Miners' Federation belonged. Mr. Baldwin, who had at first stood aside, felt it necessary to intervene and in the last ten days of April, he brought the miners and owners together in two meetings, but without effect.

On May 1, the strike of the coal miners went into effect. Coal mining completely stopped, although enough workers were left on duty to prevent the flooding of the mines. The supporting unions held off for the moment, but notice was given that unless a settlement was sooner reached the transport workers would stop work after May 3. In the meantime, the Trades Union Congress and the Government continued to seek for a way out. On May 1 and 2, the Industrial Committee of the General Council of the Congress was in conference with Mr. Baldwin and some of his ministers, and on the night of May 2 there seemed to be some prospect of an agreement; but while the Industrial Committee members were laying the Government's latest formula before the full General Council and representatives of the miners, they were surprised to receive a letter from Mr. Baldwin stating that all negotiations were called off until the general strike notices already sent out should be withdrawn and certain "overt acts . . . including gross interference with the freedom of the press" should be repudiated. The "overt act" referred to turned out to be the refusal at about this time of a few compositors on the *Daily Mail* to set up an editorial containing objectionable references to the workers and the strike. This action removed the last hope of averting the general strike and on the night of May 3 some 1,400,000 transport and railway workers, printers, and other skilled craftsmen joined the miners and left their employment.

**General Strike.** The reaction of the Government was swift and direct. Denouncing the general strike as not an industrial but a political effort, "a challenge," in the words of Mr. Baldwin, "to Parliament, and the road to anarchy and ruin," the Government assumed practically dictatorial powers through a proclamation of the King declaring a state of emergency. Special constables to the number of 250,000 were enrolled and the military made ready for action if

necessary. For a whole week, the tense deadlock continued, with the extremists among the radicals and the Conservatives waiting in the background, the one straining for a final showdown with capitalism, the other ready to set up a Fascist dictatorship. Yet throughout, there was on the surface a gay good humor. Almost no show of military strength was made by the Government, and there was practically no violence, no mob action, no attacks by the police. Seldom has the traditional self-control of the English shown to better advantage. The situation, of course, could not long endure; but before it reached a breaking point, the trade-union leaders in effect capitulated. When Sir Herbert Samuel presented an unofficial memorandum proposing a national board for revising wages but no wage revision without the reorganization of the industry proposed by the Royal Commission, the trade unions accepted it as a basis of negotiations.

On May 12, members of the General Council held a conference with Mr. Baldwin, and following it the announcement was made that the general strike would be called off in order that negotiations might be resumed. The strike, however, did not immediately come to an end. Many of the rank and file strongly objected to the yielding of their leaders. Employers also showed a strong disposition to refuse to take back the strikers except at the expense of previously hard-won privileges; but Mr. Baldwin threw the whole weight of his influence in the scale to prevent a further impasse and largely succeeded. By the end of May, economic activities were again functioning almost normally except as they were affected by the lack of coal, for the strike of the coal miners continued, and the country, safely past the danger of political revolution, found itself face to face with a "creeping paralysis" of industry for lack of the necessary fuel.

Week by week the economic machinery slowed down, while at the same time the miners saw their slender resources melt away. The contest became one of grim endurance between the coal-starved factories and railways and the food-starved miners and their families. The Government proclaimed its neutrality, but it soon became apparent that the influences within the ministry which sympathized with the mine owners were dominating its policy. The Commission's report was quite relegated to the background. In July, over the bitter opposition of the Labor Party, the Government put through an act permitting an eight-hour day in the coal industry, and in various other ways took action which the miners construed as unfriendly to them.

In August, however, Mr. Churchill, temporarily in charge of the strike situation, rather surprisingly championed their desire for a further conference of owners and workers, although it came to nothing. With no prospect of effective aid from the Government, the miners began drifting back to work in large numbers, and the strike practically came to an end on November 19, when a conference of the Miners' Federation recommended that district settlements should be made on the basis of certain stated principles. The action was tantamount to the admission of practically complete defeat.

So cataclysmic a disturbance as the general strike and the long-drawn-out coal stoppage could not help but be followed by a pronounced

aftermath. All three political parties felt the strain, but particularly the Liberals. With Lloyd George attacking the Government during the general strike and Lord Oxford vehemently opposing the strike, the rift in the party was almost complete. In October, 1926, Lord Oxford resigned the leadership because the party dissension made it too heavy a burden for his failing health to carry. Near dissolution, the party was revived and partially unified under Mr. Lloyd George in the following year in the face of Conservative extremism. The Labor Party was faced by a division when the radical elements took advantage of the discouragement over the failure of the strike to press for more direct and decisive measures; but Mr. MacDonald held his lines well together and there was far less revolt than might have been expected.

In the Conservative ranks, the victories over Labor only sharpened the appetite of the "die-hards" for greater triumphs. In the full flush of their success, they proposed to cripple the political and industrial power of Labor for a long time to come. Mr. Baldwin apparently was carried along on the tide. Little more was heard of his capital-and-labor conciliation policy, and the "new Conservatives" who had supported him in it practically subsided. In the first half of 1927, the Conservative effort reached its peak in two measures designed to consolidate their power once for all. The Trade Union Bill barred the general strike by making illegal any strike which had any other object than that involved in the dispute within the trade or industry concerned. The Laborites charged that such a provision would apply to all sympathetic strikes. The bill also took action against the "political levy," forbidding trade unions to collect assessments for political purposes from members without the specific consent of the members. As such levies had been the great source of revenue for the Labor Party, the bill was a direct blow at that party's effectiveness in future elections. In spite of the violence of Labor opposition in and out of Parliament, the bill became a law in July, 1927.

The other proposal, however, proved too much for even the docile Conservative majority itself to swallow. It was the long-discussed reform of the House of Lords. The plan advanced for discussion gave the House power over money legislation, equal power with the House of Commons of forcing an appeal to the country by disagreeing with a government measure, and the right to reject any bill affecting the constitution of the House of Lords itself. With certain exceptions, the members were to be either elected by their own order or named by the Crown. The effect of this reform would obviously have been to perpetuate in power a party which would serve as an effective barrier against future radicalism. Even by leading Conservatives, it was characterized as a crime against the constitution unless passed upon by the people. The opposition was so strong that the proposals were not put into the form of a bill. In other ways than through party changes did the effect of the 1926 strikes continue to be long in evidence. The adverse effect on the country's prosperity was reflected in growing unemployment, while among the miners themselves and their families, since great numbers of workers could not be put back in the mines, distress steadily deepened.

**Foreign Events.** While these critical events were going on at home, the foreign situation

was fortunately marked by a period of quiet, the chief exception being in China. In 1925 disorders in Shanghai and Canton led to the killing of a number of Chinese by British police and marines, and a great wave of anti-British and anti-foreign feeling swept over the country. A boycott of British goods in Canton and Hong-kong lasted for fifteen months and for a time almost paralyzed British trade in those cities. In Parliament and elsewhere, the Conservative government was accused of opposition to the Chinese Nationalists, who in 1926 made strikingly successful advances. In January, 1927, large forces of troops were sent to the Far East, but were eventually withdrawn.

In January, 1926, the Italian war debt to Great Britain was settled on the basis of a payment of about £4,500,000 yearly for 60 years and on July 12 Mr. Churchill and M. Caillaux signed an agreement for the payment of the French war debt, the total of which was put at £600,000,000 to be paid in 62 years. Ratification of the French settlement, however, was held up in France pending ratification of the American settlement, and was not finally accomplished until the Mellon-Béranger agreement was ratified in July, 1929. In September, the League impasse of the previous spring was removed in a way to satisfy Germany, who then became a permanent member of the League Council.

**Russian Relations.** With the far swing of politics to the Right, it was inevitable that relations with Russia should become increasingly cooler. The ruffled feelings of the Government when Russian trade unions sent in funds to support the striking miners in 1926 found an outlet in a sharp note of protest to the Soviet government. In China, the anti-British feeling, it was charged, was effectually encouraged by Russian influence. On Feb. 23, 1927, the British government complained vigorously to Moscow of anti-British propaganda. On May 12, the latent antipathy of the Conservative temper for communism and all its works flamed out in a police raid, sponsored by the Home Secretary, on the premises of Arcos, the Anglo-Russian trading company. It was later explained that the purpose of the raid was to obtain a highly important secret document taken from the War Department files. Adjoining the Arcos rooms were those of the official Russian Trade Delegation, and these rooms also were searched. The missing document was not found, but evidence of propaganda was obtained sufficient to cause the Government to announce on May 24 that diplomatic relations between the two countries would be severed and the trade agreement cancelled.

At the same time, a near crisis arose in Great Britain's relations with Egypt caused by a proposal in the Egyptian Parliament to omit appropriations for the Sirdar, or head of the Egyptian Army. The effect would have been to remove control of the army from the hands of the British. The British government protested and sent three battleships to Egypt, under whose persuasive influence the British demands were speedily accepted. Yet another discordant note in international affairs was struck later in 1927 when the three-power naval-disarmament conference held at the instance of the United States ended in utter failure.

**Disarmament Discussions.** On June 20, 1927, delegates from Great Britain, the United States, and Japan met at Geneva to seek a basis for reduction of naval forces. Within the first

few days, a deadlock between the American and British delegations developed which all further discussion could not remove, the former insisting on a "global" tonnage limitation within which each country might build the type of cruisers desired, and the latter on a definite limitation on each of the specified types of cruisers. The conference broke up on August 4 in an atmosphere of mutual recrimination. On August 26, Lord Robert Cecil, one of the British delegates, resigned from the cabinet and from his place as delegate to the League of Nations in a letter severely arraigning the Government for the spirit in which it had handled disarmament attempts, as evidenced in many instances other than the three-power conference. The Government could not make effective reply. In view of the strong and pronounced sentiment of the country in favor of disarmament and peace movements generally, the incident was a decided blow to the Government's prestige.

On the whole, however, the two years following the stirring events of 1926 constituted, on the surface, a period of comparative political quiet. Foreign relations, if infelicitously handled from the standpoint of those anxious for international good will, at least produced no serious crisis. The large parliamentary majority proved tractable. The working classes decided upon and followed out a course of industrial peace and reconciliation with employers; but beneath the surface, there were many clear signs of impending change. The high figure of unemployment, which dropped down somewhat in 1927, gradually rose again in 1928 until at the end of that year it stood at more than 1,500,000. The apparent indifference or inability of the Government to cope with the situation steadily weakened its support. Following Locarno, when the prestige of the Government in the conduct of foreign affairs reached its peak, one maladroit step after another produced ill feeling against Britain abroad and a growing body of aroused protest at home. Except in spots, the hoped-for commercial prosperity failed to materialize. Notably in the textile industries of Lancashire did the depression become marked, partly because of conditions within the industries themselves and partly because of the 1926 disturbances. Indications of dissatisfaction appeared in the by-elections to Parliament and in the municipal elections, in which Labor continued to mark up one emphatic victory after another. It became evident that, when the next general elections should be held, the Conservative majority would be at least greatly reduced if not entirely wiped out. In the meantime the party in power went ahead with legislation calculated to benefit industry. The safeguarding duties were somewhat extended, but they proved so popular with the Conservative Party members that they almost caused a party division.

In Parliament and out, the greatest pressure was brought to bear on the Prime Minister to extend these duties to additional articles, particularly iron and steel; but he took his stand on his election pledge not to introduce protection (insisting on the distinction between "safeguarding" and protection), and he could not be induced to alter it. Against a pronounced Conservative movement to make safeguarding the central tenet of the party, he put forward a "de-rating" scheme for the relief of industry. This plan proposed to remove restriction upon productive effort by greatly reducing or remov-

ing entirely the burden of taxation it was bearing. The greater part of the tax on agriculture had been removed already. It was proposed to do away with the remaining rates and to cut down the local taxes on industry by 75 per cent, with a new valuation to be made for taxation purposes. As given to the public in Mr. Churchill's budget bill of April, 1928, the plan provided for reimbursing local governments for the loss of these taxes out of a fund to be raised by a national gasoline tax. The valuation bill was duly passed and the new rates planned to come into effect in October, 1929.

Two other subjects which came before Parliament at this period aroused deep interest, although the controversy over them was not along party lines. In December, 1927, the revision of the Church of England prayer book came up for a vote. For many years the bishops had been working on changes tending to bring the prayer book in line with modern religious thought. As the existing form was prescribed by statute, Parliament was required to pass on the revision. The House of Lords readily assented, but in the House of Commons the revision failed of approval by 33 votes in the spring of 1928, and in June a modification was voted down by a majority of 46. The other measure passed without party opposition was the extension of the vote to women between 21 and 30 years of age. It became a law when it was passed by the House of Lords in May, 1928. The year 1928 saw the removal by death of two notable figures in British politics. Lord Oxford and Asquith, the veteran leader of the Liberals, ended a long and most distinguished career on February 15; and Viscount Haldane, former member of Liberal and Labor cabinets, died on August 19. The general elections which had been imminent for many months were recognized as being near at hand at the close of 1928. During the year, two developments in foreign affairs still further deepened the dissatisfaction with which the British public had come to regard the Conservative foreign policies. In May, 1928, the Government accepted the Kellogg peace-pact proposals, but over the protests of both Mr. MacDonald and Mr. Lloyd George, it added a reservation which retained freedom of action for Great Britain in certain regions where her interests were held to be vital. The peace advocates urged that such a qualification made of the pact little more than a pious gesture.

Much more serious was the attempt to establish an Anglo-French naval and military understanding which, it was charged, would actually have revived the pre-war Entente between France and England. In August, the news was allowed to leak out to the public that the two countries had agreed to pool their navies in case of war, and that England had consented to support the French contention that she should not be required to count trained military reserves in the total of her armies when questions of disarmament came up for settlement. At once, a storm of protest arose in England and in foreign countries alike. It was all in vain that Foreign Office spokesmen maintained that the arrangement was merely a harmonizing of views in preparation for the coming disarmament conference of the League of Nations. The suspicions of other nations could not be allayed and the effect on the friendly relations with the United States was particularly to be deplored. Between Great Britain and the United States, a greater

estrangement arose than had been known for a generation. The Government finally was moved in November, 1928, to make a statement which was virtually a withdrawal of the whole agreement. At the close of the year the nation's attention to politics was diverted for a time by the very serious illness of King George, who hovered between life and death for weeks but by the beginning of the new year was definitely on the mend. During the winter of 1928-29, the distress of the starving coal miners, of whom some 200,000 had been permanently left without employment by the necessary reconstruction of the coal industry, became extremely acute and made necessary radical measures of relief.

**Elections of 1929.** The elections for which the parties had long been preparing were set for May 30, 1929, Parliament being dissolved on May 10. For the three-cornered race, the parties presented characteristic appeals. Lloyd George early in March put the Laborites and Conservatives on the defensive by boldly advancing the plan for relieving unemployment by engaging in extensive national improvements to be financed by government loans. The Conservatives chiefly defended their record, but made a positive bid for support through Mr. Churchill's budget which rather startled the country by removing the duty on tea, as well as on other articles of popular use. For the Labor Party, a series of statements defined its attitude as Socialistic but not radically revolutionary. Of special interest was a manifesto on foreign policy which renounced the right of private blockade, declared for control of the seas through international agreement only, supported the principle of sanctions embodied in the League Covenant, and declared for disarmament, arbitration, and "pooled security." In March, Mr. Snowden attracted wide attention by denouncing the Balfour principle of balancing war-debt payments by Great Britain with payments made to her on war-debt accounts; but he denied any intention of repudiating settlements already made. The result of the elections was to return the Labor Party to power with a plurality but again without a party majority. In the new Parliament, it held 288 seats, as against 260 for the Conservatives, 59 for the Liberals, and 8 for other parties. The popular vote gave the Labor candidates 8,292,000, Conservatives 8,506,000, Liberals 5,178,000, Independents 251,000, and Communists 51,000.

The Liberals under Lloyd George thus once more held the balance of power, and announced that they would support a Labor government in putting through Liberal measures and pursuing a conciliatory foreign policy, but would oppose any Socialistic proposals. On June 4, the Baldwin ministry resigned and was succeeded by a Labor cabinet with Ramsay MacDonald at its head. Among the leading appointments were: Lord Chancellor, Lord Justice Sankey; Chancellor of the Exchequer, Philip Snowden; Home Secretary, J. R. Clynes; Foreign Secretary, Arthur Henderson; Colonies and Dominions, Sidney Webb; Lord Privy Seal and Deputy Leader of the House of Commons, J. H. Thomas. Miss Margaret Bondfield became Minister of Labor, the first woman ever to hold a place in a British cabinet.

The cabinet was everywhere commended as being an able one and calculated to inspire confidence. Mr. MacDonald announced that if he could prevent it, there would be no further gen-

eral elections for two years. Among his first moves to restore foreign good will was his announcement of a possible visit to the United States. In the latter part of July, 1929, he halted construction on two cruisers and two submarines at the same time that President Hoover stopped work on American cruiser construction. The way was openly being prepared for a new naval-disarmament conference. On July 29, the long-brewing difficulties in the Lancashire textile industry came to a head in a stoppage of work involving 500,000 workers and 1500 mills. The immediate cause was a reduction of 12½ per cent in wages. The expected renewal of relations with Russia was halted when negotiations were suspended because, as reported, the British government insisted on an arrangement for the payment of the Czarist debts. Despite these and other difficulties, however, the country faced the future in the middle of 1929 in a distinctly hopeful frame of mind.

**GREBLE, EDWIN ST. JOHN** (1859- ). An American soldier, born at West Point, N. Y., and educated at the United States Military Academy. During the Spanish-American War, he served as captain and as assistant adjutant general of volunteers and in 1899 was promoted to be mayor of volunteers. In the same year, he was appointed captain in the Regular Army and was successively promoted to be major, lieutenant colonel, colonel, brigadier general (1916), and major general (1917). During the American administration of Cuba, he served as assistant to General Ludlow and to General Wood. From 1910 to 1914, he was a member of the General Staff in charge of field artillery and commanded the 6th Field Artillery on the Mexican border, from 1914 to 1916. In 1917 he was appointed commander of the 36th National Guard Division, Fort Worth Texas. In 1918 he was retired on account of disability incurred in active service.

**GREECE.** A republic in southeastern Europe. The Glücksburg dynasty was deposed on Apr. 13, 1924. The area is 49,912 square miles, according to the boundaries fixed by the treaty signed at Lausanne, July 24, 1923. This area includes Old Greece, Thrace (west of the Maritza River), and the islands, with the exception of the Dodecanese, which belong to Italy, and Imbros and Tenedos, which now belong to Turkey. The 1928 census showed a population of 6,204,684, including 1,400,000 refugees from Turkey in Asia and Eastern Thrace. The area in 1914 was 41,933 square miles; the population, 4,363,000. Most of the population belong to the Greek race. There are some Albanians, Jews, Vlacks, Slavs, and Armenians. The great majority of the inhabitants are adherents of the Greek Orthodox Church, which, by the terms of the constitution of 1864, was declared the religion of the state. Complete toleration and liberty of worship are guaranteed to all other sects, the greater part of whom are Roman Catholics and Jews. The principal cities of Greece are Athens, with 452,919 inhabitants; Saloniki, 236,526; Piræus, 265,000; Patras, 61,278; Corfu, 22,122; Hermoupolis, 21,156; Herachum, 33,404; Volos, 51,000; Canes, 26,604; Kalamata, 28,955; Cavalla, 49,980.

**Agriculture.** The principal crops, in addition to cereals, are currants, tobacco, olives, and

figs. The principal cereals grown are wheat, barley, oats, rye, and corn. The production of the principal agricultural products in post-war years is shown in the accompanying table.

Product		1921- 1925	1926	1927
Wheat	1000 bush.	9,411	11,171	13,300
Rye	"	961	1,412	1,217
Barley	"	5,688	8,136	9,396
Oats	"	4,072	5,556	4,972
Corn	"	6,694	8,131	.....
Potatoes	"	1,940	1,854	.....
Olive oil	1000 galls.	20,318	25,476	19,708
Tobacco	1000 lbs.	88,896	124,562	114,145
Currants and raisins		372,645	384,178	.....
Figs	"	39,039	32,591	.....
Cotton	"	4,780	.....	.....
Wool	"	18,000 *	14,500	17,500

\* In 1925.

The estimated numbers of live stock in Greece at the end of 1927 were 276,741 horses; 135,299 mules; 328,152 asses; 947,143 cattle; 6,441,830 sheep, 5,500,000 goats; and 452,595 swine. The forest area is nearly 1,000,000 acres. The principal trees are oak, beech, Aleppo pine, and silver fir.

**Mining.** Greece possesses a great variety of mineral deposits, the most important of which are salt, lignite, iron, magnesite, iron pyrites, and santorin earth. The production of these metals during 1927 was as follows: emery, 15,848 metric tons; salt, 105,000; lignite, 143,346; iron ore, 123,310; magnesite, 84,484; iron pyrites, 100,050; and santorin earth, 127,384. (1926).

**Manufacturing.** Industry, after the War, made considerable progress in Greece, especially in the manufacture of foodstuffs, leather, textiles, and soap. A number of émigrés from Turkey, who were skilled in the carpet and rug industry, practically denuded that field in Turkey and added this industry to those already practiced in Greece. Factory production in 1927, excluding wine and olive oil, was valued at \$80,726,184 as compared with \$64,214,010 for 1926.

**Commerce.** The total value in dollars of imports into Greece and exports from Greece during 1912-13 (average), 1921 and 1927, was as follows:

	Imports	Exports	Total
1912-1913 (average)	\$32,385,000	\$25,589,000	\$57,974,000
1921	100,792,000	55,357,000	156,149,000
1927	166,346,000	79,694,000	246,040,000

Conversions for the above table were made in drachmas at par for 1912-13 (\$0.193); for 1921, 1 drachma = \$0.0592; 1927, 1 drachma = \$0.0126. In 1928 the imports amounted to 12,488,127 drachmas and exports 6,282,075. The average rate of the drachma in 1928 was \$0.013. The trade balance of Greece is generally adverse. The principal imports into Greece are agricultural products, textiles, and minerals and metals, including machinery and agricultural implements. The principal exports are agricultural products, mainly tobacco, currants, olives, raisins, and citrus fruit; minerals and metals, raw; alcoholic drinks and olive oil. The principal countries selling to Greece during 1928 were the United States, Great Britain, Italy, and Germany. The principal countries receiving exports from Greece were the United States, Germany, the United Kingdom, and Italy.

**Communications.** The length of railways in 1928 was about 1991 miles, of which 884 belonged to the Government. There were 12,009 miles of telegraph line in 1927; total telegrams

(1927), 3,719,833 inland and 995,665 international; miles of telephone line (1927), 4009. The Greek Merchant Marine in 1928 consisted of 724 sailing vessels of 58,670 tons and 517 steamers of 1,187,699 tons, with a gross tonnage of 1,028,813.

**Finance.** Gold and silver stock on hand in December, 1927, was 51,000,000 drachmas, which did not include 25,000,000 drachmas in the Bank of England. The banknote circulation at the end of 1913 was 245,893,000 drachmas. This increased to 1,909,638,000 drachmas in 1920; 2,507,638,000 in 1921; 3,099,141,000 in 1922; and stood at 4,480,482,808 June 30, 1928. The total public debt of Greece, according to official government statistics on Mar. 31, 1929, amounted to 38,168,619,208 drachmas. In return for a loan not to exceed £9,000,000 under the auspices of the League of Nations in 1927, the Greek government undertook to keep the budget aside from capital expenditures, within about 9,000,000,000 drachmas until the end of 1929-30 and to maintain a balance budget after that time. The budget for 1927-28 called for revenues of 8,830,000,000 and expenditures of 8,878,000,000 drachmas. In 1929 the Agricultural Bank of Greece was established.

**Education.** In 1926-27 there were 7619 primary schools, with 13,747 teachers and 632,833 pupils; 687 high schools with 2823 teachers and 92,735 pupils. There were 28 commercial schools with 269 teachers and 3013 pupils, 70 agricultural schools with 405 pupils, 6 commercial high schools with 20 teachers and 388 pupils, 10 military colleges with 1388 students, and 8 naval colleges with 275 students. In 1921 there were 10,131 teachers in elementary schools and 2018 in secondary schools, and two agricultural schools with 150 students. There are two universities in Athens, the National University and the Capodistria University, with 61 professors and 9799 students, a university at Saloniki, founded in 1925, with 14 professors and 65 students. There is also the Polytechnic with 22 professors and 170 students. There is an American School of Archaeology at Athens and a British School of Archaeology. A new educational census was undertaken in 1928.

**History.** At the outbreak of the World War, the Greek ruling class vacillated between two policies. King Constantine favored union with the German cause or at least a policy of neutrality. Venizelos, Premier since 1910, saw in the espousal of the Allies' cause the realization of dreams of territorial expansion. When the Dardanelles were attacked in February, 1915, Venizelos considered the occasion an auspicious one on which to throw the support of Greece definitely on the side of the Allies; but the King persisted in his opposition, and Venizelos was forced out of office and the Chamber dissolved. On the issue of intervention, his party won a clear majority in the June elections, but the Gounaris ministry nevertheless kept itself in office until August 23. Returning to power, Venizelos firmly maintained the Greco-Serbian accord, and proclaimed that a Bulgarian attack on Serbia would be followed by hostilities. When Bulgaria mobilized in September, he was ready to take Greece into the War; but the King stubbornly refused to countenance a war declaration, and aided by the Germanized general staff, he frustrated any attempts to succor Serbia, refusing to let French troops land at Saloniki.

In October, Venizelos was once more dismissed, and under the Zaimis and Skouloudis ministries the Greco-Serbian Treaty was repudiated and the tempting offer of Cyprus by the Allies refused. The King was determined to break the Venizelist opposition and once more called for a general election. In the balloting of December 19, with the Venizelists refraining from voting, the Government was accorded the confidence of the electorate and persisted, therefore, in its policy of neutrality.

The Allies, nevertheless, soon came to play an important rôle in Greek affairs. In December, 1915, an Allied force under General Sarail took possession of Saloniki, and that city served throughout the War as the seat of the Allies' operations in southeastern Europe. On June 3, 1916, martial law was proclaimed in the city. On June 21, the Allies demanded of Constantine demobilization of the army and the calling of new elections, and enforced a blockade. The Skouloudis ministry fell and on June 27 the King was forced to yield to all the Allied demands. Although Venizelos himself protested his loyalty, the Venizelist Party formed revolutionary committees for the purpose of forcing intervention, and a provisional government was actually set up. When the Greek government refused a demand of Admiral du Fournet, in command of the Allied fleet, for the surrender of a large portion of the Greek artillery (November 24), Allied forces occupied the Piræus and marched on Athens. The tone of the Allies now assumed a marked severity. A number of reparations demands were followed by a rigorous blockade and the recognition of the Venizelist provisional government at Saloniki. On Jan. 16, 1917, the Greek government accepted the terms, though the blockade continued.

The nonappearance of a German Army in Macedonia, the entry of the United States into the War, and the displacement of Briand by the more truculent Ribot in France, all contributed toward the creation of a more docile royal policy; but with or without official knowledge, the reservists continued to operate and by uniting with German agents in Thessaly seriously embarrassed the Allies' purposes. Once more the Allies coerced Greece, this time at the instance of powerful French opinion. On June 6, Jonnart made his appearance at Saloniki as commissioner for Great Britain, France, and Italy and at once despatched a note to Constantine demanding his abdication and that of his oldest son. On June 12, the King gave in and designated his second son Alexander as ruler. Known German sympathizers were banished; the ministry resigned; and on June 27 Venizelos was called to head a new government.

Thus, a revolution was effected by Allied intervention, though it is possible that Venizelos, had he gained the assent of the Entente, would have brought about the same end for his adherents at this time numbered some 50,000. On June 30, Greece formally entered the War on the side of the Allies. Under the French General Braquet, the army of 250,000 called to the colors was trained so rapidly that by 1918 they were able to give the Allies a great advantage on the southeastern front.

At the Peace Conference, Venizelos was undoubtedly the most important single eastern European figure. He pressed with vigor the Greek claims to Northern Epirus, Thrace, Smyrna, and the Dodecanese, and met at once

with an initial success in the treaty of Neuilly. By this document, western (Bulgarian) Thrace was ceded to the Allies (in trust for Greece), and Bulgaria was thus deprived of access to the Ægean. Another hope seemed well on the way to realization when Venizelos received the Allies' sanction for the despatch of a Greek force to Smyrna, nominally for the protection of the Christians (May 15, 1919). The Peace Conference looked favorably on the Greek claim to the Ægean islands and seemed disposed to grant the Greek requests for the Epirus in view of the cession of Valona to Italy by the Treaty of London of 1915.

The turn in Greek fortunes came, however, late in 1920. In spite of Turkish protests, so impressed was the Supreme Council with Venizelos and his apparent hold on the Greek people that by the Treaty of Sèvres, later discredited, Greek sovereignty was extended over eastern Thrace up to within 20 miles of Constantinople, Smyrna was provisionally assigned to Greece; and the islands of Tenedos and Imbros, as well as those in the Ægean Sea already occupied by Greece, were ceded. At the same time the Dodecanese, by agreement with Italy, were promised to Greece. Never did a statesman see his efforts crowned with greater success than did Venizelos when he quit the Supreme Council in the summer of 1920. Yet his long absence from home, and the high-handed character of the administration, the continuance of martial law, a drastic censorship, mobilization practically continuous since 1912, the effective pro-Constantine propaganda, and the general war weariness, contributed to his fall. The sudden death of King Alexander on October 25 at once made the return of Constantine the leading issue for the forthcoming election. In the light of the returns, the repudiation of Venizelos was complete. Of the Opposition, 246 were elected against 120 Liberals (Venizelists). Venizelos immediately retired from the country; a new ministry was formed under Rhallis; and King Constantine returned in triumph on December 19, after receiving an almost unanimous vote in a plebiscite.

It was inevitable that the Allies' attitude toward Greece, hitherto so favorable, should now be completely reversed. On December 3, the Supreme Council announced the withdrawal of all financial support to Greece. In the spring of 1921, largely at the instigation of the French, who feared for their own interests in Asia Minor as the Turkish Nationalist movement under Mustapha Kemal took on strength, the Supreme Council turned its attention toward a revision of the Treaty of Sèvres as far as Greece was affected. By March, it was evident that the Supreme Council meant to repudiate the cession of Smyrna to Greece. Under these circumstances, the Greeks began a war on the Nationalists on March 24 by marching on Afium-Karahissar and Eskişehir, on the line to Angora. Both cities soon fell; Eskişehir, however, was retaken on April 2 by the Turks; the first offensive thus closed without spectacular results. The war spirit in Greece reached fever pitch. Encouraged in a belief that Great Britain was actively championing their interests and that surcease from the pressing domestic problems would be found in great victories abroad, the Greeks renewed their demands for a continuance of the war. The second offensive began on June 10. A bloody battle was fought before Kutahia, July

16-17, and the Greeks occupied the town. On July 21, Eskişehir was once more entered, and the army pushed east on the road to Angora. Not until after the Greeks crossed the Sakaria in September did they receive their first check. In a 10 days' battle early in September, the Greeks were disastrously defeated and were compelled to fall back with heavy losses on the earlier Brusa-Afium Karahissar line. Thus, the year closed with practically no results.

Meanwhile at home, the newly elected Chamber had constituted itself a Constituent Assembly and was confronted by an advanced programme of political and economic reform prepared by Gounaris. It was idle to hope for any real reconstruction in view of the depletion of the treasury and the Chamber's preoccupation with the idea of indemnifying the victims of the Venizelist régime during the War. How precarious the situation was immediately became evident. With the beginning of 1922, the serious nature of affairs, little known at home and abroad because of a continuous official mendacity, began to appear. Turkish attacks on Greeks throughout western Asia Minor became frequent, and imprisonments and deaths were numerous. These atrocities were merely forerunners of the larger movements of the summer. In the last week of August, the Greek Army, inadequately commanded, was suddenly beset in the Afium-Karahissar and Eskişehir districts by an immeasurably superior Turkish force and struck a staggering blow. Panic at once ensued. Flight toward Smyrna was general, while thousands of soldiers took to their ships and made for Greece. The city of Smyrna, filled with refugees, was turned over to the Allies on September 8 and was entered by the Turks three days later. On September 14, a fire broke out in the foreign quarter and destroyed the whole section on the water front; some 100,000 were left homeless. Thus, in 15 days, the Turks had swept Anatolia free of the invaders and restored a balance that for more than a year had seemed all but lost. The Greeks were compelled to evacuate eastern Thrace as a condition for an armistice.

The reaction on home affairs was instantaneous. Beginning in the islands of Mytilene and Chios and spreading to the fleet and the soldiers in Thrace and Macedonia, the demand for Constantine's abdication gained such headway that on September 27 the King once more relinquished his throne, this time in favor of his oldest son, George. Constantine died suddenly at Palermo on Jan. 11, 1923. Until the meeting of the new National Assembly, affairs were in the hands of a revolutionary committee which, in order to gain popular approval, proceeded to an investigation of the late disaster. A report published on November 8 condemned all the anti-Venizelist governments from 1915 to 1922 and demanded the indictment of the ex-ministers, Gounaris, Stratos, Protopapadakis, Theotokis, Baltazis, Goudas, and Stratigos, on a charge of treason. A speedy trial took place, and the following, to the horror of Europe, were sentenced to death and duly executed: Gounaris, Stratos, Protopapadakis, Theotokis, Baltazis, and General Hadjianastis, commander of the forces in Asia Minor. Such an act only strengthened the hand of the French diplomats who sought to pacify Turkey at the expense of Greece. The Treaty of Lausanne, as finally signed on July 24, 1923 (see *TURKEY*), meant

the complete humiliation of Greece and the dissipation of those hopes of a greater Greece dominating the Southeast which had been the dream of politicians since the outbreak of the War. Eastern Thrace, Smyrna, the Dodecanese, were lost; those Greek nationals, some 600,000 living in Turkish territory, notably in Asia Minor, whose commercial activities added much to the wealth of the fatherland, were to be torn from their homes and settled lives and deported to Greece, in exchange for Turkish nationals.

A further blow was struck at Greek prestige when on August 29 as a result of the murder, at Janina two days earlier, of the Italian commissioners who had been at work on the delimitation of the Greco-Albanian boundary, Mussolini, presuming Greek responsibility, delivered an ultimatum to Greece which demanded official apologies, execution of the unknown murderers, and the immediate payment of 50,000,000 lire. The refusal of Greece to pay so large a sum at once led to the Italian bombardment and occupation of the island of Corfu, August 31. Greece thereon appealed to the League Council, under Articles XII and XV of the Covenant. Expressions of disapprobation in the Assembly and Council of the League, and, above all, English intercession for Greece, induced Mussolini to abandon his truculent attitude, accept terms of settlement proposed by the Council of Ambassadors, and withdraw from Corfu. Greece accepted the terms on September 9 and shortly thereafter made the required ceremonial apologies, besides depositing 50,000,000 lire as a forfeit, which was turned over to Italy after an impartial commission had reported that although not responsible for the murders, the Greek government had been negligent in proceeding against the assassins. See *ALBANIA* and *ITALY*.

International bankruptcy was merely one face of the shield; domestic affairs revealed the same deplorable breakdown. The revolutionary government, headed by Gonatas, though Colonel Plastiras was the virtual dictator, continued in control throughout 1923, maintaining its uneasy position only by the suppression of the constitutional liberties. The Venizelists, the party at the head of affairs, were hopelessly disunited; and with a lack of leadership, for both Venizelos and Zaimis were in political retirement, the country drifted helplessly. A half-hearted gesture at reconstruction was made on August 1 when the first army contingents were demobilized. In October, a revolt led by General Metaxas broke out and soon spread over the Peloponnese, and only with difficulty was the Government able to cope with it. Again popular opinion seemed to consider a republican constitution a universal palliative. The weeks preceding the general election of December 16 witnessed a revival of republican sentiment; attacks on the dynasty even appeared in the army and navy, hitherto generally loyal. The elections proved favorable to the Venizelists and the republicans; two days later George and his wife, Elizabeth, were invited to leave the country, and a regent, Admiral Koundouriotis, was installed in the palace.

The year 1924 thus saw Greece again about to commence a new and perilous journey. The Glücksburg dynasty was deposed, only temporarily, it was claimed, but quite definitely so far as public opinion was concerned; a National Assembly convened on January 2; and on January 4, Venizelos, the man to whom all Greece looked, appeared in Athens after an exile of

three years and consented first to head the National Assembly and then, on the resignation of the Gonatas cabinet, the Government itself, on January 11. To Great Britain and the United States, the new régime appeared to possess all the elements of stability, and recognition was formally accorded during the course of the month; but it seemed that Greece's well-wishers were to be doomed to eternal disappointment and that despair was to be the lot of those Greeks who were laboring to save their country from chaos. Venizelos was forced to relinquish his post because of illness, and although a cabinet completely made up of Venizelists succeeded him on February 6, it refused to permit the National Assembly to abolish the dynasty forthwith but insisted on a popular plebiscite. Venizelos himself had been won over with difficulty to the need for prompt action, and the plan of his followers to employ dilatory tactics so dispirited him that on March 4 he announced his intention to quit the country. The Republicans and the Military Party now joined forces with the result that the Government fell, on March 8, and Papanastassiou, the Republican leader, was summoned by the regent to form a new cabinet.

The Republican ministry, having obtained a vote of confidence in the National Assembly, lost no time in changing the name of the "Kingdom of Hellas" to the "Hellenic State," interdicting prayers for the royal family, and preparing in various other ways for the transition from monarchy to republic. The goal soon was attained. On March 25, while guns boomed and Athens rejoiced, the Assembly unanimously voted a resolution proclaiming Greece a republic, confirming Admiral Koundouriotis provisionally in his powers as regent, and permanently exiling the members of the Glücksburg dynasty. King George was permitted, however, to retain his title and four-fifths of his income for life. The Assembly's resolution was overwhelmingly ratified in a plebiscite on April 13, by 758,742 republican against 325,322 monarchist votes, and accordingly Premier Papanastassiou notified foreign powers that Greece had become a republic, and that Koundouriotis was henceforth to be styled Provisional President. On May 18, the draft of the new Greek constitution was made public. The most vexing problem confronting the new government was the repatriation of 1,000,000 or more Greek refugees from Asia Minor and eastern Thrace, and this might well have proved insuperable but for the yeoman work done by the League of Nations' Commission headed by Henry Morgenthau of New York. To aid in the settlement of these unfortunates on the land and in industry, a loan of £10,000,000 was floated in December, 1924, in England and America, the American share being \$11,000,000. In both countries, the loan was heavily oversubscribed. Mr. Morgenthau resigned from the commission and was succeeded by another American, C. P. Howland.

While the decisive voice of the electorate left no doubt as to its republican sentiment, it could not bring to the front a leader strong enough to establish the Republic on a firm foundation. The next few years were marked by a succession of ministries and great political uncertainty. On July 19, the Papanastassiou government fell because of the activities of General Pangalos, who in June had succeeded Colonel Condylis as Minister of War, and who was suspected of har-

boring dictatorship designs. A cabinet headed by M. Sophoulis lasted only a few months and was in turn succeeded, on October 1, by one with A. Michalakopoulos at its head. During its eight months of life, the new government worked with little success for the restoration of normal political conditions, urging especially that the National Assembly should finish drafting the new constitution. The ministry had elements of strength, but it could not command sufficient popular support to keep subversive elements in check, and it was finally driven from office in June. Pressure from military groups caused Michalakopoulos to resign on June 11, but he reconstituted his ministry and continued in office until June 25, when General Pangalos, under threat of bombardment of public buildings, forced his final resignation. Although practically a dictator, General Pangalos ruled for a while as constitutional Premier.

The new constitution came into effect on September 30, and on the same day, General Pangalos dissolved the National Assembly, declaring that it had lost the confidence of the people. New elections were promised for early in the following year. Hardly had the new government thus taken entire control of the country's destiny into its own hands before the belligerent character of the dictatorship almost brought the nation into a war with Bulgaria. On October 19, Greek forces, following an attack by Bulgarian irregulars, advanced several miles into Bulgarian territory. The League of Nations immediately responded to Bulgaria's request for intervention, and besides ordering the withdrawal of the Greek troops, later assessed penalties of 30,000,000 leva against Greece by way of damages, a settlement which Greece accepted in December.

Early in January, 1926, General Pangalos, feeling the need of sterner measures to combat the growing opposition to his rule, threw off all pretense and openly proclaimed a military dictatorship. Charging that the woes of the country were largely due to its parliamentary form of government, he abolished the constitution, ignored all political parties, and postponed the promised elections indefinitely. To preserve his power, he resorted to severe measures. The press was censored, a spy system was set up, and prominent political opponents were imprisoned and exiled in wholesale numbers. By reducing the value of the outstanding currency, he obtained a forced loan of some \$18,000,000, but the advantages to the national treasury of this revenue and of certain drastic economies were more than swallowed up by the heavy increases in military expenditures. Despite all repressive measures, the growing dissatisfaction with the new régime made itself manifest in many ways.

In March, President Koundouriotis resigned because his position had become meaningless. In the elections to choose his successor, General Pangalos offered himself as a candidate, and when his only opponent, Constantine Dimertji, withdrew, he received the bulk of the votes and claimed the result as an endorsement of his rule. After his inauguration on April 19, however, the opposition became so strong that he was forced into a policy compounded of both conciliatory and further repressive measures. On August 22, the end came with another military coup led by General Condylis. General Pangalos was arrested, and eventually impris-

oned in Crete. Admiral Koundouriotis was recalled to the Presidency and General Condylis assumed the position of Prime Minister pending the holding of new elections. In these elections, set finally for November 7, the real issue was once more the question of republic or monarchy. When the returns were in, the republican parties found themselves well in the lead in the new Chamber. It was deemed best, however, to form a coalition ministry and a cabinet containing both republicans and royalists began functioning on December 4, with M. Zaimis as Premier, General Condylis having shown his good faith by retiring according to his pre-election promise. In the midst of these changes, important treaties of commerce and friendship were signed with Yugoslavia and a convention relating to refugees' property with Turkey.

While the coalition government soothed the bitter partisan strife that had so long prevailed and otherwise commended itself, it quite failed to deal vigorously with the country's most pressing problems. Intrigues and plots by Pangalist and military elements kept the public and the Government uneasy. The financial situation was anything but satisfactory, with large deficits and an urgent need for a new refugee loan. However, in spite of several ministerial crises, the Government recorded some positive achievements. In February, the Assembly adopted an amendment to the constitution providing for a Senate of 120 members, although the new body did not actually hold its first meeting until more than two years later. On June 2, the constitution was finally ratified. In 1927 agreements were made with Great Britain and the United States in settlement of the war debts of Greece to those countries. That with Great Britain, signed in April, provided for the payment of a total of £21,444,000 in 62 annual installments, and that with the United States, concluded in December, for the payment of \$19,660,000 over a like period of 62 years. Both agreements were followed by arrangements for further loans for refugee, stabilization, and other purposes.

By the middle of 1928, economic and political conditions had become so unsatisfactory that the aged statesman, Venizelos, felt compelled to take the helm once more. For some time, he had been more or less active unofficially in helping with foreign financial negotiations, etc. On June 28, his sharp criticism of the financial policy of Kaphandaris, Finance Minister and Liberal leader, led to the fall of the Zaimis coalition cabinet. Once more at the head of the Liberal Party, Venizelos on July 4 formed a new Liberal ministry, immediately dissolving the National Assembly and ordering new elections. Threatening to resign, he overrode the President's objections to his unconstitutional action in substituting a straight majority representation for proportional representation. When the elections were held, on August 19, the overwhelming nature of his victory surprised every one, his Liberal Party capturing 225 seats out of a total of 250. Backed by such a popular mandate, he immediately set about straightening out the country's domestic and foreign affairs. On September 23, he signed, in Rome, a treaty with Italy providing for neutrality on the part of either nation when the other was attacked without provocation and for other measures of moral support in case of international difficulties. He then visited Paris and London to reassure

the governments there with respect to the new accord with Italy, and then turned to the task of establishing cordial relations with the rest of the neighbors of Greece.

On Mar. 21, 1929, a treaty of friendship between Greece and Yugoslavia was signed at Belgrade, following previous economic agreements, under the terms of which important disputes between the two countries are to be referred to the League of Nations for arbitration and minor disputes to an arbitration tribunal. Negotiations with Turkey presented more difficulties and by the middle of 1929 had resulted in no new treaty. The National Assembly on Feb. 13, 1929, adopted the Kellogg treaty outlawing war.

**GREELEY, WILLIAM BUCKHOUT** (1870- ). An American forester, born at Oswego, N. Y., and educated at the University of California and the Yale Forestry School. After 1904 he served with the United States Forest Service and was at various times inspector of forest reserves in California, supervisor in charge of the Sequoia Natural Forest, and government forester in Washington. Since 1920 he has been chief forester of the United States. During the World War, he served with the American Army in France as lieutenant colonel of the 20th Engineers and chief of the Forestry Section. He wrote many bulletins and circulars relating to forestry.

**GREEN, JULIEN** (1900- ). A French writer, born of American parents and brought up in France with a classical French education. He served in the army in the last year of the World War, and then spent two years in the United States at the University of Virginia. While there *Le Voyageur sur la terre* appeared in English in an undergraduate magazine. Later, it was published in French in the collection "Un Œuvre, un portrait." It was the story of the mental disintegration of an American boy. Green's two novels, *Mont Cindre* (1926), translated as *Avarice House* (1927), and *Adricne Mesurat* (1927), translated as *The Closed Garden* (1928), also showed the influence of Poe and an interest in abnormal minds. These were followed in 1929 by *The Dark Journey*, which won the Harper Prize for 1929-30. He also wrote *Suite anglaise*, literary studies.

**GREEN, THOMAS EDWARD** (1857- ). An American lecturer and author, born at Harrisville, Pa., and educated at McKendree College, Princeton University, and Princeton Theological Seminary. From 1880 until 1903, he was active in the ministry of the Presbyterian and Protestant Episcopal churches at Mt. Carmel, Sparta, and Chicago, Ill., and at Cedar Rapids, Iowa. After 1903 he was lecturer and chaplain in various national organizations, foundations, and universities. During and after the World War, he was identified with the national speakers bureau, the U. S. Treasury campaigns, and with several movements for peace or war relief. Among his publications are *The Mantraps of the City* (1884); *The Hill Called Calvary* (1898); *In Praise of Valor* (1899-1900); *The War Trust* (1914); *The Truth About Japan* (1915); *Eugenic Democracy* (1917); *The Dream of the Ages* (1921); *Guarding the Outposts* (1922); *The Mason as a Citizen* (1926); *The Man of To-morrow* (1927).

**GREENE, ARTHUR MAURICE, JR.** (1872- ). An American mechanical engineer, born in Philadelphia and educated at the University

of Pennsylvania and in Germany. After serving as instructor at the Drexel Institute, he was appointed professor of mechanical engineering at the University of Missouri in 1902 and served there until 1907, when he became professor of mechanical engineering at the Rensselaer Polytechnic Institute. He remained there until 1922, when he was appointed dean of the School of Engineering and professor of mechanical engineering at Princeton. During the World War, he was a member of the National Research Council. He wrote *Pumping Machinery* (1911); *Elements of Heating and Ventilation* (1912); *Heat Engineering* (1914); and *Elements of Refrigeration* (1916).

**GREENE, FRANK LESTER** (1870- ). A United States Senator, born at St. Albans, Vt. After working in the auditor's office of the Central Vermont Railway, he turned to newspaper work, becoming reporter (1891) and editor (1899-1912) of the St. Albans *Daily Messenger*. In the Spanish-American War, he recruited a company of the 1st Vermont Infantry. He was a member of a commission to prepare amendments to the Vermont Constitution and in 1908 was delegate-at-large to the Republican National Convention. Sent to Congress in 1912 for the 1st Vermont District to fill an unexpired term, he was reelected for five terms (1913-23). He was elected to the U. S. Senate for two terms (1923-35). In 1917-23 he was a regent of the Smithsonian Institution at Washington.

**GREENE, JEROME DAVIS** (1874- ). An American banker, born at Yokohama, Japan, and educated at Harvard and the University of Geneva. He was a member of the faculty of arts and sciences at Harvard (1905-11), general manager of the Rockefeller Institute for Medical Research in New York City (1910-12), trustee and secretary of the Rockefeller Foundation (1913-17), a member of the firm of Lee, Higginson & Co., bankers of New York (1918- ), member of Higginson & Co., London (1919-25), executive secretary of the Reparation Commission at the Paris Peace Conference (1919), and a trustee and member of several prominent institutions and societies.

**GREENLAND.** With Australia classed as a continent, Greenland is the largest island of the world. It has an estimated area of 840,000 square miles, of which about 5 per cent is habitable along the ice-free coasts; the remainder is covered by an unbroken ice-cap, exceeded in extent and thickness only by that of the continent of Antarctica. In 1921 the population numbered 14,355, practically all Eskimo. This was a gain of 896 over 1911. The births and deaths of the later years showed a steady gain of natives, probably the only instance in which a primitive people has thus thriven under a civilized and alien government. Fortunately, the detached natives have come under Danish control. These form communities living in the Smith Sound region, between Cape York and Etah, and in the smaller settlement in the district of Angmagssalik on the east coast. Almost the entire population of what is commonly known as Danish Greenland is concentrated on the southwest ice-free region, facing Baffin Bay, extending northward along the coast for 1200 miles from Cape Farewell to Tasiussak. The two districts, northern and southern, are each governed by a royal inspector who has magisterial powers and is aided by assistants at the more important places. The largest settlement

in 1921 was Sydproven (901 inhabitants) and the smallest, Skansen (49) in North Greenland. These officials act under control of the Royal Greenland Board of Trade (Copenhagen) who most efficiently guard the interests and welfare of the natives. Schools, churches, and hospitals are maintained, and the Danish Eskimos are a literate, Christian people. Trade is confined to the summer months, owing to the obstructing ice. Imports from Greenland to Denmark in 1926 were 8,301,000 kroner and exports from Denmark to Greenland, 1,865,000 kroner. Trade is a state monopoly and the exports are mostly fox skins and the products of the seal fishery. Danish energy and daring had explored the fauna, flora, geology, ethnology, etc., of this vast region with a thoroughness unequalled in any other Arctic land.

In 1921 although Sweden, Great Britain, and the United States had formally recognized Denmark's sovereignty over the whole of Greenland, Norway questioned this exclusive jurisdiction which entailed economic monopoly. A convention concluded between the nations in 1924 granted trading, hunting and fishing rights on the northern part of the east coast to Norway. Danish control rests in the Royal Greenland Bureau of the Department of the Interior. The Director resides in Copenhagen. There are two inspectors, one for North Greenland at Godhavn and one for South Greenland at Godthaab. The 62 communities of the west coast are directed by natives. The Danish government maintains a benevolent attitude toward the natives, expending large sums for their education and welfare and regulating or prohibiting harmful intrusions. An interesting experiment is the establishment of a new colony in 1925 at Scoresby Sound.

On Jan. 11, 1878, the Commission for the Direction of Geological and Geographical Investigations in Greenland was established. The 70 volumes of *Meddelelser* (communications) *om Grønland*, which are published by this Commission, form an invaluable contribution to polar research. A few of the more important expeditions of recent years are as follows. In 1912 the First Thule Expedition under Rasmussen crossed Peary Land and obtained valuable botanical and zoological information. In 1912-13 the Second Swiss Greenland Expedition under de Quervain made a crossing of the ice cap. The Second Thule Expedition, 1916-17 under Rasmussen and Lauge Koch underwent great hardships in surveying the unexplored parts of the north coast. The Third Thule Expedition under Captain Hansen reached Cape Columbia. A study of Eskimo folklore was the incentive of the Fourth Thule Expedition. The 1920-23 Bi-centenary Expedition proved Peary Channel a great depression with a lake and mapped parts of the north coast. In 1926-27 Lauge Koch made geological studies on the east coast from Scoresby Sound to Denmark Harbor. In 1926 Nörlund studied Norse ruins in South Greenland and the Cambridge Expedition carried out surveys on the east coast. The University of Michigan Greenland Expeditions under Hobbs have carried on meteorological studies since 1926 and Dr. Dumbrava, at Angmagssalik, performed a similar line of research in 1927-28.

**GREENOUGH, CHESTER NOYES** (1874- ). An American university professor and dean, born at Wakefield, Mass., and educated at Harvard University where he was instructor in

English (1899-1907). In 1907-10 he was professor of English at the University of Illinois and in the latter year returned to Harvard, where he has since remained, as assistant professor of English (1910-15), professor (1915- ), acting dean of the college (1919-20), and dean (1921-27). He is the author of *A History of Literature in America*, with Barrett Wendell (1904), and *English Composition* (1917).

**GREENWOOD, ARTHUR** (1880- ). A British Cabinet official and labor leader. Educated at Victoria University, he became head of the economics department of Huddersfield Technical College and later lecturer in economics at the University of Leeds. He was assistant secretary to the Ministry of Reconstruction (1917-29); a Labor member of Parliament (1922- ); Parliamentary Secretary to the Ministry of Health (1924); and Minister of Health in the Labor Cabinet formed June 7, 1929. After serving as general secretary of the Labor party's advisory committees in 1920-21, he assumed direction of the party's research and information department. Besides works on public health questions and international relations, he wrote *The Education of the Citizen and Public Ownership of the Liquor Trade*.

**GREET, SIR BEN** (1856- ). An English actor-manager (see Vol. X). From 1914 to 1918, he produced and acted in twenty-four of Shakespeare's plays and fifteen others in the "Old Vic" Theatre, London, and then at the request of the Board of Education presented Shakespearian plays in various parts of London and the suburbs (1918-22), which were attended by more than one million school children. After 1922 he continued this movement under the sponsorship of the London County Council. He was knighted in 1929.

**GREGORY, AUGUSTA (LADY)** (1852- ). An Irish playwright (see Vol. X), a director of the Abbey Theatre in Dublin. She continued her translations from the Gaelic, and wrote many more plays: *The Rising of the Moon* (1915), *The Golden Apple* (1916), *The Dragon* (1920), *The Travelling Man* (1921), *Three Wonder Plays* (1922), *The Story Brought by Brigit: a Passion Play* (1924), *On the Racecourse* (1925), *The Workhouse Ward* (1926), *Dave* (1927), and *Three Last Plays* (1928). She also published *Our Irish Theatre: a Chapter of Autobiography* (1913), *The Kiltartan Poetry Book* (1919), and *Hugh Lane's Life and Achievement, with some account of the Dublin Gallery* (1921). For the "Celtic Renaissance," she collected and arranged *Visions and Beliefs in the West of Ireland* (1920).

**GREGORY, CHARLES NOBLE** (1851- ). An American jurist, and international lawyer, born in Otsego County, N. Y., and educated at the University of Wisconsin. In 1872-84 he practiced law at Madison, Wis. In 1894-1914, he was dean of the law schools of the universities of Wisconsin and Iowa and George Washington University and became one of the editors of the *American Journal of International Law*. His works include *The Life of Justice Miller of the Supreme Court of the United States* (1907) and *Abstracts of Cases in Lloyd's Reports of Prize Cases* (1919).

**GREGORY, JOHN** (1879- ). An American sculptor. Born in London, England, he went to the United States in 1893. After studying at the Art Students' League of New York, 1900-03, and at the École des Beaux Arts, Paris, 1904-06, he won a fellowship in the American Academy

in Rome, 1912-15. He was a pupil of George Grey Barnard and Anton Mercié. During the World War, he was with the camouflage section of the Navy department. Until 1925 he was an associate in modeling at Columbia University. His art was strongly influenced by the archaic Greek style, but not to the detriment of his own individuality. Most of his works are garden figures of originality and charm, such as "Bacchante," "Wood Nymph," "Orpheus and Dancing Leopard," a powerful group; and most exquisite of all, "Philomela," in the possession of Payne Whitney, Long Island (replica in Metropolitan Museum, New York City).

**GREGORY, JOHN WALTER** (1864- ). A British geologist and explorer, professor of geology at the University of Glasgow since 1904. Educated at the Stepney Grammar School, Bow, he became assistant in the geological department of the British Museum (1887-1900) and made geological explorations of the western United States, British East Africa, and Spitzbergen (with Sir Martin Conway's expedition, 1896). He was professor of mineralogy and geology at the University of Melbourne (1900-04); director of the Geological Survey of the Mines Department, Victoria (1902-04); and headed expeditions to Lake Eyre (1901-02), Cyrenaica (1908), Southern Angola (1912), and Chinese Tibet (1922). Made a fellow of the Royal Society in 1901, he received the Victoria Medal of the Royal Geographical Society (1919), the gold medal of the Scottish Geographical Society (1922), the Gallois Medal of the Société Géographique de Paris (1922), the gold medal of the Royal Society, Edinburgh (1924), and was elected president of the Geological Society in 1928. His works include, in addition to over 200 scientific papers on geology, *The Foundation of British East Africa* (1901); *The Dead Heart of Australia* (1906); *The Rift Valleys and Geology of East Africa* (1921); *The Menace of Color* (1925); *Human Migration and the Future* (1928), and *Elements of Geology* (1928).

**GREGORY, WILLIAM K(ING)** (1876- ). An American paleontologist and morphologist (see Vol. X). After 1921 Dr. Gregory was curator of the department of comparative anatomy at the American Museum of Natural History and professor of vertebrate paleontology at Columbia University. He was elected to the National Academy of Sciences in 1929. His published works include *On the Structure and Relations of Northarctus, an American Eocene Primate* (1919); *The Origin and Evolution of the Human Dentition* (1922); and *Our Face from Fish to Man* (1929).

**GREIFFENHAGEN, MATRICE** (1862- ). An English painter and illustrator, who studied at the Royal Academy. In 1906 he was appointed head of the Life Department of the Glasgow School of Arts. Elected an associate of the Royal Academy in 1916, he became a fellow in 1922. He won the gold medal at Munich in 1897 and at Dresden in 1901. The University of Glasgow conferred on him the honorary LL.D. degree in 1926. Among his pictures appearing in permanent collections are *The Idyll*, in the Walker Art Gallery, Liverpool; *The Judgment of Paris*, in the Sydney National Gallery; *Portrait of Mrs. M. G.*, in the Carnegie Gallery, Pittsburgh; *The sons of God saw the daughters of men that they were fair*, acquired by the Municipal Museum of Ghent in 1909; and the Royal Academy purchased, with the Chantry

bequest, *Women by a Lake* in 1914, and *Dawn* in 1926. He also designed the historical panels for the Paris and Duncedin exhibitions of 1925.

**GRENADE.** See TRENCH WARFARE, AND STRATEGY AND TACTICS.

**GRENFELL, SIR WILFRED THOMASON** (1865- ). An English medical missionary (see Vol. X), superintendent of the International Grenfell Association, which works for the betterment of conditions among the natives of Labrador. He received the gold medal of the National Society of Social Sciences of America in 1920, was knighted in 1927, in 1928 was elected Rector of St. Andrews University, Scotland, and in 1929 received the honorary degree of LL.D. from Princeton University. His later books include *The Prize of Life* (1914); *Tales of the Labrador* (1916); *Labrador Days* (1919); *A Labrador Doctor, an autobiography* (1923); *Yourselves and your Body* (1925), and *Labrador Looks at the Orient* (1928). Consult *Wilfred Grenfell, the Master-Mariner; a Life of Adventure on Sea and Ice*, by Basil Mathews (1924), and *Grenfell: Knight Errant of the North*, by Fullerton Waldo (1924).

**GRETCHANINOV, ALEXANDER TICHONOVITCH** (1864- ). A Russian composer, born at Moscow. He studied at the Moscow Conservatory with Safonov (1881-91) and at the Petrograd Conservatory with Rimsky-Korsakov (1891-93). He never occupied any official position but devoted his entire time to composition and appeared occasionally as conductor of his own works. In 1929 he made a tour of the United States. His instrumental works show the influence of the German romanticists, but his sacred compositions rank among the finest in all Russian music. Besides two complete liturgies, a *Laudate Deum* for chorus and orchestra, and many sacred choruses a cappella, the list of his works includes two operas, both produced at Moscow, *Dobrynia Nikitich* (1903) and *Saur Béatrice* (1912); four symphonies, chamber music, and incidental music to Ostrovsky's *Snow Maiden* and A. Tolstoy's *Czar Feodor* and *Ivan the Terrible*. In 1917 he wrote *Gimn Svorodni Rossi* (Hymn of Free Russia), which was adopted as the national hymn, replacing the well-known anthem of Imperial Russia.

**GREW, JOSEPH CLARK** (1880- ). An American diplomat, born at Boston and educated at the Groton School and Harvard University. In 1904-16 he was successively clerk and deputy consul general at Cairo (Egypt), third secretary of legation at Mexico City and St. Petersburg, Russia, and secretary or counselor at Berlin and Vienna. In 1917, when the United States broke off diplomatic relations with Austria-Hungary, he was counselor of embassy and chargé d'affaires at Vienna. He was then attached to the Department of State in Washington and served on various commissions there and in Europe. In 1918 he was named secretary general of the American commission to negotiate peace, with the rank of minister, and in 1919 was American secretary of the International Secretariat of the Peace Conference. In 1920 he became Minister to Denmark and, in the year following, he went to Switzerland in the same capacity. In 1922-23 he was American representative in the Conference on Near Eastern Affairs at Lausanne. He negotiated and signed the American-Turkish Treaty of 1923. He served as Under Secretary of State, 1924-27. In May, 1927, he was appointed Ambassador to Turkey.

He published *Sport and Travel in the Far East* (1910).

**GREY, EDWARD, FIRST VISCOUNT OF FALLODON** (1862- ). A British statesman (see Vol. X), Secretary of State for Foreign Affairs from 1905 to 1916. In the latter year, failing eyesight and the succession of Lloyd George as premier caused his resignation after 11 years in office. He was created a viscount the same year. During this time, most Englishmen of both parties had confidence in him, and he exercised wide influence upon European events. By 1919 he was well enough to act as temporary Ambassador to the United States in connection with the peace settlement. He was prominent among the founders of the Royal Institute of International Affairs (1920), and was, with Viscount Cecil, joint president of the League of Nations Union. Although no longer very active, he remained interested in the welfare of the Liberal Party. He opposed Lloyd George's leadership of it, and resigned from it when the latter's funds were accepted by the party (Jan. 20, 1927). However, on July 5, 1927, he stood back of Lloyd George in order to oppose the Conservative government's House of Lords Reform Bill, which threatened the power of the House of Commons. The bill was rejected. Viscount Grey wrote *Twenty Five Years, 1892-1916* (1925), an account of his years in the public service, *Falloodon Papers* (essays, 1920), and *The Charm of Birds* (1927), with woodcuts by Robert Gibbings. See WORLD WAR, under *Outbreak of the War*.

**GREY, ZANE** (1875- ). An American author, born at Zanesville, Ohio. He studied dentistry at the University of Pennsylvania and practiced in New York until 1904, when he turned to writing. His stories, laid in the West, include: *The Mysterious Rider* (1921); *To the Last Man* (1922); and many others, all based on themes of heroic incident and adventure. Among his more recent works are *Tales of Fishing Virgin Seas* (1925); *Tales of the Angler's Eldorado, New Zealand* (1926); *Tales of Swordfish and Tuna* (1927); *Nevada* (1928); *Wild Horse Mesa* (1928); and *Tales of Fresh-Water Fishing* (1928).

**GRIERSON, grē'son, SIR GEORGE ABRAHAM** (1851- ). An English Sanskrit scholar (see Vol. X). In 1923 the Campbell Memorial Medal of the Royal Asiatic Society, Bombay, and in 1928 the Order of Merit were added to his long list of honors. He translated or edited: *Lallā-Vākyāni, or The Wise Saying of Lal Dēd, a Mystic Poetess of Ancient Kashmir* (1920); *A Grammar of the Chhattisgarhi Dialect of East Hindi* (1921); *Gipsy Languages* (1922); *The Lay of Alha: a Saga of Rajput Chivalry* (1923); and *Ilalim's Tales; Kashmiri Stories and Songs recorded by Sir Aurel Stein* (1923). In 1926 *Bihār Peasant Life*, prepared in 1885 under orders from the Government of Bengal, was published, and in 1928 the *Linguistic Survey of India* (20 vols.), which required 25 years to compile and a knowledge of 179 languages and 534 dialects.

**GRIFFES, CHARLES TOMLINSON** (1884-1920). An American composer, born at Elmira, N. Y. He received his entire musical education in Berlin, studying with Jedliczka and Galston (piano), Klatte and Loewengard (theory), and Rüfer and Humperdinck (composition). From 1907 till his death, which occurred in New York, Apr. 8, 1920, he taught at the Hackley School in Tarrytown. As a composer, he belongs to the extreme futurists. His most ambitious work is

a symphonic poem, *The Pleasure-Dome of Kubla Khan*. His other works are a dance-drama, *The Kairn of Koridwen*; a Japanese pantomime-play, *Shojo*; two pieces for string quartet; songs, and piano pieces. Two of the last, *The White Peacock* and *Clouds*, were also orchestrated.

**GRIFFIN, FRANK LOXLEY** (1881- ). An American college professor, born in Topeka, Kan., and educated at the University of Chicago. After serving on the staff of the Yerkes Observatory, he was appointed instructor of mathematics at Williams College in 1906 and was assistant professor in 1909. After 1911 he was professor of mathematics at Reed College in Portland, Oreg. He wrote *Introduction to Mathematical Analysis* (1921), and *Mathematical Analysis—Higher Course* (1926), *Periodic Orbits*, with F. R. Moulton (1920). He also contributed many articles on mathematics and astronomy to scientific papers.

**GRIFFIS, WILLIAM ELLIOT** (1843-1928). An American clergyman, educator, author, and pioneer in intercourse between the United States and Japan. In 1926-27 he made a visit to Japan, where he was received by the Emperor and was decorated with the third-class Order of the Rising Sun. He also visited Korea and Manchuria (see Vol. X). Among his later works are *The House We Live In—Architect and Tenant* (1914); *The Mikado—Institution and Person* (1915); *Millard Filmore—Constructive Statesman* (1915); *Bonnie Scotland and What We Owe Her* (1916); *Dutch Fairy Tales* (1918); *Belgian Fairy Tales* (1919); *Young People's History of the Pilgrims* (1920); *Swiss Fairy Tales* (1920); *Was Brant at Wyoming?* (1921); *Welsh Fairy Tales* (1921); *The Story of the Walloons* (1924); and *An American in the New Italy* (1925). He edited Sawyer's *History of the Pilgrims and Puritans* (1922) and Scheffer's *History of the Free Churchmen in Holland* (1922).

**GRIFFITH, ARTHUR** (1872-1922). An Irish public official, born in Dublin, the son of a compositor. He studied on the continent of Europe, and afterward traveled widely. In 1899 he returned to Ireland, where he established *The United Irishman*. In 1905 he founded the Sinn Fein movement, and published a weekly, *Sinn Fein*. In 1914 the Irish Volunteers, a more moderate movement, obtained his adherence and he published its official organ, *The Nationalist*. Griffith was arrested following the Easter rebellion of 1916, and when he was freed he found himself at the head of the greatest political party in the country. However, on the release of de Valera (q.v.) the latter's supporters gained the upper hand and de Valera became president of Sinn Fein (1917). Griffith was elected a member of Parliament in 1918, and was an outstanding figure in negotiations with the British government for securing Irish independence. His conciliatory proposals did much to bring about the final settlement. With the establishment of an Irish Parliament, he was elected president in January, 1922. In August of that year he died of heart disease.

**GRIFFITH, DAVID (LEWELYN) WARE** (1880- ). An American motion-picture director, born at La Grange, Ky. He was formerly an actor and for a time was a member of James K. Hackett's company. He became connected with motion pictures first as an actor and then as director for the Biograph Film Company. His best productions include *The Birth of a Nation*; *Hearts of the World*; *Broken*

*Blossoms*; *Intolerance*; *Way Down East*; *Orphans of the Storm*; *America*; *That Royle Girl* (1926); *Sorrows of Satan* (1927).

**GRIFFITH-BOSCAWEN, THE RT. HON. SIR ARTHUR SACKVILLE TREVOR** (1865- ). A British public official who was born near Wrexham, England, and educated at Rugby and Queen's College, Cambridge. He was private secretary to the Chancellor of the Exchequer (1895-1900), a Unionist member of Parliament (1892-1906), Parliamentary Charity Commissioner (1900-06), and served in the army in Malta (1899-1900). He reentered Parliament as a Coalition Unionist in 1910 (remaining until 1922), was a member of the London County Council (1910-13), and was knighted in 1911. He was parliamentary secretary to the Ministry of Pensions (1916-19) and to the Board of Agriculture and Fisheries (1919-21); Minister of Agriculture and Fisheries (1921-22) and Minister of Health (1922-23). In 1920 he was made a Privy Councillor. He wrote *Fourteen Years in Parliament* (1907) and *Memories* (1925).

**GRIGGS, FREDERICK LANDSEER MAUR** (1876- ). An English etcher, born at Hitchin, Herts. He studied privately, and later joined the faculty of engraving at the British School at Rome. In 1922 he was elected an associate of the Royal Academy. Examples of his work hang in the British Museum, the Museum of Fine Arts, Boston, and in the National Gallery of Canada, in Ottawa. He illustrated, among other books, *Collected Works of William Morris*; *Life of G. F. Watts*; *Memorials of Edward Burne-Jones*; *Old Colleges of Oxford* (Aymer Vallance); *History of Eton College* (Maxwell-Lyte); and *Highways and Byways in the Cotswolds*.

**GRINNELL, JOSEPH** (1877- ). An American zoologist, born at Old Fort Sill, Okla., and educated at Stanford University. At 20 years of age, he became instructor at Throop Polytechnic Institute, Pasadena, Calif. He taught ornithology, biology, zoölogy, etc., for 22 years in various California institutions and in 1920 became professor of zoölogy in the University of California. Since 1908 he has been director of the California Museum of Vertebrate zoölogy at the University of California. He was editor of *The Condor* and wrote on the birds and mammals of California and Alaska.

**GRINNELL COLLEGE.** A coeducational nonsectarian institution at Grinnell, Iowa, founded in 1847. The student enrollment increased from 512 in the college and 192 in the school of music in 1914 to a total enrollment of 755 in 1927-28, and the number of teachers in the faculty from 50 to 81. An extensive building campaign was inaugurated in 1914, which resulted in the addition of the Alumni Recitation Hall, six residence halls for men, and five cottages and a central hall forming a women's quadrangle, within the next ten years; and in 1926 a swimming pool and building were constructed. The elective system was greatly extended during the period and many new courses were added to the curriculum, especially in the departments of political science, history, economics, and business administration. The library increased from 50,000 to 78,000 volumes, and the endowment from about \$1,500,000 to \$3,995,298 (total resources). The income for 1927-28, exclusive of dormitories, was \$334,459. President, J. H. T. Main, Ph.D., LL.D., D. Hum.

**GRIPPE.** See INFLUENZA.

**GRISCOM, LLOYD CARPENTER** (1872- ). An American diplomat (see VOL. X). In 1917 he was appointed a major in the department of the adjutant general of the United States Army and afterward became a lieutenant colonel on the staff of General Pershing in France.

**GRISWOLD, SHELDON MUNSON** (1861- ). A Protestant Episcopal bishop, born at Delhi, N. Y., and educated at Union College and the General Theological Seminary. From 1885 to 1902, he held pastorates at Ilion, Little Falls, and Hudson, N. Y. In 1902 he was elected and in the following year consecrated missionary Bishop of Salina. In 1917 he was made suffragan Bishop of Chicago.

**GROLL, ALBERT LOREY** (1866- ). An American painter (see VOL. X). His preoccupation with desert scenes with conspicuous cloud effects continued until 1921, when he reverted to his earlier interest in foregrounds. In some later pictures, among them "A Breezy Day—California," and "Wind Storm in Nevada," his clouds no longer dominate.

**GROSSMITH, GEORGE** (1874- ). An English comedian and author, son of George Grossmith and nephew of Weedon Grossmith. He first appeared in an operetta by his father at the Shaftesbury Theatre (1892), becoming a popular figure in musical comedy in London and later in New York, where he first appeared in *The Girl on the Film* (1913). In 1914 he and Edward Laurillard produced *Potash and Perlmutter* in England. He appeared in *Kissing Time* (1919), *Sally* (1921), and *The Royal Visitor* (1924). He was the author or joint author of many musical plays, songs, and revues.

**GROSSMITH, WEEDON** (1853-1919). An English comedian, born in London. He was educated to be a painter but in 1885 he turned to the theatre and joined Rosina Vokes's company, touring in the provinces and the United States. His first appearance in London was as Woodcock in *Woodcock's Little Game* (1887), and he gained his first notable success in *A Pantomime Rehearsal*. In 1894 he successfully produced his own play, *The Night of the Party*. Among his best parts are the rôles of Archibald Bennick in *The New Boy*, Jimmy Jinks in *Baby Mine*, the Earl of Tweenways in *The Amazons*, and the Judge in *Stopping the Breach* (1917), the last rôle in which he played. He wrote an autobiography, *From Studio to Stage* (1913).

**GROSVENOR, GILBERT HOVEY** (1875- ). An American geographer (see VOL. X). Since 1920 he has been president of the National Geographic Society. In 1919 he discovered a lake in Alaska 28 miles long, which was named Grosvenor Lake in his honor. He wrote: *Flags of the World* (1917), *Hawaiian Islands* (1924), *Discovery and Exploration* (1924), and *A Maryland Pilgrimage* (1927), in addition to articles for the magazines.

**GROTJE, grô'tē, A. L. HUGO** (1809- ). A German writer on travel and on political and economic problems born at Magdeburg. He studied at the universities of Leipzig, Vienna, Munich, Würzburg, Rostock, and Berlin. He wrote *Tripolitanien und der Karawanenhandel nach dem Sudan* (1898), *Tripolitanische Landschaftsbilder und Volkertypen* (1899), *Die Bagdadbahn und das Schwäbische Bauernelement in Transkaukasien und Palästina* (1902), *Auf Türkischer Erde, Reisebilder und Studien* (1903), *Landeskunde von Rumänien* (1906);

*Wanderungen in Persien* (1910); *Das Albanien und Montenegro* (1913); *Das Albanische Problem* (1914); *Deutschland, die Türken, und der Islam* (1914); *Die Türken und Ihre Gegner* (1915); *Das Auswanderungsproblem und die Deutsche Volkswohlfahrt* (1920); and *Bulgarien, Natur, Staat und Volk* (1920).

**GROUP INSURANCE.** See INSURANCE.

**GROUP MIND.** See SOCIAL PSYCHOLOGY.

**GROVER, FREDERICK WARREN** (1876- ). An American college professor, born in Lynn, Mass., and educated at the Massachusetts Institute of Technology, Wesleyan University, and George Washington University, and in Germany. He served on the faculties of Harvard and Wesleyan Universities and Lafayette College, and from 1902 to 1907 was laboratory assistant and associate physicist for the National Bureau of Standards. From 1911 to 1920, he was professor of physics at Colby College, and from the latter date, assistant and associate professor of electrical engineering at Union College. After 1918 he was also consulting physicist at the Bureau of Standards. He was the author of various scientific articles and bulletins and joint author of *Principles Underlying Radio Communication* (1918).

**GROVLEZ, GABRIEL** (1879- ). A French conductor and composer, born at Lille. He studied at the Paris Conservatoire under Diémer (piano) and Gédalge and Fauré (composition). In 1900-06 he taught piano at the Schola Cantorum and also appeared frequently as a concert pianist. From 1906-09 he was chorus master at the Opéra Comique. He became conductor at the Théâtre des Arts, and in 1914 one of the conductors at the Opéra. In 1921-22 and 1925-26, he filled engagements with the Chicago Opera Company, and in 1925 with the San Carlo Opera in Lisbon. He wrote the operas, *La Princesse au Jardin* (Monte Carlo, 1920) and *Le Marquis de Carabas* (Monte Carlo, 1927); the ballets, *La Fête à Robinson*, *Maimouna*, and *Psyché*; the orchestral pieces, *Madrigal lyrique*, *La Vengeance des Fleurs*, *Le Reposeur des Amants*, *Dans le Jardin*; and many pieces for piano.

**GRUBB, WILLIAM IRWIN** (1862- ). An American jurist. He was born at Cincinnati, Ohio, and graduated from Yale (1883). After studying at the Cincinnati Law School, he was admitted to the bar and removed to Birmingham, Ala., where he practiced his profession until 1909, when President Taft appointed him U. S. District Judge for the Northern District of Alabama. In May, 1929, President Hoover named him as a member of the National Law Enforcement Commission.

**GRUBER, L. FRANKLIN** (?- ). An American clergyman, educator, and author, born near Reading, Pa., and educated at the Keystone State Normal School, Muhlenberg College, the Neff College of Elocution and Oratory, and the Mt. Airy Lutheran Theological Seminary. In 1901-02 he was professor of mathematics and English at Wagner College, Rochester, N. Y. Ordained to the Lutheran ministry in 1901, he became a pastor at Utica (1902) and later at Minneapolis, Minn. He was pastor of the Church of the Reformation at St. Paul, 1914-27. Since 1927 he has been president of the Chicago Lutheran Theological Seminary. His works include: *The Version of 1611* (1903); *The Truth About Tyndale's New Testament* (1917); *Documentary Sketch of the Reforma-*

tion (1917); *The Wittenberg Originals of the Luther Bible* (1918); *Creation ea Nihilo* (1918; republished in 1921 under the title *Whence Came the Universe?*); *The Theory of a Finite and Developing Deity Examined* (1918); *Is the Doctrine of an Infinite and Unchangeable Deity Tenable?* (1921); *The Freedom of the Will* (1923); *The Einstein Theory* (1923); and *What After Death?* (1925).

**GUADELOUPE**, ga'dá-loop'. A colony of France, comprising two islands, Guadeloupe proper, or Basse-Terre and Grande-Terre, and five island dependencies, in the Lesser Antilles in the West Indies. Area, 688 square miles; population (1926), 243,243, of whom 90 per cent were Creoles. The largest towns were Pointe-à-Pitre, 26,455 inhabitants; Basse-Terre, 8379; Le Moule, 10,000. Leading products, as reflected in the exports for 1926, were sugar, rum, coffee, and cacao. Exports for 1913 and 1926 were 18,287,480 and 167,663,138 francs, respectively. Imports for the same years were 20,174,930 and 144,849,469 francs. The increased prosperity of the islands was occasioned by the heavy demands made on them for sugar and rum by France. The budget for 1927 had increased to 29,018,596 francs, from the 1911 budget of 4,560,000 francs. A tropical hurricane which swept over the West Indies on Sept. 12, 1928, was the worst in the history of the islands. Guadeloupe's economic future received a serious setback and total damages were estimated between 300,000,000 and 500,000,000 francs.

**GUAM**. An island of the Marianas or Ladrone group, in the Pacific, belonging to the United States; area, approximately 226 square miles. The population of Guam increased from 12,652 in 1913 to 13,275 in 1920. Since the American occupation in 1901, the population has increased about 3600. Between 1918 and 1919, population decreased because of a disastrous typhoon on July 6, 1918, and an epidemic of influenza which swept over the island in October and November of that year. From Nov. 1 to Dec. 31, 1918, there were 858 deaths. Of the population, 92 per cent are called Chamorroes, a hybrid race with a Malayan strain predominating. The remainder of the population include Filipinos, Japanese, Chinese, blacks, and whites. Agaña is the seat of government.

**Agriculture**. Corn is by far the most important agricultural product, representing 60.3 per cent of the total. While there has been an increase in agricultural production since the period of American possession, Guam is not self-supporting. There is more arable land than the present population can cultivate with the means at hand. Other agricultural products are sweet potatoes, yams, tobacco, coffee, rice, cocoa, and sugar. The live stock includes carabao, horses, goats, hogs, and cattle. The carabao in 1916 numbered 6149 and the horses 4367. The carabao is the chief burden-bearing animal and is used both for drawing carts and for plowing.

**Commerce**. The chief commercial product of Guam is copra, obtained from coconuts. The exports of copra to the United States increased from 259,360 pounds in 1915 to 1,140,924 in 1919. Considerable quantities also were sent to Japan. The imports of Guam in the year 1927 were \$418,435; exports, \$224,987.

**Education**. Under the early Spanish governors, public education was discouraged; the rulers believed that the natives would be more

tractable if they remained illiterate. In later years, free schools were established, and by the time the United States assumed control of the island, a majority of the natives could read and write in Spanish. The efforts of the Americans to teach the Chamorro children to use the English language did not prove very successful. The percentage of illiteracy in 1920 was 21.8 and was especially large among the adults. The total number of persons able to speak English in 1920 numbered 4384. Gradual progress was made in the development of an educational system. By the end of that period in 1923, 14 primary schools, one intermediate school, and one high school were operated by the Department of Education. There were also several private schools. The total expenditure for public schools in 1925-26 was: current, \$48,923; outlays, \$5140. The enrollment in the schools in 1925-26 was 2913 and the average daily attendance 2861. A compulsory-education law compelled the attendance of all children between the ages of 7 and 12.

**Finance**. The receipts amount to about \$100,000, approximately balancing expenditures. United States appropriations of \$18,000 for the sick and \$12,000 toward education were used in 1928.

**GUATEMALA**, gwa'tá-mälä. The largest of the five Central American republics, with an estimated area of 48,290 square miles, and a population, according to the 1920 census, of 2,004,900. The population in 1912 was 2,119,000; estimated in 1927, 2,454,000. Guatemala, the capital, had 115,928 inhabitants in 1927. Earthquakes from Dec. 25, 1917, to Jan. 24, 1918, completely destroyed the city; but by 1925 the work of restoration had been completed. Other towns are Quezaltenango (30,125), Coban (26,774), and Totonicapan (30,888). Education was on the increase in 1927, with 3297 elementary schools, as compared with 1837 schools in 1912. The total number of pupils was 113,308, of whom 3278 were taking professional, normal, secondary, and special courses. In 1918 the University of Guatemala was opened, and by 1928, 645 students were enrolled.

**Industry**. Coffee planting is the most important single activity, and coffee exports included more than three-fourths of the exports. In 1927, 112,700,000 pounds of coffee were exported as compared with 76,219,800 in 1912. Production in 1927-28 was estimated at 82,000,000 pounds. Bananas and sugar come next in importance as export crops. Food crops are being cultivated more extensively; especially corn, rice, and wheat. Forest products are beginning to play larger rôles in the country's trade, for by 1927 chicle to the value of \$484,000 was exported (\$142,108 in 1913), and timber to the value of \$684,000 (\$247,757 in 1913). Mineral production is still backward because of lack of transportation and capital. Chrome was discovered in 1916, and oil seepages were reported in 1922, but in 1928 only mica and gold were being produced in commercial quantities. In December, 1915, the state took over all the ore lands in the country, to be exploited under leasehold only. Imports and exports for selected years follow:

	Imports	Exports
1914 .....	\$ 9,331,115	\$12,754,027
1920 .....	18,344,463	18,102,906
1923 .....	13,763,499	14,725,531
1927 .....	22,685,000	38,951,000
1928 .....	24,145,181	28,211,572

Proportions by countries of origin of imports were, for 1928, the United States, 55 per cent (50 in 1913); United Kingdom, 10.9 per cent (16 in 1913); Germany, 13.8 per cent (20 in 1913). Leading articles of importation are cotton goods, wheat flour, iron and steel manufactures, machinery, foodstuffs, drugs, and medicines. Proportions by countries of destination of exports were the United States, 55.3 per cent (27 in 1913); Germany, 33.2 per cent (53 in 1913). Coffee went to the United States to the amount of 55.4 per cent, and 37.4 per cent to Germany. Practically all bananas were shipped to the United States. The importance of the United States in the carrying trade increased enormously. In 1913, 803 ships entered Guatemalan ports; in 1926, 1714 entered.

**Communications.** In 1914 the International Railways of Central America, purchased by American capitalists in May, 1924, acquired a 60-mile railroad from Santa Marta to Las Cruces and built an extension of 45 miles from Las Cruces to Ayutla on the Mexican border. This was part of a larger scheme to build a through route between Vera Cruz and Panama, extending along the entire western length of Central America. In July 1929 the connecting link between Zacapa, in Guatemala, and San Salvador, Santa Ana, and Ahuachapan, in Salvador was completed uniting these two countries. In 1916 a concession was granted for the construction of an intracoastal canal skirting the Pacific coast for 80 miles from San José to the Esclaves River. The total railway mileage was 638 miles in 1927. In 1926, there were 4774 miles of telegraph line and 2913 miles of telephone.

**Finance.** For 1926-27 national revenues totaled \$12,411,000 and expenditures \$12,259,000. The budget for 1928-29 balanced at \$12,500,000. This was an increase of \$1,500,000 over 1927-28. On Dec. 31, 1927, the public debt was approximately \$21,665,000, of which \$14,818,000 was foreign debt, floated partly in England and partly in the United States. In 1918 a National Bank was established, one of its chief purposes being the making of agricultural loans. On June 30, 1926, there were in circulation 6,976,000 quetzales, a new unit of currency established on Nov. 26, 1924, with a par value of \$1. Since that date, there has been little fluctuation in exchange.

**History.** At the expiration of his term in 1916, Estrada Cabrera was once more reelected President. On Apr. 27, 1917, Guatemala broke off diplomatic relations with Germany and offered her transportation facilities to the United States in the prosecution of the War. On Oct. 3, 1919, peace was made with Germany. President Cabrera's virtual dictatorship since 1898 was successfully broken in 1920, when the more progressive elements of the country organized to effect a liberal administration. Cabrera was the first to resort to force, but his army deserted him and he was compelled to resign. Dr. Carlos Herrera was appointed provisional President and on Sept. 15, 1920, took the oath for the unexpired term, 1916-23. He was immediately recognized by the United States. He applied himself to repairing the damages of the earthquake and was also instrumental in having Guatemala form the Central American Union (q.v.) together with Honduras and Salvador in 1921. On Dec. 6, 1921, however, he too was overthrown by a military clique incensed at the country's participation in the Union, and

a provisional government was formed by General Orellana, chief of staff. Orellana was elected President in March, 1922; by July he was confronted by a rebellion which proved unsuccessful. The leaders were put to death, and two Catholic priests were expelled. It appeared for a time that the new government had no desire to aid in the formation of a federal Central American state, and in October, 1922, Orellana refused to adhere to the pact signed on the U.S.S. *Tacoma* on Aug. 20, 1922, by Nicaragua, Honduras, and Salvador, though his government participated in the Central American Conference of 1923 at Washington and signed the conventions concluded. In June, 1924, however, Guatemala once again took a forward step in the furthering of amicable Central American relations when her Assembly was the first to ratify the important General Treaty of Peace and Amity and the Convention for the Establishment of International Commissions of Inquiry, both adopted by the Central American Conference in Washington in 1922.

In May, 1927, Guatemala, Honduras, and Salvador signed a convention agreeing not to take separate action in examining or settling questions affecting the general interests of Central America before their foreign ministers had consulted with each other. Included among the questions to which the convention would apply were the making of an agreement by one of the three countries with any nation outside of Central America which might affect Central American nationality, declarations of war, recognition of new governments in accordance with existing treaties, and certain questions arising out of existing international treaties. President Orellana died Sept. 26, 1926, and in December Lazaro Chacon was elected to succeed him. One of the election promises made by Chacon was that he would take action to amend the constitution to prevent a president from succeeding himself. He made his word good by calling a constitutional assembly, which held sessions throughout the last half of 1927. Once started, the assembly did not confine itself to the object for which it was called, but proceeded to revise the constitution drastically for the purpose of lessening the president's power and preventing a dictatorship.

Among the provisions adopted was one prohibiting the president from holding the office again for 12 years after his six-year term expired; another providing that the president and cabinet could not legislate during the recess of the assembly; and others empowering the Supreme Court to declare laws unconstitutional and disfranchising military officers and men on active duty. These changes became effective early in 1928. Revolutionary agitation brought a suspension of constitutional guarantees by President Chacon in September, 1928. In January, 1929, a revolutionary movement in the northwest was suppressed by the army. In 1928 a century-old boundary dispute with Honduras was revived when the two countries granted concessions to different fruit companies for operating in the disputed district of Izabel. At the request of both governments, the United States agreed to act as mediator, and Roy T. Davis was appointed chairman of a mixed boundary commission. The commission made extended investigations but came to no conclusion, and in June Secretary Kellogg suggested that the dispute be left to the International Central American Tribunal. Guatemala accepted the suggestion but Honduras re-

fused. In March, 1929, diplomatic relations with Nicaragua, which had been severed during the Sacasa revolution, were resumed.

**GUCHKOV, ALEXANDER** (1862- ). A Russian politician, born at Moscow, and educated at the University there and under Professor Schmoller of Berlin. He led an adventurous youth as a volunteer in the Boer War (1899-1902) and with the Red Cross in the Russo-Japanese War. The leader of the Octobrists, in the third Duma (1907-12), he was speaker in 1910-12, and attacked the Court and the Ministry of War for inadequate military preparations against Germany. On the outbreak of the March Revolution in 1917, he went to Pskov to force and receive the Czar's abdication, and was made Minister of War, but resigned in the face of the desertions and demoralization in the army. He eventually took refuge in Paris and was a member of the group working against the Communist regime in Russia.

**GUEDALLA, GWÁ-DÁ'LA PHILIP** (1889- ). An English author, educated at Rugby and Oxford, who became a barrister of the Inner Temple in 1913, and practiced for 10 years. He was legal adviser to the Contracts Department, the War Office, and the Ministry of Munitions, and organized and was secretary to the Flax Control Board (1917-20). He contributed frequently to the *London Times*, *New Statesman*, *Daily News*, and the *American Vanity Fair*. *Ignes Fatui, a Book of Parodies* appeared in 1911, but it was not until the publication of *The Second Empire* (1922) that he was accorded general recognition. In this work, with great skill and not a little malice, he succeeded to a large extent in scaling down the heroic proportions of Napoleon the Little. His other works include *Masters and Men* (1923); *A Gallery* (1924); *A Council of Industry* (1925); *Napoleon and Palestine* (Davis Lecture, 1925); *Independence Day* (1926); *Fathers of the Revolution* (1926); *Conquistador: American Fantasia* (1927); *Bonnet and Shawl* (1928), and *Gladstone and Palmerston* (1928). From 1925 to 1928, he edited *Curiosities in Politics; a series of monographs on remarkable personalities of the 18th and 19th centuries*.

**GUÉRARD, GÁ'RÁR', ALBERT LÉON** (1880- ). A French philologist, born in Paris and educated there and in London. After an interval of travel, he became professor of literature and examiner in history at the École Normale. In 1906 he went to the United States as instructor in French at Williams College, was assistant professor of French at Stanford University (1907-13), professor of French at the Rice Institute in Houston, Tex. (1913-24), and at the southern branch of the University of California (1924-25). In the latter year, he returned to Stanford University as professor of general literature. His principal works are *French Prophets of Yesterday* (1913); *French Civilization in the Nineteenth Century* (1914); *Five Masters of French Romance* (1916); *L'Avenir de Paris* (1919); *French Civilization from Its Origins to the Close of the Middle Ages* (1920); *International Languages* (1921); *The Napoleonic Legend* (1923); *Honoré de Balzac* (1924); *Beyond Hatred* (1925), and *The Life and Death of an Ideal* (1926).

**GUERIN, JULES** (1866- ). An American painter and illustrator (see Vol. X). He was director of color and decoration at the Panama-Pacific International Exposition, 1915.

Noteworthy among his later works were the decorations of the Pennsylvania Station, New York City, and those of the Lincoln Memorial Building, Washington.

**GUERRERO, GÁ-RÁ'RÓ, MARÍA** (1868-1928). A noted Spanish actress. Born in Madrid, she early showed an inclination for the stage, which her father abetted. In 1885, she made her début in *Sin familia*, and was immediately acclaimed by the public. Later, she went to Paris, studied under Coquelin, and performed with him and with Sarah Bernhardt. After her return to Spain, she served in various companies, and in 1896 married Fernando Díaz de Mendoza (Marqués de Fontana, Conde de Balazote and Conde de Lalaing), with whom she had acted on several occasions. In 1897 they went to Argentina for the first time, returning thither yearly thereafter. In 1898 they toured France and Italy. Her most notable interpretations were in *Mancha que limpia* and *El loco Dios*, by Echegaray; *Don Juan Tenorio*, by Zorilla, *La Dolores*, by Feliu y Codina, *La Leona de Castilla*, by Villaspesa; *Mariucha*, by Pérez Galdós; *La Estrella de Sevilla*, by Lope de Vega; *El vergonzoso en palacio*, by Tirso de Molina; *Amores y Amorios*, by the Álvarez Quintero brothers; *La malquerida*, by Benavente; and *El Doncel romántico*, by Fernández de Ardevin.

**GUEST, EDGAR ALBERT** (1881- ). An American press humorist and poet, born at Birmingham, England, and educated in the public schools of Detroit. In 1895 he became connected with the *Detroit Free Press* and has since established a reputation as a writer of humorous verse and sketches. He is author of *A Heap o' Livin'* (1916), *Just Folks* (1917), *Over Here* (1918), *Path to Home* (1919), *When Day is Done* (1921), *Poems of Daily Life* (1922), *All That Matters* (1923), *The Passing Throng* (1923), *Rhymes of Childhood* (1924), *The Light of Faith* (1926), *You Can't Live Your Own Life* (1928), and *Harbor Lights of Home* (1928).

**GUIANA, BRITISH.** A British colony on the northeastern coast of South America, forming the western part of Guiana. Area, 80,480 square miles; population in 1911, 296,000; in 1927, 308,478. Georgetown, the capital, had 57,416 inhabitants in 1927. On Dec. 31, 1927, there were 127,017 East Indians in the colony, of whom 58,822 were residents on estates, and 70,142 resided elsewhere. The leading products are sugar cane, diamonds, balata, bauxite, rice, cocoanuts, coffee, cacao, wood, and timber. The steady decline of gold continues; the 1927 output was 6722 ounces as compared with 79,194 ounces in 1913. The diamond output showed increases with the discovery of new fields in 1922, the 1927 production being 173,797 carats, valued at £724,152. Imports for 1927 were valued at £2,657,265; exports, £3,525,274. The eight principal imports in 1927 were flour, textiles, manure, pickled pork and beef, boots and shoes, butter, cement, and tobacco. These came largely from Great Britain, the United States, and Canada. Total tonnage entered and cleared in 1911-12, 1920, and 1927, was 988,663; 899,748, and 1,138,493. Revenues for 1927 were £1,068,865; expenditures for the same year, £1,148,028. The public debt on Jan. 1, 1928, was £2,675,270.

**Dutch Guiana, or Surinam.** Located between British Guiana on the west and French Guiana on the east. Area, 54,291 square miles; population in 1910, 86,233; in 1927, 145,763, ex-

clusive of the Indians and Negroes living in the forests. Paramaribo, the capital, had 35,346 inhabitants in 1910 and 45,791 inhabitants in 1927. The leading products are sugar cane (26,430,000 pounds in 1910; 15,572,500 kilos in 1927); rice (4,386,000 pounds in 1910, 14,899,000 kilos in 1926); cacao (3,702,600 pounds in 1910, 215,700 kilos in 1927); coffee (445,000 pounds in 1910; 3,036,000 kilos in 1927); and bananas (462,200 bunches in 1910; 372,000 in 1927). Gold production in 1910 was 1,081,476 grams, and only 239,796 grams in 1927; balata, 1,495,300 pounds in 1910 and 503,000 kilos in 1927; and rum, 210,780 gallons in 1910 and 666,300 litres in 1926. Exports for 1927 were valued at 11,689,685 guilders; imports, 9,288,858 guilders. Leading imports are provisions, hardware, clothing, and manufactured articles. Tonnage entered in 1910 was 210,998; in 1927, 209,784 register tons; cleared, 208,999 register tons. Revenues, expenditures, and subvention for 1914 were 7,051,800, 6,260,530, and 790,260 guilders. For 1929 they were 5,951,000, 8,414,000, and 2,463,000 guilders (nominal value of the guilder, \$0.402).

**French Guiana.** Forming the eastern part of Guiana. Area, about 34,740 square miles; population in 1911, 49,009; in 1926, 47,341. Creoles make up four-fifths of the inhabitants. In 1926 the penal population totaled 6200 individuals. Cayenne, the leading town, had 13,527 inhabitants in 1911, and 13,936 in 1926. Gold is the product of greatest economic importance. Exports are gold, rosewood essence, hides, and cacao. Rice, manioc, cacao, coffee, bananas, and vegetables are cultivated in small quantities for local consumption. Imports for 1927 were valued at 61,641,424 francs; exports, 29,769,728 francs. About 90 per cent of the exports are taken by France and her colonies. The local budget for 1912 balanced at 3,592,000 francs; for 1927, receipts were estimated at 11,000,000 francs; expenses, 10,500,000 francs. Subventions from the French government are still necessary. The rivers allow of steamboat communication.

**GUILD SOCIALISM.** Guild Socialism was an English intellectual movement that flourished largely during the World War and in the four or five years immediately after its termination. By 1925 it was reduced to a paper movement. It never had many adherents but gained considerable popular attention as a result of the activities of a small group of brilliant journalists among whom the following were the outstanding figures: Orage, Penty, Cole, Hobson, Douglass, Reckitt, Bechhofer, de Maztzu, and Taylor. Bertrand Russell in his *Proposed Roads to Freedom* and Harold J. Laski in his earlier writings made the aims of the guild socialists familiar to American liberals. Guild socialism sought the abolition of the wage system and the establishment by the workers of self-government in industry through the agency of the guild. That is to say, organization in the new state was to be on the basis of function. To include all the functions of an industrial society there were to be industrial, civic, and distributive guilds. Government was to be the affair of a guild, too. As for the matter of authority or sovereignty, there was considerable disagreement among guildsmen, some holding that complete decentralization would take care of all contingencies and others believing that there was need for a centralizing authority.

The movement arose in the first decade of this century, through antagonism to the ruling collectivism in English radical thought, and was definitely formulated in 1906. Its first formal appearance, however, was in 1912. On Christmas, 1914, the Stouington Document, containing a statement of principles, was drawn up. On Easter, 1915, the present organization was completed, and the name of National Guilds' League was adopted. In the early years of the War, guild socialism grew slowly; its growth was more rapid during the last years of the War and after the Armistice. Although British trade unionists were rather unresponsive to guild ideas, the movement had nevertheless a considerable indirect influence on English labor, especially in the restive years after the War, when there was widespread unemployment, discontent, and strikes throughout the country. Guild socialism spread in one form or another, and with its increasing hold on the more revolutionary elements, it became itself more radical. The British Miners' Federation was always somewhat in sympathy with guild ideas, and its proposal for the nationalization of the mines embodied a concept of guild socialism. The Union of Post Office Workers and the National Union of Teachers adopted resolutions to organize on the guild plan. Finally, the guild idea found practical application in the Builders' Guilds, organized in conformity with guild principles. These guilds proved rather successful for a time. The guild plan spread subsequently to house furnishings, tailoring, engineering, and other trades. Partly on account of severe competition and partly on account of poor management, the Building Guild became involved in financial difficulties, and in November, 1922, it went into a receiver's hands and was later dissolved. In May, 1923, the National Guilds' League merged with the National Guilds' Council, and *The Guild Socialist*, the official monthly, ceased publication.

Guild socialism failed to seize the popular imagination because it turned largely on organization detail and could not present a programme for the capture of the industrial state; because it concerned itself with matters that the average workman held of no significance, such as liberty and other purely political concepts; and because its proponents were Oxford dons and journalists and not the stuff of which revolutionary leaders are made.

**GUILLAUME, g'èyôm', CHARLES ÉDOUARD** (1860- ). A Swiss physicist, born in Fleurier and educated at Neuchâtel and Zurich. In 1883 he was appointed assistant at the International Bureau of Weights and Measures, of which he became director in 1915. He carried out many experiments bearing on the work of the Bureau, and in 1920 was awarded the Nobel Prize for physics. His many publications include *Nickel and Its Alloys* (1898); *Applications of Nickel-Steels* (1904); *Initiation to Mechanics* (1909); *Metrological Research on Nickel-Steel* (1927), and *The Work of the International Bureau of Weights and Measures* (1927).

**GUILLERI, COMPÈRE.** See DESCAYES, LUCIEN.

**GUINNESS, THE RT. HON. WALTER EDWARD** (1880- ). A British public official, born in Dublin, the third son of the first Earl of Iveagh. He was educated at Eton, was wounded while serving in South Africa (1900-01), and was a

brigade major in the World War, winning the Distinguished Service Order. He was a Unionist and Conservative member of Parliament after 1907 and held office as Under-Secretary of State for War (1922-23), Financial Secretary to the Treasury (1923-24 and November 1924-25), and Minister of Agriculture and Fisheries (1925-1929). In 1924 he was made Privy Councillor.

**GUISEZ**, gwě'să', JEAN (1872- ). A French surgeon, authority on the ear, nose, and larynx and on the use of the bronchoscope. He has produced a number of authoritative works including *Du Traitement Chirurgical de l'Éthmoïdite Purulente* (1902); *Tracheobronchoscopie et Œsophagoscopie* (1905); *La Pratique Oto-rhino-laryngoscopique* (3 vols., 1908); *Œsophagoscopie Clinique et Thérapeutique* (1911); *Diagnose, Traitement, et Expertise des Séquelles Oto-rhino-laryngologiques* (1921); and *Diagnose et Traitement des Rétrécissements de l'Œsophage et de la Trachée* (1923).

**GUITERMAN**, ARTHUR (1871- ). An American author and poet, born of American parentage in Vienna and educated at the College of the City of New York. He did editorial work on the *Woman's Home Companion*, *Literary Digest*, and other magazines. He was president of the Poetry Society of America, 1925-27. Among his works are *Betel Nuts* (1907); *The Laughing Muse* (1915); *The Mirthful Lyre* (1918); *Ballads of Old New York* (1920); *Chips of Jade* (1920); *A Ballad Maker's Pack* (1921); *The Light Guitar* (1923); *A Poet's Proverbs* (1924); *I Sing the Pioneer* (1926); *Wildwood Fables* (1927). These were mostly light verse. Mr. Guiterman has contributed to *Life* and other periodicals.

**GUITYRY**, g'it'ri, SACHA (1885- ). A French actor and writer (see Vol. X), son of Lucien Guityry. He wrote many of his plays for his father, who died in 1925, or for Mlle. Yvonne Printemps, his wife, and often played in them himself. His later plays include *Jean de la Fontaine* (1916); *L'Illusioniste* (1917); *Deburau* (1918); *Pasteur* (1919); *Mon père avait raison* (1919); *Beranger* (1920); *Le grand Duo* (1921); *Un sujet de roman* (1923); *L'amour masqué*, music by André Mes-sager (1923); *On ne joue pas pour s'amuser* (1925); *Mozart* (1926); *Le miracle* (1927), and *Mariette* (1928). His *Deburau* and *The Grand Duke* were successful in New York with Lionel Atwill in the leading parts. Consult *Critical Ventures in Modern French Literature* by Arnold Whitridge (1924).

**GULBRANSSON**, gül-brän'sün, OLAF (1873- ). A German illustrator who was born in Oslo, Norway, but lived in Munich after 1902. He contributed illustrations and caricatures to *Simplitissimus*, and was also esteemed as a painter. *Berühmte Zeitgenossen* is a collection of his works.

**GULICK**, SIDNEY LEWIS (1860- ). An American missionary, born at Ebon, Marshall Islands, and educated at Dartmouth College and Union Theological Seminary. He was ordained in the Congregational ministry in 1886 and in the next year went to Japan, where he remained for 27 years doing missionary work. At the same time, he held the chair of theology at Doshisha, Kyoto (1906-13) and lectured at the Imperial University at Kyoto (1907-13). He was secretary of the commission on international justice and good will of the Federal Council of Churches of Christ in America after 1914

and of the National Commission on American-Japanese Relations (1921- ). Among his works are *Evolution* (1910); *The American-Japanese Problem* (1914); *The Fight for Peace* (1915); *America and the Orient* (1916); *American Democracy and Asiatic Citizenship* (1918); *The Korean Situation* (1919, 1920); *Problems of the Pacific and the Far East* (1921); *Should Congress Enact Special Laws Affecting the Japanese?* (1922); *The Christian Crusade for a Warless World* (1922); *The Winning of the Far East* (1923).

**GUNNERY**, NAVAL. The development of naval gunnery during the World War was along lines laid down several years previous. The sole innovation was "spotting" the fall of projectiles by means of aircraft. This was used only on a few occasions and in comparatively minor operations against works on shore. No vessels were fitted to carry, send out, and receive airplanes early enough to take part in purely naval warfare. The German airships did much scouting but little spotting (report of fall of projectiles), and the use of non-rigid dirigibles and kite balloons by any of the naval belligerents was unimportant except in the vicinity of naval bases. The general naval sentiment now is opposed to placing any dependence on the use of lighter-than-air aircraft for spotting work in war time. The reasons are many—paucity of numbers, cost, vulnerability, difficulty of maintenance in readiness for use, etc. For spotting, scouting, and other purposes, the great fleets of the principal naval powers are now accompanied by aircraft. All large fighting ships of the U. S. Navy carry two or more planes; and some destroyers and submarines are equipped with small folding planes. In other navies, the equipment has not yet been carried so far, either in planes or in catapults; but the general movement is toward the American model. All powers are developing airplane spotting but, concerning the degree of success achieved, much secrecy is preserved.

"Director" firing, in which guns are laid in accordance with directions electrically transmitted from a central director station, received ample verification of its importance by the experiences of the War. It was susceptible of great improvement by the better training of the men at the guns and in the director station and by greater accuracy and efficiency of observing instruments and of the means and methods of combining their readings. These instruments, consist of telescope sights on the guns and in the director tower or station, range finders, range clocks or keepers, change-of-range indicators, deflection indicators, course indicators, and mapping or combining apparatus.

The range finder most in use during and after the War is the Barr and Stroud. (See NEW INTERNATIONAL ENCYCLOPEDIA, Vol. XIX, p. 542). The range keeper is a dial or other form of register in the central station by which the range indicators at the guns are controlled. Change-of-range indicators are automatic calculating machines which, given the observed range at two moments, continue to apply the rate of change and indicate the probable range after each small interval of time. When new ranges are supplied to it, the ranges are corrected in accordance with the new rate. The ranges shown on the range keeper and range indicators at the guns are derived from the change-of-range instrument, and it may be directly con-

nected to both; in this case, the corrections to the range due to observed fall of the shot are applied to the ranges as supplied to the change-of-range instrument instead of to the range keeper. Deflection indicators keep track of the observed fall of the projectiles to the right or left of the target and transmit it to suitable dials at the guns, where the gun-sights are set in a new angle with the axis of the bore in order to correct the ascertained error due to various causes such as speeds of ship and target, changes of course, air currents, etc.

Course indicators are used in connection with the plotting or combining apparatus or diagram or for solving the enemy's course and speed. The director tower, or station, is directly connected with the central station or plotting room and with the guns. The observer at the director sight fires the battery in whole or half salvos or singly in accordance with instructions. The fall of the projectiles is noted, and if necessary, corrections are made in range or deflection. The foregoing gives only a general idea of modern methods of the control of gun fire such as were used in the War and since. While the details of operation and of the instruments are being constantly improved and much secrecy maintained as regards these improvements, the work performed is roughly as described. See ARTILLERY and ORDNANCE.

**GUNS, NAVAL.** The calibre and power of the heavy guns of battleships increased steadily from 1910. By the terms of the Limitation of Armaments Treaty, the maximum calibre was fixed at 16 inches, and guns of this calibre will probably be carried by all first-class battleships and battle cruisers built in future. Second-class battle cruisers of high speed, but of 17,500 tons or less, designed to operate against the 10,000-ton light cruisers, are under consideration in France. Such vessels would probably carry guns of less than 16-inch calibres. The length of the guns will be 45 or 50 calibres and the service muzzle velocity about 300 feet per second. Higher velocities could readily be obtained, but they would greatly shorten the effective life of the gun; at 3000 feet, the life is short enough. As "spotting" (of the fall of projectiles) from airplanes or other aircraft will be possible in future naval battles, high-angle and long-range firing is being sought, and the gun mounts of recent battleships are arranged for an elevation of 30 degrees or more. The largest calibre of gun that can be carried by cruisers under the treaty is 8 inches, and all 10,000-ton cruisers of modern design will carry six or eight 8-inch guns on high-angle mountings.

The increasing numbers of 10,000-ton light cruisers has led to improvements in guns of 8-inch calibre—the maximum size permitted in vessels of this class by the rules of the Washington Conference. The changes reported are greater length, power, elevation, range, projectile velocity, and ease of operation. New guns of all calibres show some improvement in efficiency, particularly as regards elevation and control. As far as practicable, these changes are being made in the mounts of guns on existing ships—particularly on battleships and battle cruisers. Since the War, there has been an increasing amount of attention given to the development of anti-aircraft guns. Up to the present there is, in the different navies, a wide divergence in type and calibre of these guns. The new British

battleships, *Rodney* and *Nelson*, carry six 4.7-inch anti-aircraft guns, but the 6-inch guns of the auxiliary battery have exceptional elevation and might be used against aircraft under favorable circumstances. On other British battleships and new large cruisers, 4-inch guns are mounted. French and Italian battleships carry 3-inch anti-aircraft guns and some smaller ones. The new 10,000-ton French cruisers carry eight 3-inch (or 3.5-inch) and some smaller ones. The new 10,000-ton Italian battleships have 16 guns in the auxiliary battery—all on anti-aircraft mounts. On nearly all battleships, and on all the new cruisers and aircraft carriers of the U. S. Navy, 5-inch anti-aircraft guns are mounted—8 of them on the battleships; 4 to 6 on the cruisers; and 12 on the aircraft carriers. Various types of anti-aircraft mounts are under trial and development by the U. S. Army and Navy. One of these is said to give almost complete automatism. By means of a sound locator and range control, it is kept on the target continuously and fired at the correct range.

See ARTILLERY; ORDNANCE; VESSEL, NAVAL; PROJECTILE; NAVIES OF THE WORLD.

**GÜNTHER, gün'ter, SIEGMUND** (1848–1923). A German geologist (see VOL. X). He became editor of the *Münchener Geographische Studien* in 1896 and published, in the period 1914–24, *Das Zeitalter der Entdeckungen* (1919), *Geschichte der Naturwissenschaften* (1919), and *Lehren der Revolution* (1920).

**GURLITT, gur'lit, CORNELIUS** (1850– ). A German architect, art critic, and historian, born in Nischwitz. His work on the art monuments of Saxony appeared in installments from 1894 to 1919. He also wrote *Kunst und Künstler am Vorabend der Reformation* (1890); *Beiträge zur Geschichte der Gotik* (1892); *Sir Edward Burne-Jones* (1894); *Die Kunst des Neunzehnten Jahrhunderts* (1900); *Geschichte der Kunst* (1902); numerous monographs on cities, including Berne, Zurich, Lyons, Liège, and Cambridge (1903–08); *Constantinople* (1907); *Das Französische Sittenbild im Achtzehnten Jahrhundert* (1912); *Schutz der Kunstdenkmäler im Kriege* (1915); *Die Klosterbauten in Belgien*, with Professor Clemen (1916); *Handbuch des Städtebaus* (1920); *Pflege der Kirchlichen Kunstdenkmäler* (1921), and *Langbein der Rembrandtdeutsche* (1927).

**GUSEV-ORENBURSKY, S. I.** (1867– ). A Russian writer whose novels are realistic studies of the life of the Russian clergy in the rural districts, and are filled with revolutionary feeling. He wrote *Short Stories* (1899–1916), *The Land of the Fathers over the Meadow* (1900), *Darkness* (1915), *The Lessons of the Burgher War* (1921), and *The Land of the Children* (trans. 1928).

**GUSTAVUS (GUSTAF) V** (GUSTAVUS ADOLPHUS) (1594–1632). King of Sweden (see VOL. X). His militaristic policy was considered by many as a strong factor in Sweden's ability to remain neutral during the World War. He especially emphasized the importance of close coöperation between the kingdoms of Sweden, Norway, and Denmark, and he suggested the first meeting of their three monarchs, which took place at Malmö, Sweden, in 1914. Consult *Könung Gustaf V seatio år*, by G. Asbrink (1918).

**GUSTAVUS ADOLPHUS (GUSTAF ADOLF)** (1594–1632). Crown Prince of Sweden and Duke of Skåne, born in Stockholm. He attended the University of Upsala and under-

went a strict military and athletic training. He was a clerk in all the important branches of the Government and traveled extensively in Europe, Africa, the Near and Far East, and the United States (May, 1926). A trip to Greece inspired him to be an archaeologist, a subject in which he became an authority. He worked on excavations on his estate at Sofiero, raised the money for and worked for a month and a half at the Swedish dig at Asine, Greece, and became the greatest Swedish authority on Chinese art, especially ceramics, through his work in the Far East. In 1905 he married Margaret, daughter of the Duke of Connaught (1882-1920), and in 1923 Lady Louise Mountbatten. By the first marriage, he had four sons and one daughter.

**GUTHRIE, WILLIAM NORMAN** (1868- ). An American clergyman, born at Dundee, Scotland, educated at the University of the South, and from 1889 to 1910 lecturer and professor of literature at several universities, including the University of Chicago. In 1910 he became rector of the Church of St. Mark's-in-the-Bow-erie, New York City. He attracted attention after 1922 by holding services in his church in which dances were introduced to interpret religion. Bishop William T. Manning, head of the diocese, demanded in January, 1924, that the services be discontinued and when the rector refused, he deprived St. Mark's of episcopal ministrations. Religious dances were still being performed at St. Mark's in 1929. Dr. Guthrie's publications include: *Beyond Disillusion, a Dramatic Study of Modern Marriage* (1915); *Uncle Sam and Old World Conquerors* (1915); *The Gospel of Osiris* (1916); *Leaves of the Greater Bible* (1917); *The Religion of Old Glory* (1919); *From Ragnarok to the Immediate Presence of God* (1922); *The Birth and Progress of the Human Soul* (1923); *Offices of Mystical Religion* (1927).

**GUYER, MICHAEL FREDERIC** (1874- ). An American zoologist, born at Plattsburg, Mo., and educated at the University of Missouri, the University of Chicago, and the University of Nebraska. He was assistant in zoology at the University of Nebraska (1894-97), professor of zoology at the University of Cincinnati (1900-1911), and professor of zoology at the University of Wisconsin (1911- ). Professor Guyer published articles on cytology, genetics, and the transmission of acquired defects through the influence of antibodies, as well as *Animal Micrology* (1906; rev. ed., 1917), and *Being Well Born* (1916; revised, 1927).

**GWATHMEY, JAMES TAYLOR** (1863- ). An American physician and specialist in anæsthesia, born at Norfolk, Va. He received a degree in medicine in 1899 from Vanderbilt University. At the International Medical Congress, London, 1913, he described his method of colonic anæsthesia with ether and oil and in the following year published the first edition of his book *Anæsthesia*, which has subsequently been much amplified. During the World War, he tested a method of anæsthesia for the pain of wounds and in 1923 with Dr. A. B. Davis of the Lying-In Hospital, New York, he published a new method of obstetrical anæsthesia which had been tested in that institution. Dr. Gwathmey is also clinical professor of oral surgery in the college of dentistry, N. Y. University.

**GYMNASTICS.** The United States undoubtedly pays more attention to this sport than

any other country. Colleges, Y. M. C. A.'s and athletic clubs carry through ambitious gymnastic programmes during the winter months. Football, rowing and baseball squads also incorporate certain forms of gymnastics into their training curriculums.

**GYPSUM.** The gypsum industry has taken rank as one of the foremost of the rock-products operations, and by 1929 a realization of the stabilization of the enterprises engaged therein was general. The market for gypsum and gypsum products is closely allied with the activity of the building trade. Competition among the gypsum producers is very keen and considerable research has been done in recent years in the development of new products and in extending the use of gypsum into new fields. Some of the products developed in recent years and their trade names are as follows: "Sabinite," a gypsum product for use in the treatment of walls, ceilings, floors, columns, piping vents, and mechanical equipment; "Structolite," a load-bearing tile; "Setfast," a special cement for laying gypsum tile; "Rocklath," "Locklath," and "Gyplap," new gypsum lath and plasterboard products; "Calacoustic," a new acoustic plaster; and "Thermocrete," an inside-wall insulation product. The development of the gypsum-manufacturing industry has been very great since the World War. The development has been rapid, extensive, and possibly beyond present requirements, but probably not inconsistent with the greatly increased consumption that is bound to come as the public learns more about the characteristics and quality of gypsum and its various uses.

The production of crude gypsum in the United States has increased from about 2,000,000 short tons in 1918 to nearly 6,000,000 tons in 1928. New York is by far the largest producer of crude gypsum in the United States. Other important producing States are Iowa, Michigan, Texas, Ohio, Nevada, Oklahoma, and Kansas.

Imports of crude gypsum in 1928 amounted to 918,588 short tons, valued at \$1,340,953. A large proportion of the United States imports come from Canada with Mexico of secondary importance. The gypsum-producing industry of Canada has expanded very rapidly in the past decade. In 1918 Canadian production was 152,287 short tons of gypsum; in 1927 the output was 1,063,117 tons.

**GYPSUM SOLD BY PRODUCERS IN THE UNITED STATES, IN 1927, BY USES.**  
(U. S. Bureau of Mines)

	Short Tons	Value
Without calcining:		
To cement mills	928,807	\$2,237,548
For agriculture	29,452	129,625
For other uses	7,612	21,290
	965,871	\$2,388,663
Calcined:		
Stucco	421,987	2,493,910
Neat plaster	2,089,945	14,324,857
Sanded plaster	207,210	1,414,749
Plaster of Paris, molding, etc.	173,080	1,542,916
Keenes cement	41,431	674,698
To plate-glass works	18,372	182,303
Plasterboard and wallboard	664,801	15,835,527
Tile and blocks	252,745	2,388,421
Other purposes	63,140	983,510

**GYRO PILOT.** See NAVIGATION.

# H

**H AAB**, ROBERT (1865- ). A President of the Swiss Confederation, born at Waedenswil. He studied law and practiced there, where he was elected mayor of the commune in 1894 and deputy to the Zurich Grand Council. Made a member of the Supreme Court in 1899, he became president of that body in 1908 and in 1911 director general of the Federal railways. He was minister to Berlin in 1917-18 and on his return was elected to the Federal Council. In 1922 and again in 1929, he was President of the Confederation.

**HAAN**, WILLIAM GEORGE (1863-1924). An American army officer, born at Crown Point, Ind. He graduated from the United States Military Academy in 1889 and began his military career as lieutenant in the 1st Artillery. When the World War broke out in 1914, he was a member of the General Staff. In 1917 he commanded the 57th Field Artillery Brigade at Camp MacArthur, Texas, and in 1918 the 32d Division at the Marne, Oise-Aisne, and the Meuse-Argonne offensives. He commanded the 7th Army Corps in the Army of Occupation in Germany from November, 1918, to April, 1919. On his return to the United States in 1919, he was appointed assistant chief of staff and director of war plans division of the General Staff, and was made a major general in the Regular Army on Mar. 8, 1921. He retired from the service one year later.

**HAAS**, HILS, ARTHUR E. (1884- ). An Austrian professor of physics at the University of Vienna, born at Brunn and educated at the gymnasium and the universities of Vienna and Göttingen. He taught at the University of Vienna in 1912, and in 1913 was appointed professor in the University of Leipzig. He returned to Vienna in 1921. He published many scientific articles, and also the following works: *Entwicklungsgeschichte des Satzes von der Erhaltung der Kraft* (1909); *Geist des Hellenismus in der Modernen Physik* (1914); *Grundgleichheit der Mechanik, dargestellt auf Grund ihrer Geschichtlichen Entwicklung* (1914); *Einführung in die Theoretische Physik* (1919); *Naturbilder der Neuen Physik* (1920); *Vektoranalysis* (1922); *Atomtheorie* (1924), trans. in English; *Mechanik der Massenpunkte und des starren Körpers* (1926); *Die Welt der Atome* (1926).

**HAASE**, HÄ'ZE, HUGO (1863-1919). A German politician, born at Allenstein, East Prussia, and educated at the University of Königsberg. He began practicing law in 1889, and was a member of the Reichstag from 1897 to 1907, being elected again in 1912. In 1914 he was the leader of the Social Democratic Party in the Reichstag, but in 1916 he became the leader of the Independent Socialists. After the revolution of 1918, he was chosen to be one of the six commissaries who conducted the first provisional government of the new Republic. His socialistic views were

moderate. He was fired on by an assassin on Nov. 7, 1919, and died from the wounds received.

**HABER**, HÄ'bër, FRITZ (1868- ). A German chemist (see Vol. X). He directed the Kaiser Wilhelm Institut for physical chemistry and electrochemistry in Berlin, specialized on electrochemical investigations, and received the Nobel Prize for chemistry in 1919. He published *Aus Leben und Beruf* in 1927.

**HABERMANN**, HUGO VON (1849- ). A German painter who was born in Dillingen, studied at the university there and the Academy of Munich, and traveled in France and Belgium. He is valued for his figure pieces, among them "Picta," "The Monk," "Herodias," and for his portraits. After 1905 he was professor and honorary member of the Munich Academy and also president of the Munich Secession.

**HACKETT**, FRANCIS (1883- ). A literary critic, born in Kilkenny, Ireland. He was educated in Ireland and came to America in 1900. He was with a law firm in New York in 1902, did editorial work for the *Chicago Evening Post* (1906-11), and was associate editor of the *New Republic* (1914-22). Besides numerous articles in magazines, he wrote *Ireland, A Study in Nationalism* (1918); *Horizons* (1918); *The Invisible Choir* (1920); *The Story of the Irish Nation* (1922); *That Nice Young Couple* (novel, 1924); and *Henry the Eighth* (1928). He has been one of the exponents of the modern school of literary criticism and has devoted much attention to modern political movements.

**HACKETT**, JAMES KETELTAS (1860-1926). An American actor (see Vol. X), best known for Shakespearean characterizations. He played *Macbeth* (1916); *Out There* (1918); *The Better 'Ole*; *The Rise of Silas Lapham* (1919); *Macbeth* (in London and Paris, 1920); *Othello* (Paris and London, 1922). During the spring of 1924, he played *Macbeth* in New York, with Clare Eames as Lady Macbeth.

**HADFIELD**, SIR ROBERT A, FIRST BARONET (1858- ). An English metallurgist and inventor, chairman, and managing director of Hadfields, Limited, iron and steel manufacturers of Sheffield (see Vol. X). He received the distinguished American honor of the John Fritz Gold Medal in 1921, was elected a foreign associate of the National Academy of Sciences of the United States in 1928. He was made a baronet in 1917.

**HADLEY**, ARTHUR TWINING (1856- ). An American university president (see Vol. X). Included among his later works are *Undercurrents in American Politics* (1915); *The Moral Basis of Democracy* (1919); *Economic Problems of Democracy* (1923), and *The Conflict between Liberty and Equality* (1925). He resigned from the presidency of Yale University in 1926.

**HADLEY**, HENRY KIMBALL (1871- ). An American composer (see Vol. X). He resigned as conductor of the San Francisco Symphony Orchestra in 1915 and returned to New

York, to devote his entire time to composition. In 1920, he was appointed associate conductor of the Philharmonic Society, in 1924 regular conductor of the Worcester Festival, and in 1925 musical director of Tufts College. In 1921 and 1922 he conducted the first half of the Philharmonic Society's series of summer concerts at the Stadium, and during the winter of 1921-22, appeared as guest conductor of the San Carlo Opera Company. In 1924 he conducted several of his own works in London, and in 1927 scored great success with a series of symphony concerts in Buenos Aires. He wrote four operas, which were all produced soon after their completion: *Azora*, *Daughter of Montezuma* (Chicago Op. Co., 1917); *Bianca* (won the Hinshaw Prize, New York, 1918); *The Garden of Allah* (New York, 1918); *Cleopatra's Night* (Met. Op. House, 1920). The more important of his recent works include two overtures, *Othello* and *The Spirit of the Elements*; a tone-poem, *The Ocean*; two cantatas, *Prophecy and Fulfillment* and *Mirtil in Arcadia*; *Ode to Music* for chorus and orchestra (Worcester Festival, 1917); an oratorio, *Resurgam* (Cincinnati Festival, 1923); and an opera, *The Fire Prince* (1926).

**HAESCHE, WILLIAM EDWIN** (1867- ). An American composer, born at New Haven, Conn. He studied violin with B. Listemann, piano with E. Peraho and composition with H. W. Parker at Yale, where he graduated in 1897. During 1903-24 he taught instrumentation at Yale, and then became professor of theory at Hollins College, Hollins, Va. He also was conductor of several choral societies in New Haven, and in 1907 was one of the founders of the New Haven Symphony Orchestra, in which he played among the first violins. His compositions include a Symphony in A $\flat$ ; two symphonic poems, *Fritjof* and *Ingeborg* and *The South*; two overtures, *Fritjof Saga* and *Springtime*; *Symphonicella*; a dramatic cantata, *The Haunted Oak of Nannau*; a ballad for female voices and orchestra, *Young Lovel's Bride*; *Red Godwin's Wooing* for soprano solo, female chorus and orchestra; and some chamber music.

**HAENIUM.** See PHYSICS.

**HAGEDORN, HERMANN** (1882- ). An American author, born in New York City, and educated at Harvard University, University of Berlin, and Columbia University. From 1909 to 1911, he was instructor in English at Harvard. He published, among other works: *The Silver Blade* (1907); *The Woman of Corinth* (1908); *A Troop of the Guard, and Other Poems* (1909); *Poems and Ballads* (1912); *Faces in the Dawn* (1914); *You Are the Hope of the World* (1917, 1920); *Theodore Roosevelt* (1919, 1921); *That Human Being, Leonard Wood* (1920); *Roosevelt in the Bad Lands* (1921); *Roosevelt, Prophet of Unity* (1924); *Ladders through the Blue* (poems, 1925); *The Rough Riders* (novel, 1927). He is editor of the *Memorial Edition of the Works of Theodore Roosevelt* (1923-25).

**HAGEMANN, C. A. CARL** (1871- ). A German stage manager and author. He studied at Rostock, Berlin, and Heidelberg, managed theatres at Mannheim and Hamburg, and Wiesbaden, and later became a director of the Berliner Rundfunkbetrieb, a radio broadcasting station. He has written *Geschichte des Theaterzettels* (1900); *Regie, die Kunst der scenischen Darstellung* (1921); *Die Kunst der Bühne* (1923), a life of Oscar Wilde; and other works.

**HAGEN, hū'gen, JOHANN GEORG** (1847- ). An Austrian Jesuit and astronomer (see VOL. X). He was professor of mathematics and physics at American colleges, among them Georgetown University, and in 1906 became director of the observatory at the Vatican. He published *Die veränderlichen Sterne* (Vol I, 1912-21; Vol II, 1924).

**HAGEN, WALTER C.** (1892- ). An American professional golfer, born at Rochester, N. Y. He rounded out a record that never has been equaled for tournament play by winning the British open championship in 1924, 1928, and 1929, after having been the first American player to bring this coveted trophy across the seas in 1922. He also has been the American open title holder twice, North and South open champion twice, Western open champion twice, metropolitan open champion twice, French open champion once, and Professional Golf Association champion, 1924-27. In the international competition for the Ryder Cup, at Worcester, Mass., in 1927, Hagen led the American golf forces against Great Britain and won.

**HAGGARD, SIR (HENRY) RIDER** (1856-1925). An English novelist (see VOL. X). He made a tour of the world as the member of the Dominions Royal Commission (1912-17). During the World War, he visited the Dominions for the Royal Colonial Institute of which he was elected vice president in 1917. He was a member of the Empire Settlement Committee (1917), of the East Africa Committee (1924), and of the Council of the Imperial Society of Knights. Among his later works are *The Holy Flower* (1915); *The Ivory Child* (1916); *Love Eternal* (1918); *The Ancient Allan* (1920); *The Virgin of the Sun* (1922); and *Heu-Heu: or the Monster* (1924).

**HAGGERTY, MELWIN EVERETT** (1875- ). An American psychologist. He was born at Bunker Hill, Ind., and was educated at Chicago and Harvard universities. After teaching at Indiana University, he became, in 1915, professor of educational psychology at the University of Minnesota. He was director of the psycho-educational clinics at that institution, and in 1920 he was made dean of the College of Education. After the Armistice, he was attached to the Surgeon General's office, in charge of the reeducation of disabled soldiers. He served on the Virginia Education Commission and on the school surveys of North Carolina (1920) and New York State (1921).

**HAGOOD, JOHNSON** (1873- ). An American army officer, born at Orangeburg, S. C. He graduated from the United States Military Academy in 1896, and began his military career as second lieutenant of the 2d Artillery and was promoted through the grades to major general in 1925. He served in the Philippines (1913-15), and commanded the First Expeditionary Brigade, Coast Artillery Corps, arriving in France on Sept. 11, 1917. He headed the board that created the service of supply and was its chief of staff until the Armistice. He took part in the Meuse-Argonne offensive, and on Nov. 31, 1918, established headquarters at Hohn, Germany. He returned to the United States in 1919, commanded the South Atlantic Coast Artillery District during 1920-21, and was sent again to the Philippines in November, 1921. In 1924-27 he held commands in the United States, but since Apr. 25, 1927, has been in command of the Philippine Division. He

wrote *The Services of Supply—a Memoir of the Great War* (1927), and many professional papers.

**HAGUE**, hāg, TĪE. The seat of the government of the Netherlands and residence of the sovereign. The population, according to the census of 1920, was 353,286 and, according to the communal population lists for Dec. 31, 1927, 416,179. The municipal government is entrusted to a burgomaster, five aldermen, and a town council of 45 members. In the northern part of the city, articles of luxury such as gold and silver work and porcelain are manufactured, while in the western part are dyeing, chemical, machinery, and cocoa factories. In 1917 a German Realgymnasium and in 1923 an Academy of International Law were added to the city's educational institutions. The Buitenhof, Binnenhof, and Ridderzaal (Hall of the Knights) have been recently restored, the Ridderzaal being used for extraordinary sessions of the States General, or Parliament. In contrast to these mediæval structures are the *Petrolca* and the Rotterdam Bank, two impressive examples of modern Dutch architecture. The Hague is the seat of the highest Dutch courts of justice; of the Permanent Court of Arbitration, created by the First Hague Peace Conference in 1899—a tribunal which has settled some 19 international disputes; and of the Permanent Court of International Justice (World Court), created by the League of Nations under article 14 of its covenant, the first meeting being held on Jan. 30, 1922, in the Palace of Peace.

**HAHN**, hān, HERMANN (1868- ). A German sculptor, born in Bavaria. He was apprenticed to a woodcarver, then studied industrial art, and finally entered the Academy at Munich. His principle works are a "Goethe" monument in Chicago (1914); "Emil Rathenau" in Berlin (1916); "Goethe" in Wiesbaden (1919); "Blücher" in Kiel (1920); and an equestrian bronze in Hamburg (1919). His most recent works are a Bavarian monument for Munich, a war monument for Ludwigshof, a monumental fountain for Cassel, a bronze bust of Walter Rathenau in the Rathenaumuseum of Berlin, and one of Privy Councillor E. R. Van Dyck for the Technical High School of Munich (1927).

**HAIG**, DOUGLAS, FIRST EARL (1861-1928). An English general, born in Fifehire and educated at Brasenose College, Oxford. He joined the 7th Hussars in 1885, and served in the Sudan (1898); in South Africa (1899-1902), as inspector general of cavalry in India (1903-06), as director of military training (1906-07), as director of staff duties at Army Headquarters (1907-09), again in India, as chief of staff (1909-12), and at Aldershot as general officer in command (1912-14). He commanded the 1st Army in France (1914-15), distinguished himself in the retreat from Mons, at the Aisne, Ypres, and Neuve Chapelle. From December, 1915, until 1919, he was commander-in-chief of the British Expeditionary Forces in France and in Flanders. He became a general in 1914, a field marshal in 1917, and served as commander-in-chief of the forces in Great Britain (1919-20). He was created an earl in 1919. In his last years, he devoted much of his time to aiding veterans and their dependents. He was chairman of the United Services Fund (1921-28). The Allied nations, as well as Great Britain, awarded him their highest honors. The House

of Commons voted him a grant of £100,000 (1919), and a popular subscription of nearly \$1,500,000 bought him Bemersyde, the Haig ancestral estate. He wrote *Cavalry Studies* (1907). Consult *Lord Haig*, by Sir George Arthur (1928), and *Life of Lord Haig*, by Brigadier General John Charteris (1928). (See *WORLD WAR, Western Front*).

**HAINES**, THOMAS HARVEY (1871- ). An American psychologist, born at Moorestown, N. J., and educated at Haverford College and Harvard University. He studied neurology and psychiatry at Munich, Zurich, and London, and received a medical degree from the Ohio State University. He was first assisting physician at the Boston Psychopathic Hospital (1913-14) and clinical director of the Ohio Bureau of Juvenile Research (1914-17). From 1915 to 1920, he was professor of nervous and mental diseases at Ohio State University, and in 1922-25, was director of the division on mental deficiency, National Committee on Mental Hygiene. Author of the mental deficiency bills of Tennessee and Mississippi, he took an active part in social work. His published writings include a monograph on *Mental Measurement of the Blind* (1915).

**HAINISCH**, MICHAEL (1858- ). A president of the Austrian Republic. He was the son of Frau Marianne Hainisch, a prominent worker for the advancement of women, became a lawyer by profession, and served as an official of the treasury department. For many years, he took no active part in politics but devoted his time to reading and study. He was chosen Federal President in 1921, largely because of his friendliness with all political parties, and reelected in 1924. He retired in 1928, having served the constitutional limit of two terms. Among his numerous works on sociological and political subjects are *Zukunft der Deutsch-Oesterreicher* (1892); *Der Kampf ums Dasein und die Sozialpolitik* (1899); *Die Landflucht* (1924). See *AUSTRIAN REPUBLIC*.

**HAITI**, hā'tē. An independent republic occupying the western four-elevenths of Haiti Island. Santo Domingo is the name of the remaining portion. See *SANTO DOMINGO*. Area of the Republic estimated at from 10,204 to 11,072 square miles. Population in 1912 (estimate), 2,500,000; in 1927 (estimate), 2,300,000. Negroes make up 90 per cent of the population. Port-au-Prince, the capital, had about 125,000 inhabitants in 1928, including suburban sections. The city property, in 1929, by public health census, had 79,797 inhabitants.

**Industry, Trade, Government.** Agriculture engages the majority of the population. Coffee culture occupies the place of leading importance, its export quantity in 1927 constituting 88 per cent of the total trade. Other important crops are cotton, sugar, tobacco, the production of the last named reaching 2,500,000 pounds in 1927-28. Logwood and other valuable woods enter into the foreign trade. In the fiscal year 1927, exports totaled \$15,299,000 as against \$20,248,000 in 1926, and \$17,285,485 in 1913. For the same years, imports were \$15,751,000, \$18,851,000, \$9,876,555. The financial adviser-general receiver reported for the fiscal year ended Sept. 30, 1928, exports valued at 113,336,000 gourdes and imports valued at 101,241,000 gourdes or a favorable balance in 1927-28 of 12,095,000 gourdes, as against an adverse balance of 2,262,000 gourdes in 1926-27. The gourde is equivalent to \$0.20

U. S. gold. In the calendar year 1928 the exports totaled \$21,546,748 as against \$16,549,875 in 1927, being the greatest of any recent year largely due to the coffee crop. The imports in the calendar year 1928 were \$21,316,213 as against \$16,524,938 in 1927. Imports come largely from the United States, while the exports go to France. American intervention in 1915 led to the appointment, in the following year, of a group of American officials to the posts of financial adviser, receiver general of customs, chief engineer, sanitary engineer, and chief of gendarmerie. The result was an increased stability in fiscal affairs. Expenditures for 1913-14 had been \$8,127,000; revenues, \$6,282,000. In 1928-29 revenues were \$7,580,000 and expenditures \$7,579,697. The total customs receipts for the year 1927-28 were 45,082,092.80 gourdes, and the total export duties, 14,040,033.56 gourdes. The latter were levied on coffee, logwood, cacao, cotton, sugar, and some miscellaneous products. In 1912, the public debt amounted to \$12,763,000 and 119,286,000 francs, besides an unfunded debt of \$7,077,000. On Sept. 30, 1928, the total public debt was \$18,887,623. By Jan. 31, 1929, it had been reduced to \$17,990,800. In October, 1922, great interest was aroused in Haitian affairs by the action of the National City Bank of New York, which floated for Haiti a bond issue of \$16,000,000 to be secured by a second charge on customs and a first on internal revenues. The Haitian government received 92 per cent of the nominal value. The loan was used for the conversion of outstanding loans, particularly the French loan. As a result of American activity, Haiti is provided with a well-trained constabulary, officered by American marines. The constabulary consists of 2720 men.

**History.** The internal disorders and upheavals which Haiti had experienced in preceding years continued throughout 1914. President Dailman Theodore was overthrown on Feb. 8, 1914, by Oreste Zamor, but regained control in October, only to be ousted again by Vilbrun Guillaume Sam early in March, 1915. President Sam was killed in an uprising at Port au Prince in July, 1915, whereupon American troops, which had previously been landed several times because of disputes between Haiti and her English, French, and German creditors, took possession of the country. Martial law was declared and all armed opposition was stamped out, although the Haitian civil government remained nominally in power. On Aug. 10, 1915, Sudre Dartiguenave was elected President by the Haitian Assembly and on Sept. 16, 1915, a convention was signed between the United States and the Haitian government. Effectively coerced by American control of all funds, the Haitian Chamber ratified the convention on Oct. 6, 1915 and the Senate, on November 3. Pending ratification by the United States Senate, which took place in May, 1916, a *modus vivendi* was reached for the immediate application of the treaty. The convention established a receivership of customs under American control, a native constabulary force commanded by American officers, and American control over Haitian finances to an extent necessary to safeguard the interests of the Haitian people and their American creditors. It was to remain in force ten years with the possibility of extending it if either signatory should so desire. Haiti thus became what was virtually an American political and fiscal protectorate for a term of

years, during which the United States agreed to intervene for the maintenance of Haitian independence and an orderly government if that should become necessary.

On July 20, 1918, Haiti entered the World War on the Allies' side, ostensibly because of the sinking by German submarines of a French vessel which had Haitian citizens aboard. Although under the control of the United States, Haiti became a member of the League of Nations. In 1918 a new constitution was drafted and, on submission to a plebiscite on June 19, approved by a large majority. The chief novelty of this constitution was a clause providing that foreigners residing in the country and societies formed by them should have the right to own real property. Although constitutional government was formally in existence, the actual administration was in the hands of American officials. The American occupation resulted in a marked improvement of the economic and social conditions of the country. Particularly, town sanitation and construction of modern roads progressed rapidly. Public order was guaranteed by the establishment of an efficient gendarmerie. These benefits, obvious results of the American occupation, nevertheless failed to reconcile a large part of the Haitian people with the existing status. Charges were advanced in Haitian and American quarters that the American force of occupation, composed exclusively of whites, was guilty of revolting acts of brutality against the Negro population of Haiti. The charges resulted during 1921 in an investigation by a committee of the United States Senate, the report of which, on the whole, exonerated the American troops. On Oct. 9, 1922, the National City Bank of New York as stated above, offered a Haitian loan of \$10,000,000 in 30-year bonds, at 6 per cent. This aroused protests from the Haitians and criticism in the United States. By the unanimous vote of the Legislature, Luis Borno was elected President on Apr. 11, 1922, to replace President Dartiguenave, whose term had expired. In the spring of 1924, the American government withdrew its forces from the interior, leaving only skeleton forces in certain seaports. At the same time, it was declared that because of the inability of the Haitians to guarantee the continuance of orderly government, complete evacuation was not yet in sight.

American control was further strengthened in June, 1924, by the creation of an internal revenue bureau, which was to have charge of the collection of all taxes except customs duties. Its chief was to be appointed by the President. In 1926 President Borno was reelected for a four-year term by the Council of State, whose 21 members he himself had appointed. In the summer, he visited the United States, meeting a hostile demonstration in New York from elements opposed to United States intervention. Although the programme of political and economic improvement continued to make steady progress year by year, the sentiment against intervention among the Haitians appeared to remain as strong as ever. In the United States, certain liberal and anti-imperialist publicists continued likewise to denounce the interventionist policy. This feeling was intensified in 1927 when the Haitian government refused to permit U. S. Senator King to enter the country on the ground that his record of strong criticism of intervention would rally the discontented elements in Haiti and possibly provoke disorder.

A boundary treaty between the Dominican Republic and Haiti was signed Jan. 21, 1929, and ratified by both republics in the following month. Survey commissions were appointed from both countries and the boundary was to be determined after their surveys.

**HALBE, hăl'be, MAX** (1865- ). A German dramatist and novelist (see VOL. X). His later works are *Io*, a novel (1918); *Schloss Zeitvorbei*, a drama (1918); *Hortense Ruland*, a tragedy (1920); and *Kikeriki*, a comedy (1921). An edition of his complete works in seven volumes was published (1917-23).

**HALDANE, hăl'dän, JOHN SCOTT** (1860- ). A British physiologist (see VOL. X). He became director of the Mining Research Laboratory at Birmingham University, was gas referee for the Board of Trade, president of the Institution of Mining Engineers, and Gifford Lecturer at Glasgow University. His later works include *Organism and Environment* (1917); *The New Physiology* (1919); *Mechanism, Life and Personality* (1921); *Respiration* (1922), and *The Sciences and Philosophy* (1929).

**HALDANE, THE RT. HON. RICHARD BURDON, FIRST VISCOUNT OF CLOAN** (1856-1928). A British philosopher, jurist, and statesman (see VOL. X). In 1915 he resigned from the Liberal cabinet as Lord High Chancellor, a position which he held again in 1924 under the Labor government. He was on the Judicial Committee of the Privy Council, Chancellor of the University of Bristol, a Fellow of the Royal Society, a Knight of the Thistle, and held the Order of Merit. He wrote: *Before the War* (1920) which told of Great Britain's policy toward Germany in the 8 years preceding the World War, and of his trip to Germany (1912) in an effort to stop her naval building programme; *The Reign of Relativity* (1921) in which he sought to link the physical theory with the general philosophy of idealistic relativism; *The Philosophy of Humanism* (1922), which was the ethical counterpart to the idealistic criticism of science; *Human Experience; a Study of its Structure* (1926); *Selected Addresses and Essays* (1928); and *Richard Burdon Haldane: An Autobiography* (1929).

**HALE, FREDERICK** (1874- ). A United States Senator, who was born at Detroit, Mich., and graduated from Harvard (1896). He was admitted to the bar and has practiced at Portland, Me., since 1899. In 1905 he was a member of the Maine Legislature. He was elected to the United States Senate as a Republican for three terms (1917-35), and was a member of the following Senate committees: Naval Affairs (chairman), Appropriations, Expenditures in Executive Departments, Manufactures, and Rules.

**HALE, GEORGE ELLERY** (1868- ). An American astronomer (see VOL. X). He received the Bruce Medal of the Astronomical Society of the Pacific in 1910, the Janssen Medal of the Astronomical Society of France in 1917, the Galileo Medal, Florence, in 1920, the Actonian Prize given by the Royal Institution in 1921, the Cresson and Franklin medals of the Franklin Institute in 1926 and 1927, and the Arthur Noble Medal for civic service (Pasadena) 1927. In 1923 he retired from the active directorship of the Mount Wilson Observatory, which he had organized, becoming honorary director in charge of policy and development. See PHYSICS.

**HALÉVY, a'lá'vé, DANIEL** (1872- ). A French man of letters who was educated at the Sorbonne, and devoted himself to history and criticism. By family tradition, he inherited a cultural liberalism which found expression in the ideology of Dreyfusism. Before the World War, he was affiliated with the group of Charles Péguy and the *Cahiers de la Quinzaine*, and after the Armistice, he tried to revive Péguy's tradition on a more modest scale by editing the collection of the *Cahiers Verts*. His works include: *Essai sur le mouvement ouvrier en France* (1901); *La Vie de Frédéric Nietzsche* (1911, trans.); *Luttes et problèmes* (1911); *La Jeunesse de Proudhon; Avec les boys Américains* (1918); *Le Président Wilson* (1918, tr. 1919); *Charles Péguy et les Cahiers de la quinzaine* (1919); *Le Courrier de M. Thiers* (1921); *Une Visite aux paysans du Centre* (1921); and *Vauban* (1923).

**HALÉVY, ELIE** (1870- ). A French philosophical writer who was born at Étretat, and educated at the Lycée Condorcet and the École Normale Supérieure. In 1898 he became professor at the École Libre des Sciences Politiques in Paris, and in 1926 he received the honorary D.Litt. of Oxford. His works include an analysis of Plato's philosophy of science, *La Théorie Platonicienne des Sciences* (1896); three volumes on the English utilitarians and radicals, *La Formation du Radicalisme Philosophique* (1900-03; English translation, 1 vol., 1928); *Histoire du Peuple Anglais au XIX<sup>me</sup> Siècle* (3 vols., 1913-23), translated into English in 1924-26, and continued in *Epilogue, 1895-1914* (1926), and *The Growth of Philosophical Radicalism* (1928).

**HALIDÉ EDİB** (1885- ). A Turkish leader in the movement for emancipation of women, who was born in Constantinople, and was the first Moslem girl to graduate from the American College for Girls in Constantinople (1901). She married in the same year but divorced her husband when he married a second wife. She was an intellectual, a journalist, a successful fiction writer, a liberal, and a supporter of the Young Turk movement, which necessitated her flight from Constantinople in 1909. Returning in 1916, she remarried, in the following year became professor of Western literature at the University of Istanboul, and after the Armistice, condemned to death by the Sultan, she and her husband worked with Kemal in the Nationalist cause. She was a delegate to the Nationalist Assembly, enlisted in the army and served in the war with the Greeks, rising to the rank of sergeant. After the Nationalist victory, Kemal suspected plots, and she and her husband fled to London, where they remained in exile. In 1928 she went to the United States to speak before the Williamstown Institute of Politics. Besides novels, she wrote *Memoirs of Halidé Edib* (1926), and *The Turkish Ordeal*, further memoirs (1928).

**HALL, FRANCIS JOSEPH** (1857- ). An American Protestant Episcopal theologian (see VOL. X). He was professor of dogmatic theology in the General Theological Seminary, 1913-28. Among his later works are *The Incarnation* (1915); *The Bible and Modern Criticism* (1915); *The Passion and Evaluation of Christ* (1918); *The Church and the Sacramental System* (1920); *The Sacraments* (1921); *Eschatology* (1922); *Christianity and Modernism* (1924).

**HALL, GRANVILLE STANLEY** (1846-1924). An American educator (see VOL. X). He became editor of the *Journal of Applied Psychology* in 1917 and has published *Jesus the Christ in the Light of Psychology* (1917); *Morale: The Supreme Standard of Life and Conduct* (1920); *Recreations of a Psychologist* (1920); and *Senescence* (1922). He was a frequent contributor to magazines and scientific publications. He retired from the presidency of Clark University in 1920.

**HALSTEAD, ALEXANDER SEAMAN** (1861-1923). An American naval officer, born at Philadelphia, Pa. He graduated from the United States Naval Academy in 1883 and was promoted through the grades, becoming captain in 1911. He served in the Spanish-American War and took part in the battle of Manila Bay. After commanding several battleships, he became supervisor of New York Harbor in 1915. He was commander of the district of Brest, France, during 1918-19, and commanded the naval forces in France in 1919. In October, 1919, he became commandant of the Navy Yard at Portsmouth, N. H., and remained there until 1920, when he was appointed commandant of the 12th Naval District at San Francisco. He was raised to the rank of rear admiral on July 1, 1919, and retired on Nov. 12, 1923.

**HAM, CLIFFORD DUDLEY** (1861- ). An American government official, who was born at Detroit, Mich., and graduated at Yale (1883). He was secretary to the Governor of Iowa and in newspaper work at Dubuque, Iowa, several years. In the Spanish-American War, he served as lieutenant colonel of volunteers. He edited the *Dubuque Herald* (1899-1903) and from 1903 to 1911 was in the Customs Service of the Philippine Islands as collector of customs at Iloilo and surveyor of the Port of Manila. By appointment of the President of Nicaragua, he was collector of customs for the Republic of Nicaragua and also acted as fiscal agent for the bonded foreign loans of Nicaragua from 1911 to May 31, 1928, when he resigned. Mr Ham codified the Nicaraguan laws pertaining to customs, ports, maritime commerce, and vessels.

**HAMBIDGE, JAY** (1867-1924). An American artist, born in Canada. He was a pupil of the Art Students' League in New York and of William Chase, and a thorough student of classical art. He conceived the idea that the study of arithmetic with the aid of geometrical designs was the foundation of the proportion and symmetry in Greek architecture, sculpture and ceramics. Careful examination and measurements of classical buildings in Greece, among them the Parthenon, the Temple of Apollo at Bassæ, of Zeus at Olympia and Athens at Ægina made him formulate the much discussed theory of dynamic symmetry, as demonstrated in his work, *Dynamic Symmetry: the Greek Vases* (1920). He found a disciple in Dr. Lacey D. Caskey, the author of *Geometry of Greek Vases* (1922).

**HAMBURG, hām'bûrg**. Germany's largest port, the capital of the Free State of Hamburg, and, after Berlin, her largest city. The population, according to the census of 1925, was 1,079,126. A tunnel for pedestrians and vehicles has been constructed under the Elbe, and three bridges, including the newly-opened two-story Freihafenbrücke, connect the banks of the river. Among the important new buildings are the Chile House and the Ballin House, two 10-

story office buildings built entirely of vitreous brick; the Trade Corporation House; the municipal auditorium; and the Museum of Hamburg Antiquities, opened in 1920 and containing a unique collection of ship models, guild antiquities, arts and crafts, writing and printing. A strong futuristic style of architecture is characteristic of most of the newly erected buildings. In 1919 the University of Hamburg was founded and partly housed in a lecture hall built in 1911. In 1928, 2605 students matriculated. The University makes a specialty of the study of foreign countries and institutions. Hamburg is one of the principal airports of the great air transport net of Europe and is ideally situated for this purpose because of its important and advantageous rail and steamship connections. Direct connections may be made with Bremen, Amsterdam, Copenhagen, Cologne, Berlin, Hanover, Magdeburg, Kiel, and Wesermünde and from these cities with any airport of Europe.

**Shipping.** The Free Port of Hamburg contains 3333 acres, and the quays accommodate upward of 450 seagoing vessels and 5000 smaller coast and river craft, vessels drawing 32 feet of water being able to reach them at high tide. In 1913 the shipping firms of Hamburg owned 784 vessels aggregating 1,643,000 tons, but in accordance with the Treaty of Versailles, the commercial fleet was reduced to 82,000 tons and consisted of only small vessels, not suitable for ocean service. The revival of the fortunes of the port was one of the most remarkable features of commercial history. Ships were rebuilt and services reconstructed so that in 1923 the shipping movement of the port surpassed all previous records, 15,344,116 tons being entered and 15,619,172 tons cleared. In 1927, 16,011 ships of 19,595,541 tonnage entered the port, and 20,088 ships of 19,727,470 tonnage were cleared. In 1928 the incoming ocean shipping aggregated 17,267 vessels of 21,290,000 tons. The table on page 700 shows the comparative shipping figures for seagoing ships entering the port of Hamburg.

As the main rôle of Hamburg is the trans-shipment of goods from and to all parts of the world, the number of ships which clear the port is larger than the number entering. In 1913, 16,627 ships of 14,440,026 tonnage were cleared; in 1921, 18,842 ships of 9,442,798 tonnage; in 1922, 12,782 ships of 13,302,568 tonnage; in 1923, 15,984 ships of 15,619,172 tonnage; in 1924, 15,137 ships of 15,774,505 tonnage; in 1925, 15,415 ships of 16,877,000 tonnage; in 1926, 16,907 ships of 17,038,000 tonnage; and in 1927 20,088 ships of 19,727,000 tonnage.

Hamburg and Prussia, after several years of interstate friction, finally decided on Dec. 5, 1928, upon an administrative scheme which would in effect place the entire lower Elbe district under joint management, with revenues and expenditures to be shared alike and uniform police regulation and uniform port dues throughout the entire port area. Recent port improvements include the enlargement of the old petroleum harbor and of the Vulcan Harbor to meet the increased dock requirements of the Hamburg-American line and the construction of the new Waltershof Harbor. By the Treaty of Versailles, harbor accommodation in the Port of Hamburg was granted for 99 years to Czechoslovakia. On Nov. 3, 1928, an agreement was formulated that parts of the Saale and Moldau basins should be leased to the Czech govern-

ment at a rental of 1,500,000 crowns (\$44,400) per annum and should be placed under a free-zone regime.

**History and Government.** The World War placed a heavy strain on the commerce of Hamburg, and in the fiscal year 1917 expenditures were twice as large as receipts. There was great unrest, so that most of the population joined in a general uprising on Nov. 5, 1918. A United Workmen's and Soldiers' Council was formed, proclaiming on November 22 the union of Hamburg, Bremen, Ostfriesland, and Schleswig-Holstein in a North Sea republic. The city commandant finally accepted the demands of the Council and was put under revolutionary military control. On November 12, the constitution adopted in 1906 was suspended, and a Constitutional Assembly was called, the elections to it on Mar. 16, 1919, giving an absolute majority to the Social Democrats. The Assembly opened on March 24 and two days later proclaimed a provisional constitution. The republican constitution, adopted Jan. 7, 1921, placed the legislative power of the new Republic, of which Hamburg was the capital, in a House of Burgesses of 160 members chosen for three years, and the executive power in a Senate of 15 members chosen by the Burgesses and presided over by two members chosen by the Senate itself. The Common Council consisted of 20 members of the House of Burgesses and its president. In later elections, the Social Democrats gradually lost their majority so that by October, 1924, the Government was in the hands of a coalition of Social Democrats, Democrats, and the German People's Party. These parties also carried the election of Feb. 20, 1928.

**HAMILTON, Cosmo** (?- ). A British dramatist and novelist, who served in the Royal Naval Air Service during the World War. His novels include *The Outpost of Eternity* (1912); *A Plea for the Younger Generation* (1913); *His Friend and His Wife* (1920); *The Rustle of Silk* (1922); *Unwritten History* (1924); *The Three Passions* (1928); and *Daughters of Folly* (1928). *The Little Gold Ring*, short stories, appeared in 1929. Among his plays are *The Wisdom of Folly*; *Arsène Lupin*; *The Blindness of Virtue* (1913); *The New Poor* (1924); and *Pickwick* in collaboration with Frank C. Reilly (1927).

**HAMILTON, Sir Ian** (STANDISH MONTETH). (1853- ). A British soldier (see VOL. X) promoted to the rank of general in 1914. At the outbreak of the World War, he was given command of the 4th Army, which he organized in Egypt. In 1915 as commander of the Mediterranean Expeditionary Force, he was in charge of the land forces operating at Gallipoli, but was relieved of this command in October of the same year. The failure of the Gallipoli enterprise resulted in severe criticism of his plan of campaign. He wrote a defense in the form of his *Gallipoli Diary*, in 1920. He was Lieutenant of the Tower of London (1918-20), and was created Knight of the Grand Cross of St. Michael and St. George (1917). He also published *The Millennium?* (1919); *The Soul and Body of an Army* (1921); and *The Friends of England* (lectures to members of the British Legion, 1923).

**HAMILTON, John McLure** (1853- ). An American portrait painter and illustrator (see VOL. X), residing in England. He served on the jury of awards at the Panama-Pacific

International Exposition, 1915. In 1918 he was awarded a gold medal, Pennsylvania Academy of Fine Arts. A book by him, *Men I Have Painted*, appeared in 1921.

**HAMILTON COLLEGE.** A nonsectarian college of liberal arts for men at Clinton, N. Y.; founded in 1812. The enrollment increased from 200 in 1914 to 438 in 1928-29, and the number of members on the faculty from 20 to 43; the library from 62,000 to 125,269 volumes and 30,000 pamphlets, and the productive funds from \$1,100,000 to \$3,943,989. The covered playing field, called the Sage Building, was completed in 1922; in the following year, six faculty houses were erected; in 1924-25, a biology-geology building, costing \$300,000, was completed, a soccer field was laid out, and during the summer of 1925 the golf course was enlarged from six to nine holes and in 1925-26, the exterior of Knox Hall was restored to its original appearance, the interior adapted for housing the administrative offices, and the name changed to Buttrick Hall, in honor of its original occupants who were grandparents of Elihu Root, chairman of the Board of Trustees of the college at the time. President, Frederick C. Ferry, Ph.D., Sc.D., LL.D.

**HAMLIN, CHARLES SUMNER** (1861- ). An American lawyer and public official (see Vol. X). From 1914 until 1916, he was governor of the Federal Reserve Board, and was reappointed a member of the board for the terms 1916-26 and 1926-36. He published *Index Digest of the Federal Reserve Act* and the *Index Digest of the Federal Reserve Bulletin* (1921).

**HAMLIN UNIVERSITY.** A coeducational college under the control of the Methodist Episcopal Church at St. Paul, Minn., founded in 1854. The student enrollment increased from 251 in 1914 to 500 in 1928, the teaching staff from 15 to 44, and the annual income from \$52,000 to \$180,000. The endowment during the same period rose from \$750,000 to \$1,450,000, and a campaign begun in 1924, to raise \$1,500,000 for further buildings and increased endowment, was successfully brought to a close. A new dormitory for women was completed in 1922 at a cost of \$201,851, and an athletic field and grandstand at a cost of \$43,000. President, Alfred Franklin Hughes, D.D.

**HAMMANN, OTTO** (1852- ). A German journalist and politician, born at Blankenhain. He followed a journalistic career from 1877 to 1893. From 1894 until 1916, he was director of the press section of the German Foreign Office, in this capacity acting as adviser to Prince von Bülow, and, in the nineties, taking the part of Count Caprivi, the Imperial Chancellor, and Baron Marshall von Bieberstein, the Foreign Secretary, against Bismarck's followers. After the formation of the German Republic, he published three volumes of reminiscences, in which he brought to light much of what he knew about the German secret policy: *Der neue Kurs, Erinnerungen* (1918); *Zur Vorgeschichte des Weltkrieges* (1919); *Um den Kaiser, Erinnerungen aus den Jahren 1906-09* (1919). Other works published by him are *Der missverständene Bismarck* (1921); *Bilder aus der letzten Kriegszeit* (1922); and *Deutsche Weltpolitik* (1925, English trans. 1926).

**HAMMARSKJÖLD, K. H. (JALMAR) L.** (1862- ). A Swedish jurist, diplomat and public official, born at Väderum. He was professor of law in Upsala University (1891- ),

secretary of the committee on Swedish-Norwegian union (1895-98), Minister of Justice (1901-02), Minister of Education (1905), and served as Minister to Denmark. As Prime Minister from February, 1914, to March, 1917, he inaugurated agricultural reforms and sought to maintain Sweden's neutrality in the World War. Since 1917 he has been Governor of Upsala. He was elected to Parliament in 1923 and became a member of the Swedish Academy, Swedish member of the International Court of Arbitration at The Hague, president of the League of Nations commission on the codification of international law, and a member of numerous international arbitration courts.

**HAMMERSTEIN, OSCAR** (1847-1919). An American theatre manager (see Vol. X). For the last 15 years of his life, he worked to conquer operatic inertia in New York City, and with his keen understanding of the American public, he succeeded in stimulating public interest in the opera. He built the Manhattan Opera House and brought out many artists of note, among them Mary Garden and Tetrazzini.

**HAMMOND, JOHN HAYS** (1855- ). An American mining engineer (see Vol. X). He was president of the Panama-Pacific Exposition Commission to Europe in 1912, chairman of the World Court Congress (1914-15), and chairman of the United States Coal Commission (1922-23). He is the author of *The Truth about the Jameson Raid* (1918); and *The Engineer* (1924), and co-author (with J. W. Jenks) of *Great American Issues* (1921).

**HAMMOND, JOHN HAYS, JR.** (1888- ). An American inventor, born at San Francisco and educated at the Sheffield Scientific School of Yale University. He invented a wireless-controlled torpedo for coast defense and a system for firing torpedoes from battleships; also incendiary projectiles which were employed in the World War, a radio system for the control of ships, and a system of aeroplane coastal patrol. He devised several improvements in pipe-organ mechanisms and a new type of reflecting modulator for pianos. He also took out a great number of patents for inventions in radio-telegraphy and -telephony, including one that gives complete isolation of the sender and receiver of radio messages, so that there is no "listening in" possible. He was president of the Radio Engineering Company of New York, director of the Hammond Radio Research Laboratories, director of the Radio Corporation of America, and a member of many American and foreign organizations.

**HAMMOND, ODEN HAGGERTY** (1869- ). An American diplomat. He was born at Louisville, Ky., graduated at Yale (1893), and then engaged in the real estate business in New York City and New Jersey. He was a member of the New Jersey House of Representatives (two terms, 1914-17), and chairman of the New Jersey State Board of Charities and Corrections. He was appointed Ambassador to Spain by President Coolidge in 1925, serving until 1929 when he resigned.

**HAMOR, WILLIAM ALLEN** (1887- ). An American chemist, born at Du Bois, Pa., and educated at the University of Pittsburgh. He was research chemist at the College of the City of New York, 1907-14, assistant to the director of the Mellon Institute of Industrial Research at Pittsburgh, 1914-16, and assistant director since

1916. He was major in the Chemical Warfare Service of the United States Army in the World War and served in France for 10 months as assistant chief of the Technical Division of the Chemical Warfare Service. He wrote: *History of Chemistry* (1909); *The American Petroleum Industry* (1916); *The Examination of Petroleum* (1920); *American Fuels* (1922).

**HAMP, PIERRE** (pseudonym of BOURILLON) (1876- ). A French novelist who was educated in the French technical schools and became a functionary in the railroad administration. It was there that he collected his observations for his series of impressionistic novels on *La Paine des Hommes* (*Men in Labor*). These novels combine, at times very successfully, sociological documentation and artistic presentation of human experience. His works include *Marée fraîche* (1908); *Vin de Champagne* (1909); *Le rail*; *Vieille histoire* (1912); *L'enquête* (1914); *Gens* (1917); *Le travail invincible* (1918); *Les métiers blessés* (1919); *La victoire mécanicienne*; *Les Chercheurs d'Or* (1920); *La Dérive du 4543*; *Compound 300 H. P. No. 243*; *Le Cantique des cantiques* (1922); *Le lin* (1924); *Une nouvelle fortune* (1926), and *Monsieur l'administrateur*, and *Madame la guerre*, plays (1928). Consult "Pierre Hamp, Prophet of the French Proletariat," by Thomas W. Bussom in the *South Atlantic Quarterly*, Durham, vol. 27, pp. 376-389 (1928).

**HAMPDEN, WALTER** (1879- ). An American actor born in Brooklyn, N. Y. He studied at Harvard, 1896-97, and received his bachelor's degree from the Polytechnic Institute, Brooklyn, in 1900. He first appeared on the stage in England, with F. R. Benson's company, in classical repertoire, in 1901, and then for three seasons was leading man at the Adelphi Theatre in London. In 1905 he appeared in *Hamlet*, succeeding the younger Irving. He came to the United States in 1907, supporting Mme. Nazimova, and then appeared in *The Servant in the House* (1908), *The Master Builder*, *The Yellow Jacket*, *Salome*, and other plays. He toured the country widely with his Shakespearian repertoire, his *Hamlet* in particular being a vigorous, fresh, and princely interpretation. His greatest single triumph has been *Cyrano de Bergerac*, which was judged to be the outstanding play in New York City during 1923-24. In 1925-29 he appeared in his own New York theatre co-starring (1925-26) with Ethel Barrymore in *Hamlet* and *The Merchant of Venice* and taking the lead in *Capon-sacchi*, Ibsen's *An Enemy of the People*, and *Cyrano de Bergerac*.

**HAMPTON NORMAL AND AGRICULTURAL INSTITUTE.** This institution, situated at Hampton, Va., two miles from Old Point Comfort, was founded by Gen. Samuel Chapman Armstrong in 1868, for the practical education of Negro and Indian youth. The school opened in 1868 with two teachers and 15 students in a plantation house, gristmill, and army barracks. By 1928 it had developed into an industrial village with an enrollment of 1044, of whom 988 were boarding students. In addition, there was an enrollment of 1132 in the two summer sessions; and the faculty for the regular school session ending May 29, 1928, numbered 125. The institution maintained a well-equipped trade school and a graduate course in the building trades; and the normal, agricultural, domestic science, and business schools,

offered courses of collegiate grade. The Institute is controlled by a board of trustees of which Chief Justice Taft was made president in 1914. The productive funds which amounted to \$9,081,969 in 1928, yielded an income of \$442,064. The library contained 64,738 volumes. Hampton Institute was probably the first school in the United States to combine successfully the training of the hand with that of the mind and character. The Rev. James E. Gregg, D.D., succeeded the late Hollis Burke Frissell as principal in 1918.

**HAMSUN, hām'sun, KNUT** (1859- ). A Norwegian author (see VOL. X), who received the Nobel Prize for literature in 1920. His later publications include *Segelfoss* by (1915; trans. 1925); *Markens grøde* (1917; trans. as *Growth of the Soil*, 1920); *Sproget i fare* (1918); *Konerne ved vandposten* (1920; trans. as *The Women at the Pump*, 1928); *Livets inold*, a play (1921); *Dikto*, poems (1921); *Sisto Kapitel* (2 vols., 1923); *Children of the Age* (1924), and *Landsrykere* (2 vols., 1927). Consult *Knut Hamsun*, by H. A. Larsen, or by Joseph Wiehr (both, 1922), and *Lebensgeschichte eines Rebellen*, by A. Holtscher (1924). See SCANDINAVIAN LITERATURE, under *Norwegian*.

**HANEY, LEWIS HENRY** (1882- ). An American economist, born at Eureka, Ill., and educated at Wesleyan University, Bloomington, Ill. He was a lecturer at New York University in 1908, afterward teaching in the universities of Iowa and Michigan, and from 1912 to 1916, he was professor of economics at the University of Texas. In 1916 he was in charge of the Federal Trade Commission's gasoline investigation, and in 1920-21 he was in charge of the cost of marketing division of the United States Bureau of Markets. In 1920 he became director of the New York University Bureau of Business Research and professor of economics. He wrote: *A Congressional History of Railways* (vol. i, 1908; vol. ii, 1910); *History of Economic Thought* (1911; rev. ed., 1919); *Business Organization and Combination* (1913); *The Business of Railway Transportation* (1924); and various articles on economic subjects for periodicals.

**HANIHARA, MASANO** (1876- ). A Japanese diplomat, who came to the United States in 1901 as attaché, became secretary of the Embassy at Washington in 1902, was then secretarial chief at the Foreign Office, consul general at San Francisco (1916-17), and then returned to Japan as director of political affairs at the Foreign Office (1917-19). He was a member of the Ishii Mission from which came the Ishii-Lansing agreement, and an influential member of the Washington Disarmament Conference. He was Ambassador to the United States (1923-24). He was recalled after his protest against the passage of the immigration law of 1924, excluding Japanese, had been unfavorably received in the U. S. Senate.

**HANNAY, THE REV. JAMES OWEN** ("GEORGE A. BIRMINGHAM") (1865- ). An Irish novelist and clergyman (see VOL. X), who was temporary chaplain to the forces (1916), chaplain to the British Legation in Budapest (1922-24), and rector of Mells (1924- ). His publications include *Minnie's Bishop and Other Stories* (1915); *Gossamer* (1915); *The Island of Mystery* (1918); *Up the Rebels* (1919); *Good Conduct* (1920); *Lady Bountiful* (1921); *A Public Scandal* (1922); *Send for Dr. O'Grady* (drama,

1923); *Found Money* (1923); *A Wayfarer in Hungary* (1925); *Bindon Parva* (1925); *Spillikins* (essays, 1926); *Fidgets* (1927); and *The Mermaid*, an operetta, with Sydney H. Nicholson (1927).

**HANOTAUX**, à'nô'tô', GABRIEL (1853- ). A French historian and politician (see VOL. X), who was a delegate to the League of Nations in 1921. His later writings included *La guerre des Balkans et l'Europe*, 1912-13 (1914); *Histoire de la guerre de 1914* (18 vols., 1915-24); *L'Histoire et les Historiens*; *Le traité de Versailles du 28 juin*, 1919 (1919); *L'Aisne pendant la grande guerre* (1918); *Joffre* (1921); *La bataille de la Marne* (2 vols., 1922); *Sur les chemins de l'histoire* (2 vols., 1924); *Le général Mangin* (1925); and *La Provence nicoise* (1928). He edited *Histoire de la nation française* (15 vols., 1920-24).

**HANSEN**, CECILIA (1898- ). A noted Russian violinist, born at Staniza Kamenskaya, Southern Russia. In 1909-14 she studied under Leopold Auer at the Petrograd Conservatory. Before finishing her studies, she made her debut in 1910, but did not really begin her career until 1916, when she undertook extensive tours of Europe winning recognition as one of the foremost of living violinists. She was equally successful in the United States, where she was first heard in 1923. She married the Russian pianist, Boris Zacharov.

**HANSEN**, NIELS ERBESSEN (1866- ). An American horticulturist, born in Denmark. He came to the United States in 1873 and was graduated from the Iowa Agricultural College in 1887. From 1891 to 1895, he was assistant professor of horticulture at the Iowa Agricultural College and after the latter date, professor of horticulture at the South Dakota Agricultural College and Experiment Station. Professor Hansen made explorations for the U. S. Department of Agriculture in Europe, Asia, and Africa, collecting new economic seeds and plants, and originating new fruits, especially the Hansen hybrid plum. He also introduced, from Turkestan and Siberia, new varieties of alfalfa, and imported the Siberian fat-rumped sheep. In 1924 he went to Manchuria for the State of South Dakota. He wrote numerous horticultural bulletins and papers and was also author of *Handbook of Fruit Culture and Tree Planting* (1890), and *Systematic Pomology* (with J. L. Budd, 1903). Professor Hansen was awarded the George Robert White Medal for eminent service in horticulture by the Massachusetts Horticultural Society in 1917.

**HANSON**, HOWARD (1896- ). An American composer, born at Wahoo, Nebr. Having received his first training at the Luther College Conservatory (Nebr.), he continued his studies at the School of Music of the University of Nebraska, at the Institution of Musical Art in New York, under P. Goetschius, and at the Northwestern University, Evanston, under P. Lutkin and A. Oldberg. In 1918-19 he taught theory and composition at the College of the Pacific, San José, Calif., and 1919-21 was dean of the School of Fine Arts. In 1921 he was the first recipient of a newly endowed fellowship in composition, awarded by the American Academy in Rome. The fellowship, determined by a composition in a prescribed form and submitted in open competition, provides for a three years' residence in Rome, with privilege of travel, and an annual allowance of \$2000.

In 1924, after his return to the United States, he was appointed director of the Eastman School of Music of the University of Rochester. He appeared as conductor of his own works with several of the leading American symphony orchestras. In 1923 he conducted a programme of American music with the Augusteo orchestra in Rome. His works include: *Nordic Symphony*, *Symphony No. 2* (with organ); the symphonic poems, *North and West*, *Lux Aeterna*, *Exaltation*, *Before the Dawn*, and *Pan and the Priest*; a *Symphonic Rhapsody*; a piano concerto; two piano quintets; and *The Soul of Sequoia*, a festival play for the California Redwood Park Festival (1920). He was commissioned to write a string quartet for the Berkshire Festival of 1925 and a choral work, *The Lament for Beowulf*, for the Leeds Triennial Festival of 1925. For the Beethoven Centennial, 1927, he wrote *Heroic Elegy*, for chorus and orchestra.

**HANSON**, OLE (1874- ). An American public official, born in Racine County, Wis., and educated privately for the bar. He was elected mayor of Seattle in 1918 and gained national prominence by prompt and decisive measures in meeting and overcoming a general strike in February, 1919. He wrote *Americanism versus Bolshevism* (1920).

**HANUM** (HANIM), HALIDÉ EDIB. See HALIDÉ EDIB.

**HAPGOOD**, NORMAN (1868- ). An American editor and critic (see VOL. X). He was editor of *Harper's Weekly* (1913-16), and Minister from the United States to Denmark from February to December, 1919. He was editor of *Hearst's International Magazine*, 1923-25. He published *The Advancing Hour* (1920), and collaborated with Henry Moskowitz in *Up from the City Streets*, a biography of Alfred E. Smith of New York (1927).

**HARA**, TAKASHI (1854-1921). A Japanese prime minister. He served as an official in the Foreign Office at home and abroad, attaining the rank of vice minister in 1895. In 1900, he was one of the organizers, with the late Prince Ito, of the Seiyu-kai Party and soon afterward was made Minister of Communications. He held that portfolio again in the Seiyu-kai ministry of 1906-08, was Minister of Home Affairs in 1915, and in 1918 became Premier. As Prime Minister, he practically dominated the government, and, in general, was opposed to the too rapid absorption of European ideas. Other features of his policy were the more complete coöperation between the military and other branches of government service and a spirit of conciliation in foreign affairs. Many attempts were made to overthrow his cabinet, the opposition attacking it for its policy toward China in the matter of the "21 Demands" and for its Siberian policy, demanding that the Japanese troops be withdrawn. Negotiations with China over Shantung and the policy of the conference at Darien, in which Japan had hoped to come to an agreement with the Far Eastern Republic of China, tended to sharpen the hostility between the political parties. His assassination, which occurred at Tokyo, Nov. 4, 1921, was just at the time when the Japanese delegation was gathering for the Washington Conference. See JAPAN, under *History*.

**HARAHAN**, WILLIAM JOHNSON (1867- ). An American railway official born in Nashville, Tenn., and educated at St. John's

College, New Orleans. After holding several important positions, he was appointed chief engineer of the Illinois Central Railroad in 1902. He became general manager in 1904 and in 1907 was appointed assistant to the president of the Erie Railroad. He was vice president of that road in 1911-12 and in 1912-18, was president of the Seaboard Air Line, of which he was also Federal manager (1918-20). He was a member of the United States Railway Board of Adjustment and became president of the Cincinnati and Ohio Railway and the Hocking Valley Railway in 1920.

**HARBEN, WILLIAM NATHANIEL** (1858-1919). An American story-writer (see Vol. X). His last three publications were *The Inner Law* (1915); *Second Choice* (1916); and *The Triumph* (1917).

**HARBORD, JAMES GUTHRIE** (1866- ). An American army officer, born at Bloomington, Ill., and graduated from the Kansas State Agricultural College at Manhattan, Kan., in 1886 and from the Infantry and Cavalry School in 1895. He joined the 4th Infantry as a private in 1889, and reached the rank of colonel (1903), brigadier general (1918), and major general (1919). He served in the Philippines (1903-14), was chief of staff in the American Army in France (1917-18), and commanded the Marine Brigade near Château-Thierry during June and July, 1918. He also served at Soissons, and commanded the Service of Supply during 1918-19. He was chief of the American Military Commission to Armenia in 1919. In 1921-22 he served as deputy chief of staff, U. S. Army, and in December, 1922, was retired, becoming president of the Radio Corporation of America. He wrote *Leaves from a War Diary* (1925). The Distinguished Service Medal for both Army and Navy and numerous foreign decorations were bestowed upon him.

**HARDEN, hār'dēn, MAXIMILIAN** (ISIDORE WITTKOVSKY) (1861-1927). A German journalist and author (see Vol. X). During the World War, he was probably the most outspoken critic in Germany of the German government and its policies, his attacks appearing in his newspaper, *Die Zukunft*. He was put in jail at various times, but no physical harm came to him till 1922, when an attempt was made to assassinate him. He was twice suggested for the post of Ambassador to the United States, once in 1919, and again in 1921. His early war book, *Krieg und Frieden* (1918), was followed by *Deutschland Frankreich England* (1923, English ed., 1924), and a selection from his *Köpfe*. Studies of contemporaries published from 1910 to 1924 appeared in English under the title *I Meet My Contemporaries* (1925). Another war book, *Von Versailles zu Versailles*, appeared in 1927.

**HARDING, WARREN GAMALIEL** (1805-1923). The 29th President of the United States, elected in November, 1920. He was born at Corsica, Morrow Co., Ohio, Nov. 2, 1865, and studied at the Ohio Central University. Entering the newspaper business, he became editor and publisher of the *Marion* (Ohio) *Star*. He ran for the office of Governor of Ohio in 1910, but was defeated. In 1914 he was elected a Republican member of the United States Senate for the term of 1915-21. He nominated Mr. Taft in 1912 and was chairman of the Republican Convention in 1916, making the keynote speech. In politics, he belonged to the

"stand-pat" element which was bitterly opposed to the insurgents led by Roosevelt. He was a strong supporter of President Wilson's war policies during the conflict, but in the treaty fight, he stood with Senator Lodge and signed the famous "round-robin" disapproving the linking of the League of Nations with the Peace Treaty. He voted for the submission of the Prohibition and Woman Suffrage Amendments, and in general supported the policies of the majority of his party. In 1920 through the efforts of his friend, Harry M. Daugherty, afterward Attorney General, he was put forward prominently as a candidate for the Presidency. At the convention, he was nominated on the 10th ballot, receiving 692½ votes. His selection was somewhat of a surprise to the people at large. The most difficult question before the Republican candidate was that of the League of Nations. A strong element in the Republican Party was bitter against any form of participation, whereas a smaller but more influential body, represented by such men as Mr. Hughes, Mr. Hoover, and Mr. Root, favored some sort of co-operation. Mr. Harding put forward the idea of an association of nations to which the United States would belong but reserving the right of independent action, and he also favored an international court of justice. During the two years before his death, signs of revolt against the Republican organization were evident, and in 1922 the Republican majority in the House was greatly reduced in the Congressional elections. An agricultural bloc was formed in Congress as a result of the dissatisfaction of the farmers, especially those in the West. Shortly before President Harding's death, Shipstead and Magnus Johnson were elected to the Senate and a third party movement was threatened. The conspicuous features of the latter days of his administration were his advocacy of the Permanent Court of International Justice, which was sharply attacked by Senators Johnson, Borah, and others, and the opening of the Senate investigation into the Teapot Dome (Wyo.) and Elk Hills (Calif.) oil leases, which led to the prosecution of former Secretary of the Interior Albert B. Fall, and the lessees, Edward L. Doheny and Harry F. Sinclair. President Harding died at San Francisco, Calif., on Aug. 2, 1923, on his return trip from Alaska.

**HARDING, WILLIAM P. G(OULD)** (1864- ). An American banker born in Greene County, Ala. After graduating from the University of Alabama, he entered the bank of J. H. Fitts and Company at Tuscaloosa, from there went to the Berney National Bank at Birmingham, Ala., and from 1902 to 1914 was president of the First National Bank of Birmingham. He was a member, 1914-22, and governor, 1916-22, of the Federal Reserve Board at Washington, and has been closely associated with financial transactions of the United States Government. Since Jan. 1, 1923, he has been governor of the Federal Reserve Bank of Boston. He was managing director of the War Finance Corporation in 1918-19. He wrote *The Formative Period of the Federal Reserve System* (1925).

**HARDINGE, hār'ding, OF PENSURST, CHARLES, FIRST BARON** (1858- ). A British diplomat and public official (see Vol. X). He was again Permanent Under-Secretary of State for Foreign Affairs from 1916 to 1920, when he became Ambassador in Paris, serving there until 1922.

**HARDY, THOMAS** (1840-1928). An English novelist (see VOL. X), holder of the gold medal of the Royal Society of Literature. *The Dynasts* was produced in London early in the World War, and again in 1920. His later works were *Selected Poems* (1916); *Moments of Vision* (poetry, 1917); complete *Poetical Works* (2 vols., 1919, 2nd ed., 1923); *Late Lyrics* (1922); *The Queen of Cornwall* (drama, 1923); *Human Shows, Far Fantasies, and Songs, and Trifles* (poetry, 1925); *Winter Words in Various Moods and Metres*, last poems which Hardy planned to publish on his 1928 birthday (1928); and *Old Mrs. Chundle* (1928). Consult *The Technique of Thomas Hardy*, by J. W. Beach (1922); *Thomas Hardy's Universe*, by E. Brennecke (1924); *The Life of Thomas Hardy*, by his wife, Florence Emily Hardy (2 vols. vol. 1. 1928); *Essay on Hardy*, by H. H. Tomlinson (1928); *The Landscape of Thomas Hardy*, by Donald Maxwell (1928); and *Giant and Pygmy*, an appreciation in verse by Hibbert Gilson (1928).

**HARE, HOBART AMORY** (1862- ). An American physician, born in Philadelphia (see VOL. X). He resigned as editor of the *Therapeutic Gazette* in 1927. His book, *Practical Therapeutics*, published in 1890, reached its 20th edition in 1927.

**HARKINS, WILLIAM DRAPER** (1873- ). An American university professor and chemist, born at Titusville, Pa. He was graduated from Stanford University in 1900, after which he studied at the University of Chicago, Massachusetts Institute of Technology, and at Karlsruhe, Germany. He was instructor of chemistry at Stanford University in 1898, and in 1900-12, head of the department of chemistry in the University of Montana. He was chemist in charge of the Anaconda Farmers' Association's investigation of smelter smoke from 1902 to 1910, and did research work for the Carnegie Institution of Washington in 1911. Appointed assistant professor of chemistry at the University of Chicago in 1912, he became professor of physical chemistry there in 1917. He gave many lectures on industrial research, was editor of the section on general and physical chemistry of *Chemical Abstracts*, and wrote many technical papers giving the results of original researches.

**HARMSWORTH, ALFRED CHARLES WILLIAM**. FIRST VISCOUNT HARMSWORTH. See NORTHCLIFFE, ALFRED CHARLES WILLIAM HARMSWORTH, FIRST VISCOUNT.

**HARRIES, GEORGE HERBERT** (1860- ). An American general, born at Haverfordwest, in Wales. In 1895-96, he was president of the Metropolitan Railroad Company of Washington, and from 1897 to 1915, commanded the military and naval militia of the District of Columbia. During the Spanish-American War he was colonel of the 1st District of Columbia Infantry, United States Volunteers. In the World War, he served as a brigadier general, U. S. Army, with the A. E. F. He acted as chief of the United States Military Mission at Berlin, Germany, in 1918-19, and was appointed brigadier general of the Officers' Reserve Corps in 1920, and major general in 1924. He was national commander-in-chief of the Military Order of the World War, 1920-25.

**HARRIS, CORRA MAY** (MRS. L. H. HARRIS) (1869- ). An American author (see VOL. X). Her later books include: *The Co-Oritisena* (1915); *A Circuit Rider's Widow* (1916); *Making Her His Wife* (1918); *From Sunup to Sun-*

*down* (1919); *Happily Married* (1920); *My Son* (1921); *The Eyes of Love* (1922); *A Daughter of Adam* (1923); *My Book and Heart* (1924); *As a Woman Thinks* (1925); *Flapper Anne* (1925); *Happy Pilgrimage* (1927).

**HARRIS, FRANK** (1856- ). An English author and editor (see VOL. X), who was editor of *Vanity Fair*. Among his later works were *The Yellow Ticket, and Other Stories* (1914); *Oscar Wilde, His Life and Confessions* (1916); *Contemporary Portraits* (1915, 1919, 1920, 1923); *Undreamed of Shores* (1924); *My Life* (1926); *Joan la Romée* (drama, 1926); and *Latest Contemporary Portraits* (1927).

**HARRIS, J (AMES) ARTHUR** (1880- ). An American botanist and statistician, born at Plantsville, Ohio. He was educated at the University of Kansas and Washington University (Ph.D., 1903). He was assistant in botany (1901-03) at the Missouri Botanical Garden; instructor (1903-07) at Washington University; and botanical investigator at the Station for Experimental Evolution, Carnegie Institution (1907-24). Since 1924 he has been head of the department of botany at the University of Minnesota. He was awarded the Welden Medal and Memorial Prize by Oxford University in 1921. His published work was mainly in biometry.

**HARRIS, WILLIAM LAUREL** (1870-1924). An American mural painter (see VOL. X). His later works included the mural painting and decoration in the Paulist Church, St. Bartholomew's Church, and the Corpus Christi Chapel, all in New York City.

**HARRISON, FRANCIS BURTON**. See PHILIPPINES.

**HARRISON, FREDERIC** (1831-1923). The leader of the English Positivists, and a man of letters (see VOL. X). During the World War, he was active in the anti-German propaganda, having been a constant critic of British indifference to the German military activities. Among his later works may be mentioned: *The German Peril* (1915); *On Society* (1918); *Jurisprudence and Conflict of Nations* (1919); *Obiter Scripta* (1919); *Novissima Verba* (1920).

**HARRISON, HENRY SYDNOR** (1880- ). An American novelist (see VOL. X). His later works include *Angela's Business* (1915); *When I Come Back* (1919); *Saint Teresa* (1922); and *Andrew Bride, of Paris* (1925).

**HARRISON, LELAND** (1883- ). An American diplomat and State Department official. He was born in New York City and graduated at Harvard (1907). For a year, he served as private secretary to the American Ambassador to Japan. He was then secretary of embassies and legations at Tokyo, Peking, London, and Bogota (1908-15), and in 1915 was assigned to duty in the Department of State at Washington. He was diplomatic secretary of the American Commission to Negotiate Peace at the end of the World War. In 1920 he was counselor to the American Embassy in Paris, but in the following year returned to the State Department on special duty and served as expert assistant to the American commissioners at the Conference on Limitation of Armament in 1921-22. From 1922 to 1927, he was Assistant Secretary of State. In February, 1927, he was appointed Minister to Sweden and in September, 1929, was named as Minister to Uruguay.

**HARRISON, PAT** (BYRON PATTON) (1881- ). A United States Senator, born at Crystal Springs, Mass., and educated at the Louisi-

ana State University at Baton Rouge, La. He began law practice at Leaksville, Miss., in 1902 and later removed to Gulfport in the same State. He represented the Sixth District of Mississippi in Congress for four terms (1911-19), and was elected United States Senator for two terms (1919-31). In 1924 he made the keynote speech at the Democratic National Convention. He was a member of the Senate Finance Committee and opposed the tariff legislation of 1929.

**HARSHBERGER, JOHN WILLIAM** (1869-1929). An American botanist (see Vol. X). He was professor of botany at the University of Pennsylvania (1911-29), and from 1913 to 1921 was in charge of ecology at the Marine Biological Laboratory, Cold Spring Harbor, L. I. He was a president of the Philadelphia Natural History, and a vice president of the Ecological Society of America. Included among his later books are *Vegetation of South Florida* (1914); *The Vegetation of the New Jersey Pine Barrens* (1916); *Pastoral and Agricultural Botany* (1920).

**HART, ALBERT BUSHNELL** (1854- ). An American historian (see Vol. X). Among his later works are *Monroe Doctrine* (1915); *New American History* (1917); *School History of the United States* (1917); *America at War* (1917); *Causes of the War* (1920); *We and Our History* (1923); *Wall Maps of American Government* (1927). In addition, he edited *American Patriots and Statesmen* (1916); *American Year Book* (1911-20, 1926-27); *Commonwealth History of Massachusetts* (1927-28); *Epochs of American History* (4 vols., 1891-1926); *American History Told By Contemporaries* (5 vols., 1898-1928); *American Citizen Series* (7 vols., 1899- ); *Source Readers in American History* (5 vols., 1901-27); *The American Nation* (28 vols., 1903-18).

**HART, HASTINGS HORNELL** (1851- ). An American social worker, born at Brookfield, Ohio, and educated at Oberlin College and Andover Theological Seminary. He was ordained to the Congregational ministry in 1880. After 1883, when he became secretary of the Minnesota State Board of Corrections and Charities, he was identified with social work, later in the Illinois Children's Home and Aid Society, and the Russell Sage Foundation, in which he was director of the department of child-helping (1908-24), and consultant in delinquency and penology after 1924. Among his numerous works are *Preventive Treatment of Neglected Children* (1910); *A Social Welfare Programme for the State of Florida* (1918); *How to Give Wisely \$25,000 to \$1,000,000* (1921); *The Third Degree: Methods of Obtaining Confessions and Information from Persons Accused of Crime* (1921); *Employment for Jail Prisoners in Wisconsin* (1922); *A Study of the Penitentiaries of Pennsylvania* (1923); and an important study on *County Jails* (1925).

**HART, WILLIAM S.** (1870- ). An American motion-picture actor born in Newburgh, N. Y. He began his work in motion pictures in 1914 after having acted on the legitimate stage for many years. He has appeared chiefly in Western pictures, among his best being: *O'Malley of the Mounted and Travelin' On*. His most recent pictures are *Wild Bill Hickok*; *Singer Jim McKee*; *A Lighter of Flames*. In 1920 it was stated that Hart had appeared in 27 picture plays, bringing to producers and exhibitors a return estimated at nearly \$10,000,000.

**HARTFORD.** The capital of Connecticut. The population rose from 98,915 in 1910 to 138,036 in 1920 and to 172,300 in 1928, by estimate of the Bureau of the Census. The area is 18 square miles. Hartford is the leading insurance centre of the United States, more than 40 companies being controlled from Hartford offices. The assets of the Hartford insurance companies increased from \$462,160,129 in 1915 to \$1,693,519,555 in 1927, and during this period, they paid \$2,241,865,124 to policyholders and beneficiaries. Their premium income in 1927 was \$569,712,171. These companies employ approximately 16,000 persons, who are paid \$22,000,000 in salaries annually. Hartford has 337 industrial establishments employing 30,000 persons and paying \$32,850,000 in wages annually. Among the products manufactured are electrical equipment, automobile accessories, airplane motors, automatic machines, and pipe organs. In 1927 the value of these products was \$113,674,982. Several large commercial and civic buildings have been constructed recently, among them being 'Travelers' Tower, 527 feet high and the tallest structure in New England. The Horace Bushnell Memorial Auditorium is under construction, and a county court house, costing \$1,500,000, has been erected. Hartford has 25 elementary schools, 3 high schools, 1 trade school, and 9 parochial schools (including elementary and high schools); the appropriation for education in 1928 was \$3,320,531. Brainard Field, the municipal airport located on the Connecticut River, was opened in 1921. In 1928 it contained 165 acres, and an appropriation was passed which provided that the acreage be doubled. A \$1,000,000 bond issue also was voted to reclaim 1200 acres of land and provide a dike so as to keep the field dry in all seasons. Hartford has 10 State trust companies, 3 National banks, and 4 mutual savings banks, whose total resources in 1927 amounted to \$293,901,540. Bank clearings rose from \$261,404,106 in 1914 to \$832,271,076 in 1927 and deposits in discount banks from about \$46,000,000 to \$117,490,000; savings deposits increased from \$419.06 per capita in 1915 to \$720.92 per capita in 1928. The assessed valuation of property in Hartford in 1927 was \$338,789,000; the net debt was \$16,076,000.

**HARTS, WILLIAM WRIGHT** (1866- ). An American army officer, born at Springfield, Ill., and graduated at the United States Military Academy. He had a long and varied career in the Engineers Corps, and was made a brigadier general in 1924. President Wilson appointed him military aide in charge of public buildings and grounds, with rank of colonel, from 1913 to 1917. He built the Lincoln Memorial, the Arlington Memorial, and the Red Cross Building. In 1917 he went to France with his regiment. He was chief of the American Mission at the British headquarters in 1918, and chief of staff, Army of Occupation in Germany, during 1919-20, and from July, 1922, to March, 1923. He commanded the artillery forces at the Panama Canal, 1924-26, and was military attaché of the American Embassy at Paris after 1926.

**HARTY, SIR HAMILTON** (1879- ). A noted British conductor and composer, born at Hillsborough, Ireland. He received his entire musical education from his father, an excellent organist. After filling positions as organist in Belfast and Dublin, he settled, in 1900, in London, where he soon became known as an excellent

accompanist and appeared on several occasions as conductor of the London Symphony Orchestra and with the British National Opera Company. In 1920 he was appointed regular conductor of the Hallé Orchestra in Manchester. He was knighted in 1925. His compositions include the choral works with orchestra, *Ode to a Nightingale* and *The Mystic Trumpeter*; *Irish Symphony*; *Comedy Overture*; two symphonic poems, *A Tinker's Wedding* and *With the Wild Geese*; a violin concerto in D minor; *Phantasy Scenes* for orchestra; and chamber music.

**HARVARD UNIVERSITY.** A nonsectarian, endowed, educational institution at Cambridge, Mass., founded in 1636. Many changes were made in the methods of teaching, as well as in the requirements for admission and graduation, after 1914. Important additions were made to the library and the several museums. Various schools were reorganized and several new ones were established. Many new buildings were completed. Partly by means of an endowment-fund campaign, begun in 1917 but postponed because of the War until 1919, and partly through gift, the productive funds of the university were increased so that by 1928 the total reached \$86,702,875, in which year income totaled \$11,639,715. The teaching staff increased in number from about 800 in 1914 to 1311 in 1927-28 and in the same period the students increased in numbers from 4266 to 8110. In 1922 there was inaugurated a system of alumni voting by postcard ballot for the overseers, who form one of the two governing boards of the university.

Among the important changes in Harvard College was the adoption of a method of selective admission, instituted as an experiment in 1923, whereby pupils having satisfactorily completed an approved school course and ranking scholastically among the highest seventh of their graduating class, may, on the recommendation of their school, be admitted without examination. All seniors in Harvard College, except those specializing in mathematics or the natural sciences, were required to pass general examinations in the field of concentration, not only covering the courses taken by the individual, but outside reading as well; an extension of a policy successfully practiced for a number of years in other divisions, having been instituted in the division of history, government, and economics in 1916. The plan included the increased use of the tutorial system.

The Engineering School as such, awarding the degree of S.B. after four years of undergraduate study, as well as higher degrees, was reorganized in 1918, although the teaching of engineering at Harvard dates back to 1847 with the founding of the Lawrence Scientific School. In 1920 new methods of instruction were adopted, the students training partly in the laboratories and classrooms and partly in the neighboring industrial and engineering concerns. In the same year, it joined with the Graduate School of Business Administration in laying out a five-year programme of study in business engineering.

Three other schools were established between 1914 and 1928. The Graduate School of Education, for both men and women, was founded in 1920, partly through the assistance of the General Education Board, and largely through money obtained in the endowment fund campaign. This was a school for the professional training of teachers, principals, and school super-

intendents, and for research in educational problems. In 1922, pursuant to an agreement between the Harvard Divinity School and the Andover Theological Seminary, the Harvard Theological School, nondenominational in policy, was organized, with the Rev. Willard L. Sperry as Dean. The School of Public Health, closely allied with the Medical School, was established also in 1922, with a gift of \$20,000,000 from the Rockefeller Foundation, its dean being Dr. David L. Edsall, dean also of the Medical School. The Dental School raised its standard of admission in 1921, by establishing as a prerequisite for enrollment, at least one year of college work. In the Graduate School of Business Administration, instruction by the case system, such as was used in the Harvard Law School, was extended greatly. Exchange of professors with European institutions and with Western colleges was continued and in 1923 the exchange of tutors with English universities was inaugurated.

Many physical changes were made in and about the university. The Harry Elkins Widener Memorial Library was dedicated in 1915, as was the Cruft Memorial Laboratory for high-frequency electrical work. In 1915 the rebuilding of the Gray Herbarium was completed, and the Dudley Memorial Gate and Clock Tower was erected. Three Freshman halls, Standish, Gore, and Smith, were occupied in 1914 for the first time, and two new dormitories were dedicated in 1927, one erected in memory of Isidor Straus and the other in memory of George Alexander McKinlock, Jr., of the Class of 1916. Other buildings completed since 1914 include the Germanic Museum, the Music Building, containing the John Knowles Paine Concert Hall, the Dunbar Laboratory for research in cryogenic engineering, the Crimson Building to house the undergraduate daily paper and the alumni weekly, the McKay Engineering Laboratory, the new Fogg Art Museum, dormitories, laboratories and lecture and class rooms of the graduate school of business administration, the gift of George F. Baker, a footbridge across the Charles River, named in honor of John W. Weeks, former Secretary of War, new chemical laboratories, and a medical school dormitory.

By gift of Edward S. Harkness, of New York City, and a Yale graduate, Harvard acquired in 1928 the sum of \$3,000,000 for the erection of several houses by means of which the college will be subdivided into social and residential units. Early in 1929, this gift was supplemented by an additional sum, from the same donor for the same purpose, of \$10,000,000. According to announcement, the subdivision will begin with the construction of two houses, others to be added later, in part from existing dormitories. Each house will contain about 250 students who will, as far as possible, represent a cross-section of the entire college as regards subjects of concentration, finances, and geographical distribution. The innovation contemplated no change in the methods of teaching, responsibility remaining wholly under the direction of the Faculty of Arts and Sciences. The plan was expected to give an additional stimulus to scholarship and intellectual interest, but otherwise was not an educational but a social change. The plan will make possible more personal attention to the individual student. President, A. Lawrence Lowell, LL.D.

**HARVEY, GEORGE (BRENTON McCLELLAN)** (1864-1928). An American editor, publisher,

and diplomat (see VOL. X). From 1900 to 1915, he was president of Harper & Brothers, publishers, and during 1899-1921 and 1924-26 was editor of the *North American Review*. He was for many years one of the strongest supporters of Woodrow Wilson, urging his election as Governor of New Jersey, and later as President, in *Harper's Weekly*. Rumors that the weekly was supported by a special financial group, and that its campaign on his behalf was harming his cause in the West, led to a request from Mr. Wilson that Colonel Harvey withdraw his support, and eventually to a break between the two men. Colonel Harvey was one of the bitterest opponents of the entry of the United States into the League of Nations, thus further antagonizing Mr. Wilson. In 1920 the editor was a supporter of Warren G. Harding for the presidential nomination and election, making use for that purpose of a publication which he had founded, *Harvey's Weekly*. Mr. Harding appointed him Ambassador to the Court of St. James's. Three months after the death of President Harding, he resigned his ambassadorship (December, 1923). Upon his return to America, he edited the *Washington Post* for a year. In 1926 he relinquished his post as editor of the *North American Review*, and subsequently he devoted much of his time to writing a biography of Henry Clay Frick, published early in 1928. Colonel Harvey received the degree of LL.D. from the universities of Nevada and Vermont and from Middlebury and Erskine Colleges, and that of Litt.D. from Dartmouth College. Consult Willis Fletcher Johnson, *George Harvey* (1929).

**HASKELL, WILLIAM NAFEW** (1878- ). An American army officer, born at Albany, N. Y. He graduated from the United States Military Academy in 1901; from the Infantry and Cavalry School in 1904; and from the Army Staff College in 1905. He was made captain in 1916 and in 1917 was appointed major of field artillery in the National Army. He served throughout the World War, becoming lieutenant colonel in the Regular Army in 1920. In France, he served as assistant chief of staff with the 77th Division and participated in several important campaigns. Following the close of the War, he acted as head of the American Relief Commission to Rumania and was later director general of all relief in the Caucasus. In 1921-23 he served as chief of the American Relief Commission to Russia, and Red Cross Commissioner to Greece in charge of relief work incident to the Smyrna disaster. Returning to the United States he was commissioned major general in the New York National Guard in 1926.

**HASKINS, CHARLES HOMER** (1870- ). An American educator, born at Meadville, Pa. He graduated from Johns Hopkins University in 1887 and was instructor from 1889 to 1890. He served as instructor, professor of history, and professor of European history at the University of Wisconsin from 1892 to 1902. In the latter year, he joined the faculty of Harvard University as lecturer on history, becoming successively professor of history and Gurney professor of history and political science (1912). From 1908 to 1924, he served as dean of the Graduate School of Arts and Sciences, becoming a member of many foreign and American learned societies. In 1918-19 he was a member of the American Commission to Negotiate Peace, serving on the special committee on Alsace-Lorraine and the Saar Valley, and was also on several other com-

missions in Europe. From 1920 to 1926, he was chairman of the American Council of Learned Societies. He was the author of *The Normans in European History* (1915); *Norman Institutions* (1918); *Some Problems of the Peace Conference* (with R. H. Lord, 1920); *The Rise of Universities* (1923); *Studies in the History of Medieval Science* (1924); and *The Renaissance of the Twelfth Century* (1927). He was also editor of the *American Historical Series*.

**HASSALL, ARTHUR** (1853- ). An English historian (see VOL. X). In 1918 he wrote *France, Medieval and Modern*; in 1919, *A Handbook of British History*; in 1920, *British History* (chronologically arranged, 55 B.C.-A.D. 1919), and *European History* (chronologically arranged 476-1920), the latter being an enlarged edition of an old work.

**HASSAM, CHILDE** (1859- ). An American painter and etcher (see VOL. X). Especially interesting among his works during the decade were his flag pictures of Fifth Avenue, in which, with vitality and great effectiveness he caught the exultant spirit of flowing banners, as in "Allies Day." His etching was notable for its reticence and subtlety. Several important exhibitions of his drawings, etchings, and water colors were held in New York. Among his awards were the Altman Prize, National Academy of Design, 1918; the gold medal of honor, Pennsylvania Academy of Fine Arts, 1920; and the gold medal of the Sesquicentennial Exposition, 1926. In 1919 he became a member of the American Academy of Arts and Letters.

**HASTINGS, JAMES** (1852-1922). A Scottish editor and Biblical scholar (see VOL. X), who received the Dyke-Aceland Medal in 1913. Besides continuing to edit the series of dictionaries and encyclopædias begun some years ago, he started another series, *Great Christian Doctrines*, of which there appeared: vol. i, *Prayer* (1915); vol. ii, *Faith* (1919); vol. iii, *Peace* (1921); and *The Children's Great Texts of the Bible* (1920-21).

**HASTINGS, THOMAS** (1860-1929). An American architect (see VOL. X), member of the firm of Carrère & Hastings. He was a member of the National Academy of Design and the American Academy of Arts and Letters, and was president of the Society of Beaux Arts Architects. In 1924 a design made by him for the war memorial for New York City was accepted.

**HATCH, WILLIAM HENRY PAINE** (1875- ). An American theologian, born in Camden, N. J. He was graduated from Harvard in 1898 (Ph.D., 1904), and at the Episcopal Theological Seminary, Cambridge, Mass., and the General Theological Seminary, New York City. After ordination to the Protestant Episcopal ministry in 1902, he held charges in Cambridge, Mass. (1902-03), Lake George, N. Y. (1904-05), and Lexington, Mass. (1905-08). In 1909 he went to the General Theological Seminary, becoming professor of the language and literature of the New Testament there (1913-17) and in the Episcopal Theological Seminary in Cambridge (1917- ). He was annual professor at the American School of Oriental Research in Jerusalem, 1922-23. Dr. Hatch has published many articles and reviews and is the author of *The Pauline Idea of Faith* (1917) and *The Idea of Faith in Christian Literature from the Death of St. Paul to the Close of the Second Century* (1925).

**HAUK, MINNIE** (1852-1929). An American soprano (see VOL. X). In the fall of 1912, a

false report of her death was circulated in all the musical journals of the English-speaking world. The fact that this report was unfounded did not become known until in December, 1919, some friends issued a general appeal for assistance, as the artist had become destitute through the World War and was almost totally blind. The appeal met with a generous response. In 1923 it was reported that a successful operation had brought about an improvement in her sight. She died in Lucerne, Switzerland, Feb. 6, 1929.

**HAUPTMANN**, haupt'mán, GERHART (1862- ). A German poet, dramatist, and novelist (see VOL. X). At the outbreak of the World War, he had a controversy with Romain Rolland, who had challenged him to protest against the crime of Louvain. Later, he engaged in welfare work and was particularly active in caring for the wounded during the revolution in Berlin in 1919. His later writings comprise: *Der Bogen des Odysseus* (1914); *Parsival* (1915); *Der Ketzer von Soana* (1918); *Indipohdi* (1920); *Der weisse Heiland*, a dramatic phantasy (1920); *Anna*, a rural epic (1921); *Peter Brauer* (1921); *Phantom*, memoirs of a convict (1922); *Kaiser Maxens Brautfahrt* (1924); *Ausblicke*, a volume of essays (1924); *Die Insel der grossen Mutter*, a novel (1924); the tragicomedy, *Veland*, and the drama *Dorothea Angermann* (1926); *Till Eulenspiegel* (1927); and the novel, *Wanda* (1928). An earlier romantic drama, *The Sunken Bell*, was used by the Italian composer, Respighi, as libretto of an opera, presented at the Metropolitan Opera House in New York in 1928. English translations of his works appeared in London and New York, among them *Dramatic Works of Gerhart Hauptmann*, vol. xix, in 1928.

**HAUSER, HENRI** (1866- ). A French historian and economist who was born at Orán, Algeria, and educated at the École Normale Supérieure and passed through the academic hierarchy until he became professor on the faculty of letters in the Sorbonne. For the year 1922-23, he was the French visiting professor at Harvard University, lecturing on the history of capitalism.

An authority on the economic history of the latter Middle Ages and the Renaissance, Professor Hauser wrote illuminatingly on social conditions both of the past and present.

His works include *François de la Noue* (1893); *Ouvriers des temps passés; XVe-XVIe siècles* (1898); *L'Or* (1901); *L'Impérialisme américain* (1905); *Les Sources de l'Histoire de France au XVI<sup>e</sup> Siècle* (4 vols., 1906-15); *Études sur la réforme française* (1909); *La France et ses colonies* (1912); *Le Traité de Madrid et la cession de la Bourgogne* (1912); *La Guerre Européenne et le problème colonial* (1915); *Economic Germany* (Eng. trans., 1915); *Germany's Commercial Grip Upon the World* (Eng. trans., 1917); *Les Routes fluviales de l'Europe nouvelle* (1918); *Travailleurs et marchands dans l'ancienne France* (1920); *Propos d'un ignorant sur l'économie nationale* (1923); *La Nouvelle orientation économique* (1924); *L'Amérique vivante* (1924); *Les problèmes du régionalisme* (1924); *Histoire de la période 1560 à 1661* (1925); and *Les débuts du capitalisme* (1927).

**HAUSER, houz'ér, OTTO** (1876- ). An Austrian writer, who was born at Dianesch, Croatia, and studied at the University of Vienna. He is the author of *Weltgeschichte der Literatur*

(1910); *Rassebücher, Rasse und Rassefragen* (1913); *Geschichte des Judentums* (1921); and other works of a critical and historical character. He translated Verlaine, Rossetti, Swinburne, Wilde, Van Eeden, and others, prefacing the translations by illuminating essays. He compiled anthologies of Chinese, Japanese, and Scandinavian poetry with appropriate appreciations, and he has published his own works which include: *Spinoza* (1908); *Alt Wien* (1910); *Der liebe Augustin* (1913); *Das Deutsche Herz* (1921); and *Atlantis* (1921). Among his later works are *Biblische Sonnette*, poems (1922); *Das Licht der Welt*, poems (1922); *Das Nibelungenlied* (1923); *Rasse und Kultur* (1924); and *Der germanische Glaube* (1926).

**HAUSMANN, hous'mán, ERICH** (1886- ). A German-American physicist, born in Solinger, Germany. He was graduated at the Brooklyn Polytechnic Institute in 1908, then studied at New York University. Returning to the Polytechnic Institute, he taught physics and electrical engineering, becoming professor of physics in 1918. In addition, he was a member of the graduate faculty at New York University during 1911-16. He specialized on methods of electrical communication, transmission, and traction, and on wave propagation along conductors. Dr. Hausmann has been very active in the Brooklyn Institute of Arts and Sciences, serving as vice president of its department of electricity (1909-21), and later as president. He is the author of *Electric Wave Propagation and Distribution along Conductors* (1911); *Telegraph Engineering* (1915); *Dynamo Electric Machinery* (1922); and, with others, of *Alternating Current Machines* (1908); *Direct Current Machines* (1909); *Electric Traction and Transmission Engineering* (1912); and *Physics Laboratory Experiments* (1917).

**HAVERFORD COLLEGE.** An institution under the control of the Society of Friends, at Haverford, Pa., founded in 1833. Haverford grew steadily during the years 1914-1929 with the exception of the War years, from an enrollment of 176 to 297; the faculty membership increased from 22 to 33; the library from 62,000 to 107,000 volumes; and the productive funds from \$1,100,000 to \$4,188,313. The Isaac Sharpless Science Hall for physics and biology was built in 1919, and the children of Gideon Scull gave \$146,000 in 1916 to establish a chair in English Constitutional History. William Wistar Comfort, Ph.D., LL.D., succeeded Isaac Sharpless, LL.D., as president in 1917.

**HAVRE, há'vër; Fr. LE HAVRE, lê á'vr.** The second largest seaport of France, capital of an arrondissement of the same name in the department of Seine-Inférieure, on the estuary of the Seine, and 228 kilometers (141.6 miles) from Paris. The population in 1926 was 158,022. Havre is an important cotton market, four-fifths of France's cotton supply entering through this port. It is also a leading coffee mart. Other imports are brass, wool, and tea. The manufactures include rope, wire, dyes, cloth, and flour. Since 1926 Havre has entered upon a vast programme of port extension and the construction of quays and basins upon ground reclaimed from the Seine. Among these improvements are the building of a breakwater on the sea side of the old breakwater of Saint-Jean and of a dyke approximately 1000 meters (3280 feet) long at the mouth of the Seine to the east, so as to form a new outer harbor and a tidal basin

of approximately 200 hectares (494.2 acres). In October, 1927, a new drydock, 312 meters (1023.6 feet) long and 38 meters (124.6 feet) wide, was opened. The total length of docks devoted solely to regular shipping is 6000 feet, and the area of open spaces bordering them totals 225 acres. In 1929 an ocean quay, 2000 feet long and with a depth of water in the berths of 48 feet, was under construction. The buildings used for the storage of cotton cover 90,000 square yards. Havre also has five public warehouses, covering an area of 550,000 square yards. The port is autonomous. During the World War, Havre was one of the great bases for the landing of British and American troops. The seat of the Belgian government after the fall of Antwerp and Ostend, was transferred to Sainte-Adresse, a suburb of Havre, the Parliament meeting at the Hôtel des Régates.

**HAWAIIAN ISLANDS**, or **HAWAII**. A territory of the United States, consisting of a group of islands in the north-central Pacific Ocean. Total area, 6449 square miles. The population of Hawaii increased from 191,909 in 1910 to 255,912 in 1920. The population on June 30, 1927, was estimated at 333,420. There is a great diversification of races among its population, and with the exception of the native Hawaiians, all are increasing. The Japanese form the largest proportion; they numbered 79,875 in 1910, and 109,274 in 1920. The Portuguese are second, with 22,301 in 1910 and 27,002 in 1920. The number of native Hawaiians decreased from 20,041 in 1910 to 23,723 in 1920. The other races forming the population, with their numbers, in 1910 and 1920, are as follows: Asiatic Hawaiian, 3734, 6956; Caucasian Hawaiian, 8722, 11,072; Porto Rican, 4890, 5602; Spanish, 1190, 2430, other Caucasian, 14,867 19,708; Chinese, 21,674, 23,507; Filipino, 2361, 21,031; Korean, 4533, 4950; Negro, 695,348; all other, 310, 376. In 1927 there were 12,296 births and 3029 deaths. The average rates for the five-year period, 1923 to 1927, were 39.2 and 13.4 per 1000 inhabitants, respectively.

**Agriculture.** The agricultural development of the Territory is under the Bureau of Agriculture and Forestry and the College of Hawaii. In addition to these, there are the Federal Experiment Station, which is assisted financially by the Territory, and the Hawaiian Sugar Planters' Association's Experiment Station, which meets the needs of the sugar industry. Up to July 1, 1915, the work of the Bureau was supported by a special income tax. Following that year, specific appropriations were made out of the general revenues. The United States Census of 1910 showed a total area of 305,053 acres of cultivated agricultural lands in the Territory. The maximum of the possible cultivable land is about 40,000 acres. Between the years 1910 and 1920, the number of farms in the Territory increased from 4320 to 5284. The land in farms increased from 2,590,600 acres in 1910 to 2,702,245 in 1920, while the improved land in farms increased from 305,053 acres in 1910 to 435,242 acres in 1920. The percentage of the total area in farms increased from 62.8 in 1910 to 65.5 in 1920. The value of farm property increased from \$96,363,229 in 1910 to \$151,129,085 in 1920, and the average value per farm increased from \$22,306 in 1910 to \$28,601 in 1920. The chief agricultural industry in the islands was the growing of sugar cane. The acreage under cultivation in 1909 was 186,230, and the

sugar cane was harvested in 1926 from 123,000 acres. The sugar yield of the cane crop has risen persistently, owing to improving methods of cultivation, although the cane acreage remains nearly stationary. The highest sugar tonnage up to 1924 was 645,000 tons in 1917; in 1926, 787,246 tons were produced; in 1927, 795,850. Rice is the most important cereal grown. The acreage, however, decreased after 1909. Production decreased from 41,827,900 pounds in 1909 to 29,571,845 pounds in 1919. The acreage planted to coffee increased from 3727 in 1909 to 5687 in 1919, while the production increased from 9,834,026 pounds in 1909 to 19,883,650 pounds in 1919. The growing and canning of pineapples has become the second largest industry. Its cannery output rose from 12,361,695 pounds in 1909 to 299,981,433 pounds in 1919. Canned-pineapple shipments for a year, 1926-27, were reported as 410,570,332 pounds; in value, \$35,403,305. Other fruits produced were avocados, bananas, figs, oranges, and papayas. The number of farm owners increased from 963 in 1910 to 1419 in 1920. The managers decreased from 249 in 1910 to 126 in 1920, and the tenants increased from 3108 in 1910 to 3739 in 1920. The white farmers increased from 753 in 1910 to 892 in 1920; the colored farmers from 3567 in 1910 to 4392 in 1920. The Department of Agriculture and Forestry and the Agricultural Experiment Station did work with excellent results, especially in the period from 1914. Largely through the efforts of the Agricultural Experiment Station, agriculture became more diversified. The Experiment Station was particularly successful in discovering and destroying plant pests which were destroying sugar cane and fruits. The Extension Division was established in 1914 and has developed numerous helpful points of contact with the various agricultural interests throughout the country. Owing to the effect of the mountains on the rainfall, most of the prime sugar cane land depends on irrigation. For this reason, forestry has been carried on in close alliance with agriculture, as a means of water conservation. Territorial forest reserves in 1927 aggregated 916,977 acres.

**Manufactures.** The chief industries of Hawaii were based largely on the production of sugar. The number of establishments decreased from 500 in 1909 to 496 in 1919. The wage earners, however, increased during the same period from 5904 to 9969. The capital invested was \$23,875,000 in 1909 and \$48,851,000 in 1919. The value of products increased from \$47,404,000 in 1909 to \$133,096,000 in 1919. There were 43 establishments in 1919 connected with the manufacture of sugar, compared with 46 in 1909. The value of the products of these increased from \$35,959,822 in 1909 to \$80,236,244 in 1919. In 1909 there were 74 establishments engaged in the cleaning and polishing of rice, as compared with 69 in 1919. The value of the product increased from \$2,238,667 in 1909 to \$5,436,455 in 1919. Ten establishments in 1909 were engaged in canning and preserving, as compared with nine in 1919. The value of the product increased from \$1,591,073 in 1909 to \$18,997,975 in 1919. These industries practically comprised the most important part of the manufacturing done in the Territory. Printing and publishing, cleaning and polishing coffee, the production of lumber, and the making of confectionery and ice cream were other manufacturing industries. Honolulu and Hilo are the chief manufacturing cities.

In Honolulu in 1909, there were 236 establishments and 241 in 1919. Hilo had no manufactures in 1909, but had 57 establishments in 1919. The value of the manufactures of Honolulu increased from \$10,704,744 in 1909 to \$43,611,175 in 1919. The industries of Hilo had a product valued at \$5,612,196 in 1919.

**Education.** The educational problems of Hawaii have been peculiarly difficult because of the mixture of populations and the Territory's comparatively rapid increase. There were 161 schools in 1913, and 25,631 pupils. The cost of maintenance was \$677,799. In 1925-26, there were 507 schools, and the enrolled pupils numbered 58,860, of whom 54,782 were in kindergarten or elementary, and 4078 in the secondary, grades. In 1914 there were 10,329 Japanese in the public schools. This number had increased in 1923 to 23,947. The Chinese increased from 2638 in 1914 to 4616 in 1923. The Hawaiians increased from 3288 in 1914 to 3565 in 1923. The Anglo-Saxons increased from 737 in 1914 to 1448 in 1923. Great attention has been given to the proper development of the educational system, especially with regard to agricultural and manual training. As part of this proceeding, there was a considerable reorganization and redirection of the public-school curriculum for the purpose of giving adequate recognition to branches. Junior high schools were established some years ago, and these became very popular among the people and greatly increased the interest in educational work wherever established. There were in 1927, 62,208 pupils in the public schools of the Territory, of whom 32,019 were male. The University of Hawaii, established in 1907, formerly the College of Hawaii, afforded opportunity for higher education. The enrollment increased from 144 in 1914 to 840 in 1927. The relations of the university and the community at large became much closer through the work of the extension department. Two industrial schools, one for boys and one for girls, also were maintained.

**Trade and Commerce.** The development of trade and commerce is indicated by annual totals covering several years. In 1914 the total of imports and exports amounted to \$77,144,329, of which \$41,594,072 represented exports and \$35,550,257, imports. In 1920 the total trade amounted to \$168,063,451, exports being \$104,779,804 and imports, \$63,283,647. In 1923 the total trade amounted to \$147,645,131, exports being \$72,768,317 and imports, \$64,876,814. In 1926 the total trade was \$200,342,000, of which exports amounted to \$111,504,000; imports, \$88,838,000. The exports to the United States in 1914 amounted to \$40,678,827 and the imports from the United States to \$29,267,699. In 1923 the exports to the United States amounted to \$116,956,090 and the imports from the United States to \$77,823,643. The total amount of raw sugar exported increased from 1,089,389,928 pounds, valued at \$32,108,518 in 1914, to 1,725,481,372 pounds, valued at \$70,177,023 in 1928. Fruits and nuts exported in 1914 were valued at \$5,061,525 and in 1928 at \$39,594,090, constituting, with sugar, the two largest groups of exports. Other important exports were coffee, rice, and hides. By far the largest trade was carried on with the United States, but there were important trade relations with Australia, British India, Canada, Japan, Chile, and the United Kingdom. The foreign imports consist chiefly of jutes from India, nitrates from Chile, silks from

Japan and China, native foodstuffs from Japan, and meat and butter from Australia and New Zealand. The exports to foreign countries are largely canned pineapples.

**Transportation.** The mileage of steam railroads in Hawaii increased from 307.43 in 1914 to 371.55 in 1927. There were steam railroads on all the islands operating on regular schedules, most of them carrying passengers. In addition, plantations possessed their private railway equipment for transporting cane and laborers. Passengers carried on all the railroads decreased from 1,958,548 in 1923 to 1,100,151 in 1927. The only street railway in the Territory is in Honolulu, where an electric line is operated. Traffic with the mainland is maintained by a number of steamship lines from New York and the west coast of the United States. In 1922 direct passenger and freight services were established between Los Angeles and Honolulu. Inter-island service was maintained by large and well-equipped steamboats.

**Banking.** The number of banks in the Territory increased from 19 in 1914 to 23 in 1927, while the individual deposits increased from \$10,371,874 in 1914 to \$79,214,000 in 1927. There were, in 1927, two National banks, a decrease from the five of 1914. One of these was at Honolulu and the other at Scofield. Their combined resources were \$9,223,000 in 1927; resources of all banks \$105,643,000.

**Finance.** The funded debt of Hawaii at the beginning of the fiscal year 1914-15 was \$6,844,000. This was increased, until on June 30, 1920, it amounted to \$10,894,000. Further increases brought the total on June 30, 1926, to \$22,070,000. A large part of this debt was incurred for public improvement and authorized by the Legislature in successive sessions since 1917. The increase in receipts and disbursements since 1914 will be noted by a comparison of the figures for several years of the period. In the fiscal year 1914-15, the total receipts amounted to \$4,905,149 and the disbursements to \$4,446,415. In 1923 the total receipts amounted to \$12,990,542 and the disbursements to \$11,533,819. In the year ended June 30, 1926, the receipts amounted to \$30,484,366 and the disbursements to \$26,311,921. The gross assessed value of real and personal property increased from \$161,187,226 in 1914 to \$414,064,603 in 1927. The taxes collected on real property increased from \$1,068,297 in 1914 to \$4,726,256 in 1923. The total of property and special tax receipts in the fiscal year 1926 was \$7,129,434.

**Health and Sanitation.** Nearly all the public-health work in the Territory was done by the Territorial Department of Public Health. The death rate per thousand in population decreased from 15.03 in 1914 to 11.87 for 1927. Campaigns for the eradication of rats and mosquitoes were carried on as sanitary measures. For many years, plague had been endemic in the Hamaqua district and the island of Hawaii, and the object in these areas was the destruction of rats which acted as carriers of the germs of the plague. In 1923 nearly 200,000 rats were destroyed. Several cases of plague occurred each year. Material progress was made in a sustained campaign against tuberculosis. Education and publicity work were carried on in the public press and lectures, and sanitarium were maintained for persons suffering from this disease. The Hawaiian race is especially susceptible to tuberculosis. Nearly one out of

every 100 persons of this race has the disease or traces of it. Institutions were maintained on the island of Molokai and other localities in the islands for the treatment of leprosy. The number of persons living segregated in the Molokai leper settlement in 1927 was 497. The installation of sewage systems in Hawaii and other localities resulted in a great improvement in the sanitary conditions. The United States Public Health Service rendered valuable aid in the decade, having general charge of the examination of vessels entering the ports. It also helped the Territorial Board of Health in its rat campaigns and other functions of that department.

**History.** A direct primary law, somewhat similar to the Berkeley system of double elections, was adopted by the Legislature of 1913 and elections were held under this law in 1915 and in the odd years thereafter. Sessions of the Legislature also are held biennially. The Legislature of 1915 passed much legislation of an advanced character. The laws relating to taxation were amended and ample provision was made for the encouragement of immigration in the Territory. In 1916 the Government created the Hawaii National Park, which was the first national park lying outside continental United States. In this park were included the three volcanoes, Kilauea, Mauna Loa, and Haleakala. With the entrance of the United States into the World War, Hawaii took on added importance as a naval station, and it became the largest military outpost of the United States. The National Guard was brought in numbers and plan of organization to the maximum that could be obtained under voluntary service. Four regiments and other units were organized. This organization policed the islands, thus relieving the Regular Army of this duty.

At the outbreak of the War, there were eight German merchant vessels and gunboats interned in the Port of Honolulu and several merchantmen in the Port of Hilo. These were seized by the United States Government and placed at once in commission. The Legislature in 1917 created a commission to conserve and regulate the food supply, revised banking laws, and made provision for the citizens absent in the Army and Navy. On July 1, 1918, the first and second regiments of Hawaiian Infantry were drafted into the national service. Owing to the greatest storm in the history of the Territory, a special session of the Legislature was held in this year and appropriations made to rebuild bridges and other public works destroyed by the storm. On Aug. 21, 1919, the Secretary of the Navy opened the new concrete drydock at Pearl Harbor on the island of Oahu. There was a serious strike on the sugar plantations in February, 1920, which lasted until June, when the laborers decided to return to work on the conditions that prevailed before the strike.

At the legislative session of 1921, an act was passed raising the limit of outstanding bonded indebtedness to \$16,500,000. A court of domestic relations was created and hours of child labor were regulated. A measure also was passed creating an emergency labor commission. The Legislature of 1923 authorized the preparation of a statement defining and emphasizing the status of the Territory, which was entitled "Hawaii's Bill of Rights." This statement was designed to emphasize the unique position held by Hawaii among the Territorial possessions, in

that it had always been a source of Federal revenue while it had been uniformly deprived of the benefits of the Federal appropriations. The Legislature of 1923 amended the election laws, revised the Territorial Tax Law, increased the bonded indebtedness, amended the Workmen's Compensation Act, and passed a uniform law on aeronautics. Conferences of Pacific leaders organized by the Pan-Pacific Union and held at Honolulu have met in various years since 1914.

A conference of scientists was held in 1920, a conference of educators in 1921, a conference of journalists in the same year, and a conference of commerce and finance in November, 1922. In addition, a conference on education was held in connection with the World Conference on Education which met in San Francisco in July, 1923. The United States Congress created the Hawaiian Homes Commission in 1920 to administer a project for rehabilitating the Hawaiian race; the Legislature of 1927 took steps to extend this work and obtain for it further Federal support. Lawrence M. Judd was appointed Governor of the Territory by President Hoover in 1929.

**HAWES, HARRY BARTOW** (1860- ). A United States Senator. He was born at Covington, Ky., graduated in law at the St. Louis Law School (Washington University) in 1896, and began practice in St. Louis. He represented the Republic of Hawaii in negotiations resulting in its annexation by the United States in 1898. He was a member of the Missouri House of Representatives (1916-17), represented the 11th Missouri District in Congress for three terms (1921-27), and was elected to the United States Senate as a Democrat for the term 1927-33. In the World War he was a captain in the U. S. Army, and was military attaché at Madrid. In Missouri, he was active in the agitation for good roads. He was also an organizer of the Lakes to Gulf Deep Waterways Association.

**HAWK, PHILLIP BOVIER** (1874- ). An American physiological chemist, born at East Branch, N. Y. He was graduated in 1898 at Wesleyan and studied at Yale and Columbia Universities, taking his Ph.D. at the latter in 1903. During 1901-03 he was assistant in physiological chemistry at Columbia and then went as demonstrator of that subject to the University of Pennsylvania. He held a similar professorship at Illinois in 1907-12 and later accepted the chair of physiological chemistry and toxicology at Jefferson Medical College in Philadelphia, 1912-22. Since 1926 he has been president and director of the Food Research Laboratories of New York. Dr. Hawk made a specialty of such subjects as metabolism, animal acids, food and nutrition, and the drinking of water, on all of which he has published papers. Besides editing the *Journal of Metabolic Research*, he was an associate editor of *Chemical Abstracts*. He is the author of *Practical Physiological Chemistry* (1907); *What We Eat and What Happens to It* (1919), and *The Lottery of Love* (1925).

**HAWKES, HERBERT EDWIN** (1872- ). An American educator, born at Templeton, Mass. He was graduated from Yale University in 1896 and was instructor of mathematics in that university in 1898. After post-graduate studies in Germany, he was appointed assistant professor of mathematics at Yale in 1903, serving until 1910, when he became professor of mathematics in Columbia University. In 1917-

18, he was acting dean of Columbia College and after 1918, dean. He is the author of *Advanced Algebra* (1905); *Higher Algebra* (1913); *College, What's the Use?* (1927); and the co-author of several books on mathematics. He has conducted important researches in hyper-complex numbers.

**HAWKINS, SIR ANTHONY HOPE** (1863-

). An English novelist known as Anthony Hope (see VOL. XI), who was knighted in 1918. He published: *A Young Man's Year* (1915); *Captain Dieppe* (1918); *Beaumaroy Home from the Wars* (1919); *Lucinda* (1920); *Little Tiger* (1925); and *Memories and Notes* (1927).

**HAWLEY, RALPH CHIPMAN** (1880-

). An American forester, born at Atlanta, Ga. He graduated from Amherst College in 1901 and from the Yale School of Forestry in 1904. After serving with the United States Forest Service, he was assistant State Forester of Massachusetts (1906-07) and professor of forestry at the Yale School of Forestry (1907-). Professor Hawley is the author of *Forestry in New England* (1912); *A Manual of Forestry* (1918); and *The Practice of Silviculture* (1921).

**HAWORTH, PAUL LELAND** (1876-

). An American author, born at West Newton, Ind. He graduated from Indiana University in 1899 and took post-graduate courses in history at Columbia University. He was a member of the faculty of several schools and colleges, including the Michigan Northern State Normal School, Columbia University, and Bryn Mawr College, from 1906 to 1911. In 1916 he made explorations in the Canadian Rockies and revisited the same region in 1919, discovering new lakes and mountains. In 1918-19, he was acting professor of history at Indiana University and was a member of the Indiana House of Representatives in 1920-21. Since 1922 he has been professor of history at Butler College, Indianapolis, Ind. He was the author of: *The Path of Glory* (1911); *America in Ferment* (1915); *George Washington, Farmer* (1915); *The United States in Our Own Times, 1865-1920* (revised, 1924); *Trailmakers of the Northwest* (1921). He edited *The Problems of the Nations* (4 vols.).

**HAWTHORNE, CHARLES WEBSTER** (1872-

). An American painter (see VOL. XI). Among his later awards were the Altman Prize, National Academy of Design, 1915; the Temple Medal, 1915; the Lippincott Prize, Pennsylvania Academy of Fine Arts, 1922; the Harris Prize and silver medal, 1923; the W. A. Clark Prize and silver medal, Corcoran Gallery Washington, 1923; the Carnegie Prize, Academy of Design, 1924; the Proctor Prize, National Academy of Design, 1926; the first W. A. Clark Prize, Corcoran Gallery, 1926. In his later paintings, among them, "Fisherman and Daughter," and "Adoration," there was still a spirit reminiscent of the Italian primitives.

**HAY, IAN.** See BEITH, JOHN HAY.

**HAY, WILLIAM HENRY** (1860-

). An American army officer, born in Jefferson County, Fla. He was graduated from the United States Military Academy in 1886, entered the United States Army as second lieutenant of the 3d Cavalry, and continued in the service until his retirement in 1923, in which year he was also made a major general. As colonel, he commanded the 15th Cavalry in the Philippines in 1917; and in the World War, he commanded the 28th Division, participating in the campaigns of

the St. Die sector, the Vosges, the Pont à Mousson sector, the Thiancourt sector, the Meuse-Argonne offensive, and the offensive of the 2d Army Corps. Later, he served in the Inspector General's office (1920) and then with the General Staff (1921). He was chief of staff of the American forces in Germany, 1921-22. For his services, he received the United States Distinguished Service Medal, and the Croix de Guerre with two palms, and was made a commander of the Legion of Honor and the Black Star (French), and the Order of Leopold (Belgian).

**HAYAKAWA, SESSUE KINTARO** (1889-

). A Japanese actor and playwright, who was born in Tokyo and graduated from the Navigation School of Japan in 1907, when he came to America. He studied political economy and literature at the University of Chicago and starred in moving pictures with various companies, including his own. Among his productions, of which he is also author, are *His Birthright*; *Hearts in Pawn*, and *Even unto Eternity*.

**HAYES, CARLTON JOSEPH HUNTLEY** (1882-

). An American educator and historian, born at Afton, N. Y. He graduated from Columbia University in 1904, and after post-graduate courses at that university became lecturer in history in 1907, assistant professor in 1910, associate professor in 1915, and full professor in 1919. In the World War, he served as captain of the United States Military Intelligence Division of the General Staff in 1918-19. He is a member of many historical and other learned societies and is the author of *Sources Relating to Germanic Invasions* (1909); *British Social Politics* (1913); *Political and Social History of Modern Europe* (1916; revised, 1924); *Brief History of the Great War* (1920); *Essays on Nationalism* (1926). He is also co-author of *The League of Nations; Principle and Practice* (1919); *International Relations* (1922); *Modern History* (1923); *Recent Political Theory* (1924); *These Eventful Years* (1924); *Ancient and Medieval History* (1928).

**HAYES, DOREMUS ALMY** (1863-

). An American theologian (see VOL. XI). He published *Paul and His Epistles* (1915); *John and His Writings* (1917); *The Synoptic Gospels and the Book of Acts* (1919); *Great Characters of the New Testament* (1920); *New Testament Epistles* (1921); *Greek Culture and the Greek Testament* (1925); *The Heights of Christian Love* (1926); *The Heights of Christian Unity* (1927).

**HAYES, PATRICK JOSEPH** (1867-

). An American cardinal, born in New York, and educated at Manhattan College, New York City, and the Catholic University of America. He was ordained priest in 1892, was president of Cathedral College from 1903 to 1914, and became rector of St. Stephen's Church in 1915. He was made Archbishop of New York in 1919. During the World War, he was appointed Catholic chaplain bishop for the United States Army and Navy. In 1924 he was nominated as cardinal, and went to Rome to be formally inducted into the office.

**HAYES, SAMUEL PERKINS** (1874-

). An American psychologist, born at Baldwinsville, N. Y. Educated at Amherst College, Union Theological Seminary, Columbia and Cornell universities, he became professor of psychology at Mount Holyoke in 1906. He was also director of psychological research of the Pennsylvania Institution for the Blind, the Perkins

Institution and the Massachusetts School for the Blind. He specialized in the psychology of the blind and color blindness and published an important monograph; *Mental Measurement of the Blind* (1915).

**HAY FEVER.** This affection tends to merge itself in the larger group of foreign protein sensitizations, and to range itself more and more with the asthmas and food intoxications. The former plan of inoculation in the spring with mixed pollens seems to be giving way more and more to a policy of identifying the specific exciter of the disease and immunizing against it. Dr. Schleppegrell of New Orleans has done great service in describing all plants that can set up hay fever and in giving them something of a rating as to their individual importance. In 1922 Dr. Vaughan of Richmond published the result of his experiments in isolating the offending plant in the individual case. Only when immunization with mixed pollens has failed will it become necessary to take these pains. In intractable cases, this author found that the patients were especially sensitive to the short-ragweed pollen, although this does not mean that the individual is insensitive to all others. However, the patients in question recovered under injections of the pollen of this plant although, instead of the usual weekly injection, he employed daily injection, and it therefore is suggested that the latter plan be adopted in the obstinate case. In regard to the possibility that the patient in such cases has benefited by previous treatment, the author states that untreated subjects furnished the same result. In order to determine sensitiveness to individual pollens, the skin reaction is employed. The author usually preferred to make successive routine tests with short ragweed, giant ragweed, timothy, daisy, sunflower, corn, orchard grass, goldenrod, etc., although with most of these plants reaction will be negative. This is evidently preferable to attempt at selection.

Recent experience has shown the necessity of an occasional revising down of the list of plants which are noxious or innocuous for hay-fever sufferers. Thus, goldenrod, once regarded as hostile in this respect, has now been given a clean bill of health; and conversely, the paper mulberry, once pronounced innocent, has recently been shown to cause hay fever, and quite a few cases have been traced to it during the past two years. Certain Greek emigrants who had been sensitized to this pollen in the old country have developed hay fever attacks from this cause in the United States.

**HAYS, WILLIAM CHARLES** (1887- ). An American architect, born in Philadelphia, Pa. He graduated from the University of Pennsylvania and studied in Paris, beginning the practice of his profession in 1895. In 1904 he removed to California. He became assistant professor of architecture at the University of California in 1906 and was acting director of the School of Architecture, 1917-19. Since 1927 he has been full professor. He was consulting architect of that university and designed many of its buildings.

**HAYS, WILLIAM HARRISON** (1879- ). An American lawyer and public official, born at Sullivan, Ind. He was graduated at Wabash College in 1900, later studying law. He became chairman of the Republican Central Committee of Indiana in 1910 and in 1918 was chosen chair-

man of the Republican National Committee, continuing in that office until 1921, when President Harding appointed him to his cabinet, as Postmaster General. This place he held for one year and then resigned to become president of the Motion Picture Producers and Distributors of America. During the World War, he was chairman of the Indiana State Council of Defense.

**HAYWARD, WILLIAM** (1877- ). An American lawyer, born at Nebraska City, Nebr. He was educated in Munich, Germany, and studied law at the University of Nebraska, beginning practice in Nebraska City in 1897. During the Spanish-American War, he served as colonel of the 2d Infantry of Nebraska. He removed to New York in 1911 and became a member of the law firm of Wing & Russell. He was assistant district attorney for 1913-14, and was appointed member of the Public Service Commission in 1915. He resigned to recruit and organize the 15th Infantry (colored), which later became the 369th United States Infantry, and he commanded this organization in France. He was awarded the Croix de Guerre, also decorations from the United States and foreign governments. He served as United States Attorney for the Southern District of New York (1921-25).

**HAYWOOD, WILLIAM DUDLEY** (1869-1928). An American labor leader (see VOL. XI). He became conspicuous early in 1917, when, as secretary of the Industrial Workers of the World, with headquarters in Chicago, he was arrested on a charge of seditious conspiracy. He was sentenced to 20 years' imprisonment and to pay a fine of \$10,000, but was released on bail, and, in April, 1921, he fled to Russia. In March, 1922, he headed a group of American members of his organization who received a concession to operate the Nadejdinsky Iron Works in Russia. The enterprise was unsuccessful and Haywood became leader of the Kuzbas autonomous colony, in Siberia. This, too, failed, and he returned to Moscow in 1923, where he spent the rest of his life in minor activities for the Soviet government.

**HAZARD, CAROLINE** (1856- ). An American educator (see VOL. XI). During the World War, she was prominent in the work of the Woman's Council of National Defense (1916), the first Liberty Loan (1916), the War Savings Campaign (1917), and the United War Work Campaign (1918). She wrote: *The Yosemite and Other Verse* (1917); *Anchors of Tradition* (1924); *From College Gates* (1925); and *Songs in the Sun* (1927).

**HAZEN, CHARLES DOWNER** (1868- ). An American historian (see VOL. XI). He was professor of history at Columbia University after 1916 and at the University of Strasbourg, France, in 1920-21. His later works include: *Modern European History* (1917); *The French Revolution and Napoleon* (1917); *Alsace-Lorraine Under German Rule* (1917); *The Government of Germany* (1917); *Fifty Years of Europe* (1919); and *Modern Europe* (1920). He also edited *Historical Essays by Lord Macaulay* (1921); *The Kaiser vs. Bismarck* (1921); and *The Letters of William Roscoe Thayer* (1926).

**HAZEN, SIR JOHN DOUGLAS** (1860- ). A Canadian lawyer and statesman (see VOL. XI). He represented Canada at the Imperial War Cabinet in 1917, and in 1917-19 was chairman of the Canadian Section of the Interna-

tional Fisheries Commission. He also became Chief Justice of New Brunswick in 1917 and in the following year was knighted.

**HEAD, SIR HENRY** (1861- ). A British neurologist who was educated at the Charterhouse School and Trinity College, Cambridge, and received his medical degree from Cambridge in 1892. He also studied at the universities of Halle and Prague. He made many contributions to neurology and described the sensory areas of the skin known as Head's zones. For some years, he was editor of *Brain*. His work, *Studies in Neurology*, appeared in two volumes in 1919; and in 1926 he published *Aphasia and Kindred Disorders of Speech*, also in two volumes. He attracted much attention through dangerous self-experimentation. He was knighted in 1927.

**HEADLAM, hēd'lām, THE RT. REV. ARTHUR CAYLEY** (1862- ). An English theologian, Bishop of Gloucester since 1923 (see VOL. XI). He was Regius Professor of Divinity, Oxford University, Canon of Christ Church, Oxford (1918-23), and Bampton Lecturer (1920). His later works include: *The Miracles of the New Testament* (1914); *The Revenues of the Church of England* (1917); *The Study of Theology* (inaugural lecture, 1918); *The Doctrine of the Church and Christian Reunion* (Bampton Lectures, 1920); *The Life and Teachings of Jesus Christ* (1923); *The Church of England* (1924); *Jesus Christ in Faith and History* (1925); *Economics and Christianity* (1926); and *The New Prayer Book* (1927). See GLOUCESTER, BISHOP OF.

**HEALY, TIMOTHY MICHAEL** (1855- ). An Irish Nationalist leader (see VOL. XI), and Governor General of the Irish Free State (1922-28). His later publications are *The Great Fraud of Ulster* (1917); *The Planter's Progress*; and *Letters and Leaders of My Day* (1928). Consult *The Life of Tim Healy*, by Liam O'Flaherty (1927).

**HEARING.** See AUDITION.

**HEARST, WILLIAM RANDOLPH** (1863- ). An American newspaper publisher (see VOL. XI). Although he took no active part as a candidate in politics after 1920, he continued to exercise influence through his list of newspapers, which was increased to 27 in all parts of the country. He also was the owner of many magazines of wide circulation, including *Good Housekeeping*, *Hearst's International-Cosmopolitan*, *Harper's Bazar*, and *Pall Mall Magazine* (London). Consult *W. R. Hearst: An American Phenomenon*, by John K. Winkler (1928).

**HEART DISEASE.** The enormous death rate from heart disease, to say nothing of the invalidism from the same cause, has been responsible for a concerted effort throughout the United States with the aim of salvaging and rehabilitating the cardiac cripple. At present, there are 178 heart clinics in the United States and Canada, 42 of which are in New York City alone with 16 devoted solely to children. In 1926 these clinics cared for about 8500 patients in the metropolitan area. About 1 per cent of school children have crippled hearts and attempts are in progress to segregate such children for combined school instruction and medical care. Results have been sufficiently encouraging to look forward to extension of this movement to all school children of the metropolis. In quite recent years, convalescent homes and sanatoria have been opened to cardiac patients and special

ones are being erected for them; so that, at present, there are 35 or more of general and special institutions for this purpose. During the past five years, about a thousand children have been interned in Greater New York. It is far too soon to predict the effect of these salvage efforts on the death rate. As to the actual prevention of heart disease, this question is not involved, for this involves the prevention of acute rheumatism, focal infection, syphilis, scarlet fever, and other maladies.

Since 1918 cardiac therapeutics seems to have been greatly enriched by the introduction of the drug quinidin, which already vies with digitalis in making it possible for a man with advanced heart disease to live and labor. Quinidin is even superior in some ways to the other remedy because it seems equal to an actual cure of cases of permanent loss of rhythm, indicating deep-seated disease. See ADRENALIN.

**HEBER, CARL AUGUSTUS** (1874- ). An American sculptor who was born in Stuttgart, Germany. He studied with Taft, in Chicago, and became a member of the National Sculpture Society in 1904. He was also a member of the New York Architectural League and well known for his designing of memorials. His work includes the "Champlain Memorial" at Crown Point, N. Y., the "Champlain Statue" at Plattsburg, N. Y., the "Schiller Monument" at Rochester, N. Y., the Benjamin Franklin" at Princeton University and "Pastoral" exhibited at the Art Institute in Chicago. Among his awards were a bronze medal from the St. Louis Exposition in 1904 and a bronze medal from the Panama-Pacific International Exposition in 1915.

**HECHT, BEN** (1893- ). An American author, born in New York City. He was educated in Racine, Wis., and began his journalistic career with the *Chicago Journal* in 1910. He was on the staff of the *Chicago Daily News* from 1914 to 1923. From December, 1918, to December, 1919, he was correspondent in charge of the Berlin office of the *News*. He was publisher of the *Chicago Literary Times*, 1923-25. He is the author of *Bricks Dorn* (1921); *Gargoyles* (1922); *Pantaxius Mallare* (1922); *The Negotiable* (drama); *The Florentine Dagger*; *1001 Afternoons in Chicago* (1923); *The Negotiator* (drama, 1923); *Humpty Dumpty* (1924); *Count Bruga* (1926); *Broken Necks* (1926); *The Front Page*, a play, with Charles MacArthur (1928), and short stories in the magazines.

**HEDIN, hē-dēn, SVEN ANDERS** (1865- ). Swedish explorer and author (see VOL. XI), president of the Royal Swedish Academy of Sciences. He made a journey around the world in 1923, and discovered 30 dinosaur skeletons of the Jurassic period on his expedition to the country near Santal, Asia, in 1928. It was the first discovery in Asia of dinosaurs of that age. His works were translated into many languages. The later ones include: *Blit ord till Norges folk* (1914); *With the German Armies in the West* (1915); *The War against Russia* (1915); *Till Jerusalem* (1917); *Bagdad, Babylon, Ninive* (1917); *Southern Tibet* (12 vols., 1917-22); *Ein Routenaufnahme durch Ostpersien* (2 vols., 1918-26); *En lemnads teckning* (1920); *Resare Bengt* (1921); *Mount Everest* (1922); *From Peking to Moscow* (1924); *My life as an Explorer* (1925); and *The Grand Canyon of Arizona* (1925). Consult *Min Bruder Sven*, by Alma Hedin (1925).

**HEDJAZ.** See ARABIA; CALIPHATE.

**HEDRICK, EARLE RAYMOND** (1876- ). An American mathematician, born at Union City, Ind. He was graduated from the University of Michigan in 1896, held fellowships at Harvard, and took his Ph.D. at Göttingen in 1901. During 1901-03 he was instructor of mathematics at the Sheffield Scientific School at Yale University, but in the latter year became professor of mathematics at the University of Missouri, where he remained until 1924. Since 1924 he has been professor of mathematics in the University of Southern California at Los Angeles. He became editor-in-chief in 1921 of the *Journal of the American Mathematical Association*, of which organization he was president in 1916. Dr. Hedrick edited *A Series of Mathematical Tests* and (with D. C. Jackson) the *Engineering Science Series*. He wrote *A Course in Mathematical Analysis* (1904); an *Algebra for Secondary Schools* (1908); and *Application of the Calculus to Mechanics* (1909).

**HEFLIN, J (AMES) THOMAS** (1860- ). A United States Senator who was born in Randolph County, Ala., and studied at the Southern University and the Agricultural and Mechanical College at Auburn, Ala. He was admitted to the bar in 1893. In 1902-04 he was Secretary of State (Ala.) and in 1904 was elected to fill an unexpired term in Congress as a representative of the Fifth Alabama District. He was re-elected for eight succeeding terms (1905-21) and resigned in 1920 to be elected to the United States Senate for the unexpired term of John H. Bankhead. He was re-elected for the term 1925-31. In the presidential campaign of 1928, he bolted the Democratic party following the nomination of Alfred E. Smith.

**HEGELER, A. WILHELM** (1870- ). A German novelist. He was born at Varel and studied at the universities of Berlin, Munich, Vienna, and Geneva. He is the author of: *Son-nige Tage* (1898); *Nellys Millionen* (1899); *Pastor Klinghammer* (1903); *Flammen* (1905); *Ingenieur Horstmann* (1906); *Das Aergerniss* (1907); *Die Leidenschaft des Hofrat Horn* (1914); *Die goldene Kette* (1915); *Zwei Freunde* (1921); *Der verschüttete Mensch* (1923); *Der Apfel der Elisabeth Hoff* (1924); and *Die zwei Frauen des Valentin Key* (1927). He also wrote a monograph on *Heinrich von Kleist*.

**HEGER, ROBERT** (1886- ). A distinguished German conductor and composer, born at Strassburg. He began his musical education at the Conservatory of his native town, continued it in Zurich and finished with Max Schillings in Munich. In 1907 he was appointed conductor at the opera in Strassburg, and then filled similar positions in Ulm (1908), Barmen (1909), and at the Volksoper in Vienna (1911). During 1913-21 he was conductor of the opera and of the Philharmonic concerts in Nuremberg, after which he went to Munich. In 1925 he returned to Vienna as conductor at the Staatsoper. A short season of German opera by the entire company under his direction, in Paris in 1928, aroused such enthusiasm that a similar season was given in 1929, which was repeated the same year in Stockholm, Copenhagen, Berlin, and Milan. His works consist of an opera, *Ein Fest auf Haderslev* (Nuremberg, 1919); two symphonies; a symphonic poem, *Hero und Leander*; a violin concerto in D; *Ein Friedenslied* for soli, chorus, organ, and orchestra; chamber music and songs.

**HEGNER, ROBERT WILLIAM** (1880- ). An American zoologist born at Decorah, Iowa. He was educated at the University of Chicago and at the University of Wisconsin (Ph.D., 1908). He was assistant at the University of Chicago (1905-07), professor of biology, State Normal School, River Falls, Wis. (1907), assistant in zoology at the University of Wisconsin (1907-08), and instructor at the University of Michigan (1908-10). In 1910 he went to Johns Hopkins University, where he was successively assistant professor, associate professor, and professor in charge of the department of medical zoology. In 1921 he headed an expedition for the study of tropical medicine in Porto Rico and Venezuela. He published: *College Text Book of Zoology* (1910); *The Germ Cell Cycle in Animals* (1914); and *Host-Parasite Relations between Man and His Intestinal Protozoa* (1927); besides works in collaboration with others.

**HEIBERG, HÄYBËRG, GUNNAR EDVARD RODE** (1857- ). A Norwegian dramatist and critic (see VOL. XI). His later works include *Set og hort*, essays (1917); *Ibsen og Bjornson paa scenen* (1918); *Franske visitter*, biographical essays (1919); and *Norsk teater* (1920). In 1917 his plays were collected in four volumes.

**HEIDENSTAM, HJENSTÄN (KARL GUSTAF VERNER VON)** (1859- ). A Swedish poet and author (see VOL. XI), a member of the Swedish Academy, who in 1916 received the Nobel Prize for literature. His later works include *Om Svenskarnas lynne* (1914); *Va vilja vi?* (1914); *Nya dikter*, verse (1914); *Det defästa huset och andre berättelser ur "Karolinerna"* (1915); *Ut drag af Skrifter* (1922); *Tankar och teckningar*, essays (1924); and *Nya Dikter*, poems (1924). Many of his earlier works were translated into English. Consult *Sweden's Lauricate*, selected poems translated, with an introduction, by Charles Wharton Stork (1919).

**HEIFETZ, JASCHA** (1899- ). A Russian violinist, born at Vilna. He is one of the most remarkable cases of precocity on record, for at the age of three he began to receive regular instruction on the violin from his father. After a little more than a year, he was admitted to the Imperial Music School at Vilna. At the age of six, he played Mendelssohn's concerto in public at Kovno, scoring a sensational success. Nevertheless, he continued his studies at the Music School until 1907, when he became a pupil of Auer at the Petrograd Conservatory. Even before he graduated, he made frequent public appearances which spread his fame through Russia. His international fame dates from the phenomenal success of his Berlin debut (1912), which he repeated the next year in Vienna, and the following year in all the principal cities of Germany. After an equally successful tour of Scandinavia, he made his American debut in New York (Oct. 27, 1917). His American tours were an uninterrupted series of triumphs. In 1921 he made a tour of Australia. Even before he was out of his teens, he was universally recognized as the equal of the greatest living violinists. Auer is said to regard him as his greatest pupil.

**HEIJERMANS, HJ'YER-MANS, HERMANN** (1864-1924). A Dutch dramatist and novelist (see VOL. XI). Among his later works were *Robert Bertram et Cie* (1914); *Nova Bonheur* (1919); *Dageraad* (1921); *Feest*, in the English translation, *Jubilee* (1923); and *Saltimbanc*, also in English (1923).

**HEINZE**, hin'tse, RICHARD (1867- ). A German scholar and rector of the University of Leipzig (1921-22). He was born at Naumburg and studied at Bonn, Leipzig, and Berlin. He was lecturer at the University of Strasbourg (1893-99), then professor at the universities of Berlin, Königsberg, and Leipzig. He is the author of: *De Horatio Bionis Imitatore* (1889); *Xenokrates* (1893); an interpretation of the third book of *Lucretius* (1897); *Virgils epische Technik* (1915); *Ciceros politische Anfänge* (1909); *Tertullii Apologeticum* (1911); *Die lyrischen Werke des Horaz* (1919); *Ovids elegante Erzählungen* (1920); and *Von den Ursachen der Grösse Roms* (1925).

**HELFERRICH**, KARL (1872-1924). A German economist and public official. He was born at Neustadt and educated at the universities of Munich, Berlin, and Strasbourg. He taught at the University of Berlin and later at the government school for colonial politics and Oriental languages. In 1902 he entered upon a diplomatic career. He soon became a leader in the German government's policy of economic imperialism, and in 1906 he was appointed director of the Anatolian Railway. In 1908 he was made director of the powerful Deutsche Bank in Berlin. At the close of the Balkan War, he was the German financial delegate to the international conference (1913). He was Minister of Finance from 1915 to 1917, and was said to be responsible for the policy of financing the World War through loans instead of taxes. After the Treaty of Brest-Litovsk, he was sent to Moscow as the German Ambassador to Russia, succeeding Von Mirbach, who was assassinated. Elected to the Reichstag of 1920, Helferrich threw in his influence with the extreme Nationalists and would have nothing to do with the economic fulfillment of the Versailles Treaty. He was killed in a railway wreck on Apr. 23, 1924. His works comprise chiefly economic and political studies, and include *Die Reform des deutschen Geldwesens nach der Gründung des Reiches* (1898); *Handelspolitik* (1901); *Geld und Bank* (1903); *Die Weltkrieg* (1919).

**HELICOPTER**. See AERONAUTICS.

**HELIOTROPISM**. See ZOOLOGY, under Tropisms.

**HELIUM**. See AERONAUTICS; CHEMISTRY, APPLIED.

**HELLER**, EDMUND (1875- ). An American naturalist, born at Freeport, Ill. He graduated from Leland Stanford, Junior, University in 1901. From that year to 1907, he was naturalist for the Field Museum in Chicago and was engaged in exploration in California, Mexico, Guatemala, and East Africa. In 1907-08 he was curator of mammals at the University of California Museum of Natural History, and in 1909-10, naturalist for the Smithsonian African Expedition in East Africa under the direction of Theodore Roosevelt. He was a member of expeditions in Africa, Peru, and China (1909-17). During the World War, he served on the photographic staff of the Czechoslovak Army in Siberia. He was a member of the Expedition of the Smithsonian Institution in Africa (1919-20), of the expedition across Peru and down the Amazon to its mouth (1922-23), and of that to the Mountains of the Moon and Gorilla volcanoes in Central Africa (1924-26). Later, he became assistant curator of mammals for the Field Museum, Chicago. He was the joint author (with Theodore Roosevelt) of *Life Histories of*

*African Game Animals* and wrote numerous papers on fishes, reptiles, and birds.

**HELLMAN**, GEORGE SIMNEY (1878- ). An American author, born in New York City, and educated at Columbia University. In 1918-19 he served as director of the Department of Fine and Applied Arts for the Army Educational Commission of the Y. M. C. A., in 1919 as director of instruction in Fine and Applied Arts of the American Expeditionary Forces, and in the same year, as director of the American Expeditionary Force Art Training Centre at the Bellevue in Paris. He served on several commissions relating to war memorials and in 1920 became treasurer and director of the Ilugo Ballin Productions. His writings include *The Hudson and Other Poems* (1909); *Applied Arts and Education* (1919); *Art and the Citizen* (1919); *The Way It Ended* (1920); *Washington Irving, Esq.* (1925); *The True Stevenson* (1925); *Lances of Memory* (1927). He also edited the poems of Stevenson and letters of Irving and contributed poems and stories to magazines.

**HELMICK**, ELI ALVA (1863- ). An American army officer, born at Quaker Point, Ind. Graduated at the United States Military Academy in 1888, he was made second lieutenant in the 11th Infantry and rose to the rank of major general in 1921. He served in Idaho during the Cœur d'Alene riots (1892), in the expedition of Santiago de Cuba (1898), against the Moros (1902), on the Mexican border (1910 and 1916), and in the Inspector General's office (1916-18). During the World War, he commanded the 8th Division with the provisional rank of major general, and later was in command of the service of supplies at Brest. The United States Distinguished Service Medal was conferred on him. In 1921 he was appointed inspector general and in September, 1927, he was retired.

**HEMING**, ARTHUR (1870- ). A Canadian illustrator and writer, born at Paris, Ont., who came to the United States as a student and was a pupil of Frank Brangwyn and Frank V. DuMond. Mr. Heming knows his natural scenery and puts it on canvas with a peculiar gift. Among the books which he has written and illustrated are *Spirit Lake*; *Drama of the Forest*; and *The Living Forest*. In the Royal Ontario Museum, there are 10 of his pictures on exhibition and he is also represented in the Canadian National Gallery. He was awarded a gold medal for the best work, bronze medal for best illustrations, and the MacLean Prize for illustration by the Canadian Society of Graphic Arts in 1926.

**HÉMON**, LOUIS (1880-1913). A French author who was born and educated at Brest, where his father was a professor. He took his degree in Oriental languages, but preferred story writing and sport to a university career. He won literary prizes with two short stories (1906). For a while he lived in the poorer quarters of London, where he wrote *Lizzie Blakeston*, published in *Le Temps* in 1908, and in October, 1911, he went to Canada, where he wrote the novel, *Maria Chapdelaine*. He was killed by a train near Chapleau, in western Ontario, July 8, 1913. *Maria Chapdelaine* was first published in *Le Temps* (Paris) just before the World War. His other works, published posthumously, include *La belle que voilà*, stories (1923); *Colin-Maillard*, trans. as *Blind Man's Buff* (1924); *The Journal of Louis Hémon*

(1924); *Monsieur Ripois and Nemesis* (1925); and *Battling Malone, pugiliste* (1925).

**HENDCKELL**, hĕnk'el, KARL FRIEDRICH (1864- ). A German poet (see VOL. XI) identified with Young Germany of the eighties. After 1914, he published *Lyrik und Kultur* (1914); *Weltmusik* (1918); *Gedichte* (1921); *Buch des Kampfes*; *Buch der Saat* (1923); and *An die neue Jugend* (1924).

**HENDERSON**, ARCHIBALD (1877- ). An American mathematician and author (see VOL. XI). Since 1920 he has been at the head of the mathematics department at the University of North Carolina. His later books include *O. Henry* (1914); *Star of the Empire* (1919); *Conquest of the Old Southwest* (1920); *The Teaching of Geometry* (1921); *Relativity—a Romance of Science* (1923); *Washington's Southern Tour* (1923); and *Table Talk of G. B. S.* (1925).

**HENDERSON**, RT. HON. ARTHUR (1863- ). A British public official, born in Glasgow, Secretary of the National Labor Party. He worked as an iron founder in Newcastle, became interested in the labor movement, and held various trade-union positions. He was also a Wesleyan Methodist preacher. He was on the Newcastle City and Darlington Borough Councils, was mayor of Darlington (1903), and a member of Parliament (1903- ). He was chairman of the Parliamentary Labor Party (1908-10, 14-17), chief whip of the Labor Party (1914, 1921-24, 1925-27), and became a Privy Councillor in 1915. He held cabinet positions as president of the Board of Education (1915-16), Paymaster General and Labor Advisor to the Government (1916), and Minister without Portfolio in the War cabinet (1916-17). In the latter year, he went on a special government mission to Russia. In Ramsay MacDonald's first Labor government (1924), he was Home Secretary and in the second (June, 1929- ), he was Secretary of State for Foreign affairs. He was also an internationally prominent figure in the labor world, and was president of the Labor and Socialist International (1926- ). He wrote *The Arms of Labor* (1918); *Industrial Law* (with Sir Harry Slesser, 1924), and *Trade Unions and the Law* (1927).

**HENDERSON**, LAWRENCE JOSEPH (1878- ). An American biological chemist born at Lynn, Mass. He was educated at Harvard (M.D., 1902) and at the University of Strassburg. He was lecturer in biological chemistry (1902-03), instructor (1903-10), assistant professor (1910-19), and professor (1919- ) at Harvard. Professor Henderson published *Fitness of the Environment* (1913), *The Order of Nature* (1917), and numerous papers dealing with applications of physical chemistry to biology. He is a member of the National Academy of Sciences and numerous other learned societies.

**HENDRICK**, BURTON JESSE (1871- ). An American writer, born in New Haven, Conn., and educated at Yale. For several years he was on the staff of newspapers in New Haven and New York. He was associate editor of *The World's Work* from 1913 to 1927. He wrote *The Age of Big Business* (Chronicles of America series, 1919); *Life and Letters of Walter Hines Page* (this book won the Pulitzer Prize for the best American biography of 1922); *The Jews in America* (1923); *Training of an American: The Earlier Life and Letters of Walter H. Page* (1928), which also won the Pulitzer Prize for

the best volume of American biography for that year. He was co-author, with Admiral William Snowden Sims, of *The Victory At Sea*, awarded the Pulitzer Prize as the best book published in 1920 on the history of the United States and, with Marie Doughty Gorgas, of *William Crawford Gorgas, His Life and Work*. He was a frequent contributor to magazines.

**HENDRICK**, ELLWOOD (1861- ). An American lawyer (see VOL. XI). In 1917-18 he studied chemistry at Zurich under Victor Meyer, and on his return to the United States was superintendent of the Albany Aniline and Chemical Works (1881-84), then, turning his attention to insurance and stock brokerage, continued in that business until 1915, when he retired. He was a member of the staff of the research corporation of Arthur D. Little and Company of Cambridge, Mass., 1917-22, and later became curator of the Chandler Chemical Museum of Columbia University. Besides being consulting editor of *Chemical and Metallurgical Engineering*, he is the author of many articles on science in popular magazines and published *Everyman's Chemistry* (1917); *Opportunities in Chemistry* (1919); *Percolator Papers* (1919); *Life of Lewis Miller* (1925); and *Modern Views of Physical Science* (1925).

**HENEY**, FRANCIS JOSEPH (1850- ). An American lawyer (see VOL. XI). In 1917-18, he served as special attorney for the Federal Trade Commission in charge of investigation of the high cost of living, with special reference to the packing industry. In 1924 he was appointed special counsel for the U. S. Senate Committee investigating the Internal Revenue Bureau.

**HENRI**, ROBERT (1865-1920). An American painter and portraitist (see VOL. XI). With the same sincerity of purpose and simplicity of method which he had in former years devoted to unsophisticated European types, he turned in 1914 toward the people of California and the Southwest. Among these later works were "Tam Gan," "Ramon—a Mexican," "Jim Lee," and "A Girl of the Southwest." He was awarded the portrait prize, Wilmington Society of Fine Arts, 1920. His influence as a teacher, preëminently as a personality, continued to be of much importance. *The Art Spirit* (1923) is a compilation by Margery Hyerson of fragments of his letters, and of his talks to students on the spirit, technique, and appreciation of picture making.

**HENRIOT**, ANR'ô', ÉMILE (1889- ). A French novelist and literary writer for the *Temps*, who was born in Paris and educated at the École Fénélon and the Lycée Condorcet. In 1924 he won the French Academy's Grand Prix du Roman with *Archie Brun, ou les vertus bourgeoises*, the story of a bourgeois family. His other works include *Poèmes à Sylvie* (1906); *Eurydice* (1907); *Petite Suite italienne* (1909); *L'instant et le souvenir* (1912); *A Quoi rêvent les jeunes gens*, a history and criticism of twentieth-century French literature (1913); *La Flamme et les Cendres* (1915); *Carnet d'un dragon dans les tranchées* (1918); *Valentin* (1919); *les temps innocents* (1921); *Aquarelles, 1914-1921*, poetry (1922); *Courrier littéraire* (1922); *Aventures de Sylvain Dufour* (1922); *Stendhaliana* (1924); *Les lances du second rayon; irréguliers et libertins*, history and criticism (1925); *Voltaire et Frédéric II* (1927); *En Provence* (1927); and *L'art de former un bibliothéque* (1928). In 1926 he edited, with an in-

roduction and bibliography, Musset's *Confession d'un enfant du siècle*.

**HENRI-ROBERT**, *rôbâr*, JACQUES (1863- ). A French barrister who was born in Paris and educated at the École Fénélon and the Lycée Condorcet. An irresistible speaker, he became a criminal lawyer—a branch of the law then in ill repute—and rose rapidly, finally becoming the leader of the French bar, a position rarely held by a member in its criminal branch. In 1923 he was elected a member of the French Academy. His well-known literary work was *Les grands procès de l'histoire* (4 vols., 1924-25), an account of the great trials of history. He also wrote *L'effort de Paris* (1907) and *Le maréchal Foch* (1919), two lectures; *L'avocat*, a history of the customs of the bar (1923); *Le palais de justice* (1927); *Malesherbes* (1927); and *Louis XVI* (1928).

**HENRY**, PRINCE OF PRUSSIA (HEINRICH ALBERT WILHELM) (1862-1929). A German admiral and brother of the ex-Kaiser of Germany (see VOL. XI). He was commander-in-chief of the Baltic fleet during the World War, was second in command at the Battle of Jutland, and was ardent in his support of Germany's submarine warfare. He was forced to flee from Kiel when the revolution broke out there in 1918, and retired to his estate in Schleswig-Holstein, where he died of pneumonia and complications on Apr. 20, 1929.

**HENRY**, ROBERT LLEWELLYN, JR. (1882- ). An American professor, of law, born at Chicago, educated at the University of Chicago, and as Rhodes scholar at Oxford, England; also at Heidelberg, Germany, and Grenoble, France. He held the position of professor of law at several State universities, 1907-16. During the World War, he was captain and then major of infantry in the Officers Reserve Corps. In 1919-20 he was a member of the War Department Board of Contract Adjustment in Washington. He lectured at Oxford, England, during 1921-22. Later, he was appointed judge of the Mixed Court at Alexandria, Egypt. His writings include: *Liens and Pledges* (1913); *Consideration in Contracts 601 A.D. to 1520 A.D.* (1917); *Anglo-Saxon Contracts* (1917); *Contracts in the Local Courts of Medieval England* (1926).

**HENSON**, Rt. Rev. HERBERT HENSLEY (1863- ). An English clergyman and author (see VOL. XI), Bishop of Durham since 1920. He was Dean of Durham (1912-18), Bishop of Hereford (1918-20), and honorary professor of modern history at Durham University. His later publications include: *War-Time Sermons* (1915); *Robertson of Brighton, 1816-1853* (1910); *Christian Liberty* (1918); *Anglicanism* (1921); *In Defense of the English Church* (1923); *Byron: The Rede Lecture* (1924); *Quo Tendimus?* (1924); *Notes on Spiritual Healing* (1925); *Church and Parson in England* (1927); *The Booth and the Vote* (1928). He edited *The Naked Truth*, by Bishop Croft (1919); and *Sir William Anson: a Memoir* (1920). See DURHAM, BISHOP OF.

**HEPBURN**, A (LONZO) BARTON (1846-1922). An American banker, philanthropist, and author (see VOL. XI). He was a member of the Federal Advisory Council of the Federal Reserve Board, in 1918, and was a prominent member or officer of important associations concerned with economics and political science. In 1915 he wrote and published *A History of Currency in the United States*.

**HERBERT**, VICTOR (1850-1924). An Irish-American conductor and composer (see VOL. XI). Among the numerous productions of his last decade, the following achieved conspicuous success: *Princess Pat* (1915); *Eileen* (1917); *Angel Face* (1919); *Orange Blossoms* (1921); and *The Dream Girl* (1924). In the field of light opera, Herbert not only towers far above all his American colleagues because of his inexhaustible melodious invention, splendid orchestration, and solid technical attainments but has securely established his place by the side of such masters as Johann Strauss, Offenbach, Millöcker, Suppé, and Sullivan.

**HEREDITY**. An observational and experimental study of the laws governing the transmission of physical or mental characteristics through successive generations of animals, or of physical characteristics in plants, the laws being in general the same in the two great groups of living beings. A complete theory of heredity must offer an explanation of two sets of phenomena—first, the fact that, on the whole, offspring resemble their parents more than they resemble other members of the race; and second, that this resemblance is never absolute but the offspring always show some differences from the parents, i.e., they show variability.

An important date in the history of this subject is 1809, when Lamarck formulated his theory of the effects of use and disuse of organs and of the effect of environment on the structure of plants and animals. According to Lamarck, the increased size of an organ through use or its decreased size following disuse was passed on to the offspring, so that in the course of generations, descendants of the original animals, through accumulation of these structural changes, would be quite unlike their ancestors. Similarly, plant structures would be modified in response to climatic conditions, or to changes in the environment, such as moisture or chemical composition of the soil, so as to lead in the end to considerable structural modifications.

Lamarck was arguing in favor of the evolution of species and developed this theory as an explanation of this evolution, but running, as it did, contrary to the generally held belief in the fixity of species, the theory met with nothing but opposition, and it was only after 1859, when Darwin's formulation of a theory of evolution was widely accepted, that it received recognition. In the evolutionary writings from 1859 to 1890, there was general acceptance of the doctrine of use-inheritance. This was, indeed, carried to much greater extremes than it was by Lamarck himself, in that there was a general belief that scars resulting from injuries, or the effects of mutilations such as the loss of an organ through accident, would appear as a birthmark in the offspring. Thus, the child of a German student had a birthmark reproducing the scar her father carried as the result of a student duel, and a cat whose tail was cut off by an accident henceforth gave birth to tailless kittens. Cases of this sort which had wide acceptance as popular legends were repeatedly cited as illustrating the method of evolution.

It was clearly recognized that the assumption of the inheritance of acquired characters carries with it the necessity of explaining the mechanism of the process. How, for example, is it possible for the removal of a cat's tail to so affect the sex cells of the cat, situated at a considerable distance from the tail, as to cause her to give

birth to tailless kittens? Darwin proposed as an explanation the "provisional" theory of pangenesis, which assumed that each cell of the body is constantly throwing off gemmules or ultra-microscopic particles which collect in the sex cells. When these sex cells develop, the gemmules are distributed throughout the body of the new individual, and each going to its appropriate group of cells determines the character of their development. These gemmules multiply by fission and may remain dormant for several generations. If through use or disuse or through accident, the structure of a group of cells is changed, the gemmules arising from these cells will be correspondingly modified and when they in turn take part in the construction of a new individual that individual may exhibit the changed character. Herbert Spencer had earlier attempted to explain heredity and the inheritance of acquired characters on the assumption of "physiological units" or ultra-microscopic particles having a definite polarity which are located in the body cells and by the form of their polarity determine the appearance of the cells in which they are. Use or disuse may modify the form of this polarity and thus affect the character of the race. Neither of the above explanations has any experimental basis and both are purely formal.

Later theories are based on more exact knowledge of the actual phenomena of development, knowledge not available at the time that Darwin and Spencer were writing, and a brief summary of these phenomena will be essential here. The starting-point for each new individual in biparental inheritance is the fertilized egg, a single cell formed by the union of two cells, the *ovum* from the mother and the *spermatozoon* from the father. This fertilized egg divides into two cells, each of these divides again, and the process is repeated until eventually the many-celled adult appears. Coincident with these divisions, a process of differentiation goes on, by which different portions of the complex of cells assume different structures adapted to different functions. Examination of any one of these cells under favorable conditions would show that in its central portion or nucleus is a substance called *chromatin* which just before the cell divides breaks up into rods called *chromosomes*, which are arranged in pairs and are constant in number in any one species. When the cell divides, each chromosome of a pair divides, half going to each daughter cell. Thus, the number is kept constant and each cell gets a representative of each chromosome present in the cell from which it arose.

A study of the immature sex cells shows that they also have paired chromosomes, but as they approach maturity, the members of each pair unite more or less closely with one another in a very complex fashion, later to separate and divide with the cells containing them so that the mature sex cell contains only half the normal number of chromosomes. This process is known as *maturation*. When these cells unite in the fertilization process, the number is brought back to normal and it is quite certain that one member of each pair is derived from each parent. In fertilization only the head of the *spermatozoon*, which is practically nothing but chromatin, enters the egg. Since observation shows that inheritance from the father is as strong as that from the mother, it seems evident that whatever material is the carrier of hereditary qual-

ities must be located in the chromatin. It has been shown also in the case of a few animals that the cells which give rise to the sex organs of the new generation seem to be set aside early in the development and to be quite distinct from the other organs of the body.

In the light of this further information, Weismann attacked the problem and worked out an elaborate theory of heredity. He was the first seriously to question the validity of the Lamarckian principle, and began by investigating supposed cases of inheritance of mutilations. For these, he decided there is no evidence whatever. In this connection, he developed the concept of the germ plasm. This may be defined as a material contained in the nucleus of the fertilized egg, whose function is to determine the character of the individual resulting from that egg. During development, portions of the germ plasm are distributed to the appropriate regions of the developing organism, each controlling the differentiation of its own particular area. Some of this germ plasm, however, is not distributed in this fashion but remains as residual material which goes by the shortest route to the cells which are to form the sex organs of the new individual and there locates itself in the nuclei of the embryonic sex cells. Here it remains until at the time of sexual maturity, the cell containing it matures, unites in fertilization with the cell from the opposite sex, and the process is repeated. While in this dormant condition, this residual material necessarily must receive its nutrition from the surrounding body, but Weismann supposed that it is so effectually insulated from the latter as not to be affected in any qualitative fashion by any activities of the body itself or by any influence of the environment.

If this germ plasm is thus isolated and unchangeable and determines the character of the individuals of successive generations, why are not all individuals alike? Weismann refers the origin of variations to the maturation process of the sex cells in which each cell apparently shuffles its chromatin and discards a portion of it, before fertilization takes place. Since by the law of chances this discarding is different in any two cells, it follows that no two mature sex cells are exactly alike. Further variability is produced by the union of the dissimilar chromatin of the two sex cells in fertilization. While much that is new has been discovered concerning the phenomena of maturation and fertilization since Weismann wrote, nothing has appeared that seriously affects this much of his theory. His further development of hypotheses concerning the structure of the germ plasm and its behavior are not of so much importance at the present time (see bibliography at end of article).

The net results of Weismann's work are two. In the first place, there is agreement among all students of heredity that mutilations or their effects are not inherited, nor is there any reason to accept the validity of reported cases of maternal impressions and prenatal influences. In the second place, there is agreement that without necessarily accepting Weismann's ideas as to the composition of the germ plasm, it is necessary to assume the existence of such a substance as the determiner of hereditary qualities. The question as it now stands is this: Is it possible for this germ plasm, lying in the sex cells, to be affected by any activity of the body or by any influence of the environment so as to produce precise and permanently heritable

changes in the structure of subsequent generations?

Weismann at first claimed for germ plasma a complete insulation from external influences, but later modified this position. He found that certain insects when subjected to lowered temperature became darker in color and this modification was transmitted to subsequent generations. To explain cases of this sort where animals certainly responded to external changes, Weismann developed the theory that some environmental influences are strong enough to penetrate immediately through the body and act directly on the germ plasma, causing changes in it. These changes may be inherited. Only those agencies that are strong enough thus to penetrate may affect the germ plasma.

The Neo-Lamarckians on the other hand, who believe in the transmission of acquired characters, hold that lesser influences, either acting repeatedly, from without, on the body, or the results of the activity of the body itself, may gradually penetrate to, and affect, the germ plasma. Admitting that the mechanisms by which such an effect could operate are not clearly to be seen, they believe that some observations can be explained only on the assumption that this has taken place. Botanists are rather more apt to take this position than are zoologists, for in the animal body are found much fewer protoplasmic connections between the organs, and the sex cells are more definitely isolated than is the case in plants. In fact, it is sometimes difficult to imagine any very complete separation in plants because of the elaborate arrangement of intercommunicating protoplasmic connections. Among zoologists, the paleontologists are most apt to be Neo-Lamarckians because the history of many structures seems to show a precise parallelism between the changes that these organs undergo in successive ages and the changes that would have been set up in them in each generation by the uses to which they must have been put.

It is evident that an apparent case of use inheritance might be explained equally well by either of the above hypotheses, and thus a condition of deadlock results.

Most of the earlier writers on this subject devoted their time mainly to arguing on what might be considered reasonable explanations of observed phenomena, and conclusive experimental evidence is lacking. Brown-Sequard, whose results were quoted by Darwin and by later writers, thought that certain injuries to the nervous system of guinea pigs would be followed by a condition of epilepsy and this was transmitted to descendants. This for a long time stood as a valid case of the inheritance of acquired characters, but the most recent work along this line indicates that the so-called "epileptic" state of the guinea pig appears under favorable conditions in the perfectly normal animal, and it seems certain that this case may be ruled out. Practically all of the supposed cases to demonstrate this point are either of doubtful accuracy, or are capable of two interpretations (see above) and clean-cut, precise evidence is lacking in favor of Neo-Lamarckism.

Most, if not all, biologists would agree that a decisive demonstration that external influences may produce heritable changes in germ plasma, would greatly simplify some of our problems of heredity, especially as related to evolution. For this reason, some recent investigations which

it appears may offer such demonstration have excited much interest. The first has to do with antibodies. If, for example, we inject human blood into the blood vessels of an unrelated animal, say a rabbit, the body of the rabbit will react in a definite and precise fashion, developing what is known as an antibody which has specific reactions to human blood. If the blood containing the antibody is mixed with human blood a precipitate will form, but if mixed with blood from any other animal (except a few of the higher apes) no reaction occurs. A similar formation of antibodies having a specific relation to whatever material was injected would follow from the injection of any other body tissue, or on the entrance of bacteria into the blood.

Guyer and Smith injected the material from a crushed lens from the eye of a rabbit into the blood of a fowl and in that way developed an anti-lens body in this blood. Some of this blood was injected into a pregnant rabbit at a time when the lenses of the embryos were forming, and a number of them were born with defective lenses. This defect persisted through several generations, being transmitted through the male as well as through the female and in a Mendelian fashion (see below). This would indicate that the defect was truly hereditary and not a case of infection from the mother in each generation, and leads to the conclusion that the germ plasma of the rabbit had been modified by the antibody. Guyer and Smith did not claim that their results are arguments in favor of Neo-Lamarckism, but others have so interpreted them, on the ground that if these antibodies can produce such an effect, other antibodies which conceivably may have arisen from time to time in the racial history, as reactions of the body to stimuli of various kinds, may have had corresponding effects on the germ plasma. A second line of argument is derived from the study of hormones, chemical substances formed in body cells and poured into the blood, which modify the structure of other organs. It is generally admitted that some secondary sex characters (for example those that distinguish the male from the female individual) are due to hormones formed by the respective developing sex organs. There is reason to think that hormones may be formed by any organ, and it is possible that a changed use of an organ may change the character of its hormones, and that this might react on the germ plasma.

More recent research has produced results that are even more suggestive in this connection. A number of investigators have found that treatment of animals with radium or with X-rays will produce structural changes, some of which rank as true mutations (See ZOOLOGY). Characteristic mutations appear in laboratory cultures of fruit flies; and at the December, 1927, meeting of the American Association for the Advancement of Science, the \$1000 prize annually given for the most noteworthy paper read at the meeting was awarded for a research on the effect of X-rays on fruit flies, where, after exposure to these rays, mutations similar to those that occur in laboratory cultures appeared, but 150 times as frequently. Since X-rays are found in ordinary light, it is perfectly possible that changes in their character or intensity may directly produce changes in germ plasma.

**Biometry.** An important technique for the study of heredity was developed by Galton and later by Pearson in biometry. This is an

Important practical suggestions arise from the study of sex-linked characters. It is evident from a study of the last two diagrams that it would be possible to determine which individuals would transmit the sex-linked character and which would not. If, as is true in some cases, the character is an undesirable one, it would be possible by controlling matings to eliminate the character from the race. On the other hand, if the sex-linked character is desirable, it would be possible so to control matings as to make it more common. It is evident from the diagram that, assuming absolute power to control matings, either color-blindness could be entirely eliminated, or a race could be developed all of whom would be color-blind, according to which was considered the desirable condition.

**Atavism or Reversion.** These terms should be considered as synonymous and refer to the appearance in one generation of characters not represented in the immediate parents but present in some more remote ancestors. In the case just mentioned, color-blindness skips a generation and might even seem to skip more than one, if in the intermediate generations the individual who would show it did not happen to appear. Another familiar case is where the child of brown-eyed parents has blue eyes inherited from a blue-eyed grandparent or earlier ancestor. In eye color, the pigmented (brown or black) eye is dominant to the non-pigmented (blue or albino). If, therefore, the brown-eyed parents happen to be heterozygous for brown, having the blue as a recessive character, one-quarter of their children would be homozygous for blue and be blue-eyed (see diagram above, referring to the guinea pig which, making the necessary changes in the symbols, would apply as well to this case). Since the number of individuals is so small in any human family, it might happen that several generations would elapse before the homozygous individual appears and thus the child seem to inherit something not possessed by its parents. This emergence of a previously hidden recessive character explains one type of atavism.

Another type has a different explanation. Bateson described a case where two white sweet peas when crossed gave a purple  $F_1$  and this when inbred gave in  $F_2$  nine purple to seven white. This purple color was present in the ancestral Sicilian sweet pea, so that this was an undoubted case of atavism. This can be explained on the assumption that for the production of the purple color the coöperation of two genes is necessary. If either gene is present alone, no color appears; when they are both present they produce the purple color. In the history of these two varieties of sweet peas, it happened that these two genes became separated and thus two lines of white-flowered plants arose, one carrying one of the genes, the other carrying the other. When they were crossed, color returned. Assuming that one of these genes is represented by  $C$  with an allelomorph  $c$  and the other by  $R$  with  $r$  as allelomorph, the composition of one plant would be  $Cr$  and the other  $cR$ . When crossed, this becomes  $CRor$  and color appears. Assuming that this is the case, the hybrid would form gametes  $CR$ ,  $Cr$ ,  $cR$ ,  $cr$ . Representing the result of crossing by a diagram, we have the results shown in the next column.

Nine of these squares contain both  $C$  and  $R$ , while none of the other seven has both of them. Accordingly, nine are colored and seven white,

		Ova			
		$OR$	$Cr$	$cR$	$cr$
Spermatozoa	$OR$	$OR$ $OR$	$Cr$ $OR$	$cR$ $OR$	$cr$ $OR$
	$Cr$	$OR$ $Cr$	$Cr$ $Cr$	$cR$ $Cr$	$cr$ $Cr$
	$cR$	$OR$ $cR$	$Cr$ $cR$	$cR$ $cR$	$cr$ $cR$
	$cr$	$OR$ $cr$	$Cr$ $cr$	$cR$ $cr$	$cr$ $cr$

as actual observation showed. Again, theoretical expectation and observations are in agreement and demonstrate the accuracy of the theory.

**Inbreeding.** This is regarded, and with some experimental evidence in favor of the belief, as undesirable in that it tends to produce weakened or degenerate descendants. Many plants, however, as wheat, rice, barley, oats, tobacco, and beans, are normally self-fertilizing and experiments on white rats have shown that no injurious effects follow in the closest inbreeding. It now seems certain that inbreeding in itself is not injurious, but that, if there are in a family undesirable recessive traits, these traits are more apt to become homozygous and thus visible if two members of this family mate than if either mates with a more distantly related individual. If a family is free from these undesirable recessives, no harmful effects follow inbreeding. On the other hand, "outbreeding," or mating of unrelated individuals, is sometimes followed by an increase in vigor, apparently because it results in a combination of several desirable dominant characters.

The most elaborate experiments ever made in heredity were made by Morgan and his associates on the fruit-fly, *Drosophila*, which is ideal for this purpose as it breeds rapidly and is easily kept under observation. As a result of these experiments, they have not only identified a large number of genes but have demonstrated the exact location of each of these genes on the chromosome (consult bibliography).

Of much interest is the question as to the number and character of these genes. To assume that there is in the sex cell a gene for each different character of the adult would be to assume an inconceivable complexity in the germ plasm. Moreover, it is known that sometimes one gene may affect more than one body character or, on the other hand, several genes may coöperate to determine one character. It would be possible, therefore, to explain their action by the assumption of a comparatively few genes which, reacting on the original material of the fertilized egg, start the process of differentiation, then by a second reaction on this primary differentiated material set up a further differentiation, and this series of actions and reactions continue to the end, the process being more or less modified by the reactions of one set of genes upon the others. That the genes are complex chemical compounds, possibly of the nature of enzymes, acting upon the protoplasm of the body seems a reasonable assumption from what we know of their mode of working.

It seems certain, however, that the cytoplasm of the egg plays some part in heredity and is not merely an inert mass, molded by the genes in the chromosomes. Apparently, the general characteristics, e.g., whether an egg shall develop into a dog or a horse, are determined by the cytoplasm while the individual characteristics are controlled by the genes.

If genes are chemical compounds of the nature of enzymes, it should be possible to modify their structure by chemical or other means and there is experimental evidence that this can be done. If the cases mentioned earlier, where external forces have permanently modified the race, are valid, the genes must have been modified. Mutations also (see ZOOLOGY) must owe their origin to changes in the composition of the genes.

This work in heredity has decidedly modified opinion on one point which had seemed so obvious as to be axiomatic. This was the principle which underlay all of Darwin's work on selection, that of the supposed efficiency of the selection of individual variations. Among the members of any generation are always found variations in the degree of development of any one character. Darwin supposed, and this has generally been believed until quite recently, that if extreme varieties were isolated from the remainder and allowed to breed, some of their offspring would vary still more widely in this direction and if this process were continued almost any amount of variability could be obtained. If this were true, it would mean that the character of genes could be changed by the act of selection, but the evidence indicates that it is probably not true.

In any species, the range of variability is fixed, and selection of the greatest or the smallest variate from the mean of the species would not in any way affect the range of variability of the next generation. Where the selective process seems to be sufficient, it may mean either that the original group was not homogeneous and selection has isolated different races from one another, each having its own range of variability, or that there were genes modifying or interfering with the action of the genes under consideration and the selective process has removed these, thus allowing the original gene free expression. The gene is apparently not modified through selection.

As a result of his study of biometry, Galton decided that inheritance is blending, i.e., that the offspring of two parents unlike in any particular character would be, with respect to that character, intermediate between the parents. If this were true, it would mean that the genes from the two parents had modified one another. The Mendelian interpretation is that in such a case the apparent blending is due to the peculiar action of two or more genes. For example, a brown-chaffed and a white-chaffed wheat were crossed and  $F_1$  was brown.  $F_2$ , however, did not have brown and white in the proportions of three to one, as might have been expected, but there were fifteen brown to one white and the browns were not all of the same shade. This can be explained on the assumption that there are two genes for brown,  $B$  and  $B_1$ , each capable of producing the color, but  $BB_1$  gives a more intense shade than either  $B$  or  $B_1$  alone. Worked out on the checker-board type of diagram, this theoretical expectation agrees closely with actual observations and there is no evidence for a true blending due to modifications in the character of the original genes.

By offering precise information concerning the results to be expected from any given mating, Mendelism has been of service to practical plant and animal breeders, and these services will undoubtedly be extended with advancing information. In human heredity, because of the obvious impossibility of experimental matings and because of the small size of human families, accurate information is more difficult to obtain, but enough is known to offer to eugenics much valuable assistance in its efforts to improve human qualities. This is especially true in the cases of a number of diseases which are sex linked in inheritance and which, by applying the rules mentioned above, might easily be eliminated from the race. See EUGENICS.

**Bibliography.** The following books summarize the more important works in this field: Darwin, *Animals and Plants under Domestication*; Spencer, *Principles of Biology*; Galton, *Natural Inheritance*; Thomson, *Heredity*; Cunningham, *Hormones and Heredity*; Pearl, *Modes of Research in Genetics*; Castle, *Genetics and Eugenics*; East and Jones, *Inbreeding and Outbreeding*; Morgan, Sturtevant, Muller, and Bridges, *The Mechanism of Mendelian Heredity*; Weismann, *The Germ Plasm*; Shull, *Heredity*; Sinnott and Dunn, *Principles of Genetics*.

**HERELLE, FELIX H.** See D'HERELLE.

**HERFORD, HERFORD** or här'ford, CHARLES HAROLD (1853- ). An English scholar (see VOL. XI), fellow of the British Academy of honorary professor of English literature at the University of Manchester. His later publications include: *Goethe* (1913); *Memoir of Julia Wedgwood* (1915); *Is There a Poetic View of the World?* (1916); *Shakespeare's Treatment of Love and Marriage, and other Essays* (1921); *Sketch of Shakespeare Investigation, 1898-1923* (1923); and *The Post-War Mind of Germany* (1926). He wrote for various papers and edited the *Warwick Library and Shakespeare*, and the critical section of the *Belles Lettres Series*.

**HERGESHEIMER, JOSEPH** (1880- ). An American author, born at Philadelphia, Pa. He studied painting for a time, but soon turned to literature. His first novel, *The Lay Anthony*, which was not published until 1914, was at once acclaimed as a work of the first importance. There followed in rapid succession a series of notable books, including: *Mountain Blood* (1915); *The Three Black Pennys* (1917); *Java Head* (1919); *Linda Condon* (1919); *Cytherea* (1921); *The Bright Shawl* (1922); and the collected short stories *Gold and Iron* (1918); *The Happy End* (1919); *The Presbyterian Child* (1923); *Balsand* (1924); *From an Old House* (1925); *Tampico* (1926); *Quiet Cities* (1928). Possessed of a luxurious style that is peculiarly effective for his subjects, with a feeling for exotic backgrounds that he has, nevertheless, been able to render subordinate to the essential work of character delineation, Mr. Hergesheimer, in *The Lay Anthony*, in *Linda Condon*, in the first parts of *The Three Black Pennys* and *Java Head*, has written fiction little surpassed or even equaled in the period.

**HERMANN, HERMAN**, GEORGE (pseudonym for GEORG HERMANN BORCHARDT (1871- ). A German novelist. He made old Berlin the background of most of his stories, which include *Spielkinder* (1897); *Die Zukunftsfröhen* (1898); *Aus dem letzten Hause* (1899); *Jettchen Gebert* (1906); *Henriette Jacoby* (1907); *Aus guter alter Zeit* (1913); *Heinrich Schön, Jr.* (1915);

Von gesicherten und ungesicherten Leben (1915); *Einen Sommer lang* (1917); *Schnee* (1921); *Der doppelte Spiegel*, and *Tränen um Modesta Zamboni* (1927). His plays include: *Jettoben Gebert*; *Henriette Jacoby*; *Mein Nachbar Ameise* (1920); *Die Nacht des Dr. Herzfeld* (1922); and *Frau Antonie* (1925). He is also the author of several volumes of sketches: *Randbemerkungen*; *Kleine Erlebnisse* (1920); *Spaziergang in Potsdam* (1926); and *Holland, Rembrandt, Amsterdam* (1926).

**HERMANNSSON, HALLDÓR** (1878- ). An Iceland philologist born at Völlum, Iceland. He entered the University of Reykjavik in 1898 and three years later that of Copenhagen. In 1905 he was appointed curator of the Fiske Icelandic Collection at Cornell University Library and taught Scandinavian languages at the university, becoming a full professor in 1924. His many works include *The Northmen in America* (1909); *The Ancient Laws of Norway and Iceland* (1911); *Icelandic Authors of To-day* (1913); *Icelandic Books of the 16th Century* (1916); *The Periodical Literature of Iceland* (1918); *Modern Icelandic* (1919); *Bibliography of the Eddas* (1920); *Icelandic Books of the 17th Century* (1922); *Jon Gudmundsson and His Natural History of Iceland* (1924); *Eggert Olafsson* (1925), and *Two Cartographers* (1926). He compiled a *Catalogue of the Fiske Icelandic Collection* (1914, 27) and of *Runic Literature* (1918), and edited *The Story of Griselde in Icelandic* (1914) and *An Icelandic Satire: Lof Lyginnar* (1915).

**HERMANT, ABEL** (1862- ). A French man of letters, born in Paris, and educated at the lycées Bonaparte and Condorcet. He devoted himself to journalism and to literature, writing critical essays, novels, and theatrical comedies. In all his works, he displayed a keen sense for satire and social caricature. One of his novels, *La Carrière* (1894), dealt ironically with the diplomatic "career" and it is this that was supposed to have delayed Hermant's election to the French Academy until 1927. His works include: *Monsieur Raboussin* (1884); *Nathalie Madoré* (1888); *Amour de tête* (1890); *Le disciple aimé* (1895); *Les transatlantiques* (1897); *Trains de luze* (1908); *Heures de guerre de la famille Valadier* (1915); *Chroniques françaises, 1914-1915* (1916); *Histoire amoureuse de Fanfan* (1917); *La vie à Paris* (1919); *Le roman de Loup* (1925); *La marionnette*; "Secondes Classes" (1926); *Les épaves* (1927); *Camille aux cheveux courts* (1927); also stories of court life: *La carrière* (1894); *Le sceptre* (1897), and *Le char de l'État* (1899); a series of reminiscences, including *Les confidences d'une aïeule* (1893); *Souvenirs du vicomte de Courpière* (1901); *L'aube ardente* (1919); *La journée brève* (1920); and *Grépuscule tragique* (1922). He also wrote *Le joyeux gargon* (1913); *Le caravansérail* (1917); *Le rival inconnu* (1918); *La petite femme* (1921); *L'autre aventure du joyeux gargon* (1921); and the short stories: *Cœurs à part*, *Cœurs privilégiés*, and *Daniel* (1910); and numerous essays and dramas. Consult *Abel Hermant*, by Peltier (1924).

**HERRE, PAUL** (1876- ). A German historian, who in 1920 became director of the political-historical archives at Potsdam. He was born at Magdeburg, studied at the universities of Berlin, Jena, and Leipzig, and in pursuit of a commercial enterprise traveled in Germany, Austria, Italy, and Spain. He was lecturer at

the University of Leipzig (1900-20). He is the author of: *Preussens Befreiungs- und Verfassungskampf* (1914); *Spanien und der Weltkrieg* (1915); *Weltpolitik, Weltkatastrophe* (1916); *Geschichtliche Schlaglichter auf den Weltkrieg* (1916); *Aufruf an die Neutralen zur Geduld* (1918); *Bismarcks Staatskunst* (1916); *Völkergemeinschaftsidee und Internationale Politik* (1920); *Weltgeschichte der neuesten Zeit* (1920); and *Die südtiroler Frage* (1927).

**HERRICK, MYRON T.** (1854-1929). An American diplomat (see Vol. XI). During the World War, he established the American Ambulance Hospital at Neuilly, France, and was chairman of the War Camp Community Service and of the Mayor's War Relief Committee in Cleveland. Reappointed Ambassador to France by President Harding in April, 1921, he served with conspicuous success until his sudden death on Mar. 31, 1929. At Paris, he was entrusted with difficult negotiations involving war debts, limitation of armaments, and the Kellogg-Briand multilateral peace pact. His handling of Colonel Charles E. Lindbergh's arrival in Paris following the latter's transatlantic flight was widely praised. It was largely due to his efforts that adequate quarters for the American Embassy in Paris were provided for in August, 1928. During the post-war reconstruction period, he also served as chairman of the American Commission for Devastated France. Following services in Paris, his body was returned to America on a French warship, with full military honors such as were never before accorded a foreign Ambassador. Burial was in Cleveland.

**HERRICK, ROBERT** (1808- ). An American writer and university professor (see Vol. XI). His professorship of English at the University of Chicago ended in 1923. His later books include *His Great Adventure* (1913); *Clark's Field* (1914); *The World Decision* (1916); *The Conscript Mother* (1916); *Homely Lilla* (1923); *Waste* (1924); *Wanderings* (1925); and *Chimes* (1926). He was a member of the National Institute of Arts and Letters.

**HERRIOT, EDOUARD** (1872- ). A French public official and man of letters who was educated at the École Normale Supérieure, and at the conclusion of his studies became a professor of rhetoric and literature at the Lycée of Lyons, and an instructor at the university there. He entered politics and was successively counselor general of the Rhone, Mayor of Lyons, Senator (1912), Minister of Public Works in Briand's government (December, 1916 to March, 1917) and deputy (November 1919). After the Armistice, he opposed the reparation policies of the Nationalist groups in France and favored a rapprochement with Germany and Russia. In 1922 he made a visit to Russia which he described in *La Russie Nouvelle*. He was president of the Federation of Radical and Radical Socialist parties, and was one of the leaders of the Parliamentary opposition to the *bloc national*. The elections of May, 1924, led to his premiership, supported by parties of the left bloc, from June of that year to April of the following. His policy was conciliatory toward Germany, favoring the Dawes Plan and allowing German vessels to enter French ports for the first time since the World War, and he recognized Soviet Russia (Oct. 28, 1924). He stood strongly against inflation, so when it was discovered that the Government had secretly resorted to it, the ministry was forced to resign. Painlevé, the President

of the Chamber, became Premier, and Herriot was chosen President in his place; on July 20, 1926, he left the speaker's chair to overthrow the Briand-Caillaux government. He again formed his own cabinet which was defeated on its first appearance before the Chamber, and then gave way to Poincaré, in whose government he became Minister of Public Instruction (July 23, 1926-).

In October of that year, he resigned his presidency of the Federation of the Radical and Radical Socialist parties.

As a man of letters, Herriot was best known by a work on *Philon le juif* and the Jewish-Alexandrian school of philosophy which was crowned by the Academy of Moral and Political Science in 1897. His other works include: *Un Ouvrage Inédit de Mme. de Staël* (1904); *Précis d'histoire des lettres françaises* (1905); *Agir* (1915-16); *Créer* (1919); *Lyon pendant la guerre* (1924); and *Dans la forêt normande* (1926).

**HERRMANN**, hër'mán, CONRAD EDMUND GUSTAV (1871- ). A German writer. He was born at Leipzig and attended the university there. He is the author of the plays: *Savonarola* (1886); *Sensation* (1906); *Der Triumph des Mannes* (1906); *Der grosse Baal* (1907). Other works include *Vineta*, a volume of verse (1908); *Und doch* (1915); *Sakuska*, a Russian story (1919); *Lebensfahrt* (1919); *Wilhelm Busch an der Himmelstür* (1920); *Gesichte und Grimassen* (1920); *Der lachende Olymp* (1921); *Maulwürfe* (1921); the satire *Der Affenspiegel* (1923); an edition of *1001 Nacht* (*Arabian Nights*) (1928).

**HERSHEY**, AMOS SHARTLE (1867- ). An American educator (see VOL. XI). He became head of the newly created department of political science at the University of Indiana in 1914. Among his later writings were *Modern Japan*, with Frank M. Anderson (1919); *Handbook for the Diplomatic Relations of Europe, Asia, and Africa, 1870-1914* (1918) and *The Essentials of International Law and Organization* (1927). He was a member of the staff of the American Commission to Negotiate Peace, 1918-19.

**HERTER**, ALBERT (1871- ). An American painter and craftsman (see VOL. XI). Among his later mural works were a series for the Supreme Court room of the Wisconsin Capitol, and an allegorical pageant in the St. Francis Hotel, San Francisco. At his Herter Looms, he designed and produced artistic tapestries.

**HEBTLING**, GEORG, BARON VON (1843-1919). A German administrator and Catholic philosopher (see VOL. XI). On Nov. 1, 1917, he was appointed Chancellor by the Kaiser, and by his skill brought some measure of stability into the affairs of the German government. Later, when Bulgaria capitulated at the end of September, 1918, he was driven from office. See GERMANY, under *History*.

**HERTWIG**, hër'tvîk, RICHARD VON (1850- ). A German zoölogist (see VOL. XI). He resigned his professorship at Munich in 1925 and in 1929 visited the United States, where he was elected a foreign associate of the National Academy of Sciences. He wrote *Abstammungslehre und neuere Biologie* (1927).

**HERTY**, CHARLES HOLMES (1867- ). An American chemist, born at Milledgeville, Ga., and educated at the University of Georgia (1886), Johns Hopkins (Ph.D., 1900), Berlin,

and Zurich. He was assistant chemist of the Georgia Experiment Station (1890-91), adjunct professor of chemistry at Johns Hopkins (1894-1901), and from 1901 to 1904, was with the Bureau of Forestry in the United States Department of Agriculture. During 1905-16, he was professor of chemistry at the University of North Carolina. He was the editor of the *Journal of Industrial and Engineering Chemistry*, 1917-21, president of the Synthetic Organic Chemical Manufacturers' Association, 1921-26, and adviser to the Chemical Foundation, Inc., after 1926. His principal researches have been in organic chemistry and include the determination of the constitution of inorganic compounds by physico methods; also, he invented a new method of turpentine orcharding and a rapid method for the determination of oil in cottonseed products.

**HERTZ**, ALFRED (1872- ). A distinguished German conductor (see VOL. XI). In 1915 he resigned his position at the Metropolitan Opera House and accepted the conductorship of the San Francisco Symphony Orchestra, which under him soon developed into one of the great orchestras of the country. He was largely instrumental in winning recognition for the native composer. While at the Metropolitan, he produced all the operas by American composers produced there. In 1929 he resigned as conductor of the San Francisco Symphony Orchestra.

**HERTZOG**, hër'tsôg, HON. J. B. M. (1866- ). A South African Prime Minister and general (see VOL. XI). At the outbreak of the South African rebellion against Great Britain in 1914, he refused to take part on either side. After the World War, as leader of the Nationalist Party, he headed the opposition of the government of General Smuts, and, on the defeat of the Smuts ministry early in 1924, became Prime Minister and Minister for Native Affairs.

**HERTZSPRUNG**, EJNAR (1873- ). A Danish astrophysicist, born near Copenhagen, who was successively a professor in Göttingen University, in the observatory at Potsdam, director (1919) of the Leyden Observatory, and professor in the University of Leyden (1920- ). In 1912 he worked at the Mount Wilson Observatory in California for four months. He has published much on astrophysics.

**HERZOG**, ÉMILE, SEE MAUROIS, ANDRÉ.

**HERZOG**, RUDOLF (1869- ). A German novelist and poet (see VOL. XI). In the first two years of the World War, he abandoned fiction and wrote the following volumes of verse: *Ritter, Tod, und Teufel* (1915); *Von Stürmen, Sterben, Auferstehen* (1916); and the dramatic poem *Stromübergang* (1916). He later wrote: *Die Stollenkamps und ihre Frauen*, a novel (1917); *Jungbrunnen*, a volume of stories (1918) *Germaniens Götter*, a book of German myths (1919); *Die Buben der Frau Otterberg*, a novel (1921); a volume of poems, *Windzeit und Wolfszeit* (1919); and the novels *Wieland der Schmied* (1927), and *Das Fühlein der Versprengten* (1927).

**HESS**, ALFRED FABIAN (1875- ). An American pediatricist known for his original researches into affections of childhood, notably rickets, scurvy, tuberculosis, blood states, and affections of the stomach and intestines. Born in New York City, he was educated at Harvard and at Columbia, receiving his medical degree from the College of Physicians and Surgeons in 1901. After studying pediatrics in Europe, he was made a professor of that chair in the Uni-

versity-Bellevue Medical College, New York City, in 1915. The record of his work in pediatrics and experimental pathology is contained in 70 or more papers published in periodical literature. A large share of credit for discoveries in connection with rickets, vitamin D, and effects of ultra-violet radiation on rickets and on food substances was accorded to Prof. Hess and in 1927 the Franklin Society awarded him the John Scott Medal for "producing a vitamin factor in food by ultra-violet light."

**HESS, HES, MYRA** (1890- ). An English pianist, born in London. At the age of five, she began to study the piano and two years later entered the Guildhall School of Music, where she graduated as winner of the gold medal. After further study under Tobias Matthay, she made her debut in London, in January, 1908, winning immediate success. She then made tours of Holland and France. Upon her American debut (New York, Jan. 24, 1922) she became a prime favorite in the United States, not only as soloist, but also as a fine ensemble player.

**HESS, VICTOR** (1853- ). An Austrian professor of physics at the University of Graz and contributor on radioactivity, atmosphere electricity, and kindred subjects to the publications of the Academy of Science in Vienna. From 1921 to 1923, he was director of the research laboratory of the U. S. Radium Corporation in New York, and from 1922 to 1925 consulting physicist in the U. S. Bureau of Mines, Washington. Since his return to Austria, he has published *Die elektrischen Leitfähigkeit der Atmosphäre und ihre Ursachen* (1926, in English translation: *The Electrical Conductivity of the Atmosphere and its Causes*, 1928).

**HESE, HESSE, HERMANN** (1877- ). A German novelist and poet (see VOL. XI). He took up his residence in Switzerland before the World War. His later works include: *Rosshalde* (1914); *In der alten Sonne* (1914); *Musik des Einsamen* (1915); *Knulp* (1915); *Am Weg* (1916); *Briefe ins Feld* (1916); *Schön ist die Jugend* (1916); *Marchen* (1919); *Kleiner Garten* (1919); *Klingers letzter Sommer* (1920); *Zarathustras Wiederkehr* (1920); *Blick ins Chaos* (1920); *Wanderung* (1921); a poem of India, *Siddharta* (1922); a selection from previous books of verse, *Ausgewählte Gedichte* (1922), a poetical volume, *Italien* (1923); and the novels *Demian*, *Sinclair's Notizbuch*, and *Der Steppenwolf* (1927).

**HETERODYNE.** See RADIO TELEGRAPHY.

**HEWLETT, MAURICE HENRY** (1861-1923). An English novelist (see VOL. XI). His later books include: *A Lover's Tale* (1915); *The Little Iliad* (1915); *The Song of the Plow* (1916); *Thorgils of Treadholt* (1917); *Peridore and Paravail* (1917); *The Village Wife's Lament* (1918); *Flowers in the Grass*, poems (1920); *In a Green Shade* (1920); *Wiltshire Essays* (1921); *Contemporary Essays* (1922); *Last Essays* (1924); and *The Letters of Maurice Hewlett; to Which is Added a Diary in Greece, 1914*, edited by Laurence Binyon (1926).

**HEYCK, EDUARD** (1862- ). A German historian, who was born at Doberan and studied at Leipzig, Jena, and Heidelberg. He was professor at the universities of Freiburg and Heidelberg, and librarian at Donaueschingen. Included among his later works are *Die Kreuzzüge und das Heilige Land* (1900); *Frauenschönheit im Wandel von Geschmack und Kunst* (1903); *Wilhelm von Oranien* (1908); *Florenz und die*

*Medici* (1909); *Das Deutschland von Morgen* (1917); *Parlament und Volksvertretung* (1918); and *Hohenfeuer* (1920).

**HEYMANN, LILA GUSTAVA** (1868- ). A German social worker, born in Hamburg. She engaged in propaganda for the abolition of the *Sittenpolizei*, worked for child protection and was active in municipal and communal reforms in Munich. She also wrote works about the sex problem and hygiene for young people. After 1918 she was co-editor, with Anita Augspurg, of the magazine *Die Frau im Staat*.

**HEYWARD, DUBOSE** (1885- ). An American writer. He was born at Charleston, S. C., and obtained his schooling there. He wrote: *Skylines and Horizons* (1924); *Porgy* (1925); *Angel* (1926); and *Mamba's Daughters* (1928), and was co-author (with Hervey Allen) of *Carolina Chansons* (1922). *Porgy* was dramatized in collaboration with Dorothy Heyward and produced by the Theatre Guild of New York in 1927-28.

**HIBBARD, BENJAMIN HORACE** (1870- ). An American agricultural economist, born in Bremer County, Iowa. He graduated from the Iowa State College of Agriculture and Mechanic Arts in 1898, and took post-graduate courses at the University of Wisconsin and in Germany. In 1910 he was special agent in the agricultural division of the Bureau of the Census, and in 1913 was appointed professor of agricultural economics at the University of Wisconsin. In 1919 Professor Hibbard became head of this department. He was a member of several societies and wrote *Effect of the Great War on Agriculture* (1919); *Marketing Agricultural Products* (1921); and *A History of the Public Land Policies* (1924).

**HIBBEN, JOHN GRIER** (1861- ). An American clergyman and educator, elected president of Princeton University, 1912. (See VOL. XI). For his services during the World War he was made an officer of the Legion of Honor (France), a commander of the Order of the Crown (Belgium), and a grand officer of the Order of St. Sava (Serbia). He added to his list of publications *The Higher Patriotism* (1915).

**HIBBEN, PAXTON** (1880-1928). An American war correspondent and publicist, born at Indianapolis, Ind. He graduated from Princeton University in 1903 and studied law at Harvard. In 1906 he was admitted to the bar. Entering the diplomatic service, he served as Secretary of Legation in the capitals of Russia, Mexico, Colombia, Holland, and Chile, retiring from the service in 1912. He acted as war correspondent in Europe for several newspapers and magazines from 1915 to 1917, and in 1921 was secretary of the Russian Commission of Near East Relief. During the World War, he served as first lieutenant of field artillery and also with the Finance Bureau, and in the office of the Inspector General. In 1919 he was on duty with the military mission to Armenia and was staff correspondent for the *Chicago Tribune* from 1919 to 1920. He wrote *Constantine I and the Greek People* (1920); *The Famine in Russia* (1922); and *Henry Ward Beecher—an American Portrait* (1927); and contributed many articles on subjects relating to the Near East to magazines.

**HICHENS, ROBERT SMYTHIE** (1864- ). An English novelist and journalist (see VOL. XI) who was made a fellow of the Royal Society of Literature in 1926. Among his later books are *In the Wilderness* (1917); *Snake-*

*Bite* (1919); *Mrs. Marden* (1919); *The Spirit of the Time* (1921); *The Last Time* (1922); *December Love* (1923); *After the Verdict* (1924); and *The God Within Him* (1926). The New York play, *Business is Business*, was his adaptation of *Les affaires sont les affaires*, and he wrote *The Voice from the Minaret* produced in 1919. In 1920 his novel *The Garden of Allah* was played in New York and London.

**HICKS, FREDERICK CHARLES** (1863- ). An American economist and university president, born at Capac, Mich. He was graduated from the University of Michigan in 1886, where in 1890 he also received his Ph.D. During 1891-92 he was instructor in economics at the University of Michigan, and then for eight years was professor of history and political economy at the University of Missouri. In 1900 he accepted the chair of economy and commerce at the University of Cincinnati. He became president of the latter institution in 1920. In addition to many technical papers, reports, and monographs, he is the author of *Lectures on the Theory of Economics* (1901) and *Competitive and Monopoly Price* (1911).

**HICKS, FREDERICK CHARLES** (1875- ). An American librarian, born at Auburn, N. Y. He graduated from Colgate University in 1898 and from the Georgetown Law School in 1901. After several years spent in practicing law, he was appointed librarian at the United States Naval War College at Newport, serving from 1905 to 1908. In 1908-09, he was assistant librarian of the Brooklyn Public Library and was assistant librarian (1911-15), law librarian (1915- ), and associate professor of legal bibliography (1921- ) at Columbia University. He wrote *New World Order* (1920); *Men and Books Famous in the Law* (1921); *Materials and Methods of Legal Research* (1923); and *Human Jettison* (1927); and edited several historical series, including *Famous American Jury Speeches* (1925); and *Arguments and Addresses of Joseph Hodges Choate* (1926).

**HIDES.** See LEATHER; LIVE STOCK.

**HIGGINS, EDWARD JOHN** (1862- ). An English Salvation Army worker who became general of the organization in 1929. He was born at Highbridge, Somerset, educated at Dr. Morgan's School, Bridgewater, entered the Salvation Army as an officer in 1882, and by 1896 had become chief secretary in the United States. In 1905 he was appointed assistant foreign secretary at the London headquarters; from 1911 to 1919, he was commissioner for field work in Great Britain and Ireland, and from that year until 1929, he was chief of the staff of the Salvation Army. As general, he succeeded W. Bramwell Booth. In 1920 he was made Commander of the Order of the British Empire.

**HIGGINS, WILLIAM VICTOR** (1884- ). An American painter and teacher, born at Shelbyville, Ind. He studied at the Art Institute in Chicago and at the Academy of Fine Arts there. In Paris, he was a pupil of René Menard and Lucien Simon, and in Munich, of Hans von Hyeck. Among his pictures in permanent exhibitions are his "Moorland Gorse and Bracken," in the Municipal Gallery, Chicago; "Moorland Piper," Terre Haute Art Association; "Juanito, the Suspicious Cat," in the Union League Club, Chicago; "Women of Taos," Santa Fé Railroad; "A Shrine to St. Anthony," in the collection of the Des Moines Association of Fine Arts; "Fiesta Day," at the Butler Art Institute, Youngstown,

Ohio; "Pueblo of Taos" and "Indian at Stream" in the Los Angeles Museum. Examples of his murals are found in the decorations of the Englewood Theatre, Chicago. He won the first Logan Medal and the first Altman Prize of the National Academy of Design in 1918. He became an associate of the National Academy in 1921.

**HIGGS, HENRY** (1864- ). An English economist and administrator (see VOL. XI). He retired from his position of principal clerk in H. M. Treasury (1921). He was Newmarch Lecturer in statistics (1892, 1893, 1916-18, and 1923-26) in University College, London. His later writings include: *Financial System of The United Kingdom* (1914); *National Economy* (1917); *A Primer of National Finance* (1919); and *Financial Reform* (1925). He edited *Palgrave's Dictionary of Political Economy* (1923-26).

**HIGH PRESSURE BOILERS.** See BOILERS.

**HIGH SCHOOLS.** See EDUCATION IN THE UNITED STATES.

**HIGHWAYS.** See ROADS AND PAVEMENTS; BRIDGES.

**HILDEBRAND, hil'de-bränt, ADOLF E. R.** (1847-1921). A German sculptor (see VOL. XI). Among his later works, the most important was the Hubertus Fountain at the National Museum in Munich (1921). At the time of his death, he had finished the model for a monumental fountain for Cologne, with Father Rhine as the central figure.

**HILDEBRAND, JOEL HENRY** (1881- ). An American chemist, born at Camden, N. J. He was graduated from the University of Pennsylvania in 1903, took his Ph.D. there in 1906, then studied for a year in Berlin. During 1904-05 he was assistant, and during 1907-13 an instructor, in chemistry at the University of Pennsylvania, after which he accepted a call to the University of California, where, since 1918, he has been professor of chemistry and in 1923-26 dean of men. Physical chemistry, and such topics as electro-analysis, hydrogen electrodes, vapor pressures of metals and amalgams, dissociation of alcohol, and theories of solubility are among those on which he has published the results of his studies. During the World War, he served as director of the laboratory of the Chemical Warfare Service in France with the rank of major and later commanded the gas defense school as lieutenant colonel. In 1929 he was elected a member of the National Academy of Sciences. He is the author of *Principles of Chemistry* (1917) and *Solubility* (1924).

**HILFERDING, hil'fär-ding, RUDOLF** (1877- ). A German economist and public official (see VOL. XI). A member of the Social-Democratic Party, he opposed the Government's policies during the World War. He was editor-in-chief of *Freiheit* (1918-22), Minister of Finance in the first Stresemann cabinet (1923), a member of the Reichstag (1924- ), and again Minister of Finance in the Stresemann cabinet formed in June, 1928. In 1924 he founded and became editor of *Die Gesellschaft*, an international review of Socialism and politics.

**HILL, ALBERT ROSS** (1869- ). An American university president (see VOL. XI). From 1908 to 1922, he was president of the University of Missouri. During the World War, he was on a leave of absence until 1922 as director of foreign operations of the American Red Cross. Since 1923 he has been general

manager of the Ward Investment Company of Kansas City, Mo. From 1917 to 1921 he was a member of the board of the United States Naval Academy.

**HILL, ARCHIBALD VIVIAN** (1886- ). A British physiologist. He was educated at Blundell's School, Tiverton, and Trinity College, Cambridge, where he was a fellow (1910-16). He was H. O. Jones University Lecturer in physical chemistry (1914), a fellow of King's College (1916-25), becoming honorary fellow in 1927, and University Lecturer in physiology (1919-20). He then was professor of physiology at Manchester University (1919-23), and at University College, London (1923-25), and Foulerton Research Professor of the Royal Society (1926- ). From 1910 he investigated the production of lactic acid by exercising muscles, this study resulting, in 1922, in his sharing the Nobel Prize for medicine and physiology with Otto Meyerhoff, of the Kaiser Wilhelm Institute, Berlin, a friend engaged in the same field of research. He was Oliver Sharpey Lecturer, Royal College of Physicians (1924), Herter Lecturer, Baltimore (1924), Croonian Lecturer, Royal Society (1926); Lowell Lecturer, Boston (1927), and non-resident lecturer, Cornell (1927). He was made an Officer of the Order of the British Empire. He wrote *Muscular Activity* (1925); *Lectures on Certain Aspects of Biochemistry* (1926); *Living Machinery* (1927); and *Muscular Movement in Man* (1927).

**HILL, DAVID JAYNE** (1850- ). An American diplomat and writer (see Vol. XI). His later writings include: *The People's Government* (1915); *Americanism—What It Is* (1916); *The Rebuilding of Europe* (1917); *Impressions of the Kaiser* (1918); *Present Problems in Foreign Policy* (1919); *American World Policies* (1920); *The Problem of a World Court* (1927). He was for some years president of the National Association for Constitutional Government.

**HILL, EDWARD BURLINGAME** (1872- ). An American composer, born at Cambridge, Mass. After completing, with highest honors, all the courses in music under J. K. Paine at Harvard University, he continued his studies in Boston with B. J. Lang (piano) and F. F. Bulard (composition), and in New York with A. Whiting (piano) and H. E. Parkhurst (theory). In 1908 he was appointed instructor in music at Harvard and in 1918 was made associate professor. He lectured extensively on modern French music, both in the United States and in France, and was also a frequent contributor to various periodicals. As a composer, he began as an impressionist, but soon drifted into futurism, and finally into plain jazz. His works include: two pantomimes, *Jack Frost in Midsummer* and *Pan and the Star*; two symphonic poems, *The Parting of Lancelot and Guinevere* and *The Fall of the House of Usher*; two orchestral suites, *Stevensoniana*, No. 1 and No. 2; *Nine Waltzes* for orchestra; *Poem* for violin and orchestra; prelude to Euripides's *The Trojan Women*; *Study in Jazz* for two pianos; *Jazz Scherzo* for two pianos and orchestra; and choruses, songs and pieces for piano.

**HILL, FRANK PIERCE** (1855- ). An American librarian (see Vol. XI). In 1917 he was chairman of the American Library Association war finance committee which raised over \$1,700,000 with which to provide library facilities at army camps. He was also chairman of

the Association's Committee on enlarged programme in 1919.

**HILL, JOSEPH ADNA** (1860- ). An American statistician (see Vol. XI). After service as chief statistician of the United States Census, he was appointed Assistant Director of the Census in 1921. He was the author of many census reports on child labor, the insane, divorce, and kindred subjects.

**HILL, LEONARD ERSKINE** (1866- ). An English physiologist (see Vol. XI). He was made director of the department of applied physiology of the National Institute of Medical Research, Mount Vernon, Hampstead. He published in two parts (1919-20) as a report to the Medical Research Commission *The Science of Ventilation and Open Air Treatment*; and in collaboration (Flack and Hill) *Textbook of Physiology* (1919). During the World War, he was a member of the Medical Research Commission. His later works include *Sunshine and Open Air, Their Influence on Health* (1924); *Health and Environment* (with Argyll Campbell, 1925); and *Common Colds* (with Mark Clement, 1929).

**HILLER, hül'ër, KURT** (1885- ). A German writer. He was born in Berlin and studied at the universities of Berlin, Freiburg, and Heidelberg, graduating as doctor of law. He is the author of: *Das Recht über sich selbst* (1908); *Die Weisheit der Langeweile* (1913); *Ein deutsches Herrenhaus* (1918); *Unnennbares Brudertum* (1918); *Geist werde Herr* (1920); *Logokratie* (1921); *Schmach des Jahrhunderts* (1922); *Der Aufbruch zum Paradies* (1922); *Verwirklichung des Geistes im Staat* (1925); and *Ist Genf der Friede?* (1927). He also compiled the anthology *Der Kondor* and edited the posthumous works of Max Steiner.

**HILLIS, NEWELL DWIGHT** (1858-1929). An American clergyman and writer (see Vol. XI). Since 1924 he has been pastor emeritus of Plymouth Church, Brooklyn, N. Y. Among his later books are *German Atrocities* (1918), *The Blot on the Kaiser's 'Scutcheon* (1918); *Rebuilding the Ruined Lands of Europe* (1919); *The Better America Lectures* (1921).

**HILLQUIT, MORRIS** (1869- ). An American Socialist (see Vol. XI). He was the Socialist candidate for Mayor of New York City in 1917. He wrote *From Marx to Lenin* (1921).

**HINDEMITH, PAUL** (1895- ). A German composer, born at Hanau, Hessen. He was a pupil of Hoch's Konservatorium, in Frankfurt. In 1915 he became concert master at the Frankfurt Opera, and in 1927 instructor at the Hochschule für Musik in Berlin. His first works, showing influences of Brahms, Reger, and Mahler, attracted little attention, but when he had developed into an uncompromising futurist, he was hailed as a new Messiah throughout Germany. As for ugly and grotesque effects, his music appears as a caricature of the style of Stravinsky or Schönberg. His productivity has been enormous, especially in the field of chamber music (sonatas, string quartets, etc.). His three one-act operas, *Nusch-Nuschi* and *Hoffnung, Mörder der Frauen* (Stuttgart, 1921) and *Sankta Susanna* (Frankfurt, 1922) were immediately suppressed by the police because of the alleged revolting immorality of the text. *Cardillac* (Dresden, 1926) has made the rounds of several stages of Germany, while the one-act *Hin und Zurück* had only one performance (Baden-Baden, 1927).

**HINDENBURG**, hin'den-burk, PAUL VON BENECKENDORF UND VON (1847- ). A German soldier (see VOL. XI). For his victories at Tannenberg and the Masurian Lakes, on the eastern front in the World War, he was made colonel general and, later, field marshal. In November, 1914, he was given command of the armies of the East, later of the Austrian front, and in 1918 he succeeded Falkenhayn as chief of the general staff. By that time, he was the national idol of the German people, and they erected an immense wooden statue of him in the Königsplatz in Berlin. Money was raised for war charities by charging a fee for the privilege of driving nails into the statue. After the War, he was of great assistance in disbanding the armies. He published his recollections under the title *Aus meinem Leben* (1920). After having previously twice refused to become a candidate, he was elected President of the German Republic in April, 1925, to succeed Friedrich Ebert (q.v.). In carrying out his policy of "uniting and coordinating the nation's constructive elements for the common welfare of the German people," he alienated the extreme Nationalists but gained the support of the liberal groups who favored the Republic as against a restored monarchy.

**HINDENBURG LINE.** See WORLD WAR, under *Western Front*.

**HINDHEDE**, MIKKEL (1862- ). A Danish physician and dietist, born at Lem bei Ringkøbing, who during the World War was responsible for the nutrition of the Danish people. He is known especially as a low-protein advocate. Up to the outbreak of the War, he was best known for two of his publications, *Protein and Nutrition* (1913) and *What to Eat and Why* (1914). These works are known through translations into English and German. His experiences in feeding the populace during the War were given out in 1920 in an official report of the Danish Minister of the Interior.

**HINDS**, ERNEST (1864- ). An American military officer, born in Marshall County, Ala. He was graduated at the United States Military Academy in 1887, entered the Army as second lieutenant in the 3d Artillery, and by successive promotions attained the rank of major general on Dec. 6, 1922. He participated in the War with Spain in Cuba and later saw duty in the Philippine Islands. During the World War, he was chief of artillery of the 1st Army Corps and then of the 1st Army in France, with the provisional rank of major general. In 1919-23 he was commandant of the Field Artillery School of Fire at Fort Sill, Okla., and in 1923-24 and 1925-28, of the 2nd Division and 8th Corps Area at Fort Sam Houston, Tex. He received the United States Distinguished Service Medal and the decorations of the Legion of Honor from France, the Order of Leopold from Belgium, and the order of St. Maurice and St. Lazarus from Italy.

**HINES**, FRANK THOMAS (1879- ). An American soldier, born in Salt Lake City, and educated at the Agricultural College of Utah. He enlisted for the Spanish-American War. In 1899 he was commissioned second lieutenant in the Utah Light Artillery. He then joined the Regular Army, and rising through the various grades, became captain of the Coast Artillery Corps in 1908. He was made brigadier general of the National Army in 1918 and of the Regular Army in 1920, resigning the same year. In 1917

he was assigned to the office of the Chief of Staff as assistant in the Embarkation Service, which he headed in 1918. In 1919 he was appointed Chief of the Transportation Service of the United States Army. He served at several important international conferences following the World War. In 1923 he was appointed director of the Veterans' Bureau. He was awarded the Distinguished Service Medal (both Army and Navy) and numerous foreign decorations.

**HINES**, JOHN LEONARD (1868- ). An American army officer, born in White Sulphur Springs, W. Va., and educated at the United States Military Academy. Commissioned second lieutenant in 1888, he served during the Spanish-American War, in the Philippines, and in the punitive expedition into Mexico in 1916-17, becoming brigadier general in 1918 and major general in 1921. In 1917 he was appointed assistant adjutant general in the American Expeditionary Forces and accompanied the first detachment of American troops to France. In May, 1918, he commanded the 1st Brigade Infantry, 1st Division; in October, 1918, the 3rd Army Corps, and in November, 1919, the 4th Division. He commanded the 5th Division in 1920 and the 8th Corps Area in 1921. General Hines succeeded General Pershing as Chief of Staff of the United States Army in September, 1924. He was appointed commander of the 9th Corps Area, Dec. 31, 1926.

**HINES**, WALKER DOWNER (1870- ). An American lawyer and public official, born at Russellville, Ky., and educated at Ogden College and the University of Virginia. In 1893 he began the practice of law in Louisville. He was general counsel of the Atchison, Topeka, & Santa Fé Railroad from 1906 to 1918 and chairman of the Board of Directors of this road from 1916 to 1918. In 1906-16 he engaged in general law practice in New York. In the latter year, he was appointed director general of railroads, serving until 1920, when he was in Europe as arbitrator under the Peace Treaties of questions of river shipping. On his return to the United States in 1921, he resumed the practice of law. In the summer of 1925, he made an investigation of Rhine and Danube navigation for the League of Nations. He is the author of numerous pamphlets and articles on railroad and governmental problems.

**HINKS-ON**, MRS. KATHARINE (maiden name TYNAN) (1861- ). An Irish novelist and poet (see VOL. XI). Her later writings include: *The Story of Margery Dawe* (1915); *John-a-Dreams* (1916); *Miss Mary* (1917); *Herb o' Grace* (1918); *The Man from Australia* (1919); *Love of Brothers* (1919); *The Second Wife* (1920); *The Wandering Years* (1922); *Mary Beaudesert, V.S.* (1922); *Wives* (1924); *Memories* (1924); *Life in the Occupied Area* (1925); *The Infatuation of Peter* (1926); and *The House in the Forest* (1928).

**HINSHAW**, WILLIAM WADE (1867- ). An American operatic baritone and impresario, born at Union, Iowa. While pursuing the general academic course at Valparaiso University (Ind.), he studied singing and theory with R. A. Heritage and later continued with L. G. Gottschalk and L. A. Phelps in Chicago. He made his debut on the concert stage in Chicago during the World's Fair (1893). From 1895 to 1899, he was dean of the Conservatory of Music at Valparaiso University. After coaching with A. Mareschalchi, he was engaged for

the Savage Grand Opera Company and made his operatic debut as Mephistopheles in St. Louis (Nov. 6, 1899) with marked success. In 1903 he opened his own school of opera, which soon became merged with the Chicago Conservatory, and until 1907 he was president of the combined institutions. In 1909 he organized the International Grand Opera Company of Chicago, of which he was general manager, stage-manager, and principal baritone. From 1910 to 1913, he was a member of the Metropolitan Opera Company and then made guest appearances in various German opera houses. In 1918 he became president of the Society of American Singers, an organization devoted to the production of intimate operas, especially Mozart's, in English. Since 1920 he has been directing his own chamber productions of opera comique. He offered, in 1916, a prize of \$1000 for a one-act opera by an American composer. It was awarded to Hadley's *Bianca*, produced by the Society of American Singers, New York, 1917.

**HINTON, EDWARD WILCOX** (1868- ). An American lawyer and teacher, born at Rochefort, Mo., and educated at Christian College in Columbia, Mo., and at the University of Missouri, where he studied law. He began the practice of law at Columbia, Mo. He was professor of pleading and practice at the University of Missouri from 1903 to 1913 and after the latter year was professor of law at the University of Chicago. He edited *Hinton's Cases of Trial Practice* (1915); *Hinton's Cases on Evidence* (1919); and *Cases on Equity Pleading* (1926). He was co-editor of *Cook and Hinton's Cases on Common Law Pleading* (1923).

**HINTZE, PAUL VON** (1864- ). A German admiral and diplomat, born at Schweltdon-Oder. He served for several years as military attaché at several embassies and was military plenipotentiary to Russia in 1908. In 1914 he was in service in the German Embassy in Mexico and in the same year was sent to China, where he carried on extensive propaganda in favor of Germany. He was transferred to Norway later in the same year. In 1918 he was appointed Secretary of State for Foreign Affairs and continued in this post until the fall of the empire.

**HIROHITO, EMPEROR OF JAPAN** (1901- ). Proclaimed heir apparent in 1912 when his father became Emperor, he succeeded to the throne upon the death of his father Yoshihito on Dec. 25, 1926. He was crowned Nov. 10, 1928, after a series of traditional ceremonies lasting three weeks. He was educated under private tutors at the Imperial Education Institute in Tokyo, and when he reached the age of 18 was given a seat in the House of Peers in the Imperial Diet. His father's ill health caused some of the imperial duties to devolve on the Prince in 1920. In the spring of 1921, he was sent on a visit to England, France, Belgium, and Italy, being the first Japanese prince to leave his native land. All hope of the Emperor's ability to continue his duties as ruler being abandoned, Prince Hirohito was designated Regent of Japan on Nov. 25, 1921. In December, 1923, a young student, inflamed by radical teachings, attempted to assassinate the young ruler. On Jan. 26, 1924, he was married to Princess Nagako, eldest daughter of Prince Kuni, with ancient Shinto rites.

**HIRSCHFELD, HERSCHELT, GEORG** (1873- ). A German author, at first chiefly a dramatist, and later a prolific novelist (see Vol.

XI). Among his later works are *Nachwelt* (1915); *Die Geborgte Sonne* (1916); *Die Deutsche Prinzessin* (1920); *Das Haus mit der Pergola* (1923); *Das Blut der Messalina* (1924); *Der Mann im Morgen-dämmer* (1925); *Opalritter* (1927); and *Frau Rietschel, das Kind* (1927). He also published a volume of letters and recollections, *Otto Brahm, Briefe und Erinnerungen* (1925) and a biography of *Lord Byron* (1926).

**HIRSCHFELD, LUDWIG** (1882- ). An Austrian, born at Vienna, and educated at technical schools. He was associate editor of the *Wiener Neue Freie Presse* and editor of the illustrated magazine, *Die Moderne Welt*. Hirschfeld is mainly a humorist but has written several comedies and texts for operettas, which include: *Der Wetterhan* (1911); *Der Berühmte Gabriel* (1916); *Die Steinerner Maske* (1918); *Die Grosse Dummheit* (1919); *Der Liebling der Frauen* (1920); *Die Silberne Jugend* (1921); and *Das Buch von Wien* (1927). He has also published *Die Klingende Stadt*, a volume of Viennese sketches (1912); *Wo Sind die Zeiten?* and *Ten Years of Viennese Life* (1920).

**HIRSCHFELD, MAGNUS** (1868- ). A German psychiatrist, famous for his exhaustive studies in sex confusion and allied subjects. Born at Kolberg, he settled in Berlin to practice neurology and psychiatry in 1910, and within a few years he had published the following exhaustive works: *Die Transvestiten*, 2 vols. (1910-12); *Die Homosexualität* (1914); *Sexual Pathologie*, 2 vols. (1917); *Sexual Zwischenstufen* (1922); *Sexualität und Kriminalität* (1924); and *Sexual-Katastrophen*, with L. Klauber and G. Lahnardt (1916).

**HIRT, HERT, HERMANN** (1865- ). A German philologist (see Vol. XI). Among his recent works are *Geschichte der Deutschen Sprache*; *Fragen des Vokalismus und der Deutschen Stammbildung im Indogermanischen* (1914); and *Etymologie der Neuhochdeutschen Sprache* (1920).

**HIRTH, FRIEDRICH** (1845-1927). A German-American Sinologue (see Vol. XI). He was professor of Chinese and head of the Chinese department of Columbia University, 1902-17. In 1917 he wrote *The Story of Chang K'ien, China's Pioneer in Western Asia*.

**HISPANIC SOCIETY OF AMERICA, THE**. An international organization founded in New York City in 1904 to encourage the study of the history, languages, and arts of the Spanish and Portuguese-speaking civilizations. Valuable additions have been made to the Society's original library of about 40,000 volumes, and to its collections of Hispanic paintings, manuscripts, maps, handwork, and other objects of art. Besides owning one of the most important collections of the paintings of Ignacio Sorolla in the world, the Society has sponsored temporary exhibitions of various sorts, presenting the work of such artists as Zuloaga, Cervantes, and Lope de Vega. Membership, which is honorary, is limited to 100, and includes Hispanic scholars of many nationalities. The Society publishes the *Revue Hispanique* in Paris every two months; and it also has published over 200 catalogues, reprints, and monographs. The museum and headquarters of the Society, opened in 1908; are at 156th Street, west of Broadway, New York City. The president is Archer M. Huntington; and the secretary, George Bird Grinnell.

**HISTOLOGY.** See **ZOOLOGY.****HISTORICAL ASSOCIATION, AMERICAN.**

A national organization founded in 1884 for the promotion of historical writing and studies in the United States. It publishes a quarterly, *The American Historical Review*, and the *Annual Report*. Under government provision, the association communicates its proceedings and information to the secretary of the Smithsonian Institution, for transmission to Congress. The membership, 3500 at the beginning of 1929, was drawn from Canada, Europe, and South America, as well as from every part of the United States. In 1927 the John H. Dunning Prize fund was added to the four awards regularly offered for historical essays. The Carnegie Corporation granted the association \$50,000 in December, 1928, to conduct a five-year survey of the historical and social courses offered in high schools. James Harvey Robinson succeeded James H. Breasted as president in 1928.

**HITCHCOCK, GILBERT MONELL (1859- )**.

An American lawyer, publisher, and public official. During the administration of President Wilson, he was chairman of the Foreign Relations Committee of the Senate and led in the movement for the ratification of the League of Nations in that body, 1919-20. He was defeated for reelection to the Senate in Nebraska in 1922. He has been publisher of the *Omaha World-Herald* since 1889.

**HITCHCOCK, HELEN SANDORN SARGENT (Mrs. RIPLEY HITCHCOCK) (1870- )**. An American art worker, born at Elizabeth, N. J. She studied at the Art Students' League and in 1898 founded the Art Workers' Club for Women, of which she was president for 11 years. In 1914 she founded and was first vice president of the Art Alliance of American Women. In 1917 she founded and was chairman of the Art War Relief.

**HITLER, ADOLF (1889- )**. A Bavarian reactionary leader, born in Austria, but a naturalized Bavarian. In November, 1920, he organized a movement in Bavaria similar to the Fascist movement in Italy. His followers wore gray shirts and brassards with an anti-Semitic Swastika cross in a white circular field on red. They were armed with blackjacks and, it was reported, with revolvers. Hitler had great gifts as an orator and organizer and stood for a strong united Germany. On Nov. 8, 1923, he and General von Ludendorff seized the government at Munich, but their power lasted only a few hours. Ludendorff was captured first; Hitler was taken on November 12. They were tried for treason in April, 1924, and Hitler was sentenced to a short term in the fortress at Landsberg, Bavaria. See **GERMANY**, under *History*.

**HJARNE, yår'në, HARALD GABRIEL (1848-1922)**. A Swedish historian (see **VOL. XI**). His later works include *Franförsvarsstriden* (1914); *Osteuropas kriser och Sverges försvar* (1914); *Mironredistenismen* (1915); *Vårt nuvarande tidsläge* (1916); *Vår ofverhängande fara fara* (1917); and *Finländska frågor* (1920).

**HOBAN, EDWARD FRANCIS (1878- )**. An American bishop of the Roman Catholic Church, born at Chicago and educated at St. Ignatius College, St. Mary's Seminary in Baltimore, and the Gregorian University at Rome. He was ordained priest in 1903. In 1908 he was appointed chancellor of the archdiocese of Chi-

cago and was consecrated bishop of that diocese in November, 1921.

**HOBART COLLEGE.** An institution for the higher education of men, at Geneva, New York; founded, chiefly under the auspices of the Protestant Episcopal Church in 1822, and permanently chartered by the Regents of the University of the State of New York in 1823. William Smith College, a coordinate institution for the separate instruction of women, administered by the Hobart College corporation, and with instruction given by the Hobart College faculty, was established in 1908. The student enrollment in Hobart College increased from 102 in 1914 to 312 in 1928, while registration in William Smith College in 1928 was 158, bringing the total up to 470. The combined faculty of the two colleges increased from 21 to 37 between 1914 and 1928; the productive funds rose from \$400,000 to \$1,141,000; property and equipment were valued at \$750,000 in 1928; the income for 1927-28 amounted to \$240,000; and the volumes in the library increased from 55,000 to 82,500. With a rapid increase in college enrollment following upon the World War, Hobart College turned its efforts chiefly to enlargement of endowment and expansion of the faculty, rather than to the construction of buildings. Existing property, however, was constantly improved, and a new wing, costing \$50,000, was added to the principal wing to provide additional classroom facilities. A few changes in curriculum, along the lines of modern trends, included an orientation course for freshmen, a limited number of courses in business administration for third- and fourth-year students, and a general course in science for students not specializing in scientific study. President, Murray Bartlett, D.D., S.T.D., LL.D.

**HOBHOUSE, LEONARD TRELAWNEY (1864- )**.

A British sociologist and philosopher (see **VOL. XI**). He published in 1918 a *Philosophical Theory of the State*, a work in which he attacked the metaphysical absolutistic notions set up by the Hegelian school. He held that the habit of conceiving the state as a being led to political conservatism. He also wrote *The Rational Good: a Study in the Logic of Practice* (1921); *The Elements of Social Justice* (1922); and *Social Development, its Nature and Conditions* (1924). He was joint author, with G. C. Wheeler and Morris Ginsberg, of a survey, *The Material Culture and Social Institutions of the Simpler Peoples* (1915).

**HOBHEIM, MARTIN (1883- )**. A German professor of history at the University of Berlin. He was born at Friesdorf, studied in Heidelberg, Munich, Freiburg, Berlin, and Göttingen, and was lecturer at the University of Kiel in 1913 and in Berlin in 1914. In 1916 he founded a bureau for the repression of chauvinism. He became very active in political life. Since 1921 he has been councillor of the State Archives. His principal works include: *Maachiavellis Renaissance-und Kriegskunst* (1912); *Torsteisson als Vorgänger Friedrichs des Grossen* (1918); *Die Alldeutsche Bewegung; ihre Politische Schuld und Gefahr* (1915); *Vaterlandspolitik* (1917); *Wir Brauchen Kolonien* (1918); *Chauvinismus und Weltkrieg* (1919); *Delbrück, Clausewitz, Kritik des Weltkriegs* (1920); *Untersuchungsausschuss und die Dolchstoßlegende* (1926).

**HOBSON, JOHN ATKINSON (1858- )**. An English economist (see **VOL. XI**). Besides

articles in British and American magazines, he wrote: *Towards International Government* (1915); *The New Protectionism* (1916); *Democracy after the War* (1917); *Richard Cobden: the International Man* (1918); *Taxation in the New State* (1919); *Problems of a New World* (1921); *Incentives in the New Industrial Order* (1922); *Economics of Unemployment* (1922); *Free Thought in the Social Sciences* (1926); and a study entitled *The Conditions of Industrial Peace* (1927).

**HOBSON, RICHMOND PEARSON** (1870- ). An American naval constructor, lecturer, and author (see VOL. XI). He organized (1921) and was general secretary of the American Alcohol Educational Association, and organized the International Narcotic Educational Association (1923), and the World Conference on Narcotic Education (1926). Among his later books are *Destroying the Great Destroyer* (1915); *America in the World War* (1917); *The Great Reform* (1918); *Alcohol and the Human Race for Truth Inoculation of Society* (1919); *Narcotic Peril* (1925).

**HOCHENEGG, JULIUS VON** (1859- ). An Austrian surgeon, known as a leading operator for cancer of the rectum. Having obtained his medical degree from the University of Vienna in 1885, he became an assistant to Professor Albert and in 1889 a private docent in surgery. From 1891 to 1904, he had a class in surgery in the Poliklinik of the University, after which he was made full professor of surgery with charge of the University Surgical Clinic. In 1906 he edited *Lehrbuch der Spezielle Chirurgie* (2 vols.), which was reissued in 1918. His military experiences were summed up in his *Kriegschirurgische Mittheilungen* in 1919. From time to time, he has reported his experiences with rectal cancer in the Vienna journals.

**HOCHSTETTER, hōc'shtët-ër, GUSTAV** (1873- ). A German writer, who was born at Mannheim and studied in Heidelberg and Berlin. A humorist, he edited the popular humorous magazine, *Die Lustigen Blätter*. He is the author of *Das Starre System* (1908); *Diskretion Ehrensache* (1909); *Der Tausendste* (1909); *Das Füsschen der Gnädigen Frau* (1912); *Die Heiratsjagd* (1912); *Hundert Frauen* (1913); *Wir Sind Wir* (1914); *Bismarcks Historische Karrikaturen* (1914); *Das Morse Alphabet* (1915); *Debberitzer Briefe* (1916); *Lachende Geschichten* (1917); *Das Buch der Liebe* (1917); *Venus in Seide* (1920); *Das Lustige Hundebuch* (1920); *Lachendes Blond* (1921); *Der Musenkinderswagen* (1922); and *Lustiges aus dem Hundeleben* (1926).

**HOCK, STEFAN** (1877- ). An Austrian writer, born at Vienna and educated in Vienna and Berlin. He was connected with the famous Burgtheater and was lecturer at the State Academy for music and drama. He is the author of *Die Vampyrage* (1900); *Der Traum: ein Leben* (1904); *Die Romantische Schule in Deutschland* (1910); *Karl May* (1912); *Friedrich Hebbel* (1913); *Gerhart Hauptmanns Odysseus* (1914); and *Prinz Eugen, der Edle Ritter* (1918). He compiled an anthology of Austrian verse, wrote a treatise entitled *Giebt es eine Oesterreichische Literaturgeschichte?* and edited the correspondence of Betty Paoli, Leopold Kompert, Grillparzer, and Hebbel, and translated, among other works, *Macbeth*, *Anthony and Cleopatra*, and plays by Tristan Bernard, Edouard Bourdet, and Jean Sarment.

**HOCKER, PAUL OSKAR** (1865- ). A German novelist, publisher of the magazine *Velhagen und Klasings Monatshefte*. He was born at Meiningen, had a university education, and studied at the Royal Academy of Music in Berlin. Included among his numerous works are *Fräulein Doktor* (1897); *Die Frau Rat* (1898); *Weisse Seele* (1901); *Letzter Flirt* (1902); *Frühlingsstürme* (1904); *Don Juans Frau* (1906); *Die Verbotene Frucht* (1908); *Die Sonne von St. Moritz* (1910); *Die Lachende Maske* (1911); *Die Meisterin von Europa* (1913); *Ein Liller Roman* (1916); *Die Stadt in Ketten* (1917); *Der Held des Abends* (1920); *Die blonde Gefahr* (1922); *Thaddäus* (1923); *Dicks Erziehung zum Gentleman* (1924); *Modell Sirene* (1925); *Die Frau am Quell* (1926); and *Das ungetreue Liebespaar* (1927). He also wrote two plays, *Die Wappenhans* (1904) and *Das Volk in Waffen* (1913).

**HOCKEY.** This ice sport has gained an immense hold within a comparatively short period of time. Canada, which formerly was regarded as the home of hockey, has seen its championship laurels wrested from it by the United States and the game has attained much popularity in Great Britain, Switzerland, and France. Professional hockey, sponsored by the formation of an international league comprising leading cities of Canada and the United States, has scored an amazing financial success. Madison Square Garden, New York City, and the arenas constructed in Chicago, Detroit, and other places have proved inadequate to accommodate the thousands who enjoy the thrills afforded by a fast hockey encounter. Several new amateur leagues have been established with the smaller cities of Canada and the United States furnishing the teams, and these too have more than satisfied their promoters in the way of public support. Hockey has always been played among the larger Eastern colleges of the United States and many smaller institutions which could secure the necessary links have taken up the game enthusiastically. Field Hockey, a variety of the game, has met with favor with women athletes, both in the United States and Europe, and international contests are held frequently.

**HOCKING, JOSEPH** (1860- ). An English novelist and retired nonconformist minister (see VOL. XI). His later writings include: *The Day of Judgment* (1915); *The Path of Glory and Tommy and the Maid of Athens* (1917); *The Pomp of Yesterday and The Price of a Throne* (1918); *In the Sweat of Thy Brow* (1920); *Prodigal Daughters* (1922); *Prodigal Parents* (1923); *What Shall It Profit Man?* (1924); *Rosemary Carew* (1925); and *Felicity Trevellyn* (1927).

**HOCKING, SILAS KITTO** (1850- ). An English novelist (see VOL. XI). His later writings include: *The Beautiful Alien* (1916); *His Own Accuser* (1917); *Nancy* (1919); *Watchers in the Dawn* (1920); *The Greater Good* (1922); and *My Book of Memory* (1923).

**HOCKING, WILLIAM ERNEST** (1873- ). An American philosopher, born at Cleveland, Ohio, and educated at Harvard University. He was instructor in the history and philosophy of religions at Andover Theological Seminary (1904-06). After 1906 he taught philosophy successively at California, Yale, and Harvard Universities. He was appointed to the Alford professorship at Harvard in 1920. He is the author of two important works on religion and

ethics, *The Meaning of God in Human Experience* (1912) and *Human Nature and Its Remaking* (1918; rev. ed., 1924); also of *Man and the State* (1926); *Philosophy of Law and of Rights* (1928); and *Thoughts on Self, Body, Freedom* (1928). During the World War, he gave a series of lectures on *Morale and Its Enemies* (1918).

**HODGE, Rt. Hon. John** (1855- ). A British labor leader, born in Scotland. He was president of the British Steel Smelters' Mill, Iron, Tinplate, and Kindred Trades Association, and of the Iron and Steel Trades Confederation, which he founded, taking an active part in the political, municipal, and industrial movements of Glasgow and western Scotland until the Confederation moved to Manchester (1892). He was president of the Trades Congress (1892), president of the British Section of the International Congress at Zurich (1893), and a member of the City Council (1898-1901). He was a member of Parliament (1906-23), chairman of the Labor Party in the House of Commons (1915), on the Mesopotamia Commission and Minister for Labor (1916-17), and Minister of Pensions (1917-19).

**HODGES, Harry Foote** (1860- ). An American army officer, born at Boston, Mass. He graduated from the United States Military Academy in 1881, when he was made second lieutenant in the engineers. He continued in the Army until December, 1921, when he was retired with the rank of major general. In 1907 he became assistant chief engineer and a member of the Isthmian Canal Commission. Continuing in this position until 1915, he had much to do with the designing of the locks and dams and other regulating work on the Panama Canal, for which he received the thanks of Congress. During the World War, he had command of camps Devens (Mass.), Serier (S. C.), and Travis (Tex.). He was also in France in command of the 20th Division. Later, he was in command of the North Pacific and 3d Coast Artillery districts until his retirement. He received the United States Distinguished Service Medal.

**HODGSON, Ralph** (1872- ). A British poet who, although he published little, wrote several of the outstanding poems of his time. His first book, *The Last Blackbird* (1907), was rather too conventional to draw attention to its author, but he grew rapidly thereafter and his work was awarded the Polignac Prize. Some of his best known poems were *The Song of Honour*; *Even*; and *The Bull*. His small volume of collected *Poems* was published in 1917.

**HODŽA, Milan** (1878- ). A Czechoslovak professor and public official. He was a Slovak member of the Hungarian Parliament in 1905 and became known as an author of works on Slovak problems. In 1918 he was a member of the Constitutional Assembly of the new Czechoslovakian state, in 1919 Minister of unification, in 1920 a member of Parliament, in 1922-25 Minister of Agriculture, and after 1926 Minister of Education. He became a professor in Bratislava University in 1920. He is one of the leaders of the Agrarian Party and president of the Czechoslovak Academy of Agriculture.

**HOEBER, hō'bēr, Karl** (1867- ). A German pedagogue and editor of the *Kölnische Volkszeitung*, born at Dietz and educated at the universities of Freiburg, Heidelberg, and Strassburg. He taught in various colleges and was director of the Teachers' Seminary in Metz. He

is the author of *F. W. Weber, Leben und Dichtung* (1903); *Edmund Hardy, ein Lebensbild* (1905); *Sprachgebrauch im Volkslied des Vierzehnten und Fünfzehnten Jahrhunderts* (1908); *Das Deutsche Universitäts- und Hochschulwesen* (1912); *Die Religiösen Pflichten des Gebildeten Laienstandes* (1913); *Religion, Wissenschaft, Freundschaft* (1921); and *Pro Deo et Patria* (1921).

**HOENSBROECH, hōns'brōg, Paul, Count** (1852-1923). A German theologian and writer on history and allied subjects (see Vol. XI). His later works include: *Zwei Welten: Dramatische Bilder* (1918); *Graf Herling, Reichskanzler* (1918); *Ein Stück Jesuitenmoral* (1918); *Wilhelm II, Abdankung und Flucht* (1918); and *Zurück zur Monarchie* (1918). He died Sept. 9, 1923.

**HOESSLIN, Franz von** (1885- ). An eminent German conductor, born in Munich. A pupil of Max Reger and Felix Mottl, he began his career as operatic conductor in Danzig (1907) and in 1912-14 was concert conductor in Riga. After serving in the World War, he was concert conductor in Lübeck, in 1919, and in 1920-22 conductor at the Nationaltheater in Mannheim. He went in 1923 as general musical director to Dessau, and in a similar capacity in 1926 to Barmen. In 1927 and 1928 he conducted the *Ring des Nibelungen* at Bayreuth.

**HÖFFDING, hēv'ding, Harald** (1843- ). A Danish philosopher (see Vol. XI), who, at 72, resigned his chair in the University of Copenhagen (1883-1915). In 1921 he helped organize the *Societas Spinozana*, an international body for the study and interpretation of the works of the great Dutch philosopher. Professor Höffding's later writings include: *Henri Bergson's Philosophy and Modern Philosophers* (1915); *The Great Humor* (1916); *The Concept of Totality* (1917); *Spinoza's Ethics* (1918); *Life and Interpretation* (1918); *Leading Conceptions in the Nineteenth Century* (1920); *The Concept of Relation* (1921); *The Conception of Analogy* (1923); an analysis, *Plato's State* (1924); *Epistemology and Conception of Life* (1925); *Religious Types of Thought* (1927); and *Memories* (1928). Many of these books were translated into English.

**HOFFMAN, Frederick Ludwig** (1865- ). An American statistician (see Vol. XI). Among his later books are *Industrial Accident Statistics* (1915); *Mortality from Cancer throughout the World* (1915); *A Plea and a Plan for the Eradication of Malaria throughout the Western Hemisphere* (1916); *National Health Insurance in Great Britain* (1920); *Race Amalgamation in Hawaii* (1921); *Health Conservation and Vital Statistics of South American Republics* (1921); "Record of Homicide and Suicide" (*Spectator*, N. Y., 1910-23); *Report on Lead Poisoning* (1927).

**HÖFFNER, W. F. Johannes** (1868- ). A German clergyman and writer, born at Dramburg. He studied theology at Halle and Berlin. After some years as a pastor, he became editor of the popular magazine, *Daheim*, a position which he filled until 1921. He is the author of *Pastorentheologie in Beispielen* (1906); *Der Sinn des Lebens*, a volume of stories (1909); *Frau Rat* (1910); *Der Scharfe Weingessang* (1909); *Elisabeth Goethe, geb. Teator* (1910); *Der Verschlussene Garten*, a novel (1910); *Misericordia* (1911); *Gideon der Arret* (1911); *Die Treue von Pommern* (1912); *Aus Biedermeier-*

tagen (1912); *Schiller* (1913); *O du Heimalstür* (1916); a biography of Goethe (1920); *Deutsche Seele* (1920); *Aus tiefer Not* (1921); *Melodie des Herzens* (1925); and, in Pomeranian dialect, *En beten pommersch Ird* (1927).

**HOFMANN, JOSEF** (1877- ). A celebrated Polish pianist (see Vol. XI). In 1916 he featured on his recital programmes works by an entirely unknown composer, Michel Dvorsky, which attracted favorable comment. He also played two concertos for piano and orchestra by Dvorsky, *Chromaticon* and a concerto in A $\flat$ , and the Philadelphia Orchestra produced the same composer's symphonic poem, *Le Château Hanté*. A rumor began to circulate that Dvorsky was really Hofmann. No one could get into communication with the supposed Dvorsky. Hofmann himself declared that the composer had studied in Paris and was living in strict seclusion at San Sebastian, Spain. The mystery was cleared up on Dec. 28, 1923, when Stokowski gave an all-Hofmann programme, with Hofmann as soloist, which included all the compositions mentioned. This programme was repeated in New York a few days later. Hofmann's explanation was that he wished to secure an impartial opinion regarding the public's valuation of his works, an object which could not have been realized had the works been introduced under the composer's real name. When the Curtis Institute of Music was founded in Philadelphia, in 1924, Hofmann was secured as professor of piano, which position he continued to fill also after he was appointed director, in 1927.

**HOFMANN, hōf'mān, LUDWIG VON** (1861- ). A German painter who was born in Darmstadt and studied at the Academy of Karlsruhe, the Atelier Julian in Paris, and in Rome and Berlin. He was art instructor at the academies of Weimar and Dresden, and was known for his allegorical and historical paintings, and his mural work. Among his most famous figure pieces is the group "Adam and Eve." His mural paintings are in the museum and theatre of Weimar, University of Jena, and the Library of Leipsic. He is also a portraitist. He is a member of the Academy of Fine Arts in Berlin and a corresponding member of the Munich Secession.

**HOFMANNSTHAL, hōf'māns-tāl, HUGO VON** (1874-1929). An Austrian author whose dramas made him an outstanding figure in contemporary German literature (see Vol. XI). He published after 1914: *Prinz Eugen, der Edle Ritter* (1915); *Alkestis* (1916); *Rodauner Nachklänge* (1920); *Der Tod des Tizian* (1920); *Der Schwirrige* (1921); *Die Frau ohne Schatten* (1921); *Christine's Heimkehr*, a comedy (1921); *Jedermann*, a modernized version of *Everyman* (1922); *Buch der Freunde* (1922); *Der Turm*, a tragedy in five acts (1925, published in English translation, *The Tower*, 1928). He also edited two anthologies: *Deutsche Erzähler und Deutsche Epigramme*. A number of his plays served Richard Strauss as librettos for his operas.

**HOGARTH, hō'gāth, DAVID GEORGE** (1802-1927). An English archaeologist (see Vol. XI). During the World War, he was a commander in the Royal Naval Volunteer Reserve and director of the Arab Bureau, being one of the negotiators who induced Emir (later King) Feisal to lead the Arab revolt against Turkey. He was awarded the Founder's Gold Medal of the Royal Geographical Society in 1917 and was elected

president of that body in 1925. His later works included *The Ancient East* (1914); *Carchemish I* (1914); *The Balkans* (1915); *Hittite Seals* (1920); *Arabia* (1922); *The Wandering Scholar* (1925); *Kings of the Hittites*, Schweich Lectures, (1926).

**HOG CHOLERA.** See VETERINARY MEDICINE.

**HOG FEEDING.** See GARBAGE AND REFUSE DISPOSAL.

**HOGS.** See LIVE STOCK.

**HOLBROOK, ELMER ALLEN** (1880- ). An American mining engineer and public official, born at Fitchburg, Mass., and educated at the Massachusetts Institute of Technology. In 1911-12 he was professor of mining at the Nova Scotia Technical College and from 1917 to 1922 was associated with the United States Bureau of Mines in various capacities. He was dean of the School of Mines, Pennsylvania State College, 1922-27, and dean of the Schools of Engineering and Mines, University of Pittsburgh, after 1927. He is the author of many articles on mining and engineering.

**HOLBROOK, WILLARD AMES** (1860- ). An American army officer, born in Arkansas, Wis. He graduated from the United States Military Academy in 1885 and became second lieutenant in the 1st Cavalry. Continuing in the Army, he became in 1920, after successive promotions, chief of cavalry, with the rank of major general. He served in Cuba during the War with Spain, in the Philippines, at the Pennsylvania Military Academy, and on the Mexican border. During the World War, as a major general in the National Army, he commanded the Southern Department, having supervision of the Mexican border, and later Camp Sheridan, Ala. Later, he was made chief of staff of the Southern Department and then chief of cavalry. He was retired on July 23, 1924. His services won him the United States Distinguished Service Medal.

**HOLDEN, CHARLES ARTHUR** (1872- ). An American civil engineer, born at Hudson, Mass., and educated at the Thayer School of Civil Engineering of Dartmouth College and at Harvard. For two years, he was an instructor at the Worcester Polytechnic and in 1901 he returned to the Thayer School where, in 1908, he became professor of civil engineering, and in 1919, director. Professor Holden was engineer for New Hampshire in the New Hampshire and Vermont boundary litigation (1916- ). During the World War, he was executive secretary of the emergency help and equipment commission of New Hampshire and supervisor of military training at Dartmouth. He was a member of the New Hampshire House of Representatives (1925-28).

**HOLDICH, hōld'ich, SIR THOMAS HUNGERFORD** (1843- ). An English explorer (see Vol. XI), who was president of the Royal Geographical Society from 1916 to 1918. His later publications include *Political Frontiers and Boundary Making* (1916) and *Boundaries in Europe and the Near East* (1918).

**HOLITSCHER, ARTHUR** (1869- ). An Austrian writer, born at Budapest. He is the author of novels and short stories, among them: *Leidende Menschen* (1893); *Der Vergiftete Brunnen* (1900); *Der Golem* (1909); *Schlafwandler* (1919); and *Adèle Bourkes Begegnung* (1920). He also wrote a play, *Das Andere Ufer* (1901); some essays, *Ideale des Alltags* (1920); and

books of travel, *Amerika Heut und Morgen* (1912); *Drei Monate in Sovjet Russland* (1921); *Reise durch das jüdische Palästina* (1922); *Gesang an Palästina* (1922). He also wrote *Ekstatische Novellen* (1923); *Das Theater im revolutionären Russland* (1924); *Lebensgeschichte eines Rebellen*, autobiography (1924); *Der Narranbaedeker* (1925); *Der Fall Ravachol* (1925); and *Das unruhige Asien* (1926). He translated Oscar Wilde's *Ballad of Reading Gaol*.

**HOLL, hōl, KARL** (1886- ). A German Protestant theologian, and professor at the Karlsruhe Technical High School (see Vol. XI). Like many other German writers, after the World War, he turned to Luther for spiritual guidance. He published *Die Bedeutung des Grossen Krieges für das Religiöse und Kirchliche Leben der Protestanten* (1917); *Was Verstand Luther unter Religion?* (1917); and *Luther und Calvin* (1919).

**HOLLAND.** See NETHERLANDS.

**HOLLAND, CLIFFORD MILBURN** (1883-1924). An American civil engineer, born at Somerset, Mass. He studied at Harvard. Employed by the New York Rapid Transit and Public Service Commissions, he was assistant engineer in the building of the Joralemon Street tunnel under the East River, between Manhattan and Brooklyn (1906-09), and in 1908-12, for the Fourth Avenue subway, New York City. Subsequent to 1916, he continued this service as division engineer in charge of all tunnels built under the East River. He later became chief engineer of the New York State Bridge and Tunnel Commission and of the New Jersey Interstate Bridge and Tunnel Commission, directing construction of the vehicular tunnel connecting New York and New Jersey, to which his name was given after his death.

**HOLLAND, RUFERT SARGENT** (1878- ). An American lawyer and writer, born at Louisville, Ky. He graduated from Harvard in 1900 and from the Law Department of the University of Pennsylvania in 1903. He was chief attorney for the Legal Aid Society of Philadelphia from 1904 to 1910 and lectured also for the American Society for the Extension of University Teaching. A writer of historical works and fiction, his publications include *Builders of United Italy* (1908), *Historical Inventions* (1911); *Historical Events of Colonial Days* (1916); *The Blue Heron's Feather* (1917); *The Panelled Room* (1921); and *Historic Railroads* (1927).

**HOLLANDER, JACOB H (ARRY)** (1871- ). An American economist (see Vol. XI). Since 1925 he has held the Hutzler professorship of political economy at Johns Hopkins. His later writings include *The Abolition of Poverty* (1914); *War Borrowing* (1919); and *Economic Liberalism* (1925).

**HOLLINGWORTH, HARRY LEVI** (1880- ). An American experimental psychologist, born at DeWitt, Neb., and educated at Columbia University. In 1909 he was appointed instructor of psychology at that institution, in 1916 he became associate professor, and in 1921 professor. He was one of the leaders in the movement for industrial application of scientific psychology. His principal works are *Studies in Judgment* (1913); *Outline for Experimental Psychology* (1914); *Outlines for Applied and Abnormal Psychology* (1914); *Advertising, Its Principles and Practice* (1915); *Vocational Psychology* (1916); *Science of Taste* (1917); *Applied Psychology* (1917); *Psychology of*

*Functional Neurosis* (1920); *Judging Human Character* (1922); *Psychology of Thought* (1926); *Mental Growth and Decline* (1927); and *Psychology, Its Facts and Principles* (1928).

**HOLLIS, HENRY FRENCH** (1869- ). An American public official (see Vol. IX). He served in the United States Senate from 1913 to 1919 and during the World War did relief work in Poland and Siberia. He was decorated by these governments for his services.

**HOLLIS, WILLIAM STANLEY** (1866- ). An American public official, born in Chelsea, Mass. He studied at the United States Naval Academy in 1883-84 and left on account of a gun accident. He served in several capacities in the consular service from 1889 to 1911, when he was appointed consul general of Beirut, Syria. On the entrance of Turkey in the World War, he had charge of the interest of the Allies in Syria. He was also head of the American Red Cross in Beirut and was prominent in relief work in Syria and elsewhere. He served as consul general in London in 1919 and during other periods and was a representative in London of the United States War Trade Board and other important bodies. In 1920 he was appointed consul general at Lisbon, Portugal.

**HOLLISTER, NED** (1876-1924). An American zoologist, born at Delaware, Wis. He collected extensively in field zoology throughout the western part of the United States (1902-09) and was then assistant curator of mammals at the United States National Museum (1910-16) and superintendent of the National Zoological Park (1916-1924). He published *Birds of Wisconsin* (1903); *Systematic Synopses of Muskrats* (1911); *Mammals of the Philippine Islands* (1912); *Mammals of Alpine Club Expedition to Mt. Robson* (1913); *Philippine Land Mammals in the United States National Museum* (1913); *A Systematic Account of the Grasshopper Mice* (1914); and *East African Mammals in the United States National Museum* (1918, 1919).

**HOLM, hōlm, FRITS (VILHELM)** (1881- ). A Danish explorer, born at Copenhagen, and educated at Copenhagen University and in the Danish Royal Navy. In 1907-08 he commanded a scientific mission into the interior of China, the result of which was the bringing to the Western world of the only existing monolithic replica of the famous Nestorian Monument of A.D. 781, which was lent to the Metropolitan Museum of Art in New York, 1908-16. This replica is now in the Lateran Palace in Rome, Italy. During the World War he was a correspondent and a Red Cross Commissioner, and received many decorations for his work. In 1923 he published *My Nestorian Adventure in China*.

**HOLM, GUSTAV FREDERIK** (1849- ). A Danish explorer (see Vol. XI). An English translation of *Legends and Tales from Augmasalik* appeared in 1914, and in 1925 he published *De islandske Kursforskrafters Svalbarde*.

**HOLMES, HARRY NICOLLS** (1879- ). An American chemist, born at Fay, Pa., and educated at Westminster College and Johns Hopkins University. During 1900-07 he was an assistant in chemistry at Johns Hopkins and then became professor of chemistry at Earlham College until 1914, when he was called to a similar chair at Oberlin College. Dr. Holmes is a specialist in the chemistry of soaps and in colloid chemistry. He has been a member of the National Research Council since 1923. He is the

author of *Outline of Qualitative Analysis* (1908), *Laboratory Manual of General Chemistry* (1909), *General Chemistry* (1921), *Laboratory Manual of Colloid Chemistry* (1921), and *Introductory College Chemistry* (1925).

**HOLMES, JOHN HAYNES** (1879- ). An American clergyman (see VOL. XI). He was chairman of the General Unitarian Conference from 1915 to 1917, president of the Free Religious Association from 1914 to 1919, and was made director of the Civil Liberties Bureau in 1917. He broke from Unitarianism and became an independent in 1919. His later writings include: *Is Death the End?* (1915); *New Wars for Old* (1916); *Religion for To-day* (1917); *The Life and Letters of Robert Collyer* (1917); *Readings from Great Authors* (1918); *The Grail of Life* (1919); *Is Violence the Way Out?* (1920); *New Churches for Old* (1922); and *Patriotism Is not Enough* (1925). He is editor of *Unity* (Chicago) and contributing editor of *The World Tomorrow* (N. Y.).

**HOLMES, OLIVER WENDELL** (1841- ). An American jurist (see VOL. XI). He is known for his numerous minority opinions in the Supreme Court representing a liberal feeling in a conservative court. *A Collection of Legal Papers*, by Justice Holmes, was published in 1920 and in 1924 he contributed to the volume, *Selected Essays on the Law of Torts*. Consult Richardson, *Constitutional Doctrines of Justice Holmes* (1924); and Frankfurter, *Mr. Justice Holmes and the Constitution* (1927).

**HOLMES, SAMUEL JACKSON** (1868- ). An American zoölogist, born at Henry, Ill. He was educated at the University of California and the University of Chicago (Ph.D., 1897). He was instructor in zoölogy at the University of Michigan (1899-1905), assistant professor there (1905-11), and associate professor (1912-17); he was professor (1917- ) at the University of California. He published *Biology of the Frog* (1906); *Evolution of Animal Intelligence* (1911); *Studies in Animal Behavior* (1916); *Elements of Animal Biology* (1918); *The Trend of the Race* (1921); *Studies in Evolution and Eugenics* (1923); *Louis Pasteur* (1924); *A Bibliography of Eugenics* (1924); and *Life and Evolution* (1926).

**HOLMES, WILLIAM HENRY** (1846- ). An American anthropologist (see VOL. XI). He was curator of the department of anthropology at the Field Museum in Chicago, of the department of aboriginal pottery at the National Museum in Washington, and of the National Art Gallery of Washington (1910-20). After 1920 he was director of the National Art Gallery. He has published many works on archaeological and anthropological subjects. His most recent publication is *Handbook of Aboriginal American Antiquities* (1918).

**HÖLSCHER, hñl'shër, GUSTAV** (1877- ). A German theologian and authority on the Old Testament. He was born at Norden and studied at the universities of Berlin, Munich, and Leipzig. He lectured at the universities of Halle, Göttingen, and Giessen (1904-20) and in 1921 became professor of Old Testament science at Marburg. His works include *Palästina in Persischen und Hellenischen Zeiten* (1903); *Quellen des Josephus* (1904); *Sadduzäismus* (1906); *Landes- und Volkskunde Palästinas* (1908); *Two Greek Inscriptions from Khurbet Harrawi* (1909); *Geschichte der Juden in Palästina von Siebzig nach Christus* (1910); *Propheten* (1915);

*Entstehungszeit der Himmelfahrt Moses* (1919); *Entstehungszeit des Buches Daniel* (1920); and a work on the meters of Arab, Summerian, and Hebrew poetry.

**HOLST, GUSTAV** (1874- ). An English composer, born at Cheltenham. He studied at the Royal Academy of Music under Stanford and Parry, then played for some seasons in various orchestras, and finally settled in London as a teacher. In 1907 he became director of music at Morley College and also at St. Paul's Girls' School. In May, 1923, he conducted several of his works at the Ann Arbor (Mich.) Festival. Owing to injuries resulting from a fall, he resigned all positions in 1924 and devoted all his time to composition. His works include five operas, *The Revoke* and *The Youth's Choice* (neither of them produced), *Savitri* (London, 1916), *The Perfect Fool* (ib., 1923) and *At the Boar's Head* (Manchester, 1925); a masque, *The Vision of Dame Christian*; a symphony, *Cotswolds*; an overture, *Walt Whitman*; the orchestral suites, *Beni Mora*, *Phantastes*, *The Planets*, and *Japanese*; a symphonic poem, *Indra*; a *Fugal Concerto* for flute and oboe with string orchestra; *The Mystic Trumpeter* for soprano and orchestra; *Ormul's Drapa* for baritone and orchestra; the choral works with orchestra, *Clear and Cool*, *King Psalmere*, *Choral Hymns from the Rig Veda*, *The Cloud Messenger*, *Christmas Day*, *Hecuba's Lament*, *Hymn to Dionysus*, *The Hymn of Jesus*, *Ode to Death*; *First Choral Symphony* (Leeds Festival, 1925); and chamber music, and a number of songs and part songs.

**HOLT, HAMILTON** (1872- ). An American editor and college president (see VOL. XI). He was editor and owner of the *Independent*, (1913-21). In 1917 he was special lecturer for the World Peace Foundation, and the Isaac Bromley lecturer on journalism at Yale University. In the spring of 1918, he visited the Allied battle fronts as guest of the British, French, American, Belgian, and Italian governments and represented the League to Enforce Peace at the Peace Conference at Versailles in 1919. Since 1925 he has been president of Rollins College, Winter Park, Fla., where he established in 1920 the "Conference Plan of Study."

**HOLT, HENRY** (1840-1926). An American author and publisher (see VOL. XI). In 1915 he became a member of the Harvard Overseers Visiting Committee on philosophy and psychology. From 1914 to 1921, he edited *The Unpartisan Review* (formerly *The Unpopular Review*). In 1919 he published *The Cosmic Relations and Immortality*, and in 1923 *Garrulities of an Octogenarian Editor*.

**HOLT, LUCIUS HUDSON** (1881- ). An American author, born in Atchison, Kan., and educated at Yale. He was instructor in English there from 1905 to 1908 and assistant editor of *Webster's International Dictionary* from 1908 to 1910. He became professor of English and history at the United States Military Academy in 1910, and professor of economics, government and history and acting dean in 1920. He was a member of several societies and wrote *Introduction to the Study of Government* (1914); *Leading English Poets* (1915); *History of Europe, 1862-1914*, with A. W. Chilton (1917); *Brief History of Europe 1789-1915*, with A. W. Chilton (1918); *Military Correspondence, Reports and Orders* (1918); *Elementary Principles*

of *Modern Government* (1923); and *Introduction to Ancient History* (1927).

**HOLT, L(UTHER) EMMET** (1855-1924). An American physician (see Vol. XI), who died suddenly in China, where he had gone to deliver a course of lectures on pediatrics in the new medical college established at Peking by the Rockefeller Foundation. He published *Food, Health, and Growth* (1922). The Holt treatise on pediatrics was reissued the same year under the joint authorship of Holt and Howland of Johns Hopkins University. His booklet on the feeding and care of infants was translated into many languages.

**HOLT, WINIFRED (MRS. RUFUS GRAVES Mather)** (?- ). An American sculptor and philanthropist, born in New York City. She was educated privately and studied anatomy, drawing, and sculpture in Florence. Her works, exhibited in New York and in several cities of Europe, include portraits, busts, and bas-reliefs. She founded and was secretary of the New York Association for the Blind, and through her efforts several homes for the blind were founded. She also organized so-called lighthouses for the blind in France and other parts of Europe. In 1921 she visited Poland as a guest of the Polish Government for the relief of the Polish blind. During the World War, she did much relief work among those blinded in battle. She was awarded medals by France and other governments and was the author of *A Short Life of Henry Fawcett* (1911); *The Beacon for the Blind* (1914); *The Light Which Cannot Fail* (1922), and numerous papers.

**HOLY CROSS, COLLEGE OF THE.** A Roman Catholic college for men under the Society of Jesus, at Worcester, Mass., founded in 1843. The student enrollment in the regular course increased from 597 in 1916 to 1090 in the autumn of 1928; the faculty in the same period was increased from 44 to 91; and the volumes in the library from 50,000 to 100,000. President, the Rev. John M. Fox, S.J.

**HOLY PLACES.** See ARABIA.

**HOLZ, hólts, ARNO** (1863- ). A German poet and critic (see Vol. XI), one of the founders of the naturalist movement in Germany. His later works include *Kindheitsparadies* (1924); *Stieben Billionen Jahre vor meiner Geburt* (1925); and *Götter und Götzen* (1925).

**HOLZKNECHT, GUIDO** (1872- ). An Austrian physician, pioneer in röntgenology, who attracted attention through his attempts to "rejuvenate" elderly women by raying the genital glands. Holz knecht is indirectly responsible for Gertrude Atherton's novel, *Black Owen*. Having received his medical degree from the University of Vienna, just as the Röntgen rays were coming into use in medicine, he began to devote himself to this subject and was eventually appointed professor of radiology in the university. Later, he became director of the Röntgen department of the Vienna General Hospital. He published the results of X-ray diagnosis in tuberculosis and diseases of the chest in 1901 in a volume entitled *Die Röntgenologische Diagnostik der Erkrankungen der Brusteingeweide*. In collaboration (Holzknecht and Jonas), he wrote *Die Radiologische Diagnostik der Intra und Extraventriculären Tumoren* (1908); and in 1921 he edited the large two-volume work, *Röntgenologie*.

**HOME READING COURSES.** See EDUCATION IN THE UNITED STATES.

**HOME RULE, MUNICIPAL.** See MUNICIPAL GOVERNMENT.

**HONDURAS.** A Central American republic with an area of about 44,275 square miles, and a population, on Jan. 1, 1923, of 773,408. The capital, Tegucigalpa, had 38,950 in 1920. Other important towns are La Esperanza (11,453), Santa Rosa (13,000), Nacaome (8152), Choluteca (8065), Amapala (2800); La Ceiba (8000), Puerto Cortés (4000). The percentage of illiteracy among children was 56 per cent and school attendance had increased only slightly since 1911. By the school census of 1919 only 35,912 children, out of the 87,207, were receiving instruction. In 1926-27 there were 859 public, and 36 private, schools with 35,216 children enrolled.

**Industry.** The cultivation of bananas and coconuts continues as the leading activity. During 1927 more than 19,000,000 bunches of bananas were produced and exported. The coconut production in the same year was more than 7,000,000. The coffee production remains stationary, while that of rubber has decreased. Cattle and horse raising is also on the decrease. After 1912 the country's trade consistently made gains, the imports being \$10,630,000 in 1927-28 as compared with \$5,132,679 in 1912-13; and the exports in 1927-28, \$17,546,000 as compared with \$3,180,968 in 1912-13. The United States supplied 77 per cent of the country's imports in 1927-28 and took 70 per cent of its exports.

**Finance.** For the year 1929-30, the budget was based on an estimated income of 13,101,972.78 pesos. (In 1913-14, this was 4,824,000). Receipts for the year 1928 amounted to 12,029,870.44 pesos and expenditures to 11,365,261.59 pesos. The national budget appropriations steadily increased after 1913-14, while both revenues and expenses were always larger than the budgeted amounts. The 1921-22 budget called for revenues and expenses of 6,674,895 pesos, but revenues were actually 7,386,979 pesos and expenses 7,196,161 pesos, showing a surplus of 190,818 pesos. The interest arrears on the foreign debt were not being paid with the result that the foreign debt totaled \$125,000,000 in 1923. Arrangements for its settlement were made in 1927. The internal debt in 1929 amounted to over \$9,000,000, United States currency. In 1922 the Banco de Honduras became the national bank of issue. In 1918 the peso was legally fixed at one-half the value of the American dollar. In 1920 an ambitious programme of fiscal reform was launched under the direction of an American expert, but it was not carried out because of lack of funds, while the years 1922, 1923, and part of 1924, were years of political disturbances, which made expenditures for war out of all proportion to other expenses, and created huge deficits. In 1920 the national railway of 95 kilometers was turned over to *Compañía Agrícola de Sula* to secure a credit of \$1,000,000 to be used in the complete reconstruction of the road. This *Compañía Agrícola*, a subsidiary of the American Fruit Company, was changed in 1924 to the Cortes Development Company, and retained control over the national railroad. Slightly over 500 miles of railways, in addition to the national line, were the property of American fruit companies operating on the north coast. There were no railways on the Pacific coast. There were about 200 miles of highways open the year around to wheeled traffic.

**History.** Internal affairs were stormy during and after the World War. In 1919 President Bertrand's well-prepared plans for his own reelection were upset by a revolt led by General Gutierrez. Bertrand fled the country; Gutierrez had himself declared Dictator; and, in October, 1919, was elected President. In 1920 disturbances were again reported with the result that United States warships had to proceed to the scene to protect American property. In 1923 on the eve of the forthcoming election, civil war again threatened and many prominent Hondurans sought safety in flight. After a contest, in which bloodshed and violence were not wanting, and which was marked by the continuous interference of the President, General Carias, Conservative candidate, received a plurality vote. The election was now thrown into the Congress which, in 1924, declared it could find for no one candidate. The usual round was now repeated. American marines were rushed to the scene but were not able to change the situation; the President, Gutierrez, proclaimed himself Dictator, Feb. 1, 1924; the disappointed presidential aspirants took up arms in rebellion and waged war intermittently on each other throughout February. In March, Gutierrez was put to flight, and, after a chaotic interregnum, Dr. Fausto Davilla, Conservative, was proclaimed provisional President by a group of revolutionary "generals"; but the forces defending Tegucigalpa set up a rival in the person of Zufiga Hueta. In the hope of restoring order, President Coolidge sent Sumner Welles as his special representative, in April, to mediate, and the four neighboring republics were invited to join in a conference with the warring Honduran factions. This somewhat unusual procedure met with success early in May, when one of the revolutionary chieftains, Gen. Vicente Tosta, was elected President and for a brief space the civil war seemed to be ended.

Elections were held at the end of June to choose deputies to a constituent assembly. Early in August, the fires of revolt again broke out. An insurrection against the provisional government of President Tosta, led by the Minister of War, General Ferrera, proved rather formidable, and it was not until late October that the Government, which had received the full support of the United States, was able to announce complete victory. At the close of the year, elections were held to choose a constitutional President, resulting in the choice of Dr. Miguel Paz Barahona. He was inaugurated Feb. 1, 1925, and was immediately recognized by the United States. He faced further armed revolt in the West, led by General Ferrera, but by August had restored order. His four years' administration was comparatively peaceful, in marked contrast to the long period of disorder preceding it. In 1928, as the time for a new election approached, there was intense political feeling but no armed outbreak, and the polling of the vote on October 28 was carried out peacefully. It resulted in the choice of Dr. Vicente Mejía Colindres for President and Rafael Díaz Chávez as Vice President. They were inaugurated Feb. 3, 1929.

In the field of foreign relations, a number of interesting developments were recorded during this period. On July 19, 1918, Honduras declared war on Germany and thus became an Associate Power and an original member of the League of Nations. Payment of dues in the

League became onerous, however, and on more than one occasion the country came to the verge of withdrawing but failed to take decisive action. Early in 1929, it was still listed among the members.

The government applied itself toward furthering the union of Central American states and, with Guatemala and Salvador, signed a pact in 1921 for common action in matters of trade, communications, and coinage. In 1922 a conference of the presidents of Nicaragua, Salvador, and Honduras was held on board the U. S. S. *Tacoma* in Fonseca Bay, at which the three countries reaffirmed in part the Treaty of Peace and Friendship of Dec. 20, 1907 (see CENTRAL AMERICAN UNION). On July 6, 1927, Salvador, Guatemala, and Honduras signed an agreement to consult each other before working out problems which might affect the general interests of Central America. Two attempts were made to settle the century-old dispute with Guatemala over the boundary line in the vicinity of the Montagua River Valley. In 1919 the two governments submitted the difficulty to the Secretary of State of the United States and an accurate survey under the auspices of the American Geographical Society was provided for.

In 1928 the unsettled question was again brought to the front by rival concessions granted by the two governments in the disputed area, and again the United States was asked to act as mediator. That country appointed the Hon. Roy T. Davis to head a mixed commission, but when the commission, after a thorough survey of the region affected had been made, failed to come to an agreement. Secretary Kellogg urged both countries to submit the dispute to the Central American Tribunal established in accordance with the convention of 1923. Guatemala agreed, but Honduras refused, and the dispute was still unsettled in 1929. On Mar. 8, 1926, an agreement for the settlement of a long-standing British debt was ratified, and in December, 1927, a commercial treaty with the United States, later ratified by both governments, was signed. On Mar. 11, 1929, there was approved a new immigration law restricting the immigration by providing more rigorous qualifications for entrance.

**HONEGGER, ARTHUR** (1892- ). A French composer, born at Hâvre. He studied in Zurich, 1907-09, and then with R. Martins in Hâvre and L. Capet in Paris, where he lived after 1913. He began as an extreme futurist and was soon recognized as the leader of the notorious group, "Les Six" (Auric, Durey, Milhaud, Poulenc, and Taillefer). In 1929 he visited the United States, appearing as conductor of his own works. His works comprise incidental music to Max Jacob's *La Mort de Ste.-Alm  ne*; Morax' *Le Roi David*; M  ral's *Dit des J  ux du Monde*; Gide's *Saul*; and Shakespeare's *Tempest*; a ballet, *Verit   Mensonge*; a symphonic poem, *Pastorale d'  t  *; a mimic-symphony, *Horace Victorieux*; *Rhapsodie* for piano, flutes, and clarinet; concertino for piano and orchestra; two extremely realistic pieces for orchestra, *Pacifico 231* (descriptive of a locomotive) and *Rugby* (descriptive of a foot-ball game); three nondescript stage works (an odd mixture of opera, oratorio, and ballet), *L'Emp  ratrice aux Rochers* (Paris, 1925); *Judith* (Monte Carlo, 1926) and *Antigone* (Brussels, 1928); chamber music, and songs.

*Photograph by Pach Bros.*

**HERBERT HOOVER**  
**ELECTED PRESIDENT OF THE UNITED STATES, 1928**

**HOOKER, (WILLIAM) BRIAN** (1880- ). American author (see VOL. XI). In 1915 he was awarded the prize in an American Opera Association competition for the opera *Fairyland*, with music by Horatio Parker. In the same year, he published another opera, *Morven and the Grail*, and a commemorative poem, *A.D. 1919*, also with music by Horatio Parker, and a volume of *Poems*, 1915. In 1923 he translated *Cyrano de Bergerac* from the French. He became literary editor of the New York *Sun* in 1917.

**HOOVER, C(HARLES) R(UGLAS)** (1885- ). An American chemist, born in Oskaloosa, Iowa, and educated at Haverford College and Harvard University, where he held a Carnegie fellowship, 1912-13. He was professor of chemistry at Penn College in Iowa (1909-10) and associate professor at Syracuse University (1913-15). In 1918 he became professor of chemistry at Wesleyan University, Conn. He has made determinations of atomic weights of elements, investigated tobacco smoke, and studied the analyses of gases. During the World War, he served with the Chemical Warfare Service and invented a gas absorbent and a gas detector.

**HOOVER, HERBERT CLARK** (1874- ). The thirty-first President of the United States, born at West Branch, Iowa, the son of a Quaker farmer. Left an orphan at 10 years of age, he was sent to his uncle's farm in Oregon to live. He ran away when he was 14 and went to Portland, Oreg., where he worked for a while in a real estate office. In 1891 he entered the newly established Leland Stanford, Junior, University, working his way through by establishing a laundry of which he made a success. Specializing in geology and engineering, he was in the first class graduated by the university in 1895. To perfect himself as a mining engineer, he became a common miner, and acquired familiarity with every part of the work. In 1897 he went to Australia as a mining engineer for an English syndicate and was successful in developing mines there. In 1899 he was appointed director general of mines by the Chinese government. His work in China was interrupted by the Boxer troubles; he was in Tientsin when the foreigners were besieged there. He defended not only his European co-workers but his Chinese workmen too, rescuing them in some cases from the firing squad. Later, he was engaged in mining operations in various parts of the world. He made and lost two fortunes and eventually won lasting success. He was living in England at the outbreak of the World War, and his services were at once required in aid of Americans stranded there with their funds cut off. Soon afterward, he was put in charge of the Belgian relief work and attracted wide attention by his great ability and enthusiasm. During three years, he traveled throughout Belgium and visited Brussels, London, Rotterdam, Lille, and Berlin, in order to confer with the heads of governments. About \$1,000,000,000 was expended on food and transportation, and of this sum one-half of 1 per cent was required for overhead expenses. He was appointed United States Food Administrator in 1917. He announced that the people of the United States could diminish their expenses in the necessities of life by 50 per cent. He instituted "wheatless days" and "meatless days," and urged avoidance of all waste. After the War, Mr. Hoover devised a chain of food depôts throughout central Europe on which

relatives and friends in the United States could draw for relief of the starving people in the countries desolated by the conflict. In March, 1921, he entered President Harding's cabinet as Secretary of Commerce, with the understanding that he was to continue his relief work. In 1921 he assumed general supervision of the relief work in Russia, on condition that all American prisoners held by the Soviet authorities should be released.

He was reappointed Secretary of Commerce by President Coolidge and greatly extended the scope of that department's activities and usefulness. In 1927-28 he served as chairman of the Mississippi Flood Relief Commission. He resigned his cabinet post in 1928 after receiving the Republican nomination for the Presidency, to which he was elected in November, receiving 414 electoral votes, including those of Florida, North Carolina, Virginia, and Texas, against 87 for Alfred E. Smith of New York, his Democratic opponent. In the interval between his election and his inauguration as President on Mar. 4, 1929, he made a tour of Central American and South American countries. The first months of his administration were marked by the reopening of the negotiations for limitation of naval armaments with Great Britain and other powers, and by his appointment of a National Law Enforcement Commission, headed by George W. Wickersham of New York, and of a Federal Farm Board, established by Congress at the President's request.

President Hoover holds honorary degrees from seventeen American and nine foreign universities, has received numerous medals from learned societies, was president of the American Institute of Mining and Metallurgical Engineers (1920), the American Engineering Council (1921), the American Child Health Association (1922), and served as chairman of a number of government commissions.

He wrote *Principles of Mining* (1906); *American Individualism* (1922); and in collaboration with his wife, who was Lou Henry of Monterey, Calif., a fellow student at Stanford University, he translated into English Agricola's *De Re Metallica*. His presidential campaign speeches were published under the title of *The New Day* in 1928.

**HOPE, ANTHONY.** See **HAWKINS, ANTHONY HOPE.**

**HOPE, JOHN** (1868- ). An American college president, born at Augusta, Ga., and educated at Brown and Chicago universities. After graduation from college, he devoted all his time to teaching colored youth. He served on the faculties of several colleges and universities in the South and was appointed president and professor of ethics at Morehouse College (then Atlanta Baptist College) in Atlanta, Ga., in 1906. In 1918-19 he did war work among the colored troops in France. He was a director and trustee of many institutions for colored people.

**HOPKINS, ARTHUR MELANCTHON** (1878- ). A dramatic producer, born in Cleveland, Ohio, who began his work in New York City in 1912. His best productions of later years include *The Poor Little Rich Girl*; *On Trial*; *The Deluge*; *Good Gracious, Annabelle*; *The Rescuing Angel*; *Be Oalm, Camilla*; *The Jest*; *Night's Lodging*; *Daddy's Gone a-Hunting*; *The Claw*; *Anna Christie*; *The Hairy Ape*; *The Old Soak*; *Rose Bernd*; *The Laughing Lady*; *Launsi*; *A Royal Fandango*; *What Price*

*Glory; The Second Mrs. Tanqueray; Deep River;* and plays by Tolstoy, Ibsen, and Shakespeare.

**HOPKINS, EDWARD WASHBURN** (1857- ). An American philologist (see VOL. XI). He was professor of Sanskrit language and literature and comparative philology at Yale, 1895-1926 (emeritus) and has published *Epic Mythology* (1915); *History of Religions* (1918); *Origin and Evolution of Religion* (1923); *Ethics of India* (1924); *Legends of India* (1928).

**HOPKINS, ERNEST MARTIN** (1877- ). An American college president, born at Dunbarton, N. H. He graduated from Dartmouth in 1901 and from that year to 1905 was secretary to the president there. He was secretary of the college from 1905 to 1910, and until 1916 was engaged in original research for various industrial concerns in Chicago, Boston, and other cities. He became president of Dartmouth on July 1, 1916. During 1918 he was in charge of the Industrial Relations of the Quartermaster Department, United States Army.

**HOPKINS, SIR FREDERICK GOWLAND** (1861- ). A British scientist and fellow of Trinity College, Cambridge. He has been professor of biochemistry at the University of Cambridge since 1914 and Sir William Dunn professor since 1921. He became a fellow of the Royal Society in 1905, and was the society's Croonian lecturer in 1915, and was awarded the Baly Medal (1915), the Royal Medal (1918), and the Copley Medal (1926). In 1921 he was Herter lecturer in New York and Baltimore. He was elected a foreign associate of the National Academy of Sciences (American) and numerous European learned societies, was knighted in 1925, and holds honorary degrees from seven British and Irish universities.

**HOPKINS, WILLIAM JOHNT** (1863-1926). An American author (see VOL. XI). His later works include *Those Gillespies* (1916); *The Olammer and the Submarine* (1917); and *She Blows! and Sparm at That!* (1922).

**HOPPE, WILLIAM H.** (1887- ). World's champion at 18.2 and 18.1 balkline billiards. He was born at Cornwall-on-the-Hudson, N. Y. From 1910 to 1920 and again from 1922 to 1924, he reigned supreme as a wielder of the cue despite the many times he was called upon to defend his laurels.

**HOPWOOD, AVERY** (1884-1928). An American playwright, born in Cleveland, Ohio. He was graduated from the University of Michigan in 1905, went to New York City as a correspondent for the *Cleveland Leader* the same year and there sold his first play, *Clothes*, written with Channing Pollock. His plays, which were produced not only in the United States, but in Canada, Europe, and the Orient, include *Fair and Warmer*, *The Gold Diggers*, *The Bat*, *Seven Days*, and *Spanish Love*, in collaboration with Mary Roberts Rinehart; *Ladies' Night*; *The Demi-Virgin*; *Little Miss Bluebird*; *Why Men Leave Home*; *The Alarm Clock*; *The Best People*, with David Gray; *Naughty Cinderella*; *Getting Gertie's Garter*, and *A Thief in the Night*. Virtually every one of his plays was a popular success. Many of them were broad farces.

**HORMONES.** See SECRETIONS, INTERNAL; ZOOLOGY, Physiology; HEREDITY.

**HORNADAY, WILLIAM TEMPLE** (1854- ). An American zoölogist (see VOL. XI). In 1926 he retired from the directorship of the New York Zoölogical Park. He wrote *Awake!*

*America* (1918); *Old-Fashioned Verses* (1919); *Minds and Manners of Wild Animals* (1922); *Tales from Nature's Wonderlands* (1924); *A Wild-Animal Round-up* (1925); and *Wild Animal Interviews* (1928).

**HORNBY, LESTER GEORGE** (1882- ). An American illustrator, engraver, and painter, born at Lowell, Mass., and educated at the Rhode Island School of Design at Providence, the Pape School in Boston, the Art Students' League of New York, and in Paris he studied with Laurens and others. Representative pictures of his are in the Victoria and Albert Museum (London), the Library of Congress (Washington), the New York Public Library, the Art Institute of Chicago, Detroit Institute, Carnegie Institute (Pittsburgh), etc. He has illustrated sketch books of London, Edinburgh, Paris, Boston, Washington, and Chicago, also *Some Old Riviera Towns* (1921); *Gloucester by Land and Sea* (1923); and is author and illustrator of *Balkan Sketches* (1927). His war etchings are well known.

**HORNE, HENRY SINCLAIR, FIRST BARON OF STIRKOKE** (1861- ). A British soldier, who was educated at Harrow and Woolwich and entered the Royal Artillery in 1880. He served in the South African War. In 1914 he was made commander of the artillery of the 1st Corps, and in the following year commanded the 2d Division. He was sent to Egypt to defend the Suez Canal in 1916 and in the same year commanded the 15th Army Corps, and then the 1st Army in France where he served with distinction. In 1919 he was created Baron of Stirkoke and was given the eastern command (1919-23). He was aide-de-camp and general to the King (1920-24), and retired in 1926.

**HORNE, SIR ROBERT (STEVENSON)** (1871- ). A British public official, born in Glasgow and educated at the university there. In 1896 he was admitted to the Scottish bar and after 1918 was a Unionist member of Parliament. He was in the Admiralty in 1917 as assistant inspector general of transportation and in 1918 as director of the Admiralty Labor Department and Third Civil Lord. Entering the Cabinet as Minister of Labor (1919-20), he became president of the Board of Trade (1920-21), and Chancellor of the Exchequer (1921-22). He was made a member of the Privy Council in 1919, was knighted in 1920, and in 1921 was Lord Rector of Aberdeen University.

**HORSLEY, SIR VICTOR ALEXANDER HADEN** (1857-1916). An English surgeon and neurologist (see VOL. XI). On the outbreak of the World War, Sir Victor was the head of a hospital which saw service in Egypt. Later, he was made a colonel in the Mesopotamia Expeditionary Force and in the course of his duties succumbed at Amara to heat stroke. A biography of him, by Stephen Paget, appeared in 1919.

**HORTHY DE NAGYBÁNYA, NIKOLAUS** (1888- ). Regent of Hungary who was educated at the Naval Academy at Fiume. During the World War, he gave efficient service as captain of the battleship *Novara*, was promoted to be admiral of the fleet and in this capacity surrendered the Austro-Hungarian fleet to the Allies in 1918. In 1919 he organized a counter-revolution against the Soviet government in Hungary, under Bela Kun, and on the fall of that government came into supreme control. The National Assembly elected him regent in 1920 on the theory that the monarchy in Hungary

was only temporarily suspended. By provision of the laws, he may hold this office for an indefinite period. See HUNGARY, *History*.

**HORTICULTURE.** The tremendous stimulation given horticulture, as well as other forms of agriculture, by the urgent need of food during the World War resulted in an unprecedented speeding up of production which was followed by a disastrous readjustment period following the close of hostilities. Labor costs which rose excessively failed to recede to the pre-war scale, and many other items remained correspondingly high. The great stimulus to amateur gardening which resulted from war conditions gradually subsided, the trend being to commercial production. The ravages of introduced insect and fungus pests necessitated the purchase of expensive spraying machinery and thus indirectly contributed to the elimination of small enterprises. This trend toward commercial horticulture is clearly evident from statistics compiled by the U. S. Census which show in recent years an astonishing decrease in the number of bearing deciduous fruit trees. However, in the Pacific Coast States, where commercial orcharding prevails at its best, there has been an increase in the number of trees, the decline occurring in the Mississippi Valley and Eastern States where farm orchards used to be the general rule.

Despite the changes in the number of trees, total production of orchard fruits continued to increase much more rapidly than might be expected from population growth. For example, the total production of citrus fruits in 1928 was 59,836,000 boxes, as compared with approximately 23,000,000 boxes in 1909. In the decade ended in 1928, lettuce acreage in the United States increased sevenfold, spinach acreage, fourfold, and asparagus threefold, with other crops showing corresponding increments. One of the outstanding features of the decade was the southward migration of vegetable production to Florida, Texas, and California, necessitating broad readjustments in the older truck producing areas. During the latter part of the decade there was a phenomenal increase in grapefruit plantings due largely to developments in the Rio Grande Valley of Texas and in southern Arizona. The year 1928 was marked by heavy production of practically all horticultural crops, the white potato and grape attaining records.

The nursery industry of the United States underwent a material change due to the exclusion of various evergreens, bulbs, and other plants heretofore almost entirely purchased abroad.

One striking feature of the period following the War was the rapid replacement of established varieties of fruits and vegetables by new and better sorts. The Delicious apple became one of the leading varieties. The Stayman Winesap proved so much better than its parent, the Winesap, as to replace it largely in new plantings. The Golden Bantam and other yellow sweet corns continued to gain in favor over the older white sorts. Disease resistant varieties of many species gained ascendancy because of their ability to survive under adverse conditions. The wilt resistant Marglobe tomato developed by the U. S. Department of Agriculture was a striking example.

In respect to the horticultural situation throughout the world at large, one of the most striking features was the rapid expansion of the citrus industry in the Southern Hemisphere, important plantings being made in South Africa,

Australia, and South America. Another feature was the rapid recovery of the European fruit industry which naturally suffered severely during the War and the difficult post-war period. That foreign countries contribute vast quantities of horticultural products to the United States was indicated in over \$129,000,000 worth of horticultural products imported during 1928. Of this vast sum, the banana constituted over \$35,000,000.

**Protective Measures.** One of the most important developments of the period was the organization of the Federal Horticultural Board, as the result of the Plant Quarantine Act of August, 1912. This board, reorganized July 1, 1928, as the Plant Quarantine and Control Administration, has power to promulgate and enforce necessary protective measures for preventing the entrance of insect and fungus pests into the United States, and to control the movement of potentially dangerous plant materials between the States. That such protection is needed is shown by the entrance in the past of many serious pests, including the San José scale, gipsy moth, European corn borer, Japanese beetle, chestnut blight, white pine blister rust, etc. The enactment of Quarantine 37, effective on and after June 1, 1919, prohibiting, with certain exceptions, the importation of nursery stocks and other plants and seeds into the United States, has had and is having a very great effect on American horticulture, especially on those branches concerned in the propagation of ornamental plants. As a result, the American nurserymen have been forced to propagate many species of plants hitherto imported from foreign countries.

The continued spread, despite vigorous control efforts, of the European corn borer, Japanese beetle, and many other serious pests entering the United States previous to the organization of the Federal Horticultural Board, caused serious alarm. In many cases, the pests spread so rapidly that their eradication was considered out of the question. The gipsy moth continued its westward march throughout New England, in spite of the vigorous efforts made to stay its progress. Efforts were continued to eradicate the Parlatoria date scale, an insect capable of wiping out the infant date industry of the Southwestern States.

Material advances were made in the knowledge of protecting horticultural plants from various insect and fungus enemies. The utilization of dry insecticides and fungicides, known as dusts, steadily increased, until in many parts of the United States and Canada their use has become an important part of the protective programme. The discovery that many economic plants, including the potato, tomato, raspberry, etc., are subject to a serious form of disease commonly known as mosaic caused a great deal of concern. Careful studies indicated however, that healthy vigorous stocks could be maintained by rigorous selection in the field. Disastrous freezes occurring during the blooming periods of certain years caused serious losses to the fruit growers in many parts of the country and reawakened an interest in orchard heating as a means of protecting fruits from disastrous loss. Tests of the value of the airplane as a means of distributing poisons to control outbreaks of insects featured the period.

**Improved Transportation.** Material advances were made in the shipping and handling

of perishable products. The cooling of fruits and vegetables previous to placement in refrigerator cars became a general practice and enabled distant growers to get their products to the consumer without material loss in quality. The motor truck practically replaced the horse in the truck garden industry in the vicinity of large cities, making possible not only a geographical expansion of the trucking industry but also a quicker movement of highly perishable products. Greenhouse growers of lettuce, cucumbers, tomatoes, and other vegetables, suffered severely as a result of improved transportation facilities which enabled Southern and Western produce to reach Northern markets in excellent condition at all seasons.

**Marketing.** No phase of horticultural activity has exhibited such radical changes as that of marketing. Literally hundreds of cooperative agencies sprang up in various parts of the country and in most cases rendered material assistance to the long-suffering grower. The outstanding success of the California Fruit Growers' Exchange, even under the adverse conditions of the War, greatly stimulated the cooperative plan of marketing. A new system of selling fruits and vegetables arose. This is the f. o. b. auction, in which the product is inspected at the point of origin by government authorities and sold on this basis while in transit to market. Another striking development is the tremendous growth of roadside markets in the vicinity of cities and along important highways. These markets have become highly important factors in the disposal not only of fruits and vegetables, but also of flowers, canned products, cider, etc. Marketing was greatly aided by the development of better grading and packing practices, stimulated not only by greater demand for selected uniform products but also by the enactment of various Federal and State laws on the marketing and branding of fruits and vegetables.

**Investigational Activities.** Despite the serious disrupting forces of the War, scientific investigation rapidly recovered in the post-war period. The theory advanced in 1918 by the Oregon Experiment Station, namely, that growth and fruitfulness in plants are directly related to the balance between carbohydrates and nitrogen within the plant, proved of great benefit in assisting in the explanation of many cultural, pruning, and fertilization practices and furnished the basis for important subsequent studies. Of the several fertilizers commonly applied to fruit trees, nitrogen was found to be the only material giving an adequate return, and then for the most part only on poor soils or where the trees were growing in sod. Some indication was noted that phosphorus indirectly benefits fruit trees by increasing the growth of the cover crops which are grown in the orchard as a source of organic matter.

Studies in fruit storage contributed greatly to the knowledge of the proper time for picking and of the best methods of handling fruit in the storage. The work of the U. S. Department of Agriculture in the standardization of fruit and vegetable packages did much to protect the consumer from fraud. Experimental results disproved one popular and costly fallacy, namely, that fruit trees require severe annual pruning. Widely extended studies of self- and cross-fruitfulness in apples, pears, and other fruits definitely established the fact that self-sterility is a common condition in most varieties of culti-

vated fruits, the peach being a notable exception.

**Bibliography.** A few of the large number of horticultural books appearing recently were S. W. Fletcher, *The Strawberry in North America* (New York, 1917); V. R. Gardner, F. C. Bradford, and H. D. Hooker, Jr., *Fundamentals of Fruit Production* (New York and London, 1922); U. P. Hedrick et al., *The Cherries of New York* (Albany, 1915), *The Peaches of New York* (Albany, 1917), and *The Pears of New York* (Albany, 1921); W. Poponoe, *Manual of Tropical and Subtropical Vegetable Gardening* (New York and London, 1916); E. A. White, *The Principles of Floriculture* (New York, 1915); U. P. Hedrick et al., *The Small Fruits of New York* (Albany, 1925); E. H. Wilson, *Aristocrats of the Garden* (Boston, 1926); E. H. Wilson, *More Aristocrats of the Garden* (Boston, 1928).

**HORTON, ROBERT FORMAN** (1855- ). An English Congregational minister, president of the National Free Church Council (see VOL. XI). His later writings include *Reconstruction* (1915); *An Autobiography* (1917); *The Capacity for God* (1920); and *The Mystical Quest of Christ* (1923).

**HOUBEN, HEINRICH HUBERT** (1875- ). A German author and director of the literary department of the annual Leipzig book fair. He was born at Aix-la-Chapelle and studied in Bonn, Berlin, and Greifswald. He founded the *Deutsche Bibliographische Gesellschaft* and was literary director of F. A. Brockhaus' publishing house (1907-19). He is the author of *Karl Gutschow* (1899-1901); *Emil Devrient, Leben und Wirken* (1903); *Jungdeutschlands Sturm und Drang* (1911); *Die Deutsche Revolution* (1919); *Hartmanns Revolutionäre Erinnerungen* (1919); *Karl Schurz's Befreiung Kinkels* (1920); *Adele Schopenhauer, Tagebuch einer Einsamen* (1921); *Ottile von Goethe, Erlebnisse und Geständnisse* (1923); and *Gespräche mit Heine* (1925). He also compiled *Berühmte Autoren des Verlags F. A. Brockhaus* and edited the works of Sven Hedin.

**HOUDINI, HARRY** (1874-1926). An American magician, born at Appleton, Wis. He began his career as a trapeze performer in 1892. He invented a diving suit, was interested in producing moving pictures, and was awarded a prize by the Australian Aeronautic League in 1910 for the first successful flight in Australia. He made many tours of the world and gave performances before the notables of various countries. He gained fame by exposing the tricks of mediums, as well as by his own remarkable achievements as a magician. He wrote *The Right Way to do Wrong* (1906); *Handcuff Secrets* (1907); *The Unmasking of Robert Houdini* (1908); *Miracle Mongers* (1920); *Spooks and Spiritualism*; *Rope Ties and Escapes*; *A Magician Among the Spirits* (1924). *Houdini: His Life Story*, by Harold Kellock, was published in 1928.

**HOUGH, EMERSON** (1857-1923). An American writer, born in Newton, Iowa, and educated at the University of Iowa (A.B., 1880). He spent many years in traveling over the West and wrote much on the protection of game and other subjects relating to the public domain of the United States. He was responsible for the passage of the act of Congress for preserving buffalo in Yellowstone Park. He wrote *The Singing Mouse Stories* (1895); *The Story of the Cowboy* (1897); *Mississippi Bubble* (1902); *The*

*Lady and the Pirate* (1913); *The Magnificent Adventure* (1915); *The Way Out* (1918); *The Covered Wagon* (1922); *North of 36* (1923); and the posthumous *Mother of Gold* (1924). *The Covered Wagon*, as a moving picture was the most successful made up to that time. It ran steadily for over a year in New York City.

**HOUGH, LYNN HAROLD** (1877- ). An American clergyman (see Vol. XI). He was president of Northwestern University, 1919-20; pastor of the Central M. E. Church, Detroit, 1920-28; and pastor of the American Presbyterian Church of Montreal after February, 1928. Among his later works were: *The Quest for Wonder* (1915); *In the Valley of Decision* (1916); *The Little Old Lady* (1917); *The Significance of the Protestant Reformation* (1918); *The Clean Sword* (1918); *The Productive Beliefs* (Cole lectures at Vanderbilt University; 1919); *The Eyes of Faith* (1920); *The Opinions of John Cleland* (1921); *Life and History* (1922); *Synthetic Christianity* (1923); *The Imperial Voice* (1924); *Evangelical Humanism* (1925); and *Adventure in the Minds of Men* (1927).

**HOUGHTON, ALANSON BIGELOW** (1863- ). An American manufacturer and diplomat, born at Cambridge, Mass., and educated at Harvard University, in Germany, and in Paris. He engaged in the manufacture of glass at Corning, N. Y., and became president and official in several important glass companies and other concerns. He was a Representative in Congress, 1919-23, but resigned on his appointment as Ambassador to Germany by President Harding in February, 1922. He resigned in 1925 and was appointed Ambassador to Great Britain by President Coolidge. In 1928 he resigned that post and was an unsuccessful candidate for U. S. Senator in New York State. His resignation was not accepted by President Coolidge, however, and he returned to his London post, from which he again resigned following the inauguration of President Hoover on Mar. 4, 1929. In England, he was esteemed for his quiet but efficient work.

**HOURS OF LABOR.** Since the beginning of the World War, there has been evidenced a marked general reduction of hours of labor. That long hours do not pay has been coming more and more to be believed. The experiences of the War and particularly the report of the British munition workers' committee established this general principle beyond doubt. Moreover, the influence of the forces of labor was steadily gaining and culminated in considerable economic power during the War. These two circumstances combined not only to stimulate legislation for the limitation of working hours, but also to decrease hours of work in the industries which were not affected by the protective laws.

According to the Census of Manufacturers of 1914, 11.8 per cent of the workers covered worked in eight-hour establishments. In the 1910 census, 48.6 per cent did so, while figures compiled for the 1924 census showed that 51.5 per cent worked in eight-hour plants.

Hour legislation in the United States is still, due to constitutional limitation, largely confined to the protection of women and children. Since the beginning of the War, however, were enacted the LaFollette Seamen's Act of 1915 and the Adamson Act of 1916, regulating respectively the hours of maritime and interstate railway workers. Numerous eight-hour restrictions on work undertaken for the State and

several special prohibitions of long working hours in certain particularly dangerous occupations such as mining and caisson work also have become law. By amendment, in 1923, the Oregon statute provides for an eight-hour day in the lumbering industry when the adjoining States—California, Idaho, and Washington—have adopted similar restrictions. Within the decade, 1914-1923, 16 States were added to the ranks of those which regulate the working day or week of women either generally or in certain occupations, while the scope of many other laws and orders which applied only to specified employments has been made more general. At the beginning of 1929, only five States (Alabama, Florida, Indiana, Iowa, and West Virginia) had placed no restrictions on women's hours of work. Many States had limited hours to eight or nine a day. About three-fourths had a weekly limit of less than sixty hours.

Legislation, however, has not been limited to the restriction of daily or weekly hours of work. In addition, sixteen more jurisdictions now prohibit or regulate the night work of women, while of the eight night-work laws already in effect in 1914, several have since been enlarged in scope. New regulations providing for daily rest periods and a weekly day of rest also have been adopted, while the effectiveness of many of those previously operating has been increased. See WOMEN IN INDUSTRY.

The working hours of children are limited to eight in 35 jurisdictions—a substantial gain over 1914—while every State now regulates to some extent either the daily or weekly hours of child labor. Some of these restrictions, however, are generally regarded as inadequate, such as a 60-hour week in Louisiana, Georgia, Maryland, and Kentucky. Some are difficult to enforce, while others permit a large number of exceptions. The recent child-labor amendment will, when it has been ratified by the necessary three-fourths of the States, enable Congress to enact an adequate universal restriction of hours of labor for children (see also CHILD LABOR).

In addition to these statutory limitations on working hours in the United States, union pressure, as well as public sentiment, has worked toward a general reduction of hours in fields not affected by legislation. Perhaps the most outstanding example of this was the final adoption in 1923 by the steel industry of a three-shift eight-hour system instead of the former two-shift system, in deference, according to the executive head of the United States Steel Corporation, to "public sentiment, however created." See TRADE UNIONISM; LABOR ORGANIZATIONS; INTERNATIONAL; LABOR LEGISLATION; LABOR ARBITRATION; STRIKES.

**HOUBTICQ, LOUIS** (1875- ). A French art critic, born at Brossac, in Charente, and educated in Paris at the École Normale Supérieure. He was appointed professor of aesthetics and history of art at the École des Beaux Arts and was also a member of the Superior Council of Public Instruction.

His writings include *Rubens* (tr. 1918); *France, Histoire Générale de l'Art français* (prix Fould); *Les Tableaux du Louvre; Récits et réflexions d'un combattant* (prix Montyon); *La Jeunesse de Titien* (prix Fould); *Initiation artistique; Manet; Histoire de la Peinture, des origines au XVI<sup>e</sup> siècle; La Galerie de Médicis au Louvre; Every One's History of French Art* (tr. 1919); *De Poussin à Watteau* (1921); *De*

*Québec à Vancouver; à travers le Canada d'aujourd'hui*, with G. L. Jaray (1924), and *Encyclopédie des beaux-arts* (2 vols. 1925).

**HOURLWICH, ISAAC A (ARONVICH)** (1860-1924). An American statistician (see VOL. XI). His later works include *Mooted Questions of Socialism* (1917); he was also editor of a Yiddish translation of *Das Kapital*, by Karl Marx (1919).

**HOUSE, EDWARD MANDELL** (1858- ). An American publicist, born at Houston, Tex., and educated at Cornell University. He engaged in business in Texas and was at the same time active in Democratic politics as adviser, though not as an active participant or candidate for office. He was among the most prominent of those who worked for the nomination of Woodrow Wilson for the presidency in 1912, and he gained the confidence of Mr. Wilson to a marked degree. The President relied on him for advice in matters of appointment and policy. In 1914 at the outbreak of the World War, he visited the warring countries in an effort to find a basis for peace. During the years following, he made several other visits to Europe with the same purpose. When the United States entered the War in 1917, he attended the meetings of the Supreme War Council of the Allies in London, as chairman of the American Commission, and in that capacity communicated the views of the American government in regard to the conduct of the War to the Allied premiers and foreign ministers. As the end of the War approached in 1918, he was designated by President Wilson to act for the United States in negotiations for an armistice with the Central Powers. He was a member of the American Commission to Negotiate Peace at Paris, and during the absence of President Wilson from the United States, was practically in charge of American negotiations. On President Wilson's return to Paris, a break occurred in the relationship, and Mr. House ceased to take a prominent part in the deliberations. Following the War, he retired from public life. He was joint editor, with Prof. Charles Seymour, of *What Really Happened at Paris* (1921) and also published an autobiographical novel. *The Intimate Papers of Colonel House*, edited by Professor Charles Seymour of Yale, were published in 1927-28 in four volumes.

**HOUSE, ROY TEMPLE** (1878- ). An American university professor, born at Lexington, Nebr., and educated at Miami University and the University of Michigan. He taught French and German in several schools and colleges until 1905, when he was appointed head of the modern language department at the Oklahoma Southwestern State Normal School, where he served until 1910. In the following year, he was exchange professor in Germany. In 1911 he became professor of German and in 1918 head of the modern-language department of the State University of Oklahoma. He was director for the Commission of Relief in Belgium in 1916. His published writings include *Three French Comedies* (1905) and *Classroom French* (1910). He also translated several foreign plays and contributed book reviews to periodicals. Since 1927 he has been editor of *Books Abroad*, a quarterly book-review magazine.

**HOUSING.** The housing problem even before the World War was rapidly becoming serious. Already overcrowded conditions were being aggravated by the normal increase in population

and the concentration in industrial centres. The difficulty of providing houses to rent at a figure attractive to workmen was discouraging new building by investors, and the tradition of home ownership by workers appeared to be dying out. War conditions brought the situation to a crisis. For a time after the opening of the War, there was practically general suspension of building activities, on account of the shortage of material and labor and the highly increased costs. Repairs were neglected, replacements were not made, adequate provision was not supplied even for the normal increase in population, to say nothing of the emergency concentration at industrial centres. The congestion reached the previously unaffected middle classes. The return of the soldiers after the Armistice increased the urgency, and those governments which were not forced to deal with the situation during the War were unable to evade the issue in the years that followed. A brief account is given below of the widespread legislation, marking the post-war period, which aimed fully to utilize existing facilities, to curb profiteering, and to encourage building. Although by 1921 the house shortage was still serious, not only in every important country but even in centres as remote as Bagdad and Bombay, it was generally held that the crisis then had been passed, notwithstanding the fact that it would take many favorable years to make up the deficit.

**United States.** In 1917 the acute scarcity of housing accommodation, especially in munitions and shipbuilding centres, made Federal action imperative. The United States Shipping Board was given an appropriation to provide housing for its workers (\$10,000,000 was spent at Hog Island alone in that year); and in 1918 an additional \$95,000,000 was granted for this purpose, \$20,000,000 of which was to go to transportation facilities. The War Department also built temporary villages adjacent to inaccessible munitions plants. The United States Housing Corporation, with a total appropriation of \$100,000,000, carried on construction for the Bureau of Industrial Housing and Transportation in 128 communities, housing 25,000 families and 25,000 single laborers; after the Armistice, 6000 families and 8000 single laborers. Although it was estimated that between \$150,000,000 and \$250,000,000 was spent for workers' housing throughout the country in 1918, rents continued high, and in 1919 it was estimated that 1,000,000 additional houses were needed. There was a shortage of 35,000 apartments in New York City, and Chicago reported facilities 20 per cent less than requisite. To alleviate the situation, New York passed laws to permit the remodeling of old-type buildings, to protect tenants, and to stimulate building; the St. Louis Chamber of Commerce formed a \$2,000,000 building association; North Dakota launched a programme of State aid for houses not exceeding a cost of \$5000. The effort to stimulate building produced laws exempting new structures from taxation; and other laws attempted to control profiteering by setting a maximum percentage of increase within a given period and by limiting the landlord's arbitrary right to dispossess. In 76 cities, profiteering committees were formed; in 50 others, the Bureau of Industrial Housing and Transportation adjusted rent disputes. Although, after some improvement in conditions during the summer and fall, the crisis was believed to have been passed toward the close of

1920, the United States in 1921 was still facing a deficit of about 147 per cent of its normal building programme, which affected about 4,000,000 people. It was true that building costs had fallen, but private builders were still holding off awaiting a still further decrease. As for investors, with building costs still 100 per cent above the pre-war level and rents only 25 per cent above, home-building did not attract their capital; and while investigation pointed to from 13 to 14 per cent gross as the minimum return from any rented property, it was claimed that legislative interference kept rents at a figure that did not encourage building as an investment. About this time, price-fixing combines among contractors and producers of material, in some cases working in conjunction with corrupt labor leaders, were uncovered in New York and in Illinois.

The accompanying table comparing home-ownership statistics for the years 1910 and 1920 as given in the census shows a decrease, slight yet of some significance, in the economic independence of the population of the United States:

Year	Percentage of all homes				Percentage of owned homes	
	Rented	Owned	Owned Free	Owned Encumbered	Free	Encumbered
1920	54.4	45.6	28.2	17.5	61.7	38.3
1910	54.2	45.8	30.8	15.0	67.2	32.8

Investigation of housing conditions and legislation for their control were much stimulated and guided during the years after 1910 by the activities of the National Housing Association. Other attempts to improve the type of workers' homes were made by limited dividend companies (formed by philanthropic organizations, chambers of commerce, etc.), coöperative housing associations, and by both Federal and State authorities. Coöperative housing showed a little progress. There were some successful experiments in the larger cities and Wisconsin passed an act promoting it. There had been no tendency in the United States to follow that European policy under which the Government builds workers' homes; for, although Massachusetts did, with State money, build and sell 12 houses, the experiment seemed to have been abandoned afterward, and the Federal government's construction during the period was concerned only with war industry. Those forms of encouragement most in favor seemed to be the elimination of taxes on mortgages, tax exemption on new buildings, and government aid in the financing of local activities; construction itself was chiefly in the hands of contractors, although a considerable activity was shown by building and loan associations.

Total expenditures for new buildings were less in 1927 than for any year since 1923, according to the permits issued in 257 cities of the United States having a population of 25,000 or over. Permits issued in these cities in 1921 showed an estimated expenditure of \$1,673,127,938 for new buildings. A peak of money expended for new operations was reached in 1925 when the estimated expenditure was almost \$4,000,000,000, or 141.9 per cent more than in 1921. Permits issued in 1927 indicated an estimated expenditure of \$3,137,789,130, which was 99.5 per cent more than the 1921 expenditure. The expenditure for residential buildings in 1921 was \$937,352,739. In 1925, it was \$2,461,546,270, or

162.6 per cent greater than the 1921 expenditure. In 1927 it was \$1,906,003,260, or 103.3 per cent greater than the 1921 figure. The number of families provided for by new homes in new buildings was 224,545 in 1921. In 1925, 491,222 families were provided for; in 1927, the number of families provided for was 406,095. An index number weighed by population (that is, taking care of the increase in population), showed that with 1921 as 100.0; the index for families provided for in 1922 was 163.8; in 1925, 198.4; and in 1927, 157.3. Later figures collected by the Federal Bureau of Labor Statistics showed the same continued trend downward in residential building construction for the first half of 1928. The same source made a study of costs of one-, two- and multi-family dwellings for the period 1921-27. In 1921 the average expenditure for a one-family dwelling was \$3972; by 1927 it had reached \$4830, or an increase of 21.6 per cent. The average expenditure for a two-family dwelling also climbed until it reached its peak in 1926. In 1921 the average expenditure per family was \$3762; in 1926, \$4480; in 1927, \$4368, which was 16.1 per cent greater than the 1921 figure. For apartment-house dwellings, the average cost per family was \$4019 in 1921; in 1927 it was \$4170, or only 3.8 per cent greater than in 1921.

Records for the same 257 cities showed that there was an increase in apartment-house construction. In 1921, 24.4 per cent of families provided for by new construction were living in multi-family dwellings; by 1927, this figure had increased to 48.3 per cent. The number in one-family dwellings had dropped from 58.3 per cent in 1921 to 38.3 per cent in 1927. These proportions were much greater in the large cities than in the small. It was found that in 14 cities in the country with a population of a half-million or more, only 25.8 per cent of the families housed in new dwellings in 1927 were cared for in one-family dwellings, while 60.8 per cent were housed in apartment houses. In 1921 only 34 per cent of the new housing units were in apartment houses, while 44.2 per cent were in one-family dwellings. It was apparent that if this tendency kept continuing, the American urban population would soon approximate that of the European populations who were apartment-house dwellers. Consult *Housing Problems in America* (1929), Proceedings of the Tenth National Conference on Housing, Philadelphia, Jan. 28-30, 1929.

Great Britain. Following the outbreak of the War, two housing acts were passed in 1914, but these being limited in scope were not generally productive of results. Investigations in 1917 uncovered an immediate need of 400,000 dwellings in England and Wales and 109,000 in Scotland. Since it was evident that private enterprise could not meet the situation, the Housing Bill of 1919 was passed, making it incumbent on local authorities to carry out housing schemes, with the Government assuming the annual deficit in excess of a penny rate. In the same year, an additional act went into force, providing a subsidy of £15,000,000 for private persons building small houses; checking luxury building and the wrecking of dwellings; and otherwise facilitating construction. This undertaking to provide for a shortage of from 500,000 to 800,000 houses was abandoned in 1921, in an effort to cut down expenditures. The new policy called only for the completion of 198,000

houses already undertaken, at a cost of £10,005,000, and an expenditure of £200,000 in improvement of slum areas. This discouraging outlook, however, was lightened by the activities of about 60 local building guilds. A rent law fixing the percentage of increase and controlling dispossession had been extended in 1919, and replaced by a new law in 1920. Further extension of these provisions became a definite political issue in 1923, when general decontrol was deferred to June 24, 1925, and the protection of the tenant extended to 1930. Nevertheless, under the 1923 Rent Law, it was much easier for landlords to evict tenants, and since with the coming in of a new tenant a house was "decontrolled," thereafter the landlord could charge what rent he pleased, subject only to a vague review by the courts. The housing shortage continued to be acute during the period after the War and, as late as 1929, played an important rôle in the politics of the country. In the general election of 1929, both the Liberals and the Laborites condemned the Conservative government for its failure to provide adequate housing for the working populations.

**France.** In 1919 there were still 550,000 buildings to be supplied in the devastated area, and there was much overcrowding in the larger towns. A Cheap Dwellings Bureau made some progress with garden suburbs outside of Paris; and the destruction of the Paris wall and military zone was ordered, making available about 3025 acres. Government aid was given in 1921 to about 2000 coöperative societies of reconstruction. Rent-limiting legislation had been found necessary; also some control over lodging and boarding houses. The housing shortage actually reached the stage of a crisis after the War and the Government was compelled to take extraordinary measures. Because of the necessity for the rebuilding of the devastated areas, the financial uncertainty, the movement of the rural populations to the cities, the influx of foreigners, etc., the French Parliament in 1928 found it necessary to pass a law making provision for the construction of 260,000 dwellings during the period 1928-33. The bill was passed by a unanimous vote in both Houses. Of these dwellings, 200,000 are to be sold at low prices and 60,000 are to be rented.

**Germany.** The situation in Germany was complicated by the unsettled financial and labor conditions. In a number of towns, house room was rationed and civilians were billeted in private homes; and letting or selling was subject to regulation. In 1921 a national law required all States to spend at least 30 marks per head on house construction in 1921-22. Nevertheless, by 1922, construction had practically ceased. The owners, with only about  $\frac{1}{1000}$  of their interest left to them by the Rent-fixing Law, had been practically expropriated. An attempt to raise a special fund for building was made in 1923 by levying a housing tax, fixed at 30 times the pre-war rent of houses. A law passed in 1923 to protect tenants was to have force until 1926. The shortage remained acute in the post-war period. A census made in 1927 showed that, in towns of more than 5000 inhabitants, there was a shortage of 776,000 dwellings. It was found that in cities of from 5000 to 20,000 population, families having no independent household formed 6.3 per cent of the total families; and in the large towns (over 100,000), the proportion was 10.3 per cent. The building activi-

ties, which had been checked in 1923 by inflation, were resumed in 1924 and by 1926, 199,084 new buildings had been erected in the year.

**Italy.** In 1920 Italy was trying to meet the situation through coöperative societies and building clubs in the North and by the building of garden suburbs around Rome (where one-third of the population were without permanent homes), building activity being encouraged by a government subsidy of 100,000,000 lire, a drastic Rent Law passed in 1919, and certain tax exemptions. In 1928 the Government took further measures to improve the situation in Rome when it authorized the Finance Minister to advance 48,000,000 lire to the Institute for Tenement Houses in Rome. The national Government also subsidized the construction of workingmen's dwellings in the cities of Venice and Bolzano.

**Other Countries.** Housing shortages were to be found in all the countries of Europe during and after the War and, despite governmental measures to check rent profiteering and to encourage the construction of new dwellings, the situation was still abnormal in most of the countries in the spring of 1929.

**HOUSMAN, ALFRED EDWARD** (1859- ). An English Latin scholar (see Vol. XI), who also wrote poetry. Besides magazine articles, he published *Last Poems* (1922) and edited *Book IV of Manilius* (1920) and *Lucan* (1926).

**HOUSMAN, LAURENCE** (1865- ). An English artist and author (see Vol. XI). His later publications include: *Bird in Hand* (1916); *The Sheepfold* (1918); *St. Francis Poverello* (1918); *The Heart of Peace* (1919); *The Wheel* (1919); *Ploughshare and Pruninghook* (1919); *The Death of Orpheus* (1921); *Angels and Ministers* (1921); *Possession: A Peep-show in Paradise* (1921); *Little Plays of St. Francis* (1922); *Dethronements* (1922); *Moonshine and Clover* (1922); *A Doorway in Fairyland* (1922); *False Premises* (1922); *Écho de Paris* (1923); *Trimblerygg* (1924); *The Death of Socrates* (1925); *Ironical Tales* (1926); *The Comments of Juniper—Six Plays from the Life and Legend of St. Francis of Assisi* (1926); *The "Little Plays" Handbook* (practical notes for producers of the plays, 1927); *Uncle Tom Pudd* (1928); *The Love Concealed*, poetry (1928); and *The Life of H. R. H. The Duke of Flamborough* (1928).

**HOUSTON.** A city and port of entry of Texas. The population increased from 35,784 in 1910 to 138,278 in 1920 and to 285,000 in 1928, according to local estimate. The area is 70 square miles, or 44,800 acres. In 1927 and 1928 the communities of Park Place, Kennington, Harrisburg, River Oaks, and Memorial were added, increasing the population by 15,000. The government is vested in a municipal commission, consisting of a mayor and four commissioners, with a city manager, appointed by the mayor and serving as his first assistant. The entrance to the port of Houston is through a tidal channel extending from the Gulf of Mexico through the jetties between Galveston Island and Bolivar Peninsula across Galveston Bay, a distance of 25 miles, thence up the San Jacinto River through low-lying marshes and shallow bays to Lynchburg, a distance of 9 miles, then up the historic Buffalo Bayou to the turning basin at Houston, a further distance of 16 miles, making a total distance of 50 miles from the harbor to the Gulf. From 1919 to 1925, the natural channel extending from Galveston Bay to the turning basin within the city limits was deepened, widened,

and straightened at a total cost of approximately \$20,000,000, which was contributed by the citizens of Harris County and the United States government. Of this amount, \$7,700,000 was expended for wharves, warehouses, a public grain elevator, and other port facilities; the remainder represented the cost of dredging the channel to a depth of 30 feet and a bottom channel width of 150 to 300 feet. The waterway, or Houston Ship Canal as it is generally called, will be connected with the Mississippi River by the Intra-coastal Canal which is under construction. In 1920 the total business of the port amounted to 1,210,204 tons; in 1928 it had increased to 12,979,826 tons, a gain of 900 per cent.

As a result of the inauguration of deep-water commerce, an extensive industrial development has taken place in Houston. Since 1915 there have been constructed on the banks of the waterway more than 50 industries representing a capital investment of \$150,000,000, and on the light-draft channel above the turning basin are located 32 industries whose estimated capital investment is more than \$20,000,000. For many years, Houston has been the centre of the Gulf Coast oil section, and among the 38 companies located there are five of the world's largest producers of petroleum. The city is also one of the largest lumber markets in the United States, marketing approximately 50,000,000 feet of lumber annually. In addition to being the largest spot cotton market in the world, Houston has become, as a result of its port development, the second ranking cotton port in the United States. The 22 high-density cotton compresses which operate in Houston have warehouses with a total capacity of 1,145,000 bales of cotton. In 1919, 43,391 bales of cotton were shipped from Houston to foreign countries; during 1928, 1,968,969 bales were exported. In 1924 the city celebrated the exportation of its millionth bale of cotton for one shipping season. Approximately 44,000 persons are employed in Houston's 611 industrial establishments and receive \$81,850,000 in wages; the value of products manufactured in 1928 was estimated at \$178,842,961. Bank clearings in 1928 amounted to \$1,825,696,000.

From 1924 to 1929, Houston completed the greatest building programme in its history, the valuation of building permits issued during the period being \$175,867,117. This construction included a number of large office buildings in the city's business district. In addition to this private construction, Houston carried out such civic improvements as street paving, extension of waterworks, sewers, bridges, etc., authorized by a \$7,000,000 bond issue, and the erection of the Museum of Fine Arts, a magnificent public library, an outdoor theatre, and a mammoth auditorium with a seating capacity of about 15,000, which was constructed expressly for the 1928 National Democratic Convention. In 1929 an agreement was reached between the city officials and the Southern Pacific Railroad, assuring the construction of a new passenger station which with other proposed improvements, such as street widening and opening, stream relocation, and grade-crossing elimination, would cost approximately \$7,000,000. The Houston airport has been in operation since October, 1927. The landing field, which is 2620 feet square, is used by the air mail, 36th Division (Texas National Guard) Air Corps, and commercial and privately owned planes. The airport was formally dedicated on Mar. 2, 1928. Houston has 961 miles

of streets, 646 miles of gas mains, 566 miles of sewers, and 335 miles of water mains. The water-works system, supplied by deep artesian wells, is owned and operated by the city and is valued at \$8,446,822. Since 1925 the school board has expended approximately \$7,000,000 for the construction of 34 new school buildings, the renovation of 23 others, and the installation of new equipment. More than 42,000 children are enrolled in the Houston public schools. In 1927 a junior college was established as part of the public-school system. The assessed valuation of property in Houston, according to local estimate, is \$285,000,000, an increase of \$18,000,000 over 1927; the net debt in 1927 was \$35,744,000.

**HOUSTON, DAVID FRANKLIN** (1866- ). An American public official (see Vol. XI). From February, 1920, to March, 1921, he was Secretary of the Treasury. He was also chairman of the Federal Reserve and Farm Loan Boards. From 1916 to 1920, he was a member of the Council of National Defense. After retiring from public life, he became president of the Mutual Life Insurance Company of New York. He wrote *Eight Years with Wilson's Cabinet* (2 vols, 1926).

**HOUVILLE, GÉRARD D'**. See **REGNIER, MARIE LOUISE ANTOINETTE**.

**HOVGAARD, WILLIAM** (1857- ). An American naval architect, born at Aarhus in Denmark. He graduated from the Naval Academy of Denmark in 1879 and from the Royal Naval College at Greenwich, England, in 1886. After serving in the Danish Navy from 1897 to 1901, he went to the United States and became professor of naval design and construction at the Massachusetts Institute of Technology. He was employed in the Bureau of Construction and Repair of the Navy in 1917-18, and was consulting naval architect for the Bureau in 1919-26. He became a member of many naval and scientific societies, including the National Academy of Science (1929), and wrote *Submarine Boats* (1887); *Voyages of the Norsemen to America* (1914); *Structure and Design of Warships* (1915); *Modern History of Warships* (1920); and *General Design of Warships* (1920).

**HOWARD, THE RT. HON. SIR ESME (WILLIAM)** (1863- ). A British diplomat who was born at Greystoke Castle, Cumberland, educated at Harrow, and passed the examination for the diplomatic service in 1885. After being attached to the embassies in Rome and Berlin, he retired from the service (1892), was assistant private secretary to the Secretary of State for Foreign Affairs (1894-95), and served in the Boer War. He was then honorary second secretary to the Embassy at Rome (1903), Consul General for Crete (1903-06), Councilor of the Embassy at Washington (1906-08), and Consul General for Hungary (1908-11). In 1911 he became Minister to Switzerland, in 1913 Minister to Sweden, and, after being on the British delegation to the Peace Conference and British Commissioner on the Special Interallied Mission to Poland in February and March of 1919, he became Ambassador to Spain. In 1924 he was appointed Ambassador to Washington. He was made Knight Commander of the Bath (1919), and was later raised to Knight Grand Cross of the Order of the Bath (1928).

**HOWARD, JOHN GALEN** (1864- ). An American architect (see Vol. XI). From 1901 to 1925, he was Supervising Architect and from 1913 to 1927, director of the School of Architec-

ture of the University of California, for which he designed the Greek Theatre and other buildings. He was a member of the National Institute of Arts and Letters and was formerly president of the Society of Beaux Arts Architects. In 1918-19 he served as captain in the American Red Cross in France.

**HOWARD, SIDNEY COE** (1891- ). An American dramatist. He was born at Oakland, Calif., graduated at the University of California (1915), and for a year engaged in special dramatic work under George P. Baker at the Harvard "47 workshop." In the earlier part of the World War, he served with the American Ambulance Corps on the western front and in the Balkans. After the United States entered the War, he became a captain in the U. S. Aviation Service. After the Armistice, he was on the staffs of *Life* and *Hearst's International Magazine*. He wrote the following plays: *Sicords* (1921); *Casanova* (adapted from the Spanish of de Azertis 1923); *Bewitched* (with Edward Sheldon, 1924); *They Knew What They Wanted* (Pulitzer Prize, 1925); *Lucky Sam McCarver* (1925); *Ned McCobb's Daughter* (1926); *The Silver Cord* (1926); *Salvation* (with Charles MacArthur, 1927); and *Yellowjack* (1928), besides various translations and adaptations. He is also the author of *The Labor Spy* (1921), and *Three Flights Up* (fiction, 1924).

**HOWARD UNIVERSITY.** A non-sectarian institution principally for the higher education of Negro men and women in Washington, D. C., founded in 1867, and largely supported by the Federal Government. In 1918 all the secondary schools of the University were abolished and the entire plan of undergraduate work changed. The four-year college course was divided into two periods of two years each, the Junior College, and the Senior Schools. The semester system was abolished in June, 1919, and the quarter system substituted. Departments of architecture, of public health, and of physical education were established. In 1928 the University was comprised of the following: College of liberal arts; college of education; school of applied science; school of music; school of religion; school of law; school of medicine; academic evening classes. Despite the loss of secondary students in 1918, the total enrollment of the institution rose from 1463 students in 1914 to 2384 in the autumn of 1928, including an enrollment of 402 in the summer session of that year. The faculty in the autumn of 1928 numbered 183 members. Congressional appropriations in the period under review increased from \$117,937 to \$240,000 annually, and \$150,000 toward the construction of a chemistry building in 1928-29, with an additional \$240,000 to be appropriated by the second session of the Seventieth Congress, for the same purpose. A dining hall with classrooms for the department of home economics was built in 1921 at a cost of \$301,000, and plans formulated in that year provided for a gymnasium for which Congress made appropriations in subsequent years, as well as for a medical building. A greenhouse was erected in 1919, and Howard Hall, for many years used as a detention house for incorrigible children, was renovated and made a dormitory for girls; many improvements also were made on the campus. Appropriations of \$150,000, and \$40,000 in 1928, provided for the construction of a dormitory for women. Total endowment in 1928 amounted to \$843,018, and the

library contained 46,389 volumes. President, Mordecai W. Johnson, S.T.M., D.D.

**HOWE, FREDERIC CLEMSON** (1867- ). An American lawyer and public official (see VOL. XI). From 1914 to 1919, he was Commissioner of Immigration at the Port of New York. He wrote *Socialized Germany* (1915); *Why War?* (1916); *Revolution and Democracy* (1921); *Denmark, a Cooperative Commonwealth* (1921); *Confessions of a Reformer* (1925); and other economic and political works.

**HOWE, GEORGE** (1876- ). An American University professor, born at Wilmington, N. C., and educated at Princeton, the University of Halle, Oxford, and the American Classical School in Rome. He became professor of Latin at the University of North Carolina in 1903, and from 1919 to 1922 was dean of the College of Arts. Professor Howe was the author of several textbooks and co-author of *Greek Literature in Translation* (1924), and *Latin Literature in Translation* (1925).

**HOWE, HARRISON ESTELL** (1881- ). An American chemist, born at Georgetown, Ky., and educated at Earlham College and Michigan and Rochester universities. After a period as industrial chemist, he became assistant to the president (1915), and later department manager of the research concern of A. D. Little in Cambridge, Mass. In 1919-22 he was chairman of the division of research extension of the National Research Council and also served as consulting chemist to the Ordnance Bureau. In 1921 he became editor of the *Journal of Industrial and Engineering Chemistry*, and in the same year published the *New Stone Age*. Among his later publications are *Profitable Science in Industry* (1924); *Chemistry in the World's Work* (1926); *Chemistry in the Home* (1927). He edited *Chemistry in Industry* (vol. i, 1924; vol. ii, 1925).

**HOWE, MARK ANTONY DE WOLFE** (1864- ). An American editor and author (see VOL. XI). His later works include: *The Humane Society of the Commonwealth of Massachusetts* (1918); *The Atlantic Monthly and Its Makers* (1919); *George von Lengerke Meyer, his Life and Public Services* (1919); *Memoirs of the Harvard Dead in the War against Germany*, 5 vols. (1920-24); *Memories of a Hostess* (1922); *Barrett Wendell and His Letters* (Pulitzer Prize for biography, 1924); *Causes and Their Champions* (1926). He was the editor of *Harvard Volunteers in Europe* (1916); *Marching with Sherman—Letters and Campaign Diaries of Henry Hitchcock* (1927); *Later Years of the Saturday Club* (1927); *Classic Shades* (1928).

**HOWELL, ROBERT BEECHER** (1864- ). A United States Senator, who was born at Adrian, Mich., and graduated at the United States Naval Academy in 1885. Having resigned from the Navy, he studied law at Detroit and in 1895-96 was State Engineer of Nebraska, becoming City Engineer of Omaha in 1896-97. He served as a lieutenant in the Navy during the Spanish-American War (1898). While a member of the Nebraska State Senate (1903-05), he obtained legislation that resulted in public ownership of the Omaha water plant in 1912 and he personally managed the plant until 1923. He was also director and general manager of the Metropolitan Utilities District (including Omaha and adjacent municipalities) for ten years (1913-23) and was active in establishing Omaha's

municipal ice plants. He was a member of the Republican National Committee for twelve years (1912-24) and was elected to the United States Senate for two terms (1923-35).

**HOWELLS, JOHN MEAD** (1868- ). An American architect, born at Cambridge, Mass., son of William Dean Howells. He graduated from Harvard in 1891 and afterward studied at the École des Beaux Arts. From 1907 to 1917, he was a member of the architectural firm of Howells & Stokes of New York and Seattle. In 1922 he was associated with Raymond M. Hood in designing and erecting the Tribune Tower Building in Chicago, winning in an international contest for the best design. He designed and erected buildings for Harvard, Yale, and Columbia universities and for various banks and other financial institutions. He contributed frequent articles on technical and literary subjects to magazines.

**HOWITZERS.** See ARTILLERY.

**HOWZE, ROBERT LEE** (1864-1926). An American soldier, born in Rusk County, Tex. He graduated from the United States Military Academy in 1888, served as a volunteer in the Spanish-American War, was major of the Porto Rico provisional regiment, 1901-04, and was commandant of cadets of the United States Military Academy, 1905-09. After further service in Porto Rico and as colonel of the 11th Cavalry, he was detailed to the General Staff in 1916. The same year, he was appointed brigadier general in the National Army and commanded the 2d Cavalry Brigade on the Mexican border. He became major-general in 1918 and was given command of the 38th Division. With this, he served in the Meuse-Argonne campaign and then was commander of the 3d Division with the Army of Occupation in Germany until Aug. 14, 1919. Upon his return, he was assigned to the Mexican border, commanding the 1st Cavalry Division. He was made a major general of the Regular Army in December, 1922.

**HRDLICKA, dĭch'ka, ALES** (1869- ). An American anthropologist (see Vol. XI). He was the Huxley Medal lecturer in London in 1927. His later works include *Notes on the Pathology of the Ancient Peruvians* (1914); *The Most Ancient Skeletal Remains of Man* (1914); *Physical Anthropology in America* (1914); *Anthropology of the Chippewas* (1916); *Physical Anthropology of the Lenape, Delaware and Eastern Indians in General* (1916); *The Old White American* (1917); *The Genesis of the American Indian* (1917); *Anthropology of Florida* (1922); *The Old Americans* (1925). He was founder and editor of the *American Journal of Physical Anthropology* (1918- ).

**HUARD, FRANCES WILSON** (BARONESS HUARD) (1885- ). An American writer and relief worker, born in New York City. She was privately educated and in 1905 married Baron Charles Huard, a painter and illustrator of Paris. At the outbreak of the World War, she turned her château over to the French government for hospital purposes. When this building was destroyed, she transferred the hospital in 1917 to Paris, where she maintained 100 beds through funds collected during lecture tours in the United States. She wrote *My Home in the Field of Honor* (1916); *My Home in the Field of Mercy* (1917); *Lilies White and Red* (1918); *American Footprints in Paris* (with François Boucher, 1921). She was co-author of *French Rustic Furniture* (1927).

**HUBBARD, HENRY VINCENT** (1875- ). An American landscape architect, born at Taunton, Mass. He graduated from Harvard University in 1879 and afterward studied landscape architecture there and also at the Massachusetts Institute of Technology. From 1906 to 1918, he was a member of the firm of Pray, Hubbard & White, Boston. He was appointed instructor of landscape architecture at Harvard in 1906, assistant professor in 1910, and professor in 1921. He was a founder and chief editor of *Landscape Architecture* and the *City Planning Quarterly*. During the World War, he designed and built several cantonments and also assisted in designing housing communities. His works include *Introduction to the Study of Landscape Design*, in collaboration with Theodora Kimball (1917, 3d ed., 1927). In 1919 he edited the report of the United States Housing Corporation.

**HUBERICH, CHARLES HENRY** (1877- ). An American lawyer, born at Toledo, Ohio. He was educated privately and studied law at the University of Texas and in Germany. In 1898 he was admitted to the bar. He was a member of the faculty of the University of Texas from 1900 to 1905, and assistant professor and professor of law at Leland Stanford, Junior, University, 1905-12. In 1909-10 he was professor of law at the University of Wisconsin. He was a member of several legal associations and is the author of *The Trans-Isthmian Canal* (1904); *Law Relating to Trading with the Enemy* (1918); and volumes on the commercial law of Australia, New Zealand, Canada, and other British dominions in the *Commercial Laws of the World*.

**HUCH, hooç', RICARDA** (1864- ). A German poet, novelist, and historian (see Vol. XI). Her later works include a war novel in three volumes, *Der grosse Krieg in Deutschland* (1914); *Natur und Geist als die Wurzeln des Lebens und der Kunst* (1914); *Wallenstein* (1915); *Das Judengrab* (1916); *Luthers Glaube* (1916); *Der Fall Deruga* (1917); *Der Sinn der Heiligen Schrift* (1919); *Entpersönlichung* (1921); *Bakunin und die Anarchie* (1925); *Freiherr von Stein* (1925); and her novel of *Garibaldi*, his life and times, published in English under the title *Defeat* (1928).

**HUDDLESTON, SISLEY** (1883- ). An English journalist and author, born at Barrow-in-Furness, and educated at the University of Manchester and in Paris. Becoming a resident of Paris, he was for several years correspondent there for the *London Times* and afterward for the *Christian Science Monitor* of Boston. Besides contributing articles on international politics and economics to numerous British and American newspapers and periodicals, he wrote *Peace-Making in Paris* (1919); *Poincaré: A Biographical Portrait* (1924); *Those Europeans; France and the French* (1925); the volume on "France" in *The Modern World Series* (1926); and *Louis XIV in Love and War* (1929).

**HUDSON RIVER TUNNEL.** See TUNNELS.

**HUGGENBERGER, ALFRED** (1867- ). A Swiss writer who was born at Bewangen. His publications include *Liede und Balladen* (1895); *Winterm Pflug* (1908); *Die Stille der Felder* (1913); *Wenn der Märzwind Weht* (1920); and *Lebensstreu* (1923), poems; *Von den Kleinen Leuten* (1909); *Bauernland* (1913); *Dorfgenossen* (1914); *Aus meinem Sommergarten* (1917); and *Die heimliche Macht* (1919), short stories; the

novels *Die Bauern von Steig* (1913); *Die Geschichte des Heinrich Lentz* (1915); *Jochems erste und letzte Liebe* (1922); *Die Frauen von Siebenacker* (1925); and, besides many one-act plays, the longer *Sie Hand wieder Eine* (1926).

**HUDSON, MANLEY OTTMER** (1886- ). An American lawyer and educator, born at St. Peters, Mo., and educated at William Jewell College, Harvard University, and the Harvard Law School. He was assistant in history at Harvard and Radcliffe colleges from 1907 to 1910, and from 1910 to 1919, professor of law at the University of Missouri. He joined the faculty of Harvard as assistant professor of law in 1919, was made full professor in 1921, and Bemis professor of international law in 1923. He was a member of many important commissions on State laws and in 1917 was attached to the office of the Solicitor to the Department of State. He was counsel of the United States government inquiry on the terms of peace, 1917-18, and served in other capacities at the Peace Conference in Paris. In 1919 he was a member of the legal section of the Secretariat of the League of Nations and acted as legal adviser to the International Labor Conferences in Washington and Genoa. Since 1924 he has been editor of the *American Journal of International Law*. He is the author of *The Permanent Court of International Justice* (1925); *The Next War* (1925); *Prospects for International Law in the Twentieth Century* (1925); *Current International Cooperation* (1927).

**HUDSON, W. H.** (1841-1922). A British naturalist and author, born at Quilmes, Argentina, of American parents who had settled there. He remained in South America till the age of twenty-nine, when he moved to England. Apart from his reputation as an understanding writer in natural history, which began with the publication of *Argentine Ornithology* (1888-89), he also attained a high place in English literature. It was in his writings on South America that he was most effective, poetic, and colorful. In *Green Mansions* (1904), by far his finest literary work, he produced a masterpiece of vivid description and delicate literary style. His published works include also: *The Purple Land* (1885); *A Crystal Age* (1887); *Naturalist in La Plata* (1892); *Idle Days in Patagonia and Birds in a Village* (1893); *British Birds* (1895); *Birds in London* (1899); *Nature in Downland* (1900); *Birds and Man* (1901); *El Ombú* (1902); *Hampshire Days* (1903); *A Little Boy Lost* (1907); *The Land's End* (1908); *Afoot in England* (1909); *A Shepherd's Life* (1910); *Adventure Among Birds* (1913); *Far Away and Long Ago and History of My Early Life* (1918); *Birds in Town and Village and The Book of a Naturalist* (1919); *A Traveller in Little Things and Dead Man's Pluck* (1921); and *A Hind in Richmond Park* (1922). Mr Morley Roberts in *W. H. Hudson, A Portrait* (New York, 1924), while expressly disclaiming the office of biographer supplied a valuable body of information and personal reminiscences.

**HUEFFER, FORD MADOX.** See FORD, FORD MADOX.

**HUGEL, hu'gel, FRIEDRICH, BARON VON** (1852- ). An Austrian-English writer on religion (see Vol. XI). In 1916 he wrote *The German Soul*; in 1921, *Essays and Addresses on the Philosophy of Religion*; and in 1927 *Selected Letters*.

**HUGGINS, MILLER J.** (1880-1929). Professional baseball player and manager, born at Cincinnati, Ohio. His first big league engagement was with the Cincinnati National League Club where he served from 1904 to 1909, when he was traded to the St. Louis Club of the same League. He managed this club for five years and was then made manager of the New York American League Club, his team, the "Yankees" winning pennants in 1921, 1922, 1923, 1926, 1927, and 1928, and the world's championship in 1923 and 1928.

**HUGHES, hūz, CHARLES EVANS** (1862- ). American jurist and public official (see Vol. XI). He resigned from the Supreme Court, to which he had been appointed in 1910 by President Taft, to become Republican candidate for the presidency in 1916. He was defeated by President Wilson, who received 277 electoral votes to his 254, and he then returned to the practice of law. In 1918 by appointment of President Wilson, he investigated alleged irregularities in the building of army and navy airplanes during the World War. He was Secretary of State in the cabinets of Presidents Harding and Coolidge (1921-25) and was chairman of the Disarmament Conference held at Washington in 1921-22. As Secretary of State, he negotiated the peace treaty with Germany, and handled issues involving mandates and American participation in the World Court, which he advocated in 1923. In 1926 he was appointed by President Coolidge a member of the Permanent Court of International Justice at The Hague and in September, 1928, he was elected a judge of the Court by the Council and Assembly of the League of Nations to succeed John Bassett Moore. He assumed his duties at The Hague May 1, 1929. He was chairman of the United States delegation to the Pan-American Conference at Havana in January, 1928, and for his outstanding services during that year was awarded the Roosevelt Medal of Honor. Although he had refused to be considered as a candidate for the Republican presidential nomination in 1928, he played an active and influential part in the campaign in support of Herbert Hoover, the party's nominee. After 1916 he was president of numerous legal societies, including the American Bar Association (1924-25), and other organizations.

He wrote *The Pathway of Peace* (1925); *The Supreme Court of the United States* (1927); and *Our Relations to the Nations of the Western Hemisphere* (1928). In 1929 his *Pan American Peace Plans*, lectures given at Yale University, was published.

**HUGHES, CHARLES FREDERICK** (1866- ). An American naval officer, born in Bath, Me. He graduated from the United States Naval Academy in 1884. During the Spanish-American War, he served on board the *Monterey*, participating in the battle of Manila. He was on duty with the Bureau of Equipment from 1904 to 1906 and served as Chief of Staff of the Atlantic Fleet in 1913-14. He was a member of the General Board of the Navy Department from 1914 to 1916 and served with the British Grand Fleet in the North Sea in 1917-18. In the latter year, he was promoted to the rank of rear admiral and was placed in command of the Navy Yard at Philadelphia (1918-20). He was commander of the 2d Battleship Squadron of the Atlantic Fleet (1920-21) and of Divisions 7 and 4 of the U. S. Battle Fleet (1921-23).

He was commandant of the Naval War College (1923-24), director of fleet training (1924-25), and later commandant-in-chief of the U. S. Battle Fleet and chief of naval operations.

**HUGHES, HATCHER** (?- ). An American playwright, born in South Carolina and educated at the University of South Carolina and Columbia University. In 1912 he started giving courses in the drama and playwrighting at Columbia. For four years, he directed the Morningside Players, an organization of Columbia University, which was the first to present a play by Elmer Rice. Since 1922 he has been assistant professor of English at Columbia. In 1921 with Elmer Rice, Mr. Hughes wrote *Wake Up, Jonathan*, in which Mrs. Fiske starred on tour for a solid season after three months in New York. In 1922 Mr. Hughes's *Hell-bent for Heaven* was awarded the Pulitzer Prize. He also wrote *Honeymooning* (1927).

**HUGHES, HECTOR JAMES** (1871- ). An American engineer and educator, born at Centralia, Pa. He graduated from Harvard in 1894 and later studied at its Lawrence Scientific School. In 1899-02 he was connected professionally with the Chicago, Burlington, & Quincy Railroad in Chicago. In 1902 he returned to Harvard as instructor in civil engineering, becoming in 1914 professor of that subject, and in 1920 dean of the Engineering School. He is the author of *A Treatise on Hydraulics*, with A. T. Safford (1911); *Roads and Toll Roads in America* (1913); and *Highway Engineering Education* (1914-27).

**HUGHES, RUPERT** (1872- ). An American writer (see VOL. XI). His later works include: *Empty Pockets* (1915); *Clipped Wings* (1916); *The Thirtieth Commandment* (1916); *In a Little Town* (1917); *We Can't Have Everything* (1917); *The Unpardonable Sin* (1919); *Long Ever Ago*, a volume of Irish stories (1919); *What's the World Coming To?* (1920); *Beauty* (1921); *Souls for Sale* (1922); *Destiny* (1925); *George Washington* (biography, 1926-27). He wrote and directed many motion pictures, including *Scratch My Back* (1920); *The Old Nest* (1921); *Dangerous Curve Ahead* (1921); *The Old Home Town* (1926); *The Patent Leather Kid* (1927).

**HUGHES, THOMAS WELBURN** (1858- ). An American lawyer and teacher, born in Canada and educated there and at the University of Michigan. From 1892 to 1898, he was instructor in law at that university and later served on the faculties of the University of Illinois and Louisiana State University. From 1912 to 1915 he was dean and professor of law at the University of Florida and since 1915 has held similar positions at Washburn College of Law, Topeka, Kans. He was the author of *Hughes on Evidence* (1906); *Hughes on Criminal Law* (1913); *Cases on Evidence* (1920); *Cases on Criminal Law and Procedure* (1921); *Was Jesus Guilty?* (1927); and many pamphlets and magazine articles.

**HUGHES, THE RT. HON. WILLIAM MORRIS** (1864- ). An Australian Premier, born in Wales, who emigrated to Australia in 1884. After his admission to the bar, he devoted himself to the organization of maritime unions, becoming general secretary of the Wharf Laborers and president of other allied unions. He was a Labor member of the Legislative Assembly of New South Wales (1894-1901), resigning to enter the first Federal Parliament (1901), where

he became a leader of the Labor Party. He was Minister of External Affairs (1904), chairman of the Royal Commission on the Navigation Bill, a delegate to the Imperial Navigation Conference (1907), and Attorney General (1908-21, with a break in 1909 and 1913). As Premier from 1915 to 1923, he met with three temporary defeats, two of them during the World War as a result of his attempt to force through conscription. He was a member of the Imperial War Cabinet, spoke in Great Britain and Canada urging united resistance of the Empire to Germany, and was a delegate to the Paris Peace Conference. In 1921 he became Minister of External Affairs again. With W. T. Dick, he wrote *On the Federation of the Australian States* and *The Case for Labor*. In 1929 he published *The Splendid Adventure: a Review of Empire Relations*. Consult Douglas Sladen's *From Boundary Rider to Prime Minister* (1916). See AUSTRALIA.

**HULETT, GEORGE AUGUSTUS** (1867- ). An American chemist, born in Illinois, and educated at Princeton and Leipzig. He was an assistant in chemistry at Princeton, then an instructor at the University of Michigan (1899-1904), and again at Princeton, where in 1909 he became professor of physical chemistry. He was also chief chemist of the Bureau of Mines (1912-13). During the World War, he was a member of the foreign service commission of the Natural Research Council and visited France and England to study the origin and development of scientific activities in connection with warfare. His original investigations were almost entirely in problems of physical chemistry, e.g., isomorphism in precipitates, occlusions in electrodeposits, and decomposition potentials. Since 1923 he has served as associate editor of the *Journal of Physical Chemistry*.

**HULL** (officially, Kingston-upon-Hull). A seaport city of England. The population at the census of 1921 was 287,150; in 1927 it was estimated to be 298,600. Hull is the principal seaport for shipping the manufactures of Yorkshire and Lancashire, the docks extending along the Humber for nearly 7 miles and having a total water area of 247 acres. The largest docks are the King George and the Alexandra, each containing about 53 acres. In 1926 the net tonnage of ships engaged in foreign trade was 4,922,904 for arrivals and 4,517,580 for departures; the value of sea-borne trade in 1924 was £121,186,307. Hull has large warehouses for the storage of wool and factories for the manufacture of soap, lard, and starch. One of its principal industries is the extraction of oil from cottonseed. The Art Gallery, the gift of the Rt. Hon. T. R. Farnes, and the Guild Hall have been recently constructed. In April, 1928, the foundation stone of the new University College was laid by the Duke of York.

**HULL, ALBERT WALLACE** (1880- ). An American physicist. He was born at Southington, Conn., and was graduated from Yale in 1905 (Ph.D., 1909). He was instructor in physics and assistant professor at Worcester Polytechnic Institute (1909-13). Since 1914 he has been research physicist for the General Electric Company at Schenectady, N. Y. He devised a method of X-ray crystal analysis and in 1923 was awarded Potts' Medal by the Franklin Institute for work in that field. He was elected to the National Academy of Sciences in 1929.

**HULL, CORDELL** (1871- ). An American public official (see VOL. XI). He served as a member of Congress, 1907-21 and 1923-29. From 1921 to 1924, he was chairman of the Democratic National Executive Committee. In this capacity, he called to order the Democratic National Convention of 1924 and was chairman of the platform committee at that convention.

**HULL, HARRY EDWARD** (1864- ). An American Congressman and Commissioner General of Immigration. He was born in Allegany County, N. Y., and obtained a public-school education at Cedar Rapids, Iowa. He engaged in the grain business and served, successively, as alderman, mayor, and postmaster of Williamsburg, Iowa (1897-1914). For five terms (1915-25), he represented the 2d Iowa District in Congress. Since 1925 he has been Commissioner General of Immigration.

**HULSE, HIRAM RICHARD** (1868- ). A Protestant Episcopal bishop, born at Middletown, N. Y. and educated in Philadelphia. Ordained in 1896, he was for several years vicar of the Pro-Cathedral in New York and from 1899 to 1912, was rector of St. Mary's Church there. He was also Secretary of the American Church Missionary Society and archdeacon of New York. In 1915 he was consecrated Bishop of Cuba.

**HÜLSEN, CHRISTIAN K. F.** (1858- ). A German historian and archaeologist. He was born in Berlin and studied at the university there under Mommsen. After teaching several years, he was appointed director of the German Archaeological Institute in Rome; in 1917 he became honorary professor at Heidelberg. He received the honorary D.Litt. degree from Oxford and Columbia universities. He is the author of *Die Thermen des Caracalla* (1898); *Forum Romanum* (1904); *Topographie der Stadt Rom in Altertum* (1897); *Die Thermen des Agrippa* (1910); *Il Libro di Giuliano di Sangallo* (1910); *Roms Antikengärten* (1917); *Forum und Palatin* (1926); and a volume on the mediæval churches in Rome, in Italian, *Le Chiese di Roma nel Medio Evo* (1927).

**HUMAN EVOLUTION.** See ANTHROPOLOGY; EVOLUTION.

**HUMBERT, ün'bér', GEORGES LOUIS** (1862-1921). A French general, who was born in Gazaran, entered Saint-Cyr in 1881, joined the army in 1883 and served in Indo-China, Madagascar, and other French colonies. He was in service in Morocco in 1913 and 1914, and was placed in command of the Moroccan division at the outbreak of the World War. Later in 1914, he commanded the 23d Army Corps, and was given command of the 3d Army in 1915. This post he held for three years, with distinguished success. In 1919 he was made governor of Strassburg, a position which he held at the time of his death, and in 1920 a member of the Superior War Council.

**HUNEKER, JAMES GIBBONS** (1860-1921). An American musical and literary critic (see VOL. XI). In 1921 he published *Steeplejack*, largely autobiographical. His death cost American letters one of its most discerning critics whose large and contagious enthusiasms succeeded, more than any other single force, in familiarizing Americans with modern European artistic movements. He was one of the first to write of Gauguin, Ibsen, Wagner, Nietzsche, France, Faguet, Van Gogh, and George Moore. In this sense, possibly he was only a reporter,

but he reported the advent of new genius with discrimination, a rare gift. A representative collection of Huneker's *Essays* with an introduction by H. L. Mencken was published in 1929.

**HUNGARIAN LITERATURE.** Recent Hungarian literature has not been so rich in monumental works as the period of Petöfi, Arany, Jókai, Kemény, Katona, and Madách. In lyrics, novels, and dramas, we have only smaller epigons in the past 20 years, though quite a host of poets and writers arose who enriched the literature with works of permanent value. Most of the first magnitudes in the lyrics are followers of Arany and Petöfi, or at least regard their works as a sacred inheritance of the "Golden Age" of Hungarian literature. Of the older and more conservative generation, Szabolcska (Mihály), Vargha (Gvula), and Yakab (Ödön), are worthy of mention, then Andor Kozma by his poetical name, Miklós Bárd, also, Geza Lampérth. Besides these most popular poets, there are two different groups in recent literature. Two new tendencies became prevalent during the past 20 years. One is the result of a rising admiration of the Western naturalists, more definitely speaking, the French decadents; the other tendency is an outgrowth of the World War or its consequences.

It was at about the close of the nineteenth century that a small group of young poets turned their faces to the West and gathered around their flag. This feeling is expressed in their magazine, *Nyugat* (*The West*). They revolted against the prevailing ideals, as well as the old school, of the rather retrospective and secluded national literature. Their leader and incomparably the most prominent figure in this group was Endre Ady (1877-1919). He had an interesting personality around which a very hot battle was fought, not only while he lived but after his death. Almost a whole library was published, including a host of articles and books that are still appearing, and portray the literary value of his works. Though this so-called Ady problem is an unsolved riddle as yet, owing to the contradictions of his life, as well as of his political attitude and religious thoughts, it is generally accepted that the Hungarian lyrics obtained a real, new strength and tone through his poems. Others of the same school are Mihály Babits, who is at the same time perhaps the best translator of Dante's *Divina Commedia*; and Dezső Kosztolányi, who, besides his original poems of deep feeling, also translated many American, English, French, Italian, and Spanish poems into Hungarian. These were published in three volumes under the title *Modern Poets*. The other tendency in Hungarian lyrics was born in the War and post-war times. Since Hungarians felt no real enthusiasm for the War, no poet arose to inspire its continuation. Yet a few poets were influenced at least by the awful experience which they went through during the terrible catastrophe. The very best known among them is Géza Gyöni, who has been called the "Petöfi" of the World War. His *Letters from the Calvary* were written during his imprisonment in Russia, where he died. Two other volumes of his poems were published during the World War.

Owing to the tragic end of the War for them, the dismemberment of the thousand-year-old country, a very noteworthy group of Hungarian poets arose both in the torn off parts and Hungary proper. The most popular of these irre-

dentist poets are Sándor Reményik (who wrote under the poetic name of "Végváry"), with his poems collected and published under the title *Save Us!*; then, Gyula Diák (anonym), László Mécs, with his *Slaves Are Singing* (Berlin, 1925); Elemérné Papp-Váry, and Lajos Áprily, who enriched the Hungarian literature with poems of permanent value.

In the field of novels, after the long interval of sterility that followed Kemény, Jókai, and Mikszáth, the most important and popular novelist is Ferenc Herczeg, whose works are characterized by an extraordinary variety of subjects and simplicity of style. He is most successful when writing about the middle class of the last century. Géza Gárdonyi also is very famous and widely read to this day, as a novel writer. He has a master hand, especially when dealing with the problems of the intelligentsia of the village life. Móricz Zsigmond, on the other hand, is more interested in the life and tormenting problems of the Hungarian peasants, depicting them often with realism leaning toward dark pessimism. Dezső Szabó also is weeping and lamenting over the tragic fate of the agricultural class of Hungary. Other popular novelists are Margit Kaffka, Renée Erdős (with her characteristic realism), Miklós Surányi, Aurél Kárpáti, István Tömörkényi, Zoltán Ambrus, Gyula Török, Cecil Thormay (some of her works published also in English), Kálmán Csathó, János Komáromy, and Ferencz Móra.

The most important representative of the modern Hungarian drama is Ferenc Herczeg, whose *The Seven Sisters* (*Gyurkovics Lányok*) was the first Hungarian drama on the American stage. Both his historical and social dramas had the best reputation in the theatrical world, not only in Hungary but in other countries. From the standpoint of fame in foreign lands, Ferenc Molnár made a still more wonderful career. His dramas, due to their finely-spun and witty dialogues, became world renowned. *The Devil, Lilium, The Guardsman, Fashions for Men, The Swan*, etc., had uncommon success especially on the American stage. Menyhért Lengyel had almost the same success with his *Typhoon, Sancho Panza, Antonia*, etc.; so had *Fata Morgana*, by Ernő Vajda. Other modern dramatists of good name are Jenő Heltai, Frigyes Karinthy, Sándor Bródy, Zsigmond Móricz, and Lajos Zilahy. In miscellaneous literature, Sándor Pethő's *From Világos to Trianon*, Aladár Schöppfin's work on modern Hungarian writers, Ferencz Zsigmond's *Life and Work of Jókai*, the *Petőfi* of Frigyes Riedl (one of his works published in English), and *The Development of the Hungarian Drama*, by György Lukács are counted among the most successful studies since the World War. Besides these, there are great historical works, namely, *Francois Rákóczi II*, by Sándor Márk, and *The Period of the Árpád Dynasty*, by László Erdélyi; also Jenő Cholnohy's monumental *Geography of America* and the literary studies of György Király.

**HUNGARY.** A republic of Europe from Nov. 16, 1918, to Mar. 23, 1920, when the country was declared a monarchy. The throne, however, was vacant. Under the terms of the Treaty of Trianon, the area of Hungary is 35,875 square miles. It is bounded on the north by Czechoslovakia, on the east by Rumania and Poland, on the south by Jugo-Slavia, and on the west by Austria. The population, according to the census of 1920 was 7,980,143. The estimated popu-

lation on Dec. 31, 1927, was 8,525,725. The principal cities are Budapest with a population of 1,217,325; Szeged, 119,109; and Debreczen, 103,186.

**Agriculture.** Hungary is chiefly an agriculture country. The acreage and yield of the principal crops for pre-war and post-war years was as follows:

CROPS: AREA, PRODUCTION, AND YIELD PER ACRE				
Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1909—1913 <sup>a</sup>	1927	1909—1913 <sup>a</sup>	1927
Wheat	3,712	4,049	71,493	76,933
Rye	1,608	1,653	31,377	22,569
Barley	1,322	1,011	32,809	23,319
Oats	849	637	28,464	21,717
Corn	2,192	2,589	60,818	68,347
Potatoes	619	626	71,118	66,403
Sugar beets	131	154	1,378 <sup>b</sup>	1,455 <sup>b</sup>
Grapevines	540 <sup>c</sup>	542	52,771 <sup>c</sup>	51,566 <sup>c</sup>
Tobacco	93	58	112 <sup>e</sup>	60,626 <sup>e</sup>

<sup>a</sup> Within present boundaries

<sup>b</sup> Unit, metric ton

<sup>c</sup> 1911-1915 average

<sup>d</sup> Unit, gallon of must

<sup>e</sup> Unit, pound

According to the census of 1928, the livestock was as follows: horses, 917,974; cattle, 1,811,647; sheep, 1,566,451; pigs, 2,661,539.

**Commerce.** According to figures published in 1929, the trade balance for 1927 showed an excess of imports over exports of \$60,502,000, as compared with an adverse balance of \$14,379,000 in 1926. Imports and exports in 1927 were valued at \$200,345,000 and \$139,843,000, respectively. Similar figures for 1926 were \$166,282,000 and \$151,903,000. The leading articles of imports according to value in 1927 were cotton and woolen fabrics, wood and coal, and iron and steel. The leading articles of export were wheat and wheat flour, cattle, rye, and sugar. The chief suppliers of the imports were Czechoslovakia, Germany, Austria, and Rumania; and the chief purchasers of Hungarian products, Austria, Czechoslovakia, and Germany. In 1928 imports continued to be in excess of exports amounting to 1,188,976,000 pengos, as against 818,711,000 pengos. The average exchange value of the pengo in 1928 was 0.1744.

**Mining and Manufacturing.** The Hungarian production of coal in 1927 totaled 784,000 tons of bituminous and 6,243,000 tons of brown coal. The chief Hungarian industries are those that are allied with the agricultural resources of the country and consist of grain mills, distilleries, sugar refineries, and plants for the manufacture of hemp and flax. Some iron and steel are produced.

**Transportation.** The total length of Hungarian railways, Dec. 31, 1927, was 5388 miles, of which 1897 were owned by the State. Of the total railways, 618 miles are of double track.

The fiscal year ends June 30. Figures in the table (page 756) are on the gross basis; totals include both ordinary and extraordinary items. Actual expenditures by classes for recent years are not available. Conversions to dollars have been made at par inasmuch as the deviations in exchange since the establishment of the pengo in 1926 (par \$0.1749) have been slight.

The total debt on Dec. 31, 1928, according to privately published sources, amounted to \$426,605,000, of which \$235,325,000 represented pre-war debt.

**History.** Under the government of Count Tisza, Hungary participated in the conduct of the World War, unquestioningly so far as the Magyars were concerned, but with reluctance by the other nationals. The death of the aged Emperor Francis Joseph (Nov. 21, 1916) loosed all those dissident forces which had yielded only a reluctant allegiance. The independent spirit of the Prime Minister quickly antagonized the new King, who, listening to the counsels of the court cabal, dismissed Tisza in May, 1917. Weaker men assumed control, with the result that the country was rent by political dissensions. Count Esterhazy became Premier for a time but was soon succeeded by Herr Wekerle. The agitation over the extension of the political franchise attracted attention away from more pressing concerns, with the result that the hardships of the civil population increased with the failure of the Government to buy up the harvests, etc. All the familiar customs were now to go down before the new revolutionary spirit that gripped the Hungarian people as the War dragged on. The demand for reform became increasingly insistent and gained importance from the personal prestige of Count Karolyi who had assumed leadership of the forces of discontent. His hand was strengthened by the royal manifesto of Oct. 16, 1918, which was tantamount to a dissolution of the Dual Monarchy. Thenceforth, Hungary went her separate way. Believing that Karolyi was in a position to gain more favorable terms from the Allies, Hungarian statesman yielded to his advice and on Oct. 25, 1918, formed a National Council. Five days later, Karolyi was summoned to head it as Minister-President. In accordance with his liberal, nay, republican professions, he recalled the Hungarian troops from the front and viewed with complacency the formation of workers' and soldiers' councils in Budapest. The revolution took a more violent character when, on October 30, Count Tisza, the leading representative of the old régime, was killed. On November 16, the National Council proclaimed Hungary a republic; on Jan. 11, 1919, it elected Karolyi provisional President. Karolyi's hopes that his anti-war and republican sentiments might serve to gain more favorable peace terms for Hungary received a rude check when a new armistice deprived Hungary of large territories in favor of Rumania and Serbia. This setback, the invasion of Hungarian lands by Rumanian and Czech troops, the increasing war-weariness that made any régime other than the one in power desirable, the growing turbulence of the workers, and the example of the successful Russian Revolution, united to undermine the Government. Karolyi, with more prudence than courage, yielded up his post, and on Mar. 22, 1919, Hungary became a Soviet Republic dominated by an

alliance between the Social Democrats and the Communists, the only well-organized parties.

From March 22 to August 1, the doctrine of the dictatorship of the proletariat ruled the distracted country. Alexander Garbai became President of the Republic, though the actual ruler was Béla Kun, commissary for foreign affairs, and friend of Trotsky and Lenin. Other leaders were Szamuelly, Pagany, Böhm, and Varga. Initial measures were rigorous. The revolutionary government council proclaimed the socialization of large properties, mines, industries, banks, and other commercial institutions. All ranks and titles were abolished and church and state separated. A strict censorship of the press was imposed. Money was sent into Vienna in an attempted to spread the Bolshevik propaganda there. The middleman was singled out for attack; all raw materials were made a state monopoly. For the conciliation of the peasantry, private property in holdings of 100 acres or less was permitted.

The career of the Soviet Republic was short. The closing of the factories for want of materials stirred the workers into hostility, while the persecutions of the church and the placement of Jews in high offices antagonized the devout peasants. The nobility was naturally embittered and intrigues soon led to the formation of a counter-government with an army recruited by Vice Admiral Horthy. Béla Kun's failure to come to an understanding with the Supreme Council's representative, General Smuts, and his policy of militant opposition to Hungary's enemies, hastened his downfall. His Red Army was soon at war with the troops of Rumania, Jugoslavia, and Czechoslovakia. An initial victory against the Czechs brought down the wrath of the Supreme Council on Béla Kun, and Hungary was threatened with military and economic reprisals. To conciliate the Peace Conference, Béla Kun withdrew his forces from the conquered Slovak territory, only to be confronted by an advancing Rumanian Army on the east. Resistance was useless; the Rumanians advanced on the capital with the tacit consent of the Allies; and beset by obstacles everywhere, the Soviet government resigned and took refuge in flight, finding a haven first in Vienna and later in Russia.

A White government, except for a brief interval, now succeeded the Reds. As a result of the intercession of the Allies, a moderate Social Democratic government was at once overthrown on August 7, and the reactionary Archduke Joseph was set up as regent of the state with Herr S. Friedrich as premier. All interest was diverted from internal affairs in the face of the advancing Rumanian Army. On August 3, after having pillaged the countryside, the Rumanians entered the suburbs of Budapest; on August 5,

against the injunction of the Supreme Council, the army took the city; on August 6, an ultimatum was served on the Hungarians demanding 30 per cent of the harvest, farm animals, and farm tools, 50 per cent of the rolling stock, and the equipment for an army of 300,000 men. Not until after they had stripped the country bare did the Rumanians yield to the reiterated remonstrances of the Allied Supreme Council and quit the capital, November 11, and the country entirely, February, 1920. Meanwhile, reaction was in the saddle. Archduke Joseph, at the order of the Allies, was compelled to quit the regency only to be succeeded by the virtual rule of Admiral Horthy backed by his White army. For a time, Friedrich stayed on as premier; he was succeeded for another brief period by Herr K. Huzzár. A rapid succession of ministers during 1920-21 availed the country nothing in view of the economic demoralization, the hostility of her neighbors, and the loss of the rich agricultural territories of the Banat, the Bačka, and the Little Alföld.

On Jan. 25, 1920, a general election chose delegates to the National Assembly. Hostility toward the Socialists accounted for heavy victories for the parties of the Right. In March, Admiral Horthy was formally chosen regent, the step being dictated by the antagonism of the Little Entente toward the creation of a monarchy. An indication of the bitterness of the reaction was revealed in the obstructions placed in the way of the trade unions' participation in politics. To lift such discriminations, the International Federation of Trade Unions ordered an economic boycott against Hungary and Hungarians retaliated by boycotting Austria. Demonstrations against the Jews occurred frequently and even the Government participated by restricting the number of Jewish students in the universities. Monarchist sentiment continued to prevail, and on Mar. 26, 1921, believing that the country favored his accession, the ex-King Charles suddenly appeared, to ascend the throne. The Regent refused to countenance his restoration, with the result that Charles left for Switzerland, only once more to appear in Hungary on October 22. The hostility of the Little Entente again proved disastrous for his hopes, with the result that Charles was compelled to surrender himself to the British and suffer internment on the island of Madeira which he reached November 19, and where he died, Apr. 1, 1922, of pneumonia.

The international situation, possibly more than any other single factor, contributed to the prevailing hopeless temper. On June 4, 1920, a Hungarian peace delegation, of which Count Albert Apponyi was the chief, was compelled to sign away, by the Treaty of the Trianon, at least two-thirds of the former Hungarian kingdom to the new succession states. Hungarian groups were left in Czechoslovak, Jugoslav, and Rumanian districts, while the new frontiers cut across railways, roads, waterways, and long-established administrative units. In the Bačka and the Banat, rich maize and wheat lands were lost, and in the Little Alföld north of the Danube, barley and sugar-beet fields, and pastures. With the cession of the Carpathian and Transylvanian country, Hungary saw taken from her all her salt deposits, four-fifths of her iron ore and many coal fields, as well as her sources of water power and a large share of her valuable forests. The continued hostility

of the Little Entente prevented the formulation of an economic accord between Hungary and those territories upon which her industries so much depended. In August, 1921, Hungary's burdens were increased by the cession of the Burgenland to Austria, at the bidding of the Allies.

The events of 1922 and 1923 proved how profoundly Hungary was shaken by her unhappy economic and political status. The Republic was continually being threatened by the agitations of the royalists, headed by Counts Andrássy and Apponyi, who proclaimed Prince Otto heir to the throne after the death of Charles. Horthy, quite as reactionary as the royalists, attempted to reduce the electorate by one-fourth, and to substitute open voting for secret. A rigorous censorship of the press was maintained which applied, too, to the publication and circulation of the writings of such men as Marx, Lenin, and Walt Whitman. A move was originated for the practical suppression of the civil liberties, its purpose being the imprisonment or banishment of all those suspected of questioning the prevailing political, economic, and religious beliefs. Two disturbing factors were also evident in 1923; that the courts had become the mere instruments of the authorities and that conscription had been practically restored. The populace was daily irritated by the presence of the Inter-Allied Commission of Military Control which was being maintained at Hungary's expense. Anti-Semitism was on the increase and Hungarian Fascists were being recruited. Nothing indicated better the broken *morale* of the people than the ease with which lawless bands incessantly operated. The most powerful, led by one Hejjas, terrorized Jews, trade unionists, and Communists, and led forays into the Burgenland in the summer of 1922. Attempts to suppress them legally were unavailing. Liberals in other countries believed that Hungary had been given over to a "White Terror," which was characterized by reactionary violence as cruel, perhaps, as any revolutionary terrorism.

The deplorable economic and financial situation resulting from the War and, hardly less, from civil turmoil and territorial transfers after the War, presented so grave an international problem that in December, 1923, at the instance of Czechoslovakia, the League Council proposed to undertake the financial rehabilitation of Hungary on a basis similar to that which had proved so successful in Austria. In return for an international loan of 250,000,000 gold crowns, floated under the League's auspices, Hungary was to accept League supervision of her finances, assign to the League the revenue from customs and state monopolies, abide by the terms of the Treaty of Trianon, and pay the war indemnity in 20 annual installments of 10,000,000 gold crowns. Humiliating as they were to Hungarian Nationalists, these terms were accepted by Premier Bethlen in February, 1924, and an American banker, W. P. G. Harding, was invited by the League to act as its Commissioner General in charge of Hungarian finances. On Mr. Harding's refusal, the post was accepted by Jeremiah Smith of Boston, who was cordially received in Budapest, May 1. Meanwhile, despite stubborn Socialist opposition, Premier Bethlen had carried through Parliament, April 18, a series of bills authorizing his government to fulfill the agreement.

With the path thus cleared, the plan was immediately put into effect. A new bank of issue was opened June 2 and shortly thereafter an international loan of about \$50,000,000 was floated, chiefly in England and America. It was secured by revenues from the customs, from the State tobacco and salt monopolies, and from the sugar tax. These revenues proved unexpectedly large and together with proceeds from new and heavy taxes quickly brought the national finances to a good position. Early in 1925, Mr. Smith was able to report that although two and a half years had been allowed for balancing the budget, the task was actually accomplished in six months. It was necessary to use only a part of the international loan. After two years of operation, the plan had fully restored the financial health of the country and at the end of June, 1926, Mr. Smith resigned, giving his two years' salary of \$100,000 to Hungary's poor. League control was accordingly brought to an end.

Attempts to negotiate commercial treaties with Hungary's neighbors met with only limited success, because, as alleged, of the mistrust of Hungary's reactionary government and of the Fascist factions. This reactionary spirit was manifested in many ways. In 1925 Count Bethlen, the Premier, forced through a new election law abridging the right of suffrage and providing for open instead of secret voting. In September, 1925, large numbers of Communists were arrested without conclusive evidence to support the charge of plotting against the Government. It was constantly charged by the opposition that the courts were unusually severe in dealing with liberals and radicals, but very tender toward Fascists and other reactionaries. A source of continuing disorder rising occasionally to the point of bloodshed was the militant anti-Semitism fostered by the Fascists and by secret organizations. It found expression in a national law limiting the number of Jewish students at the various universities. When the League of Nations objected to the law as a violation of the treaty clause relating to the rights of minorities, it was slightly modified, but Jewish students were driven by violence from the universities.

Had it not been that the Conservative extremists were divided into two factions, they might have carried their cause much farther. One of these factions was the Legitimist Party, supporting the claim of the young Otto, son of the late Emperor Charles, to the throne. The other, composed of Fascist elements largely, backed Archduke Albrecht, and became so strong in 1925 that they threatened the establishment of a Fascist dictatorship; but in December and January, they received a severe blow which for the time being effectively silenced them. A huge counterfeiting scheme involving the forging of French francs was uncovered, and it was disclosed that all the leading actors were closely connected with Fascist and Royalist factions. When brought to trial in May, they pleaded the patriotic motive of revenge against France. Although Count Bethlen himself was not proved to be implicated, the Government was not unsympathetic toward the offenders and they received light sentences.

The sensational plot and its aftermath had violent political repercussions, both at home and abroad, but Count Bethlen weathered the storm and indeed profited by it. With the Fascists in a chastened mood, he became practically a dictator. In November, 1926, Parliament

passed a law reviving the Upper House, which was made to consist of 240 members representing and chosen by the nobility, the churches, the business and professional interests, etc., with limited legislative powers. In December, Count Bethlen had so consolidated his power that he deemed it safe to call new elections. Amid charges of government corruption and intimidation, the elections were held and resulted in an overwhelming victory for the Premier, who could count on controlling nine-tenths of the members of the Lower House. Parliament thereupon became hardly more than an agency for carrying out the will of the Government. In March, 1927, it ratified a treaty of arbitration and friendship with Italy, marking a rapprochement with that country which was to be continuously in evidence in following years. A commercial treaty with Czechoslovakia was likewise ratified. Early in 1928, a flurry was caused throughout Europe by the discovery of a disguised shipment of machine-gun parts from Italy to Hungary. When the League and the powers moved to investigate, the material was destroyed and the affair blew over.

Chief among the questions which agitated the public mind of Hungary at this period were the continued insistence on a revision of the Treaty of Trianon, a matter especially close to the heart of the Premier, and the restoration of the monarchy. The latter question became especially prominent on Nov. 20, 1928, when Archduke Otto became of age. In October Count Bethlen, who opposed the Legitimists, predicted an early referendum to determine the form of government; but in May, 1929, he asserted that the existing situation was satisfactory and would probably continue as long as the Regent, Admiral Horthy, lived. On June 12, 1929, Count Andrássy died. He was a leader of the Legitimists and had long been an outstanding figure in Hungarian national life.

**HUNGERLAND**, HEINZ F. W. (1873- ). A German writer, born at Bremen and educated at the universities of Greifswald, Göttingen, Kiel, and Münster. He traveled in England and Scandinavia, did some work at the universities of London, Copenhagen, and Lund, and was instructor at Lund. He specialized in Old German language and Old Norse Literature. He is the author of *Zeugnisse zur Wölsung- und Nibelungensage aus der Skaldenpoesie* (1903); *Das Wissenschaftliche Studium der Deutschen Sprache* (1906); *Deutschland und die Deutschen* (1913); *Siegrunen, Kriegsgedichte* (1915); *Die Volkshochschule, Deutschlands Rettung* (1919); *Herkunft und Bedeutung des Hakenkreuzes* (1921); *Spuren altgermanischen Götterdienstes in und um Osnabrück* (1924); *Die Osnabrücker Mäusesage* (1924); *Die Sage von der Ankumer Totenmette im Lichte der Volkskunde* (1925); *Die Volkskunde eine Hilfswissenschaft der Geschichte* (1926); *Auslandstum und Heimatsbewegung* (1927). He also compiled an anthology of Scandinavian lyrics, which he had translated.

**HUNSAKER**, JEROME C. (1886- ). An American aeronautical engineer, born in Creston, Iowa, and educated at the Naval Academy and the Massachusetts Institute of Technology. He studied aerodynamics in Europe and in 1914-16 was instructor at the Massachusetts Institute

of Technology in that subject. He translated much of Eiffel's work, including *Resistance of the Air*, and built the first wind tunnel at the Institute where original research was conducted, the results of which were given to builders. Under him, graduate students were trained as aeronautical engineers. Commander Hunsaker was in charge of the aircraft division of the Bureau of Construction and Repair of the Navy Department, 1916-23. He designed the first modern airship produced in the United States, as well as the *C* and *D* class Navy airships. He also designed the *NC* flying boats with Westervelt and Richardson. In 1917 he was a member of the joint Army and Navy Technical Board to frame an aircraft programme and in 1918 was attached to the Inter-Allied Naval Armistice Commission. Later, he became affiliated with the Bell Telephone Laboratories in New York. Among his published works are *Stable Biplane Arrangements*; *Aerodynamic Properties of the Triplane*; and *Aeroplane Stability*.

**HUNT, CLARA WHITEHILL** (1871- ). An American librarian, born at Utica, N. Y. She graduated from the New York State Library School in 1898 and for several years taught in the public schools. In 1898 she organized the work with children in the Apprentices' Library in Philadelphia and from that year to 1902 was with the Newark Free Public Library. In 1903 she became superintendent of the Children's Department of the Brooklyn Public Library. She lectured much on library topics and was the author of *What Shall We Read to the Children?* (1915); *About Harriet* (1916); *The Little House in the Woods* (1918); and *Peggy's Playhouse* (1924).

**HUNT, EDWARD EYRE** (1885- ). An American sociologist, born in Nebraska and educated at Harvard. From 1912 to 1914, he was on the editorial staff of the *American Magazine* and was also war correspondent in Europe. From 1914 to 1916, he was American delegate of the Commission of Relief to Belgium in charge of the province of Antwerp. He was a director of publicity for the American Red Cross in 1917 and was head of the economic rehabilitation work of the Red Cross in France in the year following. In 1920 he was a member of the engineers' commission on the elimination of waste in industry. In 1921 he acted as secretary of the conference on unemployment and in the following year, as secretary of the U. S. Coal Commission. His published writings include *War Bread—A Personal Narrative of the War and Relief in Belgium* (1916); *Tales from a Famished Land* (1918); *Waste in Industry*, with Herbert Hoover and others (1921); and *Conferences and How to Run them* (1925). He was also co-author of *Business Cycles and Unemployment* (1923) and *Seasonal Operation in the Construction Industries* (1924). He edited *Scientific Management Since Taylor* (1924) and *What the Coal Commission Found* (1925).

**HUNT, GEORGE WILEY PAUL** (1859- ). An American public official and diplomat, born at Huntsville, Mo., and educated in the public schools. For several years he was engaged in ranching in Arizona. In 1893 he was elected a member of the Legislature of that State and of the Senate in 1897 and was reelected for several terms. He was president of the Constitutional Convention (1910) and in 1911 was elected first Governor of the State of Arizona. He was reelected for terms from 1915 to 1919 and was

meanwhile United States Commissioner of Conciliation to negotiate settlement of the miners' strike in Arizona (1917). In 1920 he served as Minister to Siam, resigning in the following year. He was again elected Governor of Arizona in 1922 and for successive terms until 1929. In 1927 he was elected chairman of the Arizona-Colorado River Commission.

**HUNT, HENRY THOMAS** (1878- ). An American lawyer, born at Cincinnati and educated at Yale and the Cincinnati Law School. Admitted to the Ohio bar in 1903, he took an active interest in civic and State politics and was a member of the Ohio House of Representatives, 1906-07. From 1908 to 1911, he was prosecuting attorney of Hamilton County and from 1912 to 1914, mayor of Cincinnati. During the World War, he served in France and as a member of the War Department Claims Board in Washington. In 1920-21 he was a member of the Railroad Labor Board.

**HUNT, THOMAS FORSYTH** (1862-1927). An American agriculturist, born at Ridott, Ill., and educated at the University of Illinois. He was assistant agriculturist for the Illinois Agricultural Experiment Station, 1888-91, on the faculty of the Pennsylvania State College as professor of agriculture, 1891-92, professor of agriculture at the Ohio State University, 1893-96, and dean of the College of Agriculture and Domestic Science there, 1896-1903. He was professor of agronomy at Cornell University from 1903 to 1907 and dean of the School of Agriculture and director of the Pennsylvania Agricultural Experiment Station of the Pennsylvania State College from 1907 to 1912. In the latter year, he became professor of agriculture and dean of the College of Agriculture at the University of California. Until 1919 he was also director of the Agricultural Experiment Station at that university. Professor Hunt wrote: *History of Agriculture and Rural Economics* (1899); *How to Choose a Farm* (1906); and *Farm Animals*, with Charles W. Burkett (1917).

**HUNTER, GEORGE LELAND** (1867-1927). An American art authority (see VOL. XI). During the last fifteen years of his life, he published *Inside the House That Jack Built* (1914); *Italian Furniture and Interiors* (1917); *Decorative Textiles* (1918); *Decorative Furniture* (1923); *Practical Book of Tapestries* (1925); *Tapestries of Clarence H. Mackay* (1925); and contributed to the magazines many articles on related subjects.

**HUNTER, WALTER SAMUEL** (1889- ). An American psychologist, born at Decatur, Ill., and educated at the universities of Texas and Chicago. He taught at the University of Texas from 1912 to 1916 and from 1916 to 1925 at the University of Kansas. Since 1925 he has been G. Stanley Hall professor of genetic psychology at Clark University, Worcester, Mass. From 1916 to 1924 he was associate editor of the *Psychological Bulletin*, and since 1921, of the *Journal of Comparative Psychology*. He was the author of various studies in animal behavior, space perception, and social psychology. His best known work is his textbook, *General Psychology* (1919; revised, 1923). He also has edited *Comparative Psychological Monographs*, *Psychological Index*, and *Psychological Abstracts*.

**HUNTER, (WILEY) ROBERT** (1874- ). An American sociologist, born at Terre Haute, Ind., and educated at the University of Indiana. He was for several years an official of the Chicago Bureau of Charities and a resident at

Hull House from 1899 to 1902. After doing settlement work in England, he became head worker at the University Settlement of New York City in 1902-03. From 1902 to 1906 he was chairman of the New York Child Labor Committee. He was president of the Berkeley Commission of Public Charities in 1921. His books include: *Tenement Conditions in Chicago* (1901); *Poverty* (1904); *Violence and the Labor Movement* (1914); *Labor and Politics* (1915); *Why We Fail as Christians* (1919); *The Links* (1926). He was lecturer on economics and English at the University of California (1918-22).

**HUNTER, WILLIAM** (1861- ). A British physician, credited with priority in the recognition of buccal infection (oral sepsis) as an extensive cause of disease (neuritis, anæmia, etc.). His announcement of this doctrine appeared in 1901, years before that of Billings and others in the United States. After studying at the University of Edinburgh, he spent several years as a research student at Cambridge. He then became associated with Charing Cross Hospital and was dean of the medical school there, 1910-15. He was also physician to the London Fever Hospital and in 1915 was sent by the British government to Serbia to study the epidemics of typhus and relapsing fever. Serbia recognized his work by making him a grand officer of the Order of St. Sava. His major writings comprise *Pernicious Anæmia* (1901), expanded in 1909 to *Severest Anæmias*. He also wrote *Historical Account of Charing Cross Hospital and Medical School* (1914); *The Great Serbian Epidemic of Typhus* (1919); and *Nervous Disorders in Anæmias* (1922).

**HUNTER COLLEGE OF THE CITY OF NEW YORK.** A college of liberal arts established in 1870 for the education of women. It is supported by public funds; tuition, textbooks, and other supplies are furnished without cost to the students; the degrees of A.B., A.M., B.S. in Education, and M.S. in Education are offered; and summer, evening, and extension sessions, in which courses of college grade are conducted, are partially supported by the payment of small matriculation and tuition fees. The student enrollment in the regular day sessions increased from 1400 in 1915 to 5204 in 1928, and the teaching staff from 121 to 335 members. The summer session increased from 894 students and 55 instructors in 1923, to 3190 students and 125 instructors in 1928. The evening and extension sessions increased from 3265 students and 110 instructors in 1924, to 7775 students and 273 instructors in 1928. New buildings to accommodate 12,000 students were in process of construction in the Borough of the Bronx in 1928. James M. Kieran, LL.D., who became acting president on Feb. 1, 1928, following upon the resignation of Dr. George S. Davis, was elected president and assumed office on Feb. 1, 1929.

**HUNTING, GEORGE COOLIDGE** (1871-1924). A Protestant Episcopal bishop, born at Milwaukee. He studied theology at the Virginia Theological Seminary and was ordained in 1897. For several years, he was engaged in missionary work in Nevada and Utah and from 1899 to 1902 was rector of St. Paul's Church at Evanston, Wyo. For the five years following, he was superintendent and chaplain of St. Mark's Hospital at Salt Lake City and again engaged in missionary work until 1914, when he was consecrated Bishop of Nevada. From 1909 to 1911, he was editor of the *Nevada Churchman*.

**HUNTINGTON, ANNA HYATT.** See HYATT, ANNA VAUGHN.

**HUNTINGTON, EDWARD VERMILYE** (1874- ). An American mathematician, born at Clinton, N. Y., and educated at Harvard and in Europe. In 1901 he joined the faculty of Harvard, where he became in 1919 professor of mechanics. His scientific work has had to do with various systems of postulates forming the bases of elementary mathematical theories. He was editor of *Annals of Mathematics* during 1902-11 and was president in 1918 of the Mathematical Association of America. In addition to editing various scientific memoirs and works, he is known as author of *Four-Place Tables of Logarithms and Trigonometric Functions* (1907); "The Fundamental Propositions in Algebra," the fourth in *Young's Mathematical Monographs* (1911); *Essentials of Elementary Dynamics* (1916); *The Continuum and other Types of Serial Order* (1917); and *Handbook of Mathematics for Engineers* (1918).

**HUNTINGTON, ELLSWORTH** (1876- ). An American geographer and educator (see Vol. XI). From 1910 to 1915, he was assistant professor of geography at Yale and after 1917 was research associate. During the World War, he served as captain of the Military Intelligence Division. His later books include *The Climatic Factor* (1914); *Civilization and Climate* (1915); *World Power and Evolution* (1919); *The Red Man's Continent* (1919); and *Principles of Human Geography*, with S. W. Cushing (1920); *The Character of Races* (1924); *West of the Pacific* (1925); *The Pulse of Progress* (1926); and *The Human Habitat* (1928). With Leon F. Whitney executive secretary of the American Eugenics Association he wrote *The Builders of America* (1928).

**HUNTINGTON, GEORGE SUMNER** (1861-1927). An American surgeon and anatomist, born at Hartford, Conn. He received his A.B. degree at Trinity College in 1881 and his M.D. degree at the College of Physicians and Surgeons, Columbia University, New York, in 1884. He was professor of anatomy at Columbia (1889-1927) and American editor of the *Journal of Anatomy and Physiology* during the same period. His chief publication was a large work on the surgical anatomy of the peritoneum.

**HURD, HENRY MILLS** (1843-1927). An American physician and psychiatrist, born in Union City, Mich. (see Vol. XI). He remained editor of the *Modern Hospital* and also one of the editors of the *American Journal of Insanity* until 1920. He also edited a four-volume work, *Institutional Care of the Insane in the United States and Canada* (1917).

**HURLBUT, JESSE LYMAN** (1843- ). An American clergyman and writer (see Vol. XI). His later books include *Traveling in the Holy Land through the Stereoscope* (1913); *Hurlbut's Story of Jesus* (1915); *Story of the Christian Church* (1918); and *The Story of Chautauqua* (1921).

**HURLEY, EDWARD NASH** (1804- ). An American manufacturer and public official, born in Galesburg, Ill. He was educated in the public schools of Chicago, served as engineer and traveling salesman for several companies, and organized and developed the pneumatic tool industry in the United States and Europe. From 1908 to 1915, he was president of the Hurley Machine Company of Chicago. In 1913 he was appointed trade commissioner to the Latin-American re-

publics and served as vice chairman and later as chairman of the Trade Commission until 1917, when he was appointed chairman of the United States Shipping Board and president of the Emergency Fleet Corporation. This post he resigned in 1919. Since 1924 he has been a member of the World War Funding Commission. He wrote *The Awakening of Business* (1916); *The New Merchant Marine* (1920); and *The Bridge to France* (1927).

**HURRICANES.** See METEOROLOGY.

**HURST, FANNY** (MRS. JACQUES S. DANIELSON) (1889- ). An American author, born in St. Louis, and educated at Washington and Columbia universities. Her short stories were an immediate popular success. Collected in book form, they include *Gaslight Sonatas* (1916); *Humoresque* (1918); and *The Vertical City* (1921). An early novel, *Star Dust* (1919), won little attention. Her *Lummow* (1923), at once raised Miss Hurst to the front rank of American fictionists. Undoubtedly showing the influence of May Sinclair, *Lummow* nevertheless presents the working of a mature and confident mind. Miss Hurst wrote *The Untamed Lady* (1926), as a photoplay. *A President Is Born*, regarded by many critics as her most important novel, appeared in 1928, and *Five and Ten* in 1929.

**HUSE, HARRY McLAREN PINCKNEY** (1858- ). An American naval officer, born at West Point, N. Y. He graduated from the United States Naval Academy in 1878 and was appointed ensign in 1882. In 1905 he served as professor of mathematics at Annapolis and was promoted to be commander in 1907, captain in 1909, and rear admiral in 1916. In 1919 he served as commander of the Atlantic Fleet Train and was on special duty in London and Paris. In 1920 he commanded the United States naval forces in European waters, with the rank of vice admiral, and from July 26, 1921, to Dec. 3, 1922, when he was retired, was a member of the General Board of the Navy.

**HUSSEIN IBN ALI**, hōōs-sūn' ib'n il'ā, (1856- ). First King of the Hedjaz, who was recognized by the Mohammedans as senior descendant of Mohammed. From 1800 to 1908, he was a prisoner at Constantinople, where he gave his four sons, Ali, Abdullah, Feisal, and their half-brother Zaid, a modern education. After the Turkish Revolution of 1908, he was appointed Grand Sherif of Mecca, and gained great influence over the Arab troops. He refused to proclaim a Holy War on behalf of Germany and was invited by societies in Syria and Mesopotamia to lead an Arab revolt. He subsequently took the side of the Allies and rendered efficient service with the British troops in Arabia and Mesopotamia. In recognition of these services, he was proclaimed King of the Hedjaz on Oct. 29, 1916, and King of Arabia on June 21, 1917. With the assistance of Great Britain, he established and maintained a well-organized government in his new kingdom, which was recognized by the Allies. In 1924 he refused to sign a treaty with Great Britain because the status of Jerusalem was not satisfactory to him. On Mar. 7, 1924, he was proclaimed Caliph. An invasion of the Wahabis under Ibn Saud in September, 1924, caused his abdication both as Caliph and King on October 4 of that year. His son ALI IBN HUSSEIN (1878- ), ruled for a year, but was defeated and succeeded in December, 1925, by Ibn Saud. See CALIPHATE and ARABIA, *History*.

**HUSSEY, WILLIAM JOSEPH** (1862-1926). An American astronomer, born at Mendon, Ohio, and educated at the University of Michigan. During 1884-89 he was principal of various schools in Ohio and Illinois and in the latter year went to the University of Michigan as an instructor of mathematics; in 1891, he became acting director of the Detroit Observatory; and a year later, went to Stanford University, where in 1894 he became full professor. During 1896-1905 he was astronomer at the Lick Observatory, but in 1905 returned to Michigan where he became professor of astronomy and director of the observatory. Dr. Hussey was director of the Argentina National Observatory at La Plata (1911-17), of the Lick Eclipse Expedition to Egypt in 1905, and of La Plata Eclipse Expedition to Brazil in 1912. He discovered more than 1600 double stars; in recognition of this achievement, he received the Lalande Prize of the French Academy in 1906. In addition to many minor contributions to scientific journals, he was the author of *Logarithmic and Other Mathematical Tables* (1891, 1895); *Mathematical Theories of Planetary Motions* (1892); and *Micrometrical Observations of the Double Stars Discovered at Pulkowa* (1901).

**HUTCHESON, ERNEST** (1871- ). An American pianist, born at Melbourne, Australia. He received his first instruction there from Max Vogrich and was exhibited as a wonder-child at the age of five. After graduating from the Leipzig Conservatory, where he had been a pupil of Reinecke, he studied for some time with Stavenhagen in Weimar. During the next 10 years, he devoted himself mainly to teaching. After a successful tour of Germany and Russia in 1900, he came to the United States, where he taught at the Peabody Conservatory in Baltimore until 1912. His second European tour (1912-14) established his reputation as one of the foremost contemporary pianists. At the conclusion of this tour, he returned to the United States, making his home in New York. In the season of 1924-25, he attracted attention with a remarkable historical cycle of seven recitals, presenting 112 compositions, illustrative of the development of piano music from the sixteenth century to the present day. In 1927 he was appointed dean of the Juillard Foundation of New York. He composed *Symphonic Suite: Piano Concerto: Symphonic Poem* (produced in Berlin); *Two-Piano Concerto* (world premiere, 1926, Philadelphia); *Symphony; Violin Concerto*, and many piano pieces.

**HUTCHESON, GROTE** (1862- ). An American soldier, born in Cincinnati, Ohio. He graduated from the United States Naval Academy in 1884, served in the Spanish-American War and in various commands in the Regular Army, and became colonel of cavalry in 1916. He was made brigadier general in the National Army in 1917. In 1918 he created and organized ports of embarkation at Newport News and Norfolk, Va. He was promoted to be brigadier general in the Regular Army in 1920, was on duty in and around New York City in 1921-23, and at Schofield Barracks, Hawaii, 1923-24, and was made a major general and retired in July, 1924. He was awarded the Distinguished Service Medal for specially meritorious service in the administration of the Port of Embarkation. He saw service, during his career, against the Indians, and in Porto Rico, China, and the Philippines.

**HUTCHINS, ROBERT MAYNARD** (1899- ). An American university president, who was born in Brooklyn, N. Y., and studied at Oberlin and Yale (A.B., 1921; LL.B., 1925). He was master of English and history at Lake Placid (N. Y.) School (1921-23), secretary of Yale University (1923-27), lecturer in the Yale Law School (1925-27), acting dean (1927-28), and professor of law (1927-29). During the World War, he was in the American Ambulance Service, and with the Italian Army. He was decorated with the Croce di Guerra of Italy. In April, 1929, in his thirty-first year, he was appointed president of the University of Chicago.

**HUTCHINSON, A(ETHUR) S(TUART) M(ONTETH)** (1880- ). An English novelist, born in India, the son of a British army officer, and educated on the Isle of Thanet, Kent. He studied medicine at St. Thomas's, but gave it up to become a journalist, rising to be editor of the *Daily Graphic* for four years, before serving in France for four more. *If Winter Comes* (1921) was his first popular success. Other works were *Once Aboard the Lugger*, a humorous book (1908); *The Happy Warrior* (1912); *The Clean Heart* (1914); *This Freedom* (1922); *The Eighth Wonder and Other Stories* (1923); and *One Increasing Purpose* (1925).

**HUTIER, OSKAR E. VON** (1857- ). A German soldier, born near Erfurt. In the German advance in France in 1914, he commanded the Prussian Guards and was one of the most aggressive and skillful of the German leaders in that movement. In 1915 he was given command of the 21st Army Corps and in 1917 commanded Army Group D. Later in the same year, he was assigned as commander of the 8th Army, and, with this, occupied Riga. He was transferred to the 18th Army on the western front and took an important part in the great German advance which began in March, 1918.

**HUXLEY, ALDOUS (LEONARD)** (1894- ). An English author, son of Leonard, and brother of Julian Huxley, who was educated at Eton and Balliol, Oxford. He entered journalism, writing for *The Athenaeum* (1919-20), and *The Westminster Gazette* (1920-21). His published works include poems, essays, and novels. The better known are *Limbo* (1920); *Leda* (1920); *On the Margin* (1923); *Little Mexico and Other Stories* (1924); *Along the Road* (1925); *Jesting Pilate* (1926); *Essays Old and New* (1926); *Proper Studies* (1927); *Point Counter Point* (1928); *Diverse Laws* (1928); also the novels, *Crome Yellow* (1921); *Mortal Coils* (1922); *Antio Hay* (1923); and *Those Barren Leaves* (1925). Possessed of a lively wit and a feeling for the unusual, his characters were vivid, his situations piquant, and his intelligence mordant and unrelenting.

**HUXLEY, JULIAN SORELL** (1887- ). A British biologist and writer, son of Leonard and brother of Aldous Huxley (q.v.). He was educated at Eton and Balliol College, Oxford, was lecturer in zoology at that College (1909-11), and traveled in Germany as research associate of Rice Institute (1911-12). He then spent four years in the United States as assistant professor at Rice Institute, Houston, Texas, did war service in England and as staff lieutenant at G.H.Q. in Italy (1916-18), and in 1919 became a fellow of New College and senior demonstrator in zoology at Oxford University. In 1921 he was a member of the Oxford University Expedition to Spitzbergen and, from 1925 to 1927, was

professor of zoology at King's College, London, becoming honorary lecturer there in the latter year. In 1926 he became president of the National Union of Scientific Workers and Fullerton professor of physiology in the Royal Institution. Besides articles for periodicals, he wrote *The Individual in the Animal Kingdom* (1911); *Essays of a Biologist* (1923); *The Stream of Life* (1926); *Essays in Popular Science* (1926); *Religion without Revelation* (1927); and, with J. B. S. Haldane, *Animal Biology* (1927).

**HUXLEY, LEONARD** (1860- ). An English writer and Greek scholar, eldest son of Thomas Henry Huxley, and father of Julian and Aldous Huxley (q.v.). He was educated at University College School, St. Andrews, and Balliol College, Oxford, and was assistant to the professor of Greek at St. Andrews (1883). After being reader to Smith, Elder & Co., he was editor of the *Cornhill Magazine*, which that company founded. He wrote *Life of Huxley* (1900); *Life of Sir Joseph Hooker* (1918); *Anniversaries and Other Poems* (1920); *Thomas Henry Huxley, a Character Sketch* (1920); *Charles Darwin* (1921); and *Progress and the Unfit* (1926). He translated Hausser's *New Testament Times*, part II, and *Time of the Apostles* (1895); and edited *The Uttermost South* (1913); *Scott's Last Expedition* (1913); and *Jane Welsh Carlyle, Letters to Her Family* (1924).

**HUYSMANS, u's'mân', or h's'mâns, CAMILLE** (1871- ). A Belgian political economist, professor in the New University of Brussels. He was a member of the town council of Brussels (1905-21) and in the following year became a member of the town council of Antwerp. He entered the Chamber of Representatives in 1910, was Minister of Sciences and the Arts from 1925-27, and in the latter year he was Minister of Education. His works include *L'affiliation des syndicats au Parti ouvrier* (1907); *Étude sur les Assurances sociales* (1912); *The Policy of the International* (1916); *Recherches politiques*; *De Menschoordingh*; *Mystère de Michel de Sueren* (1927).

**HYATT, ANNA VAUGHN** (MRS. ARCHER M. Huntington) (1876- ). An American sculptor (see Vol. XI). Her able craftsmanship in the sculpture of animal life, consistently evidenced in such later works as "Great Danes," "Colts in a Snowstorm," and "Reaching Jaguars," gave her a foremost position in this field in the United States. Her achievement in the statue of Joan of Arc, Riverside Drive, New York (1915), notable among such for its truth of detail, its simplicity and dignity, turned her interest somewhat toward equestrian subjects, with noteworthy results. Among her awards were the Rodin Gold Medal, Philadelphia, 1917, and the Saltus Gold Medal, 1920 and 1922. She became a member of the National Academy of Design in 1922, and a chevalier of the Legion of Honor (France), in 1922.

**HYDE, ARTHUR M.** (1877- ). An American Governor and Secretary of Agriculture. He was born at Princeton, Mo., and was graduated at the University of Michigan in 1899 (LL.B., State University of Iowa, 1900). He practiced law at Princeton, Mo., for fifteen years, serving as mayor for one term, and then moved to Trenton in the same State. He was elected Governor of Missouri as a Republican for the term 1921-25. On Mar. 4, 1929, he was appointed Secretary of Agriculture in President Hoover's cabinet.

**HYDE, CHARLES CHENEY** (1873- ). An American lawyer, born in Chicago, and educated at Yale University and the Harvard Law School. In 1898 he began practice in Chicago. He was solicitor for the Department of State at Washington, 1923-25, professor of law at the Northwestern University Law School, 1907-25, and Hamilton Fish professor of international law and diplomacy at Columbia after 1925. His several works on international law included *International Law, Chiefly as Interpreted and Applied by the United States* (1922); "Charles Evans Hughes as Secretary of State" (in vol. 10 of *American Secretaries of State*, 1928).

**HYDROPHONE.** This name has been applied to any instrument for listening to sounds transmitted through water. Before the World War, such instruments were used for receiving signals from submerged bells. The hydrophone as usually fitted consisted of a small water-tight box of which one side was a metal diaphragm operating a microphone enclosed in the box. The box itself was suspended in a tank built against the ship's outer plating which formed one side of it. Early in the War attempts were made to use some form of hydrophone for detecting the presence of vessels (particularly submarines) within sound range of their internal machinery or propellers. For some time, no great success was attained but the effectiveness of listening devices was materially improved. Several fish-shaped hydrophones, 12 feet apart, towed astern and electrically connected for receiving the sound on board the vessel, gave fair results; but the Walzer hydrophone (the invention of a French naval officer), which attained its final form early in 1918, was said to have given greater satisfaction and was much used after March of that year. The receiving diaphragms were arranged at regular intervals over the surface of a hemispherical bulge built into the hull on each side toward the bows. The system acted as a sound lens, the sound focus occurring at a point where the sound paths by alternate routes were equal. From the results received, the direction of the source of sound could be calculated.

Hydrophones have been improved in recent years. The U. S. Navy uses the K-tube fish type (acoustic radius 30 miles) and the SC-tube and MB-tube types (acoustic radius 3 miles) which are built into the hull and insulated against noise. In using the fish type, the en-

gines and auxiliaries must be stopped; the built-in types, on the other hand, may be used without stopping the ship.

**HYLAN, JOHN F.** (1868- ). An American public official, born at Hunter, Greene Co., N. Y. He was educated in the public schools and engaged in various occupations in New York City. He graduated from the New York Law School in 1897 and in the same year was admitted to the bar. From 1906 to 1914, he was city magistrate and in 1914-15, judge of the county court. Mr. Hylan became mayor of New York City in 1918 and was reelected in 1922 for the term ending 1925.

**HYMANS, éman, PAUL** (1865- ). A Belgian diplomat, who was born in Brussels, and educated at the university there. He practiced at the Court of Appeals after 1885. In 1900 he became a Liberal member of Parliament and professor of law at Brussels University, in 1911 a member of the Royal Academy, and in 1914 a Minister of State. He was then Ambassador to London (1915-17), Minister for Foreign Affairs (1918-20), first Belgian plenipotentiary at the Peace Conference (1919), President of the first Assembly of the League of Nations (1920) and of the Council (1922), Minister for Foreign Affairs (1924-25), Minister of Justice (1926-27), and again Minister for Foreign Affairs (1927- ). He signed the Kellogg-Briand Peace Pact on behalf of his Government at Paris, Aug. 27, 1928. He was president of the Commission of Conciliation and Arbitration between Finland and Norway, and between Switzerland and Rumania. He wrote *Histoire parlementaire de la Belgique* (1880-1910), with Alfred Delcroix (3 vols.); *Bruxelles moderne*; and *Frère Orban* (2 vols., 1906-10). In 1927 he was made a Knight Grand Cross of St. Michael and St. George (British).

**HYTHE CONFERENCE.** See **REPARATIONS.**

**HYVERNAT (EUGÈNE XAVIER LOUIS) HENRY** (1858- ). A French Orientalist who studied at Lyons, Paris, and the Pontifical University of Rome. He was professor-interpreter of Oriental languages for propaganda and professor of Assyriology and Egyptology in Rome, 1885-89, and in 1889 went on a scientific mission to Armenia for the French government. He then came to America as professor of Oriental languages and archæology at the Catholic University. He is the author of *Les actes des martyres de l'Égypte* (1886); *Album des paléographie copte*, an introduction for the previous book (1888); *Du Caucase au golfe persique* (1892); *A Check List of Coptic Manuscripts in the Pierpont Morgan Library* (1919); and edited a 57-volume catalogue of the Coptic Manuscripts in the same library.

**I**BAÑEZ, BLASCO. See BLASCO IBAÑEZ, VICENTE.

**IBERT, JACQUES** (1890- ). A French composer, born in Paris. He studied at the Conservatoire in 1911-14, and in 1919 won the Prix de Rome with a lyric scene, *Le Poète et la Fée*. In his orchestral works he is a decided impressionist, while his chamber music shows strong sympathy with the neo-classicists. He has written two symphonic poems, *Noël en Picardie* and *La Balade de la Gêlle de Reading*; an orchestral fantasy, *Persée et Andromède*; three sketches for orchestra, *Escapes*; a symphonic scherzo, *Féerique*; an orchestral suite, *Le Jardinier de Samos*; a concerto for 'cello and wind instruments; a quartet for wood-wind; a violin-sonata and a flute sonata; a ballet, *Les Rencontres* (Paris, 1925); an operatic farce, *Angélique* (Paris, 1927); and pieces for organ, piano, and harp.

**IBN SAUD, ib'n soud** (1882- ). King of the Hedjaz and leader of the Wahabi Mohammedans, who, as Sultan of Nejd, allied himself with Great Britain during the World War, and by 1918 was master of Central Arabia. When Hussein (q.v.), King of the Hedjaz, pronounced himself King of Arabia, Ibn Saud announced that he was unacceptable to Central Arabia, and declared war, soon conquering Mecca (1924). By the close of 1925, his success was assured, and in January, 1926, he was proclaimed King of the Hedjaz at Mecca. His government was recognized by the leading powers interested in Arabia, except Italy and Egypt. Deeply religious, one of his first efforts was to make the pilgrimage to Mecca as easy, safe, and cheap as possible; heretofore, pilgrims had been frequently robbed and attacked. He extended his power over several tribal chiefs, and on May 20, 1927, signed a treaty with Great Britain which recognized the independence of his Government. See ARABIA, under *History*, and *CALIPHATE*.

**IBSEN, ib'sen, SIGURD** (1859- ). A Norwegian statesman and author (see VOL. XI). His later works include *Robert Frank*, a play (1914), and *Tempel der Erinnerung* (1918), both translated into German and the former into English.

**ICE CREAM.** See *DAIRYING*.

**ICELAND.** An island in the North Atlantic, formerly a Danish possession but since 1918 a separate kingdom united to Denmark under a single crown. Its area is estimated at 39,709 square miles. The population rose from 85,183 in 1910 to 94,690 in 1920; in 1927 it was estimated to be 103,317. The population density of 2.5 per square mile is misleading because much of the country is uninhabitable; the practical density is about 11.1 per square mile in populated districts. Of the 1920 population, 54,245 lived in rural districts, and the rest in towns of over 300. Except for 706 persons, the population was entirely native born. Almost one-fifth of the total population lives in the modern capital, Reykjavik; this city in 1926 had 23,244

inhabitants. Besides Reykjavik, there are six other towns with a total population of 11,377. There is no immigration to, and very little emigration from Iceland.

Only one-quarter of one per cent of the land is under cultivation, mainly in hay, potatoes, and turnips. In 1926 the crops were hay, 3,458,000 cwt., potatoes, 66,000; turnips, 23,000. Live stock has shown an increase, with a 1926 figure of 52,800 horses, 27,900 cattle, 590,000 sheep, and 2800 goats. In 1925 the total value of the fisheries, the most important single industry, was 46,791,000 krónur, of which the cod catch alone was valued at 43,378,000 krónur. Three products belonging almost exclusively to Iceland are eider down, taken from the nests of the eider duck; Icelandic moss used by pharmacists; and the double-refracting crystals of Iceland spar used by opticians, the world's sole quarry of this material being situated near Eskifjörður in the southeastern part of Iceland and owned by the Icelandic government.

There is little manufacturing in Iceland, although the country has great potentialities because of its innumerable waterfalls. It has been estimated that from the Thjorsá River alone 1,000,000 horse power could be developed. However, the hot springs which abound in Iceland are beginning to be utilized, and in the last few years cures of rheumatism, gout, and kindred ills have been effected, although the methods and appliances used were of the most primitive kind. A new use for the hot springs has been found in the heating of buildings and of the soil of gardens, making it possible to raise vegetables throughout the year. The first heating installation of this kind on a large scale was made in 1920 in the Alafoss Cloth Mills near Reykjavik. Other possible manufacturing developments are electro-chemical plants for the production of nitrates and aluminium.

In 1926 exports were valued at 53,070,455 krónur and imports at 57,767,346 krónur, Great Britain and Denmark being, as in previous years, Iceland's leading trade factors. Financially, this was, in many respects, a poor year, because the summer was unusually wet and for that reason haymaking and the drying of fish were done under great difficulties. The 1928 budget estimate listed revenues at 10,451,600, and expenditures at 10,453,878, krónur. The largest charges were for communications, 3,225,930 krónur, and for instruction, 1,404,076 krónur. At the beginning of 1927, the public debt was 2,026,588 krónur, held for the most part in Denmark. There are no railways in Iceland, but there are 379 miles of carriage roads in excellent repair. In 1927, 81 vessels of 23,788 gross tonnage were flying the Icelandic flag.

**History.** By the Act of Union of Nov. 30, 1918, Iceland was granted home rule under the Danish Crown. Complete sovereignty was vested in the home government; foreign affairs alone were to be the charge of the Danish government until 1940. Iceland's perpetual neutrality was

established, and no armed force or fortifications were permitted her. Danish goods in Iceland and Icelandic goods in Denmark were to receive no more consideration than the products of other countries. By the new constitution promulgated in 1920, the executive rests in the King through a responsible ministry of three, the chief of whom is the president of the council. The ministry consists of the Prime Minister and Minister of Finance, Minister of Industries and Commerce, and Minister of Justice and Ecclesiastics. The legislative power resides in a bicameral House (Althing). The Lower Chamber of 28 members is elected; the Upper of 10 members is chosen, six by proportional representation at large and eight by the Lower House. All bills must be sent to Denmark for the King's approval. For administrative purposes, the country is divided into seven urban municipalities and 16 provinces or prefectures, which are, in turn, subdivided into 226 parishes with a certain amount of autonomy. The franchise is enjoyed by all Icelandic citizens (men and women) of good reputation (unless they are indebted for poor relief) who are over 25 years of age and have resided in the country during the previous five years. At the head of the local judicial system is the Supreme Court stationed at Reykjavik; this is the court of last appeal. The 100th anniversary of the establishment of the Althing was to be impressively celebrated in 1930.

Consult Knut Gjerset's *History of Iceland* (London and New York, 1924); W. A. Craigie's *Easy Readings in Old Iceland* (Edinburgh 1924); and Snaehjörn Jónsson's *Primer of Modern Icelandic* (Oxford, 1927).

**ICELANDIC LITERATURE.** See SCANDINAVIAN LITERATURE.

**IDAHO.** The twelfth State in size (83,888 square miles) and the forty-second in population; capital, Boise. The population increased from 325,594 in 1910 to 431,866 in 1920, a gain of 32.6 per cent; estimated population, 1928, 546,000. The white population rose from 319,221 (1910) to 425,668 (1920); Japanese, from 1363 to 1509; and native white, from 278,794 to 386,705. The number of foreign-born whites decreased from 40,427 to 38,963; of Indians, from 3488 to 3098; of Chinese, from 858 to 585. The urban population mounted from 68,898 to 119,087; the rural, from 255,696 to 312,829. The chief cities are Boise and Pocatello. The former grew from 17,358 to 21,393; and the latter from 9110 to 15,001.

**Agriculture.** The number of farms decreased 3.6 per cent, or from 42,106 in 1920 to 40,592 in 1925; while the acreage in farms fell from 8,375,873 to 8,116,147, and the improved land in farms from 4,511,680 to 3,714,336 acres. The total value of farm property showed a decrease, from \$716,137,910 in 1920 to \$451,884,713 in 1925; and the average value of farms from \$17,008, to \$11,132. In interpreting these values, the inflation of the currency in years immediately previous is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1920 was 15.7; in 1925, 15.2. Farms reported as under mortgage numbered 20,060 in 1920; 30,195 in 1925; the change was due to the agricultural depression following the War. Of the farms in 1920, 34,647 were operated by owners, as compared with 30,195 in 1925; 758, by man-

agers, as compared with 511; and 6701, by tenants, as compared with 9886. The area under irrigation had increased from 1,430,848 acres in 1909 to 2,488,806 in 1919. The total number of cattle on farms in 1920 was 714,903; in 1925, 605,604; sheep numbered 2,356,270 in 1920; 1,745,769 in 1925; dairy cows numbered 138,768 in 1925. The estimated production of the chief farm crops of 1928 was: Corn, 2,438,000 bushels; wheat, 28,792,000; oats, 6,439,000; barley, 6,192,000; potatoes, 19,720,000; hay, 2,766,000 tons; and sugar beets, 285,000 tons. Comparative figures for 1913 are corn, 448,000 bushels; wheat, 14,094,000; oats, 15,112,000; barley, 7,560,000; potatoes, 5,780,000; and hay, 2,044,000 tons. Apple trees of bearing age numbered 1,005,668 in 1910 and 2,380,523 in 1920. In 1919, 3,645,640 bushels of apples were grown; in 1925, 5,000,000.

**Mining.** Idaho is one of the important mineral-producing States, especially for its metal mining. The products in the order of their value are lead, silver, zinc, and stone. In addition, there are produced copper, sand and gravel, and a considerable amount of gold. The condition of the mining industry in the decade 1914-24 is shown by the following comparison of production for several years: 1914, lead, 348,526,069 pounds, valued at \$13,592,517; silver, 12,479,516 ounces, \$8,901,172; gold, \$1,152,315; zinc, 42,012,435 pounds; 1917, lead, 393,559,521 pounds; silver, 12,029,338 fine ounces; gold, \$804,800; zinc, 79,854,136 pounds; 1920, lead, 249,609,976 pounds; silver, 7,326,794 fine ounces; gold, \$485,590; zinc, 27,932,326 pounds; 1928, lead, 290,645,905 pounds; silver, 8,998,330 ounces; gold, \$410,000; zinc, 62,526,648 pounds. A considerable amount of copper is produced; the output in 1928 was 2,072,105 pounds, compared with 2,538,396 pounds in 1920 and 6,445,187 pounds in 1914. The State ranked third in 1926, in respect of the amount of lead that was produced yearly. In addition to those minerals which have been mentioned, there have been produced antimony, bismuth, tungsten, cobalt, nickel, molybdenum, mica, asbestos, and coal. The total value of the mineral products in 1928 was \$31,752,821; in 1925, \$31,611,166; in 1921, \$16,502,273; \$32,440,783; in 1920; \$10,445,567 in 1919; \$36,872,270 in 1918; and \$24,913,223 in 1914.

**Manufactures.** Idaho is not an important manufacturing State, although its industries have increased considerably in number and in value of products. There are only two cities having a population of more than 10,000, Boise and Pocatello. These cities, with 8.4 per cent of the total population of the State, in 1919 reported 11.4 per cent of the total value of products. The number of establishments in the State in 1909 was 725; 1919, 922; 1925, 487; and 1927, 470; manufacturing wage earners numbered 13,917 in 1919; 15,782 in 1925; and 13,513 in 1927. The value of products rose from \$22,399,960 in 1909 to \$80,510,749 in 1919; and to \$96,641,797 in 1925; but fell to \$86,256,399 in 1927. This increase was partly due to the change in the industrial conditions brought about by the War. The increase in the number of persons engaged in manufactories and in the number of manufacturing establishments, however, indicates a large increase in the industrial activities of the State. The chief products in point of value are those from the manufacture of lumber and timber, which in 1909 were valued at \$10,689,000; 1919, \$30,643,000; 1925, \$40,304,157, and

in 1927, \$31,660,296. Flour-mill and gristmill products rank high, amounting to \$2,480,000 in 1909; \$3,396,000 in 1914; and \$13,501,000 in 1919; and \$6,001,897 in 1927. Dairy products totaled \$10,974,381 for 1925, and \$11,543,060 for 1927.

**Education.** Idaho has always been in the forefront of the States in educational progress. In 1912 a constitutional amendment was adopted which established the so-called Idaho System. This, in brief, provided for unity in the educational system; it established a State Board of Education which has charge of both the higher institutions and the public schools. The school code of 1913 provided that the State Board of Education should consist of five members appointed by the governor. This board was made also the board of regents of the universities; board of trustees for the normal schools, the Technical Institute, the School for the Deaf and Blind, and the Industrial Training School and had general charge of the entire public-school system. It has since been made also the State Board for Vocational Education. This system had admirable results from the year in which it was inaugurated, and in subsequent years still further advances were made. One of the most important of these was in 1917, when it was provided that thereafter candidates for the teaching profession must have completed courses in one of the high schools of the State, or have equivalent education, and must have had at least some professional training before being certified to teach. The Legislature of 1923 passed several important measures affecting education, among them one abolishing county institutes and several amending the tax laws relating to education. One of the most notable features of education was the growth of the Technical Institutes. Under the coöperative agreement with the United States, vocational education was carried on with great efficiency after 1917; and work on the rehabilitation of persons injured in industry was also begun. The enrollment in the public schools increased from 92,437 in 1914 to 117,656 in 1925-26. In the high schools, there were enrolled in the latter year 21,825 pupils. The expenditure for education in public day schools in 1925-26 was: current, \$8,376,301; outlays, \$646,206. The percentage of illiteracy in the State decreased from 2.2 in 1910 to 1.5 in 1920. In the native white population, it remained at 0.3 per cent; and in the foreign-born white population it decreased from 6.9 to 6.5 per cent. Illiteracy among the Negro population decreased from 6.4 per cent to 5.4.

**Finance.** State expenditures in the year ended Sept. 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$5,135,756 (of which \$629,704 was aid to local education); for interest on debt, \$333,231; for permanent improvements, \$3,163,260; total, \$8,632,247 (of which \$3,497,600 was for highways, \$846,705 being for maintenance and \$2,650,895 for construction). Revenues were \$8,160,495. Of this, property and special taxes furnished 28.9 per cent; departmental earnings and charges for officials' services, 5.6 per cent; sales of licenses and the tax on gasoline, 24.5 per cent. Property valuation was \$482,690,646; State taxation thereon, \$2,980,138. Net State funded debt on Sept. 30, 1927, was \$4,783,106, chiefly highway debt.

**Political and Other Events.** During recent years, political control in the State has fluctuated between the Republican and Democratic parties. For the greater part of the time, the former party was in control. In 1914 J. H. Brady, Democrat, was elected to the Senate, while Moses Alexander, also a Democrat, was elected governor. The Democrats were successful also in 1916, when they elected their State ticket by a plurality of 572 votes. The Republicans, however, elected two representatives to Congress. In the presidential election of 1916, Wilson received 70,021 votes; Hughes, 56,368. A new irrigation project was begun during that year to develop the territory known as the Bruneau country, about 400,000 acres in extent, and an electric railroad through this territory was begun. Several anti-alien bills were introduced in the Legislature of 1917, but at the request of the Secretary of State, followed by the protest of the Japanese Ambassador to Secretary Lansing, they were not passed. These bills would have prevented any Japanese from owning land. In the election of 1918, Senator Borah was reelected and John F. Nugent, Democrat, was elected to the Senate, to complete the term of J. H. Brady, deceased.

As a result of legislation in 1919, the State administration was reorganized. For 46 boards and commissions was substituted a commission or cabinet of nine officials representing the departments of agriculture, commerce and industry, finance, immigration, labor and statistics, law enforcement, public investment, public works, public welfare, and reclamation. In 1920 the Republicans elected D. W. Davis, governor and Frank R. Gooding, United States Senator. At this election, several constitutional amendments were adopted, one increasing the membership of the Supreme Court from three to five. In 1922 C. C. Moore, Republican, was elected governor. The question of the direct primary, the chief issue in this election, occupied the attention of the Legislature in 1923. The primary law, so far as it related to State officers, had been repealed by the previous Legislature, which had a Nonpartisan-Democratic majority, and the governor had been elected on a platform which endorsed the repeal. A new primary law was passed; but it was vetoed by the governor. The vote of the State in 1928 favored constitutional amendments to extend terms of elective State officers to four years and to give the State authority to limit the use of streams for water power. H. C. Baldridge, elected governor in 1926, was reelected in 1928. The vote for president in 1928 was: Hoover (Republican), 97,322; Smith (Democrat), 52,926.

**Legislation.** The Legislature in 1915 passed an anti-alien land ownership bill similar in its provisions to the California measures prohibiting the ownership of land in the State by alien persons, firms, or associations. A State-wide prohibition bill, effective in 1915, also was passed. A workmen's-compensation measure was vetoed by the governor. The same Legislature provided for absentee voting. In 1921 measures were passed authorizing the school districts to provide for the education of adult residents who were unable to read and write; creating a bureau of budget and taxation; providing for coöperative marketing; and establishing a teachers' retirement fund. The Legislature of 1923 created a small-claims court and provided that where a person had been three times convicted of a felony,

whether within or without the State, he might be sentenced to prison for not less than five years. A measure was passed extending the absent-voter privilege to persons who, because of physical disability, expect to be confined to their homes on election day. Another measure reserved the mineral rights of State lands to the State, and provided for their lease on a royalty basis. An act to establish primaries for county and legislative nominations was passed in 1927.

**IDAHO, UNIVERSITY OF.** A State institution for the higher education of men and women at Moscow, Idaho, founded in 1889. In the period from 1914 through the autumn of 1928, the enrollment at Moscow increased from 747 to 2109, with an additional registration of 309 in the summer session of the latter year. At the Southern Branch of the University at Pocatello, the 1928 autumn enrollment was 531, the summer-session enrollment, 111. The faculty increased from 80 to 153. In the period under review, the library was increased from 32,000 to 90,000 volumes; productive funds in 1928 amounted to \$2,016,460; and income to approximately \$1,250,000. The School of Mines and the School of Forestry were established in 1917; the School of Education in 1920, and the School of Business Administration, and the Graduate School in 1925. Lindley Hall, a men's dormitory was erected in 1920-22, Mary E. Forney Hall, a dormitory for women, was opened in 1923; accommodations of the College of Engineering were augmented in the same year by the purchase of the plant and equipment of a Moscow industrial concern, including several shop buildings; the Science Hall was completed in 1925 at a cost of \$400,000; a \$300,000 armory-gymnasium, in memory of Idaho's service men and women in the World War and other wars, was added in 1927-28 through the joint efforts of the University alumni and the Idaho department of the American Legion; a science hall was built on the campus of the Southern University, and other building improvements effected. The Southern Branch, which was established by act of the legislature and opened its first academic year in 1927, had formerly been the Idaho Technical Institute, which in turn had replaced the Academy of Idaho in 1915. A forestry experiment station was established at the University at Moscow in 1928. President, Frederick James Kelly, Ph.D.

**IDDINGS, EDWARD JOHN** (1879- ). An American educator and animal husbandman, born at Peru, Ind., and educated at Butler College in Indianapolis and Colorado Agricultural College. He was a member of the faculty of the latter until 1910, when he joined the faculty of the University of Idaho. In 1910-11 he was principal of the School of Practical Agriculture and assistant in animal husbandry, and in 1911 he became professor of animal husbandry. Since 1918 he has been dean of agriculture and director of the Agricultural Experiment Station and since 1924 director of extension service. He is the author of numerous bulletins and articles relating to live stock.

**IDO.** See INTERNATIONAL LANGUAGE.

**ILLEGITIMACY.** See CHILD WELFARE.

**ILLINOIS.** The twenty-third State in size (56,665 square miles) and the third in population; capital, Springfield. The population increased from 5,638,591 in 1910 to 6,485,280 in 1920, a gain of 15 per cent; estimated population 1928, 7,390,000. The white population rose from 5,526,962 (1910) to 6,229,333 (1920); Negro,

from 109,049 to 182,274; native white, from 4,324,402 to 5,092,382; foreign-born, from 1,202,560 to 1,206,951. The urban population mounted from 3,476,926 to 4,403,153; the rural decreased from 2,161,662 to 2,082,127. The growth of the principal cities was as follows: Chicago (q.v.), 2,185,203 to 2,701,705; Peoria, 66,950 to 76,121; East St. Louis, 58,547 to 66,767; Rockford, 45,401 to 65,651.

**Agriculture.** Illinois is one of the most important of the agricultural States and conditions after the World War, therefore, were affected by the general agricultural situation in regard to wheat and other products. (See AGRICULTURE, CORN, and WHEAT.) The number of farms decreased 4.8 per cent, or from 237,181 in 1920 to 225,601 in 1925; the acreage in farms decreased from 31,974,775 to 30,730,497. The improved land embraced 27,294,533 acres in 1920; crop land totaled 21,314,837 acres in 1925. The total value of farm property rose from \$3,905,321 in 1910 to \$6,666,767,235 in 1920, but fell to \$4,627,964,933 in 1925. The average value per farm was (1910) \$15,505, (1920) \$28,108, and (1925) \$20,514. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. The percentage of land in farms decreased from 90.7 in 1910 to 89.1 in 1920 and 85.7 in 1925. Of the total number of farms in 1925, 129,074 were operated by owners; 1877, by managers; and 94,650, by tenants; while the comparative figures for 1910 were 145,107; 2386; and 104,379. The white farmers in 1920 numbered 236,288, compared with 250,447 in 1910; foreign-born farmers, 22,111 and 33,394; colored farmers, 893 and 1425. In 1920, 51,030 farms were reported as under mortgage; in 1925, 45,814. The number of dairy cows in 1920 was 1,148,173; in 1925, 833,097; "beef" cows numbered 501,034 in 1920, 403,897 in 1925; mules, 168,274 in 1920, 167,760 in 1925; hogs, 4,639,182 in 1920, 4,249,101 in 1925; and sheep, 637,685 in 1920, 566,079 in 1925. The estimated production of the principal farm crops in 1928 was: Corn, 367,488,000 bushels; wheat, 24,200,000; oats, 174,338,000; barley, 20,060,000; potatoes, 7,700,000; and hay, 4,091,000 tons. Comparative figures for 1913 are corn, 282,150,000 bushels; wheat, 41,888,000; oats, 104,125,000; barley, 1,404,000; potatoes, 5,750,000; and hay, 2,450,000 tons.

**Mining.** Illinois, although it produces practically no metals, is one of the most important of the mineral-producing States. It ranked seventh in the value of its mineral products in 1926. These, in the order of their value, are coal, clay products, petroleum, and cement. The movement of mineral production in the period starting with 1914 is indicated by the figures given below. The production of coal in 1914 was 57,589,197 short tons, valued at \$64,693,529; 1917, 86,199,387 and \$162,281,822; 1918, 89,291,105, and \$206,860,291; 1919, 60,862,608 and \$140,075,969; 1920, 88,724,893 and \$273,509,000; 1921, 69,602,763 and \$190,986,000; 1922, 58,467,736 and \$168,925,000; 1926, 69,366,923 and \$148,604,000; 1927, 46,848,224 and \$101,356,000. The declines of 1921-22 and of 1927 were largely the result of protracted strikes in the Middle West coal fields. Production of petroleum decreased with comparative steadiness after 1914. In 1914 there were produced 21,919,749 barrels, valued at \$25,426,179; in 1916, 17,714,235, at \$29,237,168; 1918, 13,365,974, at \$31,230,000; 1922, 9,383,000, at \$19,291,000; 1927, 7,024,000

barrels at \$11,800,000 (estimated). The value of clay products on the whole increased; in 1914 they amounted to \$13,318,953; 1918, \$12,459,777; 1920, \$26,138,419, and 1926, \$37,030,004. The production of cement, exclusive of natural cement, increased gradually, ranging from 5,401,605 barrels in 1914 to 7,017,047 in 1927. It was 5,538,558 in 1920, and 5,587,825 in 1921. The value of the product, however, greatly increased, owing chiefly to the decreased purchasing power of money and the consequent higher prices. The value of shipments in 1914 was \$4,848,522, while in 1921, for practically the same production, the value was \$9,992,982. The 1927 cement shipments totaled \$11,312,783. The State produces large quantities of coke, sand and gravel, and stone, and smaller quantities of asphalt, mineral waters, and natural gas. The total value of the mineral products in 1927 was \$180,288,060, compared with \$237,241,600 in 1926; \$373,926,540 in 1920; \$213,701,212 in 1919; \$271,244,365 in 1918, and \$117,166,370 in 1914.

**Manufactures.** Illinois is one of the most important manufacturing States. It has 44 cities with populations of more than 10,000, which form 58.7 per cent of the total population. Of the total value of the manufactured products in 1919, these cities reported 84.3 per cent. In 1909 there were in the State 18,026 manufacturing establishments; in 1919, 18,593; in 1925, 14,104, and in 1927, 14,711; while wage earners engaged in manufactories numbered 506,943 in 1914, 653,114 in 1919, 622,127 in 1925, and 623,468 in 1927. The capital invested amounted to \$1,548,170,701 in 1909 and \$3,366,452,696 in 1919. The value of the products in 1909 was \$1,919,276,594; in 1919, \$5,425,244,694; in 1925, \$5,317,635,887; and in 1927, \$5,386,003,235; the increase up to 1919 was due largely to changes in industrial conditions brought about by the War and cannot be properly used to measure the normal growth of manufactures, but the increase shown in the number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. The most important industry in point of value of products is that connected with slaughtering and meat packing, the value of its product in 1909 was \$389,595,000; in 1919, \$1,294,167,000; in 1925, \$680,591,940; in 1927, \$663,054.31. Foundry and machine-shop products amounted in 1909 to \$138,579,000; 1914, \$141,329,000, and 1919, \$421,969,000. The manufacture of men's clothing in 1909 amounted to \$89,473,000; in 1914, \$89,144,000; in 1919, \$201,816,000; and in 1927 to \$130,482,815. Industries related to the manufacture of iron and steel products attained a yearly output of \$86,608,000 in 1909; \$173,345,000 in 1919; \$295,342,113 in 1925. In 1927 the output of blast furnaces was valued at \$70,943,000 and of steel works and rolling mills at \$208,563,956.

The chief manufacturing cities are Chicago, Peoria, East St. Louis, and Rockford. In Chicago in 1909, there were 9656 manufacturing establishments with a product valued at \$1,281,171,000; in 1919, 10,537, with \$3,657,242,000; in 1925, 9112, with \$3,439,163,000; in 1927, 9955 manufacturing establishments reported products valued at \$3,478,753,623. In 1909 Rockford had 205 manufacturing establishments with products valued at \$22,226,000; in 1914, 265, with \$26,371,000; and in 1919, 312, with \$74,919,000. In Peoria in 1909, there were 283 establishments, with products valued at \$63,061,000; in 1914, 283, with \$64,689,000; and in 1919, 253, with

\$57,075,000. Similar figures for East St. Louis were: in 1909, 138 establishments with products valued at \$18,104,000; in 1919, 157, with \$77,293,000.

**Education.** Illinois has always been one of the most aggressive States in the development of educational systems, and its progress has continued during recent years. Prior to 1924 an active campaign was carried on by the State Teachers' Association to secure an annual distribution of \$20,000,000 from the State and the various counties for educational purposes. This movement had a great effect in turning the attention of taxpayers and lawmakers to the principles underlying the educational State distributive fund. The Legislatures from time to time enacted several important laws, including measures providing for humane education; physical education; the teaching of all elementary subjects in the English language only; and, in 1921, a measure for making the teaching of representative government in the public schools and other educational institutions in the State compulsory. In 1923 a State continuation-school law became effective, requiring that continuation classes be organized in districts having as many as 20 boys and girls between the ages of 14 and 18 out of school, unless such individuals have completed a four-year high-school course. Vocational education was carried on successfully during this period and included, under vocational home economics, courses in home-making, nursing, and dietetics. The Legislature of 1921 created a State Educational Commission to investigate the entire educational system of the State with a view to the standardizing, unification, and correlation of its various efforts, policies, and agencies, and for other purposes. A teachers'-pension law was enacted by the Legislature of 1915. In 1923, 325 school districts had been consolidated, in the elementary schools of which 7332 were enrolled, and in the high schools, 1337. Vocational courses, including courses in agriculture, industrial education, and home economics, were being conducted in 199 cities in 1923; and \$435,327 was disbursed from Federal and State funds for their support. The enrollment in the public schools increased from 1,007,894 in 1911 to 1,331,329 in 1925-26; in the elementary schools, from 941,549 to 1,095,618; in the high schools, from 66,355 to 235,711. The total expenditure for education in the public day schools of the State in 1925-26 was: for current expenses, \$106,382,345; outlays, \$31,968,339. The percentage of illiteracy in the State decreased from 4.7 per cent in 1910 to 4.3 per cent in 1920; among the native white population from 2.2 to 1.4 per cent; among the Negro population, from 12.4 to 7.9 per cent. Among the foreign-born white population, it increased from 10.3 to 11.7 per cent.

**Finance.** State expenditures in the year ending June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of departments, \$44,037,302 (of which \$8,485,637 was for local education); for conducting public-service enterprises, \$39,022; for interest on debt, \$5,944,465; for permanent improvements, \$20,768,850; total, \$70,789,639 (of which \$19,275,200 was for highways, \$2,556,918 being for maintenance and \$16,718,282 for construction). Revenues were \$79,483,126; of this, property and special taxes formed 51.2 per cent; departmental earnings, 3.8 per cent; receipts from licenses, 38.4 per cent. Assessed property

valuation was \$4,195,581,136; State taxation thereon, \$27,271,277. Net State debt on June 30, 1927, was \$140,158,985.

**Political and Other Events.** In the elections in 1914, women participated under a law of 1913, voting for all but constitutional officers. Lawrence Y. Sherman was reelected to the Senate. The Republicans also elected 16 members of the House of Representatives, including Joseph G. Cannon. In 1915 Carter H. Harrison, five times elected mayor of Chicago, was defeated for the Democratic nomination by Robert M. Schweitzer, who in turn was defeated by William Hale Thompson, Republican. Frank O. Lowden in 1916 was nominated by the Republicans for governor and was elected. In the election for President, Charles E. Hughes received 1,152,316 votes; President Wilson, 950,081. In 1916 a serious race riot in East St. Louis occurred on June 8 between Negroes and white men; it lasted for three days. The killed numbered 29 persons, of whom 25 were Negroes; over 300 houses were burned. The riot began when a Negro attacked an automobile which contained several policemen. A grand jury declared in its findings that the police had been grossly negligent and could have prevented the riot. In the elections of 1918, Medill McCormick was elected United States Senator, defeating Senator James Hamilton Lewis, Democrat. In 1920 Len Small, Republican, was elected governor, and William B. McKinley, also Republican, United States Senator. In the voting for President, Warren G. Harding received 1,420,480 votes; J. M. Cox, 543,395. In 1920 a constitutional convention was called. The new constitution proposed by the convention was rejected by popular vote, Dec. 12, 1922. On July 20, 1921, Governor Small and Lieut. Gov. Fred E. Sterling were indicted for conspiracy to defraud the State and for embezzlement of public money during their respective terms as State Treasurer. These indictments were based on charges that the accused officials had retained for their own use large sums paid them as interest on State funds. Governor Small was acquitted on June 24, 1922, but was later held accountable for the retained interest, in civil actions. During 1922, the State suffered from coal-mining strikes which were accompanied in several cases by riots. In Herrin, a mob of striking coal miners killed 50 nonunion miners, after they had surrendered their arms, under the most brutal conditions. In 1923 William E. Dever, Democrat, was elected Mayor of Chicago, succeeding William Hale Thompson. Fred Lundin, the political boss of the city during the Thompson administration, was tried for fraud in 1923 and acquitted. Len Small was renominated for governor by the Republicans in 1924 and elected. The vote for President was: Coolidge, 1,453,321, Davis, 576,975; LaFollette, 432,027. Serious trouble arose early in 1924 in Williamson County, the scene of the Herrin murders of 1922, over attempts to destroy illicit stills and to suppress related forms of lawlessness. Conflicts took place between the police, alleged members of the Ku Klux Klan, and other citizens.

A number of States brought action in 1926 to restrain the Chicago Sanitary District from drawing water in excess of its permitted allowance through the Chicago Drainage Canal. The U. S. Supreme Court ruled in 1928 that the withdrawal of water was excessive, but allowed time for the construction of sewage disposal works.

Frank L. Smith, Republican candidate, was elected Senator in 1926, but owing to alleged excessive expenditures on behalf of his campaign, the U. S. Senate refused to admit him in 1927. William Hale Thompson was elected Mayor of Chicago Apr. 5, 1927, by the Republican vote, and his administration proceeded to oust the city school superintendent, William McAndrew, a step that was widely condemned. In April, 1928, a Republican element opposed to Mayor Thompson and Governor Small gained the nominations and in November were elected: U. S. Senator, Otis F. Glenn; Governor, Louis L. Emmerson, and other State officials, all Republican. The Chicago Crime Commission promoted action against alleged corrupt alliances of officials and commercialized criminality in that city. The vote of the State for President in 1928 was: Hoover (Republican), 1,768,141; Smith (Democratic), 1,313,817.

**Legislation.** In 1917 the Legislature adopted a State civil administrative code by which branches of the government were readjusted. The Legislature also enacted a "blue sky" law. The Legislature in 1919 ratified the Federal suffrage amendment; passed a "search and seizure" bill for the enforcement of the Prohibition law; entered on a road-building project involving the expenditure of more than \$87,000,000, abolished the State Board of Equalization, substituting the State Tax Commission of three members to be appointed by the Governor. In 1921 the Legislature passed measures providing for equality in voting between men and women. An act also was passed providing for compensation to veterans of the War, to be paid out of a bond issue of \$55,000,000. The act was duly approved by popular vote. The Legislature in 1923 passed a bill to facilitate cooperative marketing of agricultural products and made provision for creating associations for this purpose. Capital punishment by the electric chair was adopted in 1927.

**ILLINOIS, UNIVERSITY OF.** A State institution for the higher education of men and women at Urbana-Champaign, Ill., founded in 1867. The enrollment increased from 5500 in 1914 to 12,150 in the autumn of 1928, with an additional enrollment of 2270 in the summer session of the latter year. The faculty increased from 704 in 1914, to 743 above the rank of assistant, 418 of the rank of assistant or lower, and 26 administrative officers; the library was increased from 310,000 volumes to 762,187 volumes and 160,560 pamphlets in 1928; and the income of the institution from \$2,775,000 to \$7,730,842, of which \$5,722,113 was from the State. Among additions to the physical plant during the period under review were a genetics building and the vivarium erected in 1916, a women's residence hall in 1917, an educational building in 1917, the Smith Memorial Music Building in 1919, and the medical research laboratory and library at Chicago. The horticultural and agricultural buildings and stadium were begun in 1922; buildings under construction in 1924 included a new commerce building, a new library building, and a gymnasium; a hospital was completed in 1925 and construction was begun on an architectural building, and additions to the library, gymnasium, and armory; in 1927 additions were made to Lincoln Hall and the Library; and in 1928 a building for architecture and kindred arts was constructed, and a laboratory of applied mechanics and an addition to Lincoln Hall were under construction. David Kinley, Ph.D., LL.D., suc-

ceeded Edmund J. James, Ph.D., LL.D., in 1919, as president.

**ILLINOIS CANAL.** See CANALS.

**ILLINOIS COLLEGE.** The oldest collegiate institution in Illinois, founded in 1829 at Jacksonville, Ill. The student enrollment increased from 131 in 1914 to 519 in 1928-29; the faculty numbered 24 members in the autumn of 1928; and the library contained 22,000 volumes. The invested endowment in May, 1928, amounted to \$1,174,012, and the income for 1927-28 to \$131,380, exclusive of boarding departments. The science building was partly burned in 1920 and was reconstructed at a cost of \$50,000; departments of psychology, economics, education, and business administration were established between 1914 and 1924; the Department of Music was merged with a similar department of Illinois Woman's College of the city of Jacksonville in 1927-28; and a new library, to cost about \$200,000, was under construction in 1928, to be dedicated at the celebration of the centenary of the founding of the college in 1929. President, Charles Henry Rammelkamp, Ph.B. Ph.D.

**ILLINOIS WOMAN'S COLLEGE.** An institution for women founded in 1846 at Jacksonville, Ill. The number of students registered in the regular college courses increased from 185 in 1914 to 341 in the autumn of 1928, special students numbered 11, and others in music and junior courses not already counted brought the total enrollment up to 694. The faculty in the autumn of 1928 numbered 42. The number of volumes in the library increased from 3000 to 15,506 volumes and the productive funds exceeded \$600,000. New courses were added during the year 1928 in nurses' training, kindergarten training and German, a science hall was completed at a cost of \$251,000, and an athletic field was under construction. President, Clarence Paul McClelland, S.T.D., D.D.

**ILLITERACY.** See EDUCATION IN THE UNITED STATES.

**ILLUMINATION.** See ELECTRIC LIGHTING.

**IMELMANN, RUDOLF H. R. (1879- )**. A German writer and specialist on the English language and literature, born in Berlin, and educated at the universities of Jena, Bonn, Berlin, and Freiburg. He became professor of English literature at Rostock. His principal works

are *Das Altenglische Menologium* (1902); *Layamon* (1906); *Der Deutsche Krieg und die Englische Literatur* (1915); *Forschungen zur Altenglischen Poesie* (1920); a history of English literature; and translations of Byron and Browning.

**IMMIGRATION.** The widespread agitation for the restriction and control of immigration, which was increasingly successful from 1914 to 1929, seemed to indicate the abandonment, at least temporarily, of the time-honored theory that the United States should be a refuge for those persecuted and in distress; the stand was definitely taken in this period that immigration should be regulated primarily in accordance with the need and best interests of the country itself. The growth in this sentiment for restriction was based not so much, perhaps, on actual increase in the number of alien immigrants (although fear of flooding after the War had much to do with bringing the issue to a head) as on the changed character of the immigration. It was the rapidly increasing proportion from southern and eastern Europe, a class regarded as less easy to assimilate, which gave rise to fears in some quarters that the problem of assimilation, already serious, would grow quickly out of hand unless restrictive measures were taken. Some groups saw in a flood of this divergent type a danger to the fundamental character of the population and a menace to cherished institutions. Labor fought against the overcrowding of the market with workmen whose standards of living and inaccessibility for organization had a tendency to lower wages and living standards. The steady growth of this sentiment against so-called unassimilable elements in immigration, and the success of the attempt to check their influx, made the period important in the development of a definite immigration policy. See ANTHROPOLOGY; ETHNOGRAPHY; RACE PROBLEMS.

The tendency in immigration before the War was generally to increase numerically. For 1905-14 the average was 1,012,194 aliens entering in one year. With the War, there came a sharp decline in numbers and the annual average for 1915-18 dropped to 257,887; but in 1921, the number of alien immigrants admitted was again over 800,000. In 1928-29 279,678 immigrants

NET INCREASE OF POPULATION BY ARRIVAL AND DEPARTURE OF ALIENS, FISCAL YEARS ENDING JUNE 30, 1908 TO 1928

	Immigrant	Admitted Nonimmigrant	Total	Emigrant	Departed Nonimmigrant	Total	Increase
1908	782,870	141,825	924,695	395,078	319,755	714,828	209,867

arrived, the smallest number since 1919. The table giving the net increase of population by arrival and departure of aliens, 1908-29, shows an equally sharp curve.

The number of alien immigrants admitted in the decade ending in 1910 was 8,795,386, or 116 per 1000 of the initial population. For the decade ending in 1920, the number was 5,735,811, or 62 per 1000. While in 1910, out of a total population of 91,972,266, the foreign-born numbered 13,345,545, or 14.5 per cent, in 1920, out of 105,710,620, they numbered 13,712,754, or 13 per cent, practically the same proportion as in 1880 (13.2). (See POPULATION.) The lessening of the proportion of foreign-born during the decade was no doubt due in large part not only to the falling off in immigration during the War but also to the unusually high rate of emigration among aliens. In 1916, 129,765 aliens left the United States; in 1917-21, the average annual emigration amounted to 164,083; in the two years following the War, the outward movement to Europe, largely to the southern and eastern sections, practically offset the immigration from that continent. In the latter part of 1920, however, the tide began to turn, and by 1921 the annual increase in population because of immigration was well on its way to the peak figure.

It was the marked change in the character of the immigration, however, which seemed the main cause of uneasiness. In 1882, 85 per cent of the European immigrants came from the northern and western parts; by 1907, 85 per cent was coming from the eastern and southern parts. For a considerable number of years before 1914, the normal annual number of alien immigrants from northern and western Europe had been 185,000, as compared with 750,000 from the eastern and southern Europe. Although immigration from Austria, Hungary, Germany, and Russia fell off to practically nothing in the years immediately after 1917, and although about this time there was a striking increase in immigration from Mexico and Canada, in 1920-21, 66.7 per cent of the total number of immigrants admitted were of races and peoples peculiar to southern and eastern Europe and Asiatic Turkey. With the turn of the tide in the latter part of 1920, and the prospect of increasing numbers from southern and eastern Europe, the feeling against this type of immigrant grew stronger. Because of racial differences, they were not easy to assimilate; they showed a greater tendency than the northwestern Europeans to crowd in urban centres and thus oversupply the labor market; they brought with them more often the danger of racialism.

The growing movement to control immigration, which up to 1910 had developed only so far as to exclude the morally and physically undesirable and the contract laborer, to bar Chinese, and practically to bar Japanese by virtue of the "Gentleman's Agreement," at first contented itself with efforts to set a literacy test. The struggle for this restrictive measure dated back to 1897, when Cleveland vetoed the proposal; it had become prominent again in 1906. Taft vetoed such a bill in 1912, Wilson in 1915. In 1917 Wilson vetoed the proposal for the second time, on the ground that it punished the immigrant for what was no fault of his, and because, in allowing for the exemption of refugees from religious persecution, it might lead to embarrassing expressions of opin-

ion on governmental policies abroad; but the measure was passed over his veto. This bill required that all aliens over 16, who were physically able, in order to be admitted must be able to read English or some other language or dialect, although it allowed for the bringing in of father or grandfather over 55, wife, mother, grandmother, unmarried or widowed daughter, and for the entry of those persecuted for religious reasons, even if illiterate. It also contained a clause restricting Oriental immigration and increased the poll tax on entering aliens to \$8. The effect of this bill is shown in the fact that while between 1908 and 1917, 1,617,000 illiterates over 14 had been admitted, and while in 1913 illiterates made up 26.6 per cent of the entering alien immigrants, in 1920 this class numbered only 15,094, or 4.4 per cent of the total number admitted. There is some significance also in the increased proportion of rejected applicants: 2.3 in 1914; 5.3 in 1915; 4.9 in 1916; 4.2 in 1917; 3.3 in 1918; 3.6 in 1919; this, although due in some measure to the more rigid inspection possible when immigration had fallen low during the War, was also attributable to the new requirement.

In 1920, with a marked increase in immigration toward the end of the year, the fear of a flood from the war-stricken countries of Europe was intensified, and the demand for still further restriction became insistent. An emergency measure presented to Congress in 1920 provided for the practical shutting off of immigration for 14 months. The bill, finally passed in 1921, was based on the percentum-limit plan; it provided that the number of aliens of any nationality admitted in any fiscal year was not to exceed 3 per cent of the number of foreign-born residents of that nationality in the United States in 1910, nationality to be determined by country of birth. It applied only to Europe and the Near East, Africa, Australia, New Zealand, Asiatic Russia, and islands of the Atlantic and Pacific not adjacent to the mainland of the Western Hemisphere.

This plan was designed to decrease the number of immigrants from eastern and southern Europe and to increase proportionately the numbers from western and northern European countries; whereas in the years before 1914, the normal number of immigrants from northern and western Europe had been about 185,000 and from southern and eastern Europe about 750,000, under the new quota arrangements these figures were limited to 200,000 and 155,000, respectively. During 1913-14, for example, from southern and eastern Europe there came 75.6 per cent of the country's immigrants and from northern and western Europe, there came 20.8 per cent; in 1922-23, under the Quota Law, the proportion for the former was 31.1 per cent, as against 52.5 per cent for the latter. In May, 1922, the life of the 1921 Quota Law was extended to June, 30, 1924, and at the same time the requirement of one year's residence in an adjacent country, to escape the quota restriction, was raised to five years.

On May 26, 1924, a new Quota Law was signed by President Coolidge for the purpose of further restricting eastern and southern European immigration. This law limited immigrants to 2 per cent of the nationals of any country who had been in residence in the United States in 1890. By this measure, the aggregate immigration from outside the Western Hemisphere was limited to

161,000 persons annually for three years and to 150,000 thereafter. Under the new quotas, 75 per cent of the immigrants were to be drawn from the countries of northern and western Europe. Wives, minor children (of 18 years and under) and elderly parents were privileged to enter as a nonquota class. All quota and non-quota immigrants were to be in possession of immigration visas issued by American consuls at the port of embarkation. The act further provided that after July 1, 1927, quotas were to be based on "national origins," i.e., the annual quota of any nationality was to be a number which was to bear the same ratio to 150,000 as the number of inhabitants in continental United States in 1920 having that national origin bore to the number of inhabitants in continental United States in 1920.

The National Origins Commission, made up of the Secretaries of Commerce, Labor, and State was to prepare the table of quotas. The Commission found the task attended by the greatest difficulties and Congress was twice called upon to postpone the promulgation of the new regulations (in 1927 and 1928).

On Feb. 27, 1929, President Coolidge sent to Congress a table of quotas based on these national origins as worked out by the experts of the commission with the following noncommittal statement of the commission's members: "We wish it to be understood that we neither collectively nor individually are expressing any opinions on the merits or demerits of this system of arriving at quotas." Mr. Hoover, when a member of the commission, had many times expressed his disapproval of the national-origins plan and there was considerable speculation whether he would issue a presidential proclamation inaugurating the new quotas or call upon Congress to abandon the method.

Late in March, 1929, President Hoover issued a presidential proclamation putting into operation the national-origins quotas as of July 1. Though he had consistently opposed the method for establishing quotas, he had learned from the Attorney General that the law gave him no other recourse. His proclamation said: "The Attorney General has advised me that in failure of Congress to suspend action, it is now mandatory upon me under the Immigration Act to issue the proclamation establishing 'national origins' as the basis of the immigration quotas. The proclamation must be issued prior to April 1 and will be issued at once. It will go into effect on July 1, unless action is taken by Congress in the meantime."

In the table that follows, the national-origins quotas submitted by President Coolidge are shown in column A; those submitted on Feb. 27, 1928, are shown in column B; the quotas based on the law of 1924 are shown in column C (1890 census); and those based on the law of 1921 (1910 census) are shown in column D.

With restrictive immigration in operation for seven and one-half years, it was generally agreed that the system had been of benefit to the country. There were still certain aspects of the matter that nevertheless were cause for criticism. The law was considered unduly harsh upon the relatives and children of aliens in the country in that it did not make it easy for families to be united, with the result that each year saw more emigrations of the nationals of certain southern and eastern European countries than there were immigrations; the favoring of the northern and

The totals for columns A and C include 37 minimum quotas of 100 each for 37 minor geographical subdivisions; column B's total includes 16, while column D's includes 32.

\* Includes the Irish Free State.

western Europe as against other sections was interfering with the flow of unskilled labor into the country with the result that Mexicans were encouraged by industry to migrate to the United States; inadequate administrative machinery was making it possible for some individuals to carry on a lucrative trade in the bootlegging of immigrants, etc. All these matters were receiving public attention toward the close of the period being surveyed. In 1927-28, for example, the immigrants from the Northern Hemisphere numbered almost half those admitted. Mexicans and Canadians alone made up 43 per cent, the Mexicans totaling 59,016 and the Canadians, 73,154; as against 45,778 immigrants from Germany; 24,544 from the Irish Free State; 19,958 from Great Britain; 17,728 from Italy; and 16,184 from the Scandinavian countries.

As already stated, the total of immigrant aliens admitted in the fiscal year 1928-1929, 279,678, was the lowest since 1919. The decrease for the year 1928-1929 was largely confined to three countries, namely: Irish Free State, Canada, and Mexico. Immigration from the Irish Free State dropped from 24,544 in 1928 to 17,672 in 1929, or 28 per cent; from Canada it dropped from 73,154 to 64,440, or 12 per cent; and from Mexico from 59,016 to 40,154, or 32 per cent. There was an increase from nearly all of the other countries, particularly from England, Scotland, and Sweden, the total immigrants from all Europe being 158,513 in 1928 and 158,598 in 1929.

Aliens debarred during the year 1928-29 numbered 18,127, or 3.6 per cent of the 497,454 applicants at all ports. The percentage of rejections at the seaports was only six-tenths of 1 per cent; it was still smaller at the port of New York where 300,467 aliens sought admission, of whom 939 were debarred, or 3 denied admission out of every 1000 applicants. Aliens reported in 1928-29 under warrant proceedings totaled 12,-

908. The largest number of these deportees were sent to Mexico, 5481 going to that country, while 4227 went to Europe, 2185 to Canada, 370 to Asia, 308 to the West Indies, 235 to Central and South America, and 102 to the other countries.

In some quarters, the size of the Mexican immigration was regarded with alarm and bills were before Congress for the purpose of placing Mexicans on the restricted list (the Box-Harris bills). It was estimated that there were 1,200,000 Mexicans in the country who had become integral parts of the life of Texas, Arizona, and California, and, to a lesser extent, of New Mexico, Colorado, and Kansas. The Mexicans worked as unskilled laborers on large farms and on the railroads. In fact, the railroads of the Southwest were demanding that the prevailing restrictions (head taxes and visa fees) be lifted rather than quotas be imposed and pointed out that Mexican labor was seasonal, the Mexicans returning to their own country during the winter. In 1924, 89,339 Mexicans entered the country, as against 69,685 in 1927 and 57,765 in 1928. Opponents sought restriction on the grounds of racial purity and insisted that the Mexicans were of low intelligence and were the recipients of charity. The Secretary of Labor (Mr. Davis) opposed free Mexican immigration because it stood for cheap labor; the Secretary of State (Mr. Kellogg) was opposed to restriction because of the effect of this policy on the prevailing friendly relations with Latin-American countries.

Beginning with June, 1925, in Great Britain and the Irish Free State, the United States immigration service inaugurated the policy of examining immigrants at the port of embarkation before the granting of visas. The result of this policy was at once felt. By the end of 1926, about 90 per cent of the quota immigration was arranged for at European ports under American technical advisers, so that for that year the ratio of immigrants barred from entry at the port of New York was only 6 out of 1000 as against 40-50 per 1000 before the system was inaugurated. By the end of 1927, the ratio of barred immigrants was 4 per 1000. Technical advisers were attached to the consulates of 24 European cities in the following countries: Belgium, Northern Ireland, Norway, Germany, Irish Free State, Denmark, Italy, Scotland, Sweden, England, Czechoslovakia, Holland, Poland.

As a result of the quota law, bootlegging in aliens became one of the country's outstanding unofficial industries. The Secretary of Labor put the number of immigrants who had gained illegal entry into the country at 1,500,000. Cuba and the Bahamas served as relay stations in the illegal traffic with Florida as the objective. It was estimated that as many as 170,000 aliens were being smuggled into the country annually. In 1924 the immigration service inaugurated the border patrol to combat this situation. Patrols were divided into 11 districts scattered along the Northern and Southern borders. An idea of the effectiveness of this service may be gained from the fact that during 1927-28, there were apprehended 25,534 persons seeking unlawful entry into the country of whom 18,000 were smuggled aliens and 330 were smugglers of aliens. The Secretary of Labor (Mr. Davis) during the period besought Congress to pass legislation for the registration of aliens as the only complete method of coping with the situation. The measure was strenuously combatted on the score that it would mean unnecessary bureaucratic surveillance.

Beginning with July 1, 1928, the Department of Labor ruled that all aliens were to carry their passports as a source of identification, in this way hoping to control the later arrivals. In view of the fact that this did not affect those who had gained admission prior to that date, it was difficult to see how the regulation was to help matters for at least a generation. In fact, the enforcement of the Immigration Law was largely similar to the status of prohibition enforcement: the job was either to be done thoroughly by complete administrative control (at a great expenditure of money), or, in the course of events, it was inevitable to expect leakages. This was, of course, always one of the penalties of government by legislation as against government by consent.

**Asiatic Immigration.** Under the Chinese Exclusion Bill, and the "Gentlemen's Agreement" (1907) by which Japan bound herself to give no passports to laborers coming to the United States and to limit the number to Canada and Mexico, the influx of Asiatics had already been greatly restricted. The 71,531 Chinese residents in the United States at the census of 1910 had decreased to 61,686 in 1920. On the other hand, the number of Japanese had increased 53.86 per cent in the 10 years, from 72,157 to 111,025, an increase of about 30,000 in California and about 4000 in Washington. A growing protest against Oriental immigrants began to make itself heard. In 1914 two amendments to the general immigration bill were proposed and rejected, one to exclude all Asiatics except those with rights under existing agreements, and the other anti-Japanese. The Immigration Bill of 1917 contained a clause excluding Oriental laborers and directed chiefly at Hindus and Malays. Meanwhile, on the Pacific coast, feeling against the Japanese had been growing more intense. Not only was the Japanese, like other Orientals, considered unassimilable; the American farmer was not able to compete with his gift for intensive cultivation, his unflagging energy, and lower working and living standards; his growing numbers, and increasing success at the expense of other farmers, changed uneasiness into alarm. The desire for protection was reflected in State laws in California, Washington, Arizona, and Oregon. Not only the right to own land was taken from the Japanese; the right to lease it for three years, which had previously been allowed, was denied in 1920; in 1923 even croppage contracts were forbidden. Following this, there was incorporated in the immigration bill in 1924 a clause excluding would-be immigrants who were not eligible for citizenship, in abrogation of the "Gentleman's Agreement." During the lively debate that followed, the Japanese Ambassador, Hanihara, in a letter to the State Department, asked that Japan be given the opportunity to arrange the matter by treaty and called attention to the possibility of "grave consequences" if the Japanese were subjected to the indignity of such discrimination. His letter aroused much criticism, and was styled an attempt to intimidate and to dictate legislation on a domestic matter. Contrary to the advice of Secretary Hughes that Japan be placed on the quota basis, the bill was quickly passed by the Senate by a vote of 76 to 2. The House had previously passed the bill by a vote of 376 to 71. All Japanese, except ministers, members of the learned professions and arts, and students, with their wives and children, were barred. President Coolidge favored the general

principle of exclusion but recommended a delay till March, 1925, to arrange the matter by treaty with Japan, if possible. Congress, however, refused by a large majority to accept this recommendation, and the President, moved by other considerations, gave the bill his signature as it originally stood. It was pointed out that Japan was willing to coöperate in excluding any or all of her citizens and desired only that it be by a law putting her on a par with other nations or by a treaty. Perhaps the most convincing argument against the clause was the claim that it was unnecessary. Secretary Hughes had advocated that the Japanese be included in the 2 per cent quota provision, calling attention to the fact that the entailed admission of 250 immigrants a year was virtual exclusion. The President, in favor of settlement of exclusion by treaty, styled the measure "unnecessary and deplorable." There was much comment on the fact that in so vital a matter, affecting sensibly the general attitude of Japan toward the United States, the definitely expressed opinion of the President and Department of State could be overridden by a Congress without party control. The wiser counsels (though unheeded) of the President and the Secretary of State were borne out by subsequent events. During the year 1927-28, for example, 2957 more Japanese left the country than had entered it, and the decrease in the Chinese for the same year, as a result of heavier emigration, was stated at 1361. See RACE PROBLEMS, UNITED STATES.

**INCE, THOMAS HARPER** (1880-1924). An American moving-picture director, born at Newport, R. I., and educated in the public schools. He was for several years an actor under Charles Frohman. In 1909 he was appointed general director of the New York Motion Picture Corporation and was later president of the Thomas H. Ince Studios and other companies. He directed many successful pictures.

**INCHCAPE OF STRATHNAVER, JAMES LYLE MACKAY, FIRST EARL** (1852- ). A British industrialist, born at Arbroath, Forfarshire, and educated at Arbroath and Elgin. Going to India in 1874, he was a member of the legislative council of the Viceroy (1891-93) and of the Council of India (1897-1911). As the King's special commissioner, he signed a commercial treaty with China in 1902. During the World War, he served on committees for imperial defence, food production, and port facilities. He was broker for the Government in the sale of its standard ships (1919), the 418 ex-enemy ships allotted to Great Britain by the Peace Treaty (1920-21), the Mesopotamian war craft (1920), and vessels taken during the War as prizes (1921-23 and 1927). In 1921-22 he served as a member of the Geddes National Economy Committee and in 1922-23 as chairman of the Indian Retrenchment Committee. When his daughter, Elsie Mackay, lost her life in an attempt to fly across the Atlantic, he gave her \$2,500,000 estate to the Empire as a memorial. He was created a baron in 1911, a viscount in 1924, and an earl in 1929.

**INCOME TAX.** See TAXATION IN THE UNITED STATES.

**INDEX NUMBER.** See COST OF LIVING IN THE UNITED STATES.

**INDIA.** The peninsula of Hindustan and the regions to the North, including all those territories governed directly and indirectly by the British. Total area, 1,805,332 square miles; total population in 1911, 315,156,396; in 1921, 318,942,480; gain in population for the decade, 1.2 per cent. Of the British provinces, losses for the decade 1911-21 were shown by Bihar and Orissa, Bombay, Berar, and the United Provinces of Agra and Oudah. Among the native states and agencies, the following declined: Central India Agency, Hyderabad, Rajputana Agency, and the United Provinces States. The heavy ravages of famine, the plague, and other diseases accounted for the population's remaining almost stationary. In 1919, for example, births were 30.24 per 1000 to 35.87 deaths; for 1920, births were 33 per 1000 and deaths were 30.8. The 1918 losses of population as a result of harvest failures and the influenza epidemic were among the severest recorded. The death rate in that year mounted past 62 per cent per 1000. Populations of the largest cities in 1921 were (1911 figure in parentheses): Calcutta, with suburbs, 1,327,547 (1,222,313); Bombay, 1,175,914 (979,445); Madras, 526,911 (511,660); Hyderabad, 404,187 (500,623); Rangoon, 341,962 (293,316); Delhi, the winter capital, 304,420 (232,837). By religions, the population in 1921 was divided as follows (1911 figure in parentheses): Hindus, 216,734,586 (217,586,900); Sikhs, 3,238,803 (3,014,466); Buddhists, 11,571,268 (10,721,449); Mohammedans, 68,735,233 (66,623,412); Christians, 4,754,079 (3,876,196); Animists, 9,774,661 (10,295,168).

**Education.** The 1921 census indicated that in spite of recent educational progress, the total illiteracy remained enormous. In Bengal, the most advanced of the provinces, 43,000,000 out of the total 47,000,000 were classed as wholly illiterate. Only some 500,000 of the women of Bengal might be classed as literate. The increase in education may be seen from the fact that in 1919-20, in a total of 202,981 institutions, there were in attendance in British India 7,612,839 (1,306,711 of these female), as compared with 6,128,725 (875,660 female) in 1912. The cost of maintenance of educational institutions in 1913-14 was £8,696,585; 1919-20, £14,889,696. The well-attended colleges and secondary schools seemed strangely out of place in a system where primary education was so largely neglected. This feature is one of the leading preoccupations of the administration during recent years, with the result that more attention is being applied toward reaching the masses. University supervision over the colleges is exercised by the six universities of Calcutta, Madras, Bombay, the Punjab, Allahabad, and Patna (established in 1917); the three residential universities of Dacca, Lucknow, and Rangoon; the two denominational universities at Benares (Hindu, established 1917) and Aligarh (Moslem); and the two universities in Indian states at Mysore (established 1916) and Hyderabad.

**Agriculture.** India is primarily an agricultural country. The monsoon, which lasts from June to September, is the chief controlling factor in crop production. The crops harvested during the winter (around 'February') are rice, sugarcane, castor beans, and groundnuts.

Wheat, rape, and mustard are gathered in the spring and sesame is harvested in the fall. There are two crops of cotton, one in April and one in October. In 1927 India enjoyed the sixth successive favorable monsoon. In the British Provinces in 1925-26, there were 304,811,000 acres of arable land (43 per cent of the total); 1,471,000 acres of trees, shrubs, and bushes; 86,934,000 acres of forest; 151,869,000 acres of uncultivated productive land; and 150,187,000 acres of unproductive land. In 1926 in the same provinces, there were 120,353,000 cattle, 30,480,000 buffaloes, 23,201,000 sheep, 39,295,000 goats, 1,684,000 horses, and 1,478,000 mules and asses. In the Indian states in 1925 were 28,821,000 cattle, 7,433,000 buffaloes, 13,591,000 sheep, and 11,248,000 goats. The coöperative movement in India is making comparatively rapid progress. At the end of 1926-27, there were in India 89,071 societies with a membership of 3,422,000, and a total capital of 679,400,000 rupees.

**CROPS: AREA, PRODUCTION, AND YIELD PER ACRE (Including Indian States)**

Crop	Area (thousands of acres)		Production (thousands of units—bushels except as indicated)	
	1913-14	1927-28	1913-14	1927-28
Wheat	28,496	31,089	312,368	334,059
Barley <sup>a</sup>	7,157	.....	125,800	.....
Rice (rough)	76,000	77,790	1,435,000	2,144,000
Sugar cane	2,537	2,954	2,297	3,221
Oilseed	17,812	17,873	2,663	3,250
Cotton	25,027	23,812	2,026,000	2,192,000
Jute	3,552	3,371	4,192,000	4,092,000
Indigo	173	60	3,002	1,254

<sup>a</sup> Not including Indian States.

<sup>b</sup> Unit, long ton.

<sup>c</sup> Incomplete.

<sup>d</sup> Unit, pound.

**Mining.** The following comparative figures reveal the state of the mining industry over the period under discussion. Coal production: 1914, 17,565,000 tons; 1922, 19,010,986 tons; 1927, 22,082,336 tons. Gold production: 1913, 595,761 troy ounces; 1927, 384,272 troy ounces. Silver production: 1914, 236,446 fine ounces; 1921, 3,587,587 fine ounces; 1927, 6,024,806 fine ounces. Iron ore production: 1914, 441,674 tons; 1921, 942,084 tons; 1927, 1,846,735 tons. Manganese production: 1914, 622,898 tons; 1921, 679,286 tons; 1927, 1,129,353 tons. Petroleum production: 1914, 250,342,710 imperial gallons; 1927,

281,113,909 imperial gallons. Mica production: 1914, 4,537,000 pounds; 1921, 3,639,000; 1927, 2,043,394. Progress was thus inconsiderable. The average number of workers in the mines was 250,000, of which, in 1921, 65,786 men, 42,000 women, and 1171 children were engaged in the collieries. Legislation affecting mine workers prohibited the employ of children in the mines; fixed the maximum hours of labor at 54 hours a week; and gave the government power to regulate the conditions of women employed underground. In 1927 the average number of workers in the coal-mining industry was 180,532, with an output per capita of 122 tons.

**Manufacturing.** The weaving of cotton cloths continues the most important single industry and shows increases, too; the production of cotton cloth mounted from 1,164,292,000 yards in 1913-14 to 1,954,460,667 yards in 1926. Similarly, the manufacture of gunny bags and jute cloth rose from 487,848,000 bags and 447,309,000 yards of jute cloth (1914) to 500,000,000 bags and 1,482,107,000 yards of jute cloth (1926). The impetus that the World War gave to industry in India by cutting off the foreign sources of supply, and the encouragement accorded to industrialization by the existence of such large stocks of raw materials, were immediately perceptible. From 1917 to 1922, rice mills increased 12 per cent, engineering works 30 per cent, woolen mills 50 per cent, sugar factories 37 per cent, and flour mills 25 per cent. In all, the 4939 establishments of 1917 increased to 6140 in 1922; 1,252,006 workers of 1917 increased to 1,367,136 in 1922. The increased capitalization of joint-stock companies reflected the trend toward industrialization. The total paid-up capital of such companies increased from 750,000,000 rupees in 1913 to 2,770,319,000 in 1927. It is becoming evident that with encouragement of trade unionism, readjustment of wages, decreased cost of living, better housing conditions, and increasing interest in technical education, the status of labor is taking on an optimistic cast.

**Commerce.** During the World War, it did not take long for India to become readjusted to the new conditions. The insistent demand for foodstuffs, cotton materials, bagging, and hides from the Allies immediately put Indian raw materials at a premium. But for the depression of 1921, India's commercial activity showed an unbroken advance as is evidenced by the accompanying table.

**Transportation.** Railway line on Mar. 31, 1928, amounted to 39,711 miles, of which 28,426 miles were Imperial State lines, and 4988 miles belonged to Indian States, and the remainder to private companies. Additions to the lines totaled 871 miles in 1927-28 and several important new lines were commenced. Construction of 7000 miles during the five years ending Mar. 31, 1932, is planned.

000,000 rupees, so that the estimated national debt amounted to 9,755,400,000 rupees on Mar. 31, 1927, as against 4,110,000,000 rupees in 1914. It should be noted, however, that 310,000,000 rupees of the annual deficit were covered by the inflation of the currency. Total revenues for 1913-14 for imperial and provincial governments, with the rupee rated at 15 to £1, were £85,207,000; expenditures, £82,895,000. Revenues for 1922-23 for the imperial government alone, with the rupee rated at 10 to £1, were £133,228,000; expenditures, £142,391,000. By the devolution rules, the following heads of revenue were allocated to the central government: opium, salt, customs, income tax, tributes, post office and telegraph, railways, mint, military services; the following to the provincial governments: land revenue, stamps, excise, forest, registration, irrigation, and civil departments. Provincial governments were required to pay annual contributions to the central government.

For the years 1924 to 1929, India's finances have prospered. Budget deficits have been turned into surpluses, provincial contributions have been abolished, the cotton excise duty has been removed, and the rupee has been stabilized. With

lative Assembly. Strenuous measures to check the advancing expenditures, the chief concern of Indian financing for the five years, 1919-24, were of no avail, for deficits steadily mounted. The annual deficits of the period totaled 1,000,-

creased rapidly from 1919-20 to 1923-24 has since increased relatively little.

**Immigration.** In 1916 it was announced by the Indian government that the policy of providing for the eventual abolition of indentured

labor in Jamaica, Trinidad, British Guiana, Dutch Guiana, and Fiji, had been accepted by the Secretary of State for India. The system, which had been inaugurated in 1842 and had been pressed by licensed agents, had led to annual migrations of 10,000 coolies, on an average, for work under contract. The permanent settlement of these coolies in Africa, in particular, had led to vexing internal problems. (See KENYA; SOUTH AFRICA, UNION OF.) The result had been the prohibition of such emigrations to Natal and Mauritius (1910) and then (1917) to the areas cited above. The decision to put an end to this system was received with approval by the Indians, who had always regarded contract labor as a form of slavery.

**Government.** In 1919, in order to hasten a more effective native participation in Indian affairs, the Government of India Act was passed, effective for 1919-29. It was based on the report formulated by the Secretary of State for India, Mr. Montagu, and by Lord Chelmsford, the Viceroy. The keynote of the report was the recommendation of a progressive movement toward responsible government founded on a native ministry. With this as its purpose, the Act incorporated the idea of a dual form of government for the major provinces, i.e., the Presidencies of Madras, Bombay, and Bengal; the United Provinces, the Punjab, Bihar, Cissa; and the Central Provinces, Assam, and Burma. This system, called "dyarchy," consists of the division of provincial matters into two groups, viz., "reserved subjects" over which the governor-in-council of the province retains control, and "transferred subjects" over which the provincial ministry is the final arbiter. The transferred subjects include local self-government, medical administration, public health and sanitation, education, public works, agriculture, fisheries, coöperative societies, excise, registration, adulteration, weights and measures, and religious and charitable endowments. The governor-in-council was in charge of the reserved subjects; the governor and a responsible ministry were in charge of the transferred subjects. The purse for both branches was held in common, and definite sources of revenues were assigned the provinces (see above, *Finance*). Responsible government was assured by making the provincial ministers, appointed by the governor of each province, answerable to the provincial legislative council, at least 70 per cent of whose members were to be elected. Representation by special interests was provided for; the franchise was extended, and in Madras (by statute) and in Burma, women were given the ballot. For example, of Bengal's 130 members, 113 were elected, 20 were nominated officials, and 6 were nominated non-officials representing special interests. The governor's powers remained large; he was permitted to withdraw from consideration or to pass over the heads of the council any legislation which he considered jeopardizing the tranquillity or safety of his province. Incidentally, he was the focal point to which the affairs of the executive council, the legislative council, and the larger concerns of the central government radiated.

Responsible government was not the rule of the central government. In place of the unicameral House, there was the two-chamber Legislature, made up of the Council of State and the Legislative Assembly. The Council of State consists of 60 members, only 20 of whom were to

be nominated members. The Legislature Assembly was to be made up of 144 members, of whom only 26 of the 41 nominated members could be officials; the other 103 were elective. The Governor General, or Viceroy, was not a member of the Legislature, but for the direction of affairs, he was to have to aid him an Executive Council consisting, in 1923, of 8 members. The Governor General had the power of enacting legislation, subject to the approval of Parliament, and of vetoing legislation that affected the tranquillity or safety of the country. Within clearly defined limitations, the annual budget was to be submitted to the Legislative Assembly and Council of State for their approval, though the Governor General might certify any item in the budget, or even the whole of it. The Act of 1919 also provided for the appointment of a high commissioner for India resident in London. For the visit of the Simon Commission to India in 1928-29, see below, under *History*.

**History.** The outbreak of the World War found India tranquil. The pledges of loyalty and the offers of money and munitions which poured in reassured the home government that any effort in the war prosecution would not meet with an organized opposition. The result was that India was stripped of its internal defenses to a remarkable degree, so that men and war materials might be dispatched to the theatres of war. By 1916 upward of 300,000 men, both British and natives, had left the country. Indian contingents saw service in France, Egypt, East Africa, Gallipoli, and Mesopotamia. The campaign in Mesopotamia was under the exclusive control of the Indian government. Even the entry of Turkey into the War failed to stir up any considerable discontent. Recruiting was pushed vigorously; a war munitions board controlled the output of materials; and a loan of £100,000,000 was floated for the aid of the Empire. The active measures taken by the government in the regulation of prices and exports and the increased prosperity which came to the population from the sale of raw materials served further to assure tranquillity.

Lord Hardinge was followed by Lord Chelmsford as Viceroy in 1916. The latter's administration was confronted by an awakened nationalistic sentiment taking on greater proportions as the War progressed, and echoed in a growing repressive policy on the part of the Indian government. Under the lead of the National Congress and the Moslem League, the demand for Indian Home Rule became widespread. In 1916 the proposal formulated at the meeting of the two organizations at Lucknow became the official statement of policy of the dissidents and received wide currency as the agitation continued. Unfortunate official tactics added fuel to the flames. Mrs. Annie Besant was in 1917 compelled by the Madras government to quit the city and confine her activities to certain delimited areas. It became increasingly necessary for the home Government to make a clear-cut pronouncement of its policy as Lord Chelmsford's position became more difficult.

In 1917, Edwin Samuel Montagu, who had just come to the Indian Office after the resignation of Austen Chamberlain, realizing the changed state of affairs in India, as well as the new attitude toward the country in the whole Empire, made a declaration promising radical reforms. The chief point of his statement was that an increasing measure of self-government for India was

inevitable. In the winter of 1917 and into 1918, Montagu, together with Lord Chelmsford, held extended hearings in India, resulting in the Montagu-Chelmsford Report. The findings set forth the proposal that self-government be tried just in the major provinces under a limited scheme, and that, for the whole of India, complete home rule was as yet inadvisable because of the dissimilar elements in the population and the general unpreparedness. Some moderate elements in the Indian population expressed their approval, but their attitude was overshadowed by the pronounced disappointment and indignation of the thoroughly conscious Indian Nationalists, who regarded the proposed reforms as utterly inadequate. On Sept. 1, 1918, the Indian National Congress at Bombay unanimously rejected the reforms. Counter-proposals demanded the extension of the dual government idea to the central government of India and the abolition of the Council of State. Other resolutions passed called for a guarantee of full responsible government within 15 years, equal rights for women, and a large proportion of native Indians in the civil service. Meanwhile, the suggestions embodied in the report had been incorporated in the Government of India Bill, which passed the British Parliament in December, 1919. See above, *Government*.

India's war effort may be summarized here. In men, India had contributed upward of 1,250,000 recruits, of whom some 30,000 had died overseas as a result of wounds and disease. A loan of £100,000,000 had been guaranteed. India had been the sole source of supply for the operations in India, Mesopotamia, and Egypt in respect to a great variety of commodities, including butter, oatmeal, tinned beef, mutton, biscuits, boots, wearing apparel, as well as 1500 miles of railway, 4500 vehicles, and 250 engines. Strong measures in 1918 had prevented an invasion of India from the North after the collapse of Russia, and the friendly relations with Afghanistan had kept that country well disposed during the War. In all, considering the usual poverty of the great proportion of India's population, the effort had been extraordinary. No doubt the following unrest was engendered by the after-effects of the War.

The years immediately following the War saw increasing disorder. Matters were brought to a head in March, 1919, by the passage of the untimely anti-sedition Rowlatt Acts giving the Governor General extraordinary powers in acting against revolutionary suspects. They created a furore. Indian leaders universally condemned them and the Indian National Congress denounced them and passed resolutions of a radical tenor, including a demand for self-determination and the appointment of a commission comprising Tilak, Gandhi, and Hassan Imam to put the Indian case before the Peace Conference. As a result of the activities of M. K. Gandhi, the Passive Resistance League was formed at Bombay. The movement quickly spread through northern India and frequent disturbances followed, with rioting and fighting at Delhi, Amritsar, and other places. Martial law was declared over the district of Lahore, from April to June. The now admitted intemperance of the British in suppressing these disorders and such incidents as the arrest of Gandhi further inflamed the populace. On Apr. 13, 1919, an outbreak which reached tragic proportions occurred at Amritsar. As a

result of the zeal of General Dyer, British soldiers fired on a meeting of unarmed Indians, with the result that 400 were killed and at least 1000 wounded. See GANDHI, M. K.

Affairs were rendered more serious by the outbreak of the Afghan War, following the accession of the Amir Amanulla, who attempted to surprise the Indian Army by moving his troops into the Khyber Pass, but was checkmated by a hasty mobilization. The Capture of Dacca and the bombing of Kabul and Jalalabad brought him to terms and a treaty was signed in August, 1919. The Waziristan campaign against neighboring tribes, however, was not concluded until May, 1920. The cost of these two operations was £15,000,000. Meanwhile in India, the Nationalistic agitation continued. Late in 1919 Gandhi inaugurated a "noncoöperation" movement which received the approval of the Indian National Congress in 1920. Boycotts against the courts by lawyers, against the legislative councils by public men, against foreign imports by consumers, against educational institutions by students, became the rule. The hostility was reflected in England where Montagu was severely attacked in the House of Commons and General Dyer was penalized by retirement and a vote of censure.

The anti-Mohammedan character of the Treaty of Sèvres was responsible for serious disorders in southern India, rioting in Malabar being frequent throughout 1921. The influence of Gandhi showed no signs of weakening. His "civil disobedience" policy, marked by a refusal to pay taxes and to coöperate with the Government, was approved by the Indian National Congress of 1921, which discountenanced a policy of violent resistance. The boycott of English cotton goods, etc., spread over the country. When the Prince of Wales visited India in November, 1921, rioting occurred all along his route. Among the Liberals in England, the methods employed by the British government in putting down these outbreaks aroused unsparing criticism, and quite evidently the policy enlisted only a reluctant consent from Montagu and Lord Reading, the new Viceroy. Montagu, finally, was asked to resign following his publication of a dispatch from the Indian government setting forth Moslem objections to the Treaty of Sèvres.

In spite of Gandhi's protests, Indian resistance frequently took the form of violence, tax collectors particularly being subjected to indignities. On Feb. 9, 1922, the Government took the summary step of ordering Gandhi's arrest on the charge of sedition. After a brief hearing, he was found guilty and sentenced to prison for six years. For the moment, this act only strengthened the resolve of the Nationalists, who, late in 1922, formally rejected the proposal to seek seats in the Legislative Assembly; but it became increasingly evident in 1923 that noncoöperation was doomed. The boycott was a failure, and Gandhi himself advised the Indian National Congress meeting at Delhi in September, 1923, to abandon it, and to relinquish noncoöperation at least temporarily and contest seats in the national and provincial assemblies. In the elections for the second Legislative Assembly late in 1923 the Swaraj Party headed by Das announced a programme of obstructionist tactics in their participation in the government, and secured 50 out of the 145 seats, as well as a preponderating majority in the Central Provinces. Disorders did not abate. They were, however,

due to other antagonisms as well as the resistance to British rule. Communism was gaining a sure foothold in India, as indicated by the Government's energy in dealing with suspects, while the perennial Hindu-Moslem feud broke out frequently in open fighting.

In July, 1923, the last session of the first Legislative Assembly closed. Its initial steps had been taken with so much caution that doubt was expressed in British circles as to whether its work was of a nature to justify its existence. The rise of the Labor Party to power in Great Britain did not materially affect the situation. True, Gandhi was released, on Feb. 4, 1924, because of illness, and Sir Sidney Oliver, appointed to the Indian Office, was a champion of equal rights; but the British Labor government proceeded to reject the native Assembly's demand for a round-table conference on home rule, and point was given to this general attitude when Ramsay MacDonald issued a warning against the entertainment of too sanguine hopes. Hostility thus became general and outspoken once more. On March 17, the Swaraj majority rejected the Government's budget in the Legislative Assembly, which had convened January 31; three days later, in spite of the recurrence of disorders, the Assembly voted to deprive the Government of summary power. The only answer the British government could give to all this was the appointment of a commission to consider defects in the Government of India Act of 1919, and not a wholesale revision.

The committee reported early in 1925 that the time was not yet opportune to consider constitutional changes. While the Nationalist agitation was passing through these various phases, the Communist menace continued to be more and more in evidence. In 1924 the Government discovered what appeared to be a widespread revolutionary conspiracy, especially prominent in Bengal, and special powers were given to the Bengal government to deal with it. When on Dec. 24, 1924, the executive committee of the Indian National Congress accepted Gandhi's advice to abandon the noncooperation movement, the beginning of the end of that line of tactics was seen. It may be considered as having come definitely to a close in 1925 when the Council of the Swaraj Party, to which the centre of gravity of Indian resistance had gradually shifted, announced that under certain conditions it was willing to work with the Government if a Dominion status should be granted to India by Great Britain.

In June, 1925, the Swarajist leader, C. R. Das, died and his party position in the Legislature was taken by Pandit Motilal Nehru. With Gandhi in retirement, a period of comparative political quiet ensued in India, broken chiefly by ever-recurring religious riots. In the spring and summer of 1926, they were especially frequent and resulted in the death of more than 100 persons. Both the Indian Nationalists and the British authorities endeavored to bring the opposing religious bodies together. Lord Irwin, who succeeded Lord Reading as Viceroy in April, 1926, continually urged the importance of harmony between them if the country expected to assume greater control of its own affairs. The elections held in December, 1926, further confirmed the decline of Nationalist feeling, as the Swarajists lost 9 of their 46 seats in the Legislature. However, the extremists controlled the meeting of the Indian Congress at the close of

the year at which a favorable attitude toward noncooperation measures was taken.

It was the continuance of the tense religious antagonism, according to report, which induced the British government, toward the close of 1927, to take the important step of appointing a commission to investigate the whole subject of the government of British India. This anticipated by two years the action provided for in the Government of India Act of 1919, under which a 10-year experiment was to be carried on in gradual transfer of governmental functions from British to Indian shoulders. The commission appointed was a distinguished one, headed by Sir John Simon. When its personnel was announced in November, the fires of nationalism blazed up hotly again in India because of the fact that no Indian representatives were included on the commission. The British government, however, had provided for systematic cooperation in the investigation by committees of the national and provincial legislatures of India, and for a full hearing of the presentation of the Indian case by a parliamentary joint committee before any action on the report should be taken.

These provisions were deemed inadequate by the Nationalists in India. A wave of opposition swept over the country and in December the Indian National Congress proclaimed a boycott on the Simon Commission and took its stand for full independence for India. At this Congress and elsewhere, renewed efforts were also put forth to obtain greater Hindu-Moslem unity, but with no great success. The Moslems, greatly in the minority in the country, held back from the Nationalist movement because of the fear of oppression by the Hindus under a system of self-government, and in general supported the British authorities and opposed the boycott of the Simon Commission.

The year 1927 was marked by further religious rioting. The Simon Commission made a preliminary visit to India in February, 1928, returning to England April 7. Its presence served to accentuate the opposition which had flamed up on the announcement of its appointment, and the hostility found expression in strikes and riots, in the refusal of the Legislative Assembly to cooperate in the investigation, and in a general increase in popular restlessness. In October, the commission returned to India and entered in earnest on its work of touring the country and taking evidence. While it received the help of committees of practically all the provincial legislatures, the strong reaction against it throughout the country continued to be pronounced, and was reflected, among other things, in the unhelpful attitude of the National Legislature on other matters than the work of the commission. On September 24, the Government's much desired bill to permit the deportation of alien Communists or other dangerous agitators was lost when the President of the Assembly broke a tie vote by casting his ballot against the bill on the ground that it was unnecessary. Communist agitation, nevertheless, had become particularly troublesome. Extended labor difficulties also marked the summer of 1928, particularly in the textile industry in Bombay, where a strike lasting from April to October slowed down the city's whole industrial life, and also in the steel industry and in railway activities.

Toward the close of 1928, two important conferences took action bearing on the home-rule question. In December, the annual meeting of

the National Congress fully indorsed the report of the Nehru committee, which in May, at a conference in Bombay of representatives of many parties, had drawn up a proposed Constitution for India providing among other things for a Dominion status for the country. At this December meeting, a resolution offered by Mahatma Gandhi was adopted stating that unless the Nehru Constitution should be put in force before the end of 1929, the noncooperation movement, including nonpayment of taxes, would again be revived. An important All-India Moslem conference also met in December for the purpose of formulating a political programme for the protection of the rights of the Moslems of India. It declared for a federal system for India and for various safeguards of Moslem minorities, and resolved to oppose any constitution which did not incorporate these provisions.

While the Simon Commission was at work, a special committee presided over by Sir Harcourt Butler was also busy with an important collateral inquiry into the relations between the British government and the larger number of native states which maintain a semi-independent status under their own rulers. Comprising about one-fifth of the population of India, these states are bound to the Empire by ties defined in various treaties. They are represented in a Chamber of Princes, which has only conference powers but serves as a voice for their common interests. In February, 1929, this Chamber declared unanimously against any form of government for India which would dissolve the British connection. In May, a conference of representatives of subjects of these native states declared for a unified federal government for all India, a proposal to which the rulers themselves are cold. The Butler committee, however, had already reported on April 17, stating that it could find no practicable method for bringing the native states and British India together in a federated commonwealth, and that two Indias must continue to be recognized.

The first part of 1929 was a period of great agitation in India in which all the chief causes of unrest had a part. Communist propaganda increased to such an extent that the Government felt it necessary to make a hundred arrests for sedition in the principal cities. The Government also introduced into the National Legislature the Anti-Communist Bill which had been defeated in the year before, with a further provision permitting the seizure of funds brought into the country for Communist propaganda purposes. While this bill was being debated, on April 8, with Sir John Simon present, two bombs were exploded among the Government members, while Communist leaflets were dropped from the balcony. Several members were injured. Four days later the Viceroy passed the bill by ordinance. In February, religious warfare again broke out in Bombay, where several hundred people were reported killed, and the rioting spread over the whole land. Mahatma Gandhi again led a movement against the use of British cloth, and although he was arrested and fined, the movement went on with various damaging results. The Simon Commission returned to England in April and its report was awaited with the keenest interest.

**INDIANA.** The thirty-seventh State in size (36,354 square miles) and the eleventh in population; capital, Indianapolis. The population increased from 2,700,876 in 1910 to 2,930,390 in 1920, a gain of 8.5 per cent; estimated popula-

tion, 1928, 3,176,000. The white population rose from 2,639,961 (1910) to 2,849,071 (1920); Negro, from 60,320 to 80,810; native white, from 2,480,639 to 2,698,203. Foreign-born whites decreased in number from 159,322 to 150,868. The urban population mounted from 1,143,835 in 1910 to 1,482,855 in 1920; the rural fell from 1,557,041 to 1,447,535. The principal cities grew as follows: Indianapolis (q.v.), 233,650 to 314,194; Fort Wayne, 63,933 to 86,549; Evansville, 69,647 to 85,264; South Bend, 53,684 to 70,983.

**Agriculture.** Indiana is one of the chief agricultural States and general conditions in the years since the War have reflected fluctuations in the local production and prices of the chief products, particularly grains. For a full discussion of this general situation, see AGRICULTURE, CORN, WHEAT, OATS, etc.

The rural population declined from 65.7 per cent in 1900 to 57.6 per cent in 1910 and to 49.4 per cent in 1920. The number of farms decreased 4.5 per cent, or from 205,126 in 1920 to 195,786 in 1925; the total acreage in farms from 21,063,332 in 1920 to 19,915,120 in 1925. The improved land in farms embraced 16,680,212 acres in 1920; crop land acreage in 1925 was 11,981,079. The total value of farm property rose from \$1,809,135,238 in 1910 to \$3,042,311,247 in 1920, but declined to \$1,931,742,483 in 1925; the average value per farm was (1910) \$8396; (1920) \$14,831; and (1925) \$9867. Prices of farm land increased greatly, stimulated by war-time prices for products. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. The percentage of land in farms decreased from 92.3 in 1910 to 91.3 in 1920. Of the farms in 1925, 137,429 were operated by owners; 1268, by managers; and 57,089, by tenants. The comparative figures for 1910 are 148,501, 2297, and 64,687. White farmers in 1920 numbered 204,554, compared with 214,680 in 1910; colored farmers, 572, compared with 805. The farms reported as under mortgage in 1920 numbered 51,474; in 1925, 49,900. The total number of cattle in 1920 was 1,546,095; in 1925, 1,281,810. Dairy cows numbered 946,401 in 1920, 596,379 in 1925; swine, 3,613,906 in 1920 and 2,939,074 in 1925; sheep, 643,889 in 1920 and 595,461 in 1925. The estimated production of the principal farm crops in 1928 was: Corn, 161,322,000 bushels; wheat, 9,590,000; oats, 93,684,000; rye, 946,000; potatoes, 6,649,000; tobacco, 11,234,000 pounds; and hay, 2,504,000 tons. Comparative figures for 1913 are: Corn, 176,400,000 bushels; wheat, 39,775,000; oats, 36,380,000; rye, 1,566,000; potatoes, 3,975,000; tobacco, 11,925,000 pounds; and hay, 1,800,000 tons.

**Mining.** Indiana ranked eleventh among the States in the value of its mineral products in 1927. These are almost entirely nonmetallic; in the order of their value, they are coal, cement, stone, and clay products. There is also a large quantity of petroleum. During the period starting with 1914, coal production showed considerable fluctuation, indicated by the following comparative values: In 1914, 16,641,132 short tons, valued at \$18,290,928; 1917, 26,539,329 at \$52,940,106; 1918, 30,678,634 at \$70,384,601; 1919, 20,912,288 at \$46,345,750; 1920, 29,350,585 at \$92,867,000; 1921, 20,319,509 at \$52,269,000; 1926, 23,186,006 at \$45,889,000; in 1927, 17,935,758, at \$36,381,000; and 1928, 16,378,580, at \$29,212,000. The production in 1922 and again

in 1927 showed a decrease, due chiefly to protracted coal-miners' strikes in the Middle West. Cement ranged from 9,595,923 barrels in 1914 to 10,050,433 in 1916 and 5,291,851 in 1918. The value of clay products showed a considerable change, largely the result of the fluctuating purchasing power of money, and the consequent shifts of prices during the period. The value in 1914 was \$7,655,285; in 1920, \$15,494,795; in 1921, \$11,199,024 in 1926, \$18,747,825. The output of stone increased in value from \$4,136,132 in 1914 to \$22,797,189. Petroleum production during the period varied from 1,335,456 barrels in 1914 to 769,036 in 1916; 1,158,000 in 1921; 1,087,000 in 1922; and 852,000 in 1927. In addition to the minerals noted above, the State produces coke, sand and gravel, and pig iron. The limestone produced for construction in 1928 amounted to 14,520,060 cubic feet valued at \$17,760,022. The total value of the mineral production in 1926 was \$118,692,304; compared with \$146,736,294 in 1920; \$82,270,784 in 1919; \$96,558,784 in 1918, and \$42,864,267 in 1914.

**Manufactures.** Indiana is an important manufacturing State. It has 31 cities with a population over 10,000, and six of these, Evansville, Fort Wayne, Gary, Indianapolis, South Bend, and Terre Haute, have 50,000 or more. Of these cities, 29, with a combined population of 37.8 per cent of the total for the State, in 1919 had 62.5 per cent of the value of the manufactured products. There were 7969 manufacturing establishments in the State in 1909; 7016 in 1919; 4702 in 1925; and 4726 in 1927. Wage earners engaged in manufactories numbered 277,580 in 1919, 280,633 in 1925, and 280,717 in 1927. The capital invested in 1909 was \$508,717,197; in 1919, \$1,335,714,103. The value of the products in 1909 was \$579,075,046; in 1919, \$1,898,753,387; in 1925, \$2,125,382,017; and in 1927, \$2,153,479,432. The increase in the value of the products about 1919 was due largely to the change in industrial conditions brought about by the War and cannot properly be used to measure the normal growth of manufactures; but the increase in the number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. The first industry in point of value of products is that connected with iron and steel works and rolling mills, the value of which was \$38,652,000 in 1909; \$199,274,000 in 1919; \$343,236,025 in 1925. Slaughtering and meat packing attained a total of \$47,289,000 in 1909; \$51,022,000 in 1914, and \$134,029,000 in 1919. Automobile production was valued at \$23,764,000 in 1909; \$179,065,000 in 1919; \$233,589,813 in 1925. The manufacture and repair of steam railways had products in 1909 worth \$9,498,000; in 1914, \$21,570,000, and in 1919, \$86,021,000. Indianapolis is first among the cities of the State in manufactures, having 853 establishments in 1909, with a product of \$126,313,000; 1004, with \$398,667,000 in 1919; and products totaling \$344,925,000 in 1925. There were 218 establishments in South Bend in 1909, with products valued at \$27,855,000; 250, with \$31,180,000 in 1914, and 214, with \$75,339,000 in 1919. Similar figures for Fort Wayne are 230, with \$23,687,000 in 1909; 228, with \$30,205,000 in 1914; 247, with \$76,713,000 in 1919.

**Education.** Indiana has always been in the forefront among the States in the interest of its citizens in education, and great progress was made of late years. In 1913 the Legislature

enacted three measures which had an important effect on the schools of the State; the Vocational Educational Law, the High-school Inspection Law, and a Compulsory-attendance Law. Succeeding Legislatures amended these laws and passed others. The Legislature of 1920 enacted the Minimum-wage Law for teachers, fixing the minimum at \$800, which became effective in 1920-21. The general Senate of 1921 enacted the Compulsory-attendance Law providing that employment certifications shall not be issued until a pupil has completed the elementary school course. The establishment of a division of teacher training, doing excellent work, was followed by improvement in ability of the teaching force. In 1921-22, 98 school corporations conducted schools in one or more of the fields of agriculture, home economics, and industry, with nearly 20,000 pupils enrolled. The Division of Vocational Rehabilitation, charged with the duty of returning physically disabled civilians to profitable employment, was eminently successful. In 1922-23 the General Education Board made a comprehensive investigation of the public-school system of the State and recommended sweeping changes in regard to a State school administration, local school administration, and the training and certification of teachers. The enrollment in the public schools in 1914 was 548,497, including both elementary and high schools; in 1925-26 it was 635,227; of this number, 488,780 were in elementary and 146,447 in high schools. The expenditures for education in the public day schools of the State in 1925-26 were: current, \$50,776,866; outlays, \$10,452,228. The percentage of illiteracy in the State decreased from 3.9 in 1910 to 2.8 in 1920. Among the native white population, it fell from 3 per cent in 1910 to 1.8 per cent in 1920; among the Negro, from 17.5 to 11.7; among the foreign-born population, illiteracy increased from 11.8 to 12.4.

**Finance.** State expenditures in the year ending Sept. 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$26,194,760 (of which \$5,233,413 was aid to local education); for interest on debt, \$77,606; for permanent improvements, \$13,846,016; total, \$40,118,382 (of which \$17,287,205 was for highways, \$6,839,494 being for maintenance and \$10,447,711 for construction). Revenues were \$43,078,196. Of this, property and special taxes furnished 34.7 per cent; departmental earnings and charges for officials' services, 10 per cent; and sales of licenses and the tax on gasoline 39.8 per cent. Property valuation was \$5,188,356,739; State taxation thereon, \$11,933,220. Net State debt on Sept. 30, 1927, was \$1,640,500.

**Political and Other Events.** In 1914 though the Democratic vote showed a decrease of about 10,000, Senator Shively, Democrat, was reelected. The Democrats also elected 11 representatives to Congress. In the presidential election of 1916, both candidates for vice president were residents of Indiana. As a result of the election, the Republican Party was returned to power; James P. Goodrich was elected governor. Owing to the death of Senator Shively in 1916, it was necessary to elect two senators. James E. Watson and Harry S. New, both Republicans, were elected. For President in 1916, Charles E. Hughes received 341,005 votes; President Wilson, 334,003. In the elections of 1918, the Republicans elected the entire State ticket. On Aug. 2,

1918, the State came under the operation of the "bone dry" Prohibition Law. Warren T. McCray, Republican, was elected governor in 1920, and James E. Watson, Republican, was reelected United States Senator. In the voting for President, Warren G. Harding received 696,370 votes; James M. Cox, 511,364. In 1921 a special election was held on September 26 and an amendment conferring full suffrage on women and prohibiting aliens from voting until they were fully naturalized was adopted. Samuel M. Ralston, Democrat, former Governor of the State, was elected Senator in 1922. On Mar. 31, 1921, the Mayor of Gary, Roswell C. Johnson, and other officials, were found guilty of a liquor conspiracy and were sentenced to fines and terms of imprisonment. Gov. Warren T. McCray was indicted for fraudulent misuse of the mails and for other offenses in 1923, and in 1924 he was found guilty and sentenced to a term in the Federal prison in Atlanta.

In the election of 1924, the vote of the State for President was: Coolidge, 703,042; Davis, 492,245; LaFollette, 71,700. The Republican candidate, Ed. Jackson, was elected governor. He was charged in 1927, while in office, with having offered a bribe to McCray when the latter was governor. Tried on this charge in 1928, Jackson was acquitted under the statute of limitations. In 1926 and 1927 inquiries were conducted, concerning alleged corrupt practices connected with officials of the State Ku Klux Klan organization, of which the former Grand Dragon, D. C. Stephenson, had been sent to prison on a criminal charge. Mayor John L. Duvall of Indianapolis was convicted in 1927 of having made a corrupt political bargain in 1925; he was deprived of office and condemned to prison for 30 days. In 1928 the vote of the State for President was: Hoover (Republican), 848,280; Smith (Democratic), 562,691. Harry G. Leslie (Republican) was elected governor; A. R. Robinson (Republican) was elected United States Senator.

**Legislation.** In 1915 several important measures were passed, relating to electoral reform and liquor regulation, and also a workmen's compensation law. The Legislature of 1917 passed an act providing for a constitutional convention, granted women the right to vote, and enacted the State-wide "bone dry" Prohibition Law which went into effect on Apr. 2, 1918. In 1919 a measure was enacted giving the State Board of Tax Commissioners power over State and local levies and municipal bond issues, and women were given the right to vote for President. The Legislature recreated the legislative reference bureau which had been permitted to lapse in 1917. Measures also were passed forbidding the display of the red flag or any other symbol or emblem calculated to excite hostility or violence against the Government. The Legislature of 1921 enacted the Pure Agricultural Seed Law, provided for the creation of an executive State budget, and authorized cities to create city-planning and zoning commissions. In 1923 the Legislature passed a measure for establishing equal rights for women, abolishing the legal disability of married women to make contracts and allowing them to hold property as if single. At this session, the penalties for violating the Prohibition Law were increased, and a uniform stock transfer act was passed. In 1927 the Legislature repealed the requirement of registration as a prerequisite to voting; redefined the

crime of voluntary manslaughter; and made possible State sterilization of defectives.

**INDIANAPOLIS.** The capital and largest city of Indiana. The population rose from 233,650 in 1910 to 315,746 in 1920 and to 382,100 in 1928, by estimate of the Bureau of the Census. The area is 50.43 square miles. A city planning commission of nine members was created in 1921, and in the year following a comprehensive zoning plan with distinct use, height, and area districts was adopted. In 1927 at a special election, Indianapolis voted to adopt government by commission and manager, the change to take effect Jan. 1, 1930. The city purchased the privately-owned reduction works in 1918; in 1924 it built a new sewage plant using the activated-sludge system. Indianapolis has 796.84 miles of streets, 591.00 miles of sewers, and 609.34 miles of water mains. Two municipal theatres, in which free entertainments are given, were established in 1922. The national headquarters of the American Legion have been established in Indianapolis, and an impressive World War Memorial has been constructed by the city, Marion County, and the State of Indiana. The base of the building, which is constructed of Indiana limestone, is 180 feet square; and the tower, which rises to a height of 230 feet, is 50 feet square. The building and Memorial Plaza, covering five city blocks, will represent, when completed, an expenditure of more than \$10,000,000. A municipal airport has been established on a 1000-acre field seven miles from the city.

The number of industrial establishments in Indianapolis increased from 886 in 1914, employing 31,791 persons and making products valued at \$39,700,016, to 1215 in 1922, employing 56,000 persons and making products valued at \$427,100,000; the capital investment rose from \$87,569,251 to \$220,250,000. In 1928 Indianapolis had 850 industries that produced more than 1200 different commodities, the leading ones being automobiles, slaughtering and meat packing, metal trades and machine shops, automobile accessories, wearing apparel, canning, printing and publishing, and grain and cereal products. These industries employed 45,752 persons who received approximately \$74,000,000 in wages. The value of products manufactured in 1928 was \$435,000,000. The resources of 4 National, 24 State, and 13 trust-company banks in 1928 were \$293,017,222, and the total assets of 58 building and loan associations were \$99,680,167. Approximately 10 per cent of the membership in building and loan associations in the United States is listed in Indianapolis, and approximately 40 per cent of the families own their own homes. Building construction in Indianapolis grew from \$7,933,081 in 1914 to \$23,669,315 in 1928. During 1928, 4200 permits were issued for new buildings at a cost of \$23,669,315. The assessed valuation of property in Indianapolis in 1928 was \$672,689,970; the net debt was \$31,419,575.

**INDIANA UNIVERSITY.** An institution for the higher education of men and women at Bloomington, founded in 1820. In 1928 it had the following divisions: College of arts and sciences, graduate school; law; commerce and finance; music; education; medicine; dentistry; nurses' training; and social service. During the period 1914 to 1928-29, the attendance increased from 2620 to 4233; the faculty from 155 members at Bloomington and 50 at Indianapolis in 1923, to 299 in 1928; the volumes in the library

from 99,760 to 197,700; and the income from \$396,216 to \$2,000,000 from State and private sources, the endowment amounting to \$774,778 in the latter year. A new commerce building costing \$235,000 was finished in 1923, and a stadium with a seating capacity of 22,000 was completed in 1924. Other new buildings ready or under construction in 1924 were a men's dormitory with a capacity of 115; a women's dormitory with a capacity of 250; James Whitcomb Riley Memorial Hospital (Indianapolis), dedicated. A new wing of the library was begun in 1925 and additional appropriations were given for library equipment in both 1926 and 1927. In the latter year, the Legislature appropriated a mill tax that was expected to yield \$350,000 per year, for 10 years, to be used exclusively for the construction of new buildings and the purchase of land. In October, 1928, a new home for the Nurses' Training School, costing \$500,000, the gift of Ball Brothers, of Muncie, Ind., was dedicated. In 1925 by act of the legislature, Indiana Dental College was purchased for the University and the four-year dental course was changed to a five-year course to take effect in the ensuing year. President, since 1902, William Lowe Bryan, Ph.D., LL.D.

**INDIAN PROBLEM.** See KENYA COLONY; SOUTH AFRICA, UNION OF.

**INDIANS (UNITED STATES).** The Indian population seems to have increased in the period since 1914. According to the U. S. Bureau of Indian Affairs, the number of Indians was 331,250 in 1914 and 354,940 in 1927, a gain of 23,690. For certain intervening years, their numbers were: 1921, 340,838; 1922, 340,917; 1923, 344,303; 1924, 346,902. The difficulty with accepting these figures on their face is that part of the increase may be due to the inclusion of large numbers of mixed-bloods with increasingly small proportions of Indian blood, and to the notorious inexactness of Indian census records. Part of the increase is undoubtedly real, due to improved health conditions resulting especially in fewer infant deaths. The U. S. Census of 1910, available in 1915, gives 265,083 in the United States and 25,331 in Alaska. While it may be possible that "Indians" in the census sense (i.e., those having an appreciable amount of Indian blood) are increasing, it is obvious that there has been no general increase in the number of full-bloods.

The current figures may be contrasted with estimates of the population at the time of exploration. There is a high degree of probability in the figures given by J. Mooney (*Aboriginal Population of America North of Mexico*, 1928) as follows: United States proper, 849,000; British America, 221,000; Alaska, 73,000; Greenland, 10,000; total, 1,153,000. Of these, the greatest number were in California (260,000), the Plains (141,800), and Gulf States (114,400). Kroeber estimates a smaller number for California (133,000), but agrees that its density was greatest (*Indians of California*, 1925). Mooney's estimate is smaller than that of K. Sapper (*XXI Int. Congr. Amer.*, The Hague, 95). Of a total of forty to fifty million for both Americas, there were in North America north of the limits of cultivation, one-half million; to the Mexican boundary, two to three million; Mexico, twelve to fifteen million; Central America, five to six million; West Indies, three to four million; tropical Andes, twelve to fifteen million; tropical East South America, two or three million; and in tem-

perate South America, one or two million. For aboriginal life, see ETNOGRAPHY.

The present distribution is very unequal, Indians residing principally in the Western States. Those having largest populations in 1926 were in their order: Oklahoma, 120,487; Arizona, 44,729; South Dakota, 24,676; New Mexico, 22,527; California, 18,913.

Hybridization is in progress among the Indians. The proportions of full-blooded and mixed-blooded Indians were established with accuracy for the first time in the U. S. Census of 1910, prepared under the direction of a competent anthropologist, R. B. Dixon (*Indian Population of the United States and Alaska*, 1915).

	United States		Alaska	
	Number	Per cent	Number	Per cent
Full-blooded	150,053	56.5	21,444	84.7
Mixed-blooded	93,423	35.2	3,887	15.3
Not reported	22,207	8.3	....	...

Those of mixed blood were predominantly Indian-white (including Mexicans); mixtures with Negroes were only 1.5 per cent of the total. In five adjoining States (New Mexico, Utah, Arizona, Colorado, and Nevada), comprising the interior arid plateau, and in Iowa and Mississippi, the proportion of full-bloods was more than 85 per cent. In California, Idaho, South Dakota, and Wyoming, the proportion was more than 70 per cent; in Louisiana, Montana, Nebraska, Oregon, and Washington, more than 55 per cent. Oklahoma, which contained one-third of all Indians, had only 36.6 per cent of full-blooded. Principal tribes with the highest percentages of full tribal blood were: Hopi (Arizona), 99.3 per cent; Navajo (Arizona-New Mexico-Utah), 99.0 per cent; Zuni (New Mexico), 98.4 per cent; Papago (Arizona), 95.8 per cent; Pima (Arizona), 95.3 per cent; Laguna (New Mexico), 94.8 per cent; Ute (Colorado-Utah), 93.0 per cent; Mohave (Arizona-California), 91.3 per cent; Arapaho (Oklahoma-Wyoming), 89.4 per cent. These figures are an index of the extent to which tribal solidarity has been preserved. All of these tribes, excepting Arapaho, live in relative isolation from white settlements. These data for 1910 are probably representative of conditions in 1928, except that the percentage of mixed-bloods may be slightly greater.

Several studies of inheritance of physical traits among mixed-bloods have recently been made. Jenk's *Indian-White Amalgamation* (1916) showed that among descendants of Ojibwa and French-Scotch, breadth of face and head varied between the ancestral extremes according to the preponderance of one strain or the other. A more extensive study was Sullivan's *Anthropometry of the Siouan Tribes* (1920). It appeared here also that there was a tendency among the offspring to inherit the wide face of the Indian or the narrow face of the white parent, but not to form an intermediate type. Narrow heads and narrow faces tended to be inherited together. In characters such as skin, hair, and eye color, and in hair form, the half-bloods approached Indians more closely than whites. Half-bloods were taller than full-bloods. These confirm earlier observations of the same nature by Boas.

Fecundity and vitality among Indians are related to the percentage of mixed blood in the parents. The percentage of sterile women in the total is 8.6; in full-blood marriages, 10.7; in mixed marriages, 6.7. Sterility further decreases in direct proportion to the amount of

mixed blood. Mixed marriages also show a greater fertility, although the proportion of mixed blood does not affect the result; average number of children in all marriages, 4.8; in full-blood, 4.5; in mixed marriages 5.1. Vitality is also greater among children of mixed marriages: per cent of children surviving in all marriages, 74.7; in full-blood, 69.7; in mixed marriages, 79.0. The vitality of the children increased proportionately to the white blood of the parents. It is not clear whether this relative superiority of mixed unions is due to social or racial conditions.

A measure of changing social conditions among Indians appears in the records of school attendance and illiteracy. School attendance is obviously related to the facilities provided. The number of school children in 1910, in 389 schools, was 31,930; in 1900 (329), 26,771; in 1890 (246), 16,377. This varied with tribes from Hopi, 79.3 per cent of children in school, to Navajo, 8.9 per cent. Illiteracy among Indians was 45.3 per cent in 1910, compared with 7.7 per cent for the entire United States. It has decreased, however, from 1900 (56.2 per cent). This varied with tribes from Navajo (95 per cent males, 84 per cent females) and Zuni (95 per cent males, 60 per cent females) to Chickasaw (21 per cent males, 6 per cent females). The Hopi and Zuni are Pueblo peoples concentrated in a few fixed villages; the Navajo, a widely scattered desert people; the Chickasaw live on terms of equality with the Oklahoma whites.

Social conditions vary enormously among the Indians, from that of the Five Civilized Nations of Oklahoma and the Indians of New York State, whose status is substantially that of whites, to the Indians of Arizona, Nevada, and Utah, where their existence in remote districts is still on a primitive level. Hence, their problems and those of the Bureau of Indian Affairs, charged with their protection and development, are highly variable. The general policy of the Government is to fit them as rapidly as possible for complete amalgamation with white communities, gradually withdrawing from the capacity of guardian. Progress has been much slower than was anticipated, partly owing to the handicap of poverty and ill-health of the Indians, partly to their isolation in many instances, and partly to the ineptitude and vacillating policy of the Indian Bureau. A large part of the gain made by Indians in 1914-28 is indirectly due to the rapid expansion of automobile roads in the West opening up the more inaccessible districts.

For some years, the policy of the Bureau has been to declare individual Indians competent to manage their own affairs as rapidly as possible, rather than wait for whole tribes to reach this status. In 1917 the Bureau declared for including all having one-half white blood or more in this group, but in 1921 the Commissioner of Indian Affairs annulled this blanket policy as unworkable. The Bureau had also for some years been contracting with the States to include Indian children in public schools. This had the advantage of hastening their induction into white communities and relieving the Federal Government of many administrative costs. In 1927 the number of children so placed was about thirty-four thousand. The Bureau was aware that its health programme had not kept pace with progress elsewhere, due to financial neglect of the service and the high turnover of underpaid workers. Coöperation was arranged with the U. S.

Public Health Service and State boards, which materially improved the situation. The Bureau had also requested extension of existing Federal and State laws to include minor crimes committed on reservations and which did not fall under Federal statutes. These had previously fallen in the jurisdiction of reservation courts, whose authority was meagre and punishments mild.

The Indian's legal status and property rights were brought sharply into public focus by the introduction in Congress of the Pueblo Land Bill. This provided that white claimants to Pueblo Indian lands and water rights in New Mexico should be recognized without regard to the rights of the Indians and that should the Indians thus be deprived of sufficient land to support themselves, they were to be removed to other lands. The outburst of public sentiment was such that the bill was withdrawn.

About the same time, the Commissioner of Indian Affairs issued a proscription against all Indian dances (which have both social and religious significance). The demands for the prohibition came largely from religious organizations, although Indians and their advocates maintained that this was a punitive act for having blocked the Pueblo Land Bill. The previous policy of the Bureau had been not to interfere with native ceremonies, except with respect to unlawful practices, which were rare. Thus, the question of religious freedom was raised. Opposition spread rapidly to white citizens, as well, and several associations for their assistance were organized, notably the Indian Defense Society. Public opinion forced the Commissioner to recede from his position. See also G. E. F. Lindquist, *The Red Man in the United States* (1923).

These two acts had the salutary effect of re-arousing public interest in the Indian. For the first time, the general public became aware of the wretched condition of these people. Knowing only by repute of the great wealth of a single tribe, the Osages, derived from oil-land royalties, the popular impression had been that Indians generally were well-to-do. The organizations friendly to the Indians soon remedied that misapprehension and the public conscience demanded a new policy on the part of the Indian Bureau.

An outgrowth of this agitation was the investigation of the condition of the Indians and *The Problem of Indian Administration* (1928), by the Institute for Government Research, at the request of Secretary Work. While this report was primarily concerned with the Indian Bureau, it is a mine of information on the present status of its wards.

The conditions it reported were shocking. Indians are miserably poor. While other resources vary from one reservation to another, it may be noted that their cash income per capita per year is under five hundred dollars (Carson, \$15 to Colville, \$418), except for Klamath, \$1523, and Osage, \$19,119. Per-capita earned incomes vary from \$8 to \$351 per annum. The concomitant of this poverty is disease. The tubercular are estimated at one in ten. Deaths from it are 6.3 per 1000, as compared with 0.87 for the general population. Trachoma, which causes blindness, is widespread and venereal disease rife. Infant mortality is high: deaths of children under one year constitute 26.2 per cent of all deaths; of those under three years, 36.0 per cent (compared with 13.6 per cent and 16.2

per cent in the general population). The total death rate is abnormally high, 25.6 per 1000, as compared with the general 10.2. The highest Indian death rate (39.2) is in Nevada. Hospitals, sanatoria, and the like, maintained for them are insufficient in personnel, equipment, management, and design. Boarding schools are not only overcrowded, but the children are undernourished, routinized, made to labor for the maintenance of the school, taught subjects unrelated to their life, and turned back on reservations without aid in establishing themselves. The per diem for food in these schools is eleven cents, totally inadequate to feed them. Legal protection is inadequate, although much of the best work has been done by the Indian Service in this field. Indians are despoiled of their holdings by designing individuals. Others are ignorant of the value of land placed in their hands by patent, and dispose of it to their own harm. There is hardly a phase of Indian life in which they are not below the standards of even the poorest whites. This is not a fault of their own creation, but is due to the encroachments of whites and the lack of any broad and sustained plan on the part of the Indian Bureau.

On the basis of their report, the Institute for Government Research made recommendations to improve conditions among the Indians and increase the effectiveness of the Indian Bureau. "The fundamental requirement is that the task of the Indian Service be recognized as primarily educational . . . devoting its main energies to the social and economic advancement of the Indians, so that they may be absorbed" or be fitted to live "at least in accordance with a minimum standard of health and decency." It is recognized that this cannot be achieved without a material increase in the Congressional appropriation. To use this effectively, a Division of Planning and Development should be created, the expert members of which should be able to advise the Bureau, prepare programmes of local development, and check the effectiveness with which they are carried out. Recognizing that local problems are highly variable, they recommend a maximum decentralization in planning and supervising the Bureau's activities.

Among the immediate improvements, health conditions stand first, since these affect not only the Indians but the whole population. Public health clinics are recommended, extensions of hospital service, periodic examination of children, and material improvement of the children's diet. Educational improvements are possible by a programme better suited to the children's needs and by raising the qualifications of teachers. Routinization in the schools, which destroys individual initiative, should be abolished. Similarly, much of the labor of the pupils for school-maintenance, condoned as giving industrial training, should be done away with. Provision should be made for after-school placement in order that the pupils may not revert to reservation conditions. Economic conditions can be improved by creating opportunities for remunerative work; withholding fees from unearned incomes as conducive to pauperism. Improvement in the homes is possible by a more adequate home-demonstration and public-health service. A check on exploitation can be had by legal services more in the Indian's interest, and by preventing the sale of inherited lands which leaves the Indians landless. The most drastic criticism of the Indian Service is on the ground

of the inadequate training and personality of its local staffs, which are also insufficient in numbers to serve its purpose. It is recognized that this is the result of unattractive salaries. Accordingly, higher salaries are recommended, which are to be paid, however, only for more adequately prepared individuals.

Immediate action is recommended to feed the generally undernourished school children; then to proceed in turn with the Division of Planning, improving the present personnel and equipment, the health and economic programmes, and obtaining new specialists for the purpose. While a general estimate of additional appropriations is not made, it appears that more than seven millions a year will be needed over a period of five to ten years. The current appropriation (1928) is \$14,991,485, including \$2,151,800 from tribal funds. This addition would create an efficient organization, the upkeep of which would diminish year by year as the Indians merge into the general population.

Late in 1928, a senatorial committee began hearings on the Indian question in California. The 1928 platform of the Republican Party favored a commission to inquire into any infringements of the rights of Indians. It remains to be seen if anything comes of this. See RACE PROBLEMS; EUGENICS; ANTHROPOLOGY; ETHNOGRAPHY.

**INDUSTRIAL CHEMISTRY.** See CHEMISTRY, APPLIED.

**INDUSTRIAL DEMOCRACY.** During and immediately after the World War, various programmes were considered, and some adopted, for the purpose of giving the workers a greater share in the management of industry. None of these had a real success though some of them did, for a time, stabilize working conditions in a number of industries. Theoretically, the concept of industrial democracy aimed at the introduction of democratic principles in industry and the control of the means of production by the producers, i.e., the workers. What was to be, in short, was a form of syndicalism. Expression was to be given to the idea through the organization of workers' committees in the shops not only for the purpose of exercising control but to perfect profit-sharing devices. In Great Britain and Germany, some organizations were set up; in the United States, the only thing to emerge was a paper plan (the so-called Plumb Plan) which soon dropped out of sight.

In Great Britain, under war conditions, shop stewards, as they were called, assumed leadership in many factories and represented their fellow-workers in discussions concerning hours, wages, and shop conditions. The movement was syndicalist in character and had as its real aim the setting up of control by the workers, and because the shop stewards were largely to be found in the engineering trades (which were so vital in the production of munitions), they played very important rôles. With the end of the War, however, the shop-steward movement declined and trade unionism once more assumed its leadership of the working-class movement. The same was the fate of the Whitley Councils which first appeared in Great Britain in 1918 as the result of a governmental committee investigation. This body recommended joint standing industrial councils as the means for adjusting relations be-

tween employers and employees. There were to be in the system district councils and work committees, as well as national councils. During 1918-20, these councils spread and, at the end of the two years, there were 72 councils and 11 interim reconstruction committees; but the idea never took hold in the important industries and the council languished, as trade unions, freed from war restrictions, once more gained control.

The fact is, in Great Britain and Germany, too, where the working populations were organized on political lines, it was recognized that the present industrial situation of private ownership partook more or less of the nature of a truce. The trade-union position was this: the State, increasingly, was to be used as an instrument in giving the worker security against unemployment, sickness, and old age; it was sooner or later to take over the key industries; and trade unionism was the only weapon of the worker in the protection of working conditions. In the individual shop, everything was in favor of management; hence, the individual worker had to have back of him the organized effort of the whole working class and not merely that handful with whom he had an affinity of interest through propinquity. English industrialists were realists and showed that they appreciated the situation when, as a result of the efforts of Lord Melchett, the English Conference on Industrial Relations (1928) insisted upon the recognition of trade unionism and sought to maintain peace in industry not through the so-called democratization of industry but by treating with trade unionism as a component element in the situation.

In 1920 Germany provided for the creation of works councils in all establishments where 20 or more persons were employed. The functions of the councils were: to cooperate with employers to increase efficiency; to promote industrial peace and adjust grievances; to supervise the adjustment of awards affecting employees and agree on working rules; to promote safety and good health; and to cooperate in the administration of welfare programmes. For a brief time, the councils functioned. During the inflation period (ending November, 1923), they helped in the stabilization of wages; but, with deflation and the resulting unemployment, the position of the trade unions was seriously weakened and the works councils were shorn of most of their power. In 1925 the trade unions had recovered and works councils began to reappear in larger establishments. In smaller plants, they continued to disappear and, in ordinary commercial establishments, they were practically nonexistent. The works councils have largely acted to enforce trade agreements made by the unions with the employers and to protect workers against unjust dismissals. The system has fallen very far short of its expectations when its advocates said it was going to give the workers a share in the control of management.

In the United States, immediately after the War, much attention was given to the Plumb Plan, whose purpose was the setting up of a system of workers' control among the railways. This plan, named after its author Glenn E. Plumb, who was the general counsel for the railway brotherhoods in the United States, proposed government purchase of the railways and the creation of a national railways operating corporation, the board of directors of which was to

consist of 15 members, five chosen by the workers, five by the officials of the railways, and five by the Government. The Interstate Commerce Commission was to fix rates and wages were to be fixed by a wage board. Profits were to be divided between the Government and the corporation. The railroad brotherhoods sponsored the plan and succeeded in gaining the endorsement of it by the American Federation of Labor at the conventions of 1920 and 1921, but nothing came of the plan.

Another scheme that received attention was the Baltimore & Ohio plan for the union-management cooperation in the running of the railway shops of the system. The plan was first inaugurated in 1923 and by 1929 was in operation in the 45 shops of the Baltimore & Ohio, as well as on the Canadian National Railways, the Chicago & North Western, and the Chicago, Milwaukee & St. Paul. The essentials of the Baltimore & Ohio plan were as follows: Each shop is organized as a unit. Trade unions are recognized, and management and the unions are to develop written agreements governing wages, working conditions, adjustment of disputes, etc. There is to be cooperation between management and the unions for the purpose of increasing efficiency and the elimination of waste. The workers, on the other hand, are to be assured that employment will be stabilized. In other words, for greater efficiency, the worker is promised security in employment, better working conditions "and sharing in the gains of cooperation."

**INDUSTRIAL EDUCATION.** See EDUCATION IN THE UNITED STATES.

#### INDUSTRIAL WORKERS OF THE

**WORLD.** A labor organization founded in Chicago in 1905, by a group of radicals who were discontented with the conservative policies of the trade unions. It was based on industrial unionism as opposed to the craft unionism of the American Federation of Labor, and in this sense it was a form of syndicalism. It drew its strength largely from the unskilled and migratory labor of the West, that is to say, the men from the logging and railroad-construction camps and those who followed the harvesting season from the South to the North. It worked with some degree of success among dockworkers and seamen. During the period of the War and immediately afterwards, the organization was prominently identified with a series of important strikes in the West. It was associated with the disorders in Bisbee, Ariz. (1917), as a result of which a large group of workers was deported into the State of New Mexico; its leaders were charged with interfering with the prosecution of the War and in 1918, 95 of them were tried and found guilty of conspiracy. They were sentenced to serve twenty-year jail terms and pay fines of \$20,000. I. W. W. leaders were charged with having fired on a parade of veterans in Centralia, Wash., Nov. 11, 1919, and a round-up of I. W. W. members resulted. In the years immediately after the War, a number of the Western States dealt harshly with the movement and made membership in it a criminal offense. Notably, California and Washington led in these prosecutions.

After 1924, the movement declined and by the close of the period surveyed (1928), the I. W. W. had passed from the industrial and political scene. Its decline may be attributed to the following reasons: the defection of its leader, William D. Haywood, who deserted his fellow

prisoners and fled to Russia while out on bail; the internal strife that had been part of the movement since the Russian Revolution; an attempt on the part of some to make the I. W. W. less revolutionary and more scientific by carrying on surveys in key industries, etc.; official persecutions in the West; the falling out with the Red International. This last probably was the chief reason for the disappearance of the movement. The success of the Russian Revolution had seized the imagination of the radicals in the country and they became convinced that the methods of Communism and affiliation with the Communist international at Moscow (a thing which I. W. W. leadership had steadily refused to do) were more likely to produce success than the more intellectual methods of the I. W. W. After 1924, therefore, the Workers' Party supplanted the I. W. W. as the radical organization in the United States.

**INFANTILE PARALYSIS.** In 1921 a new serum treatment for this disease was announced by Dr. Rosenow of the Mayo Foundation, and artificial sera have been tested extensively, but despite many favorable results published the tendency at present is to depend on the use of natural convalescent serum when this can be obtained. The possibility of the recurrence of the epidemic incidence of the disease as witnessed in 1907 and 1916 has caused this malady to take on renewed interest with the lapse of time. An intensive campaign, chiefly of education, was planned in 1929 by a body of practitioners and research men and funds have been supplied for the collection and preservation of convalescent serum. The details have not yet been worked out but the movement has been sponsored by the Rockefeller Institute and the campaign proposed is international in scope, with Dr. W. H. Park as chairman. Reports in which the early use of serum treatment has appeared to cause a great sparing of life and function have recently been published, but credit is given almost entirely to convalescent serum and it does not appear that manufactured sera can duplicate results from the latter. It is so difficult not only to make a correct early diagnosis and institute treatment at the proper time, but also to make certain of a large supply of convalescent serum that too much must not be hoped for should the disease appear in wholesale incidence.

**INFANTRY.** See **ARMIES AND ARMY ORGANIZATION; STRATEGY AND TACTICS.**

**INFLATION.** See **FINANCE AND BANKING.**

**INFLUENZA.** The pandemic of 1918 wrote a new and significant chapter in the history of this contagious disease. Up to that period, it had been regarded commonly as an air-borne affection, proof against isolation and quarantine; its spread by personal contact is now acknowledged by health authorities. Before the pandemic, influenza had been generally viewed as a relatively harmless but very annoying malady, dangerous chiefly to weaklings and through occasional complications. When influenza is deadly, it is because of the complication of pneumonia, and so prevalent was this complication in the pandemic that some clinicians came to regard the disease as essentially pneumonic, although under ordinary circumstances this feature is quite latent or suppressed. The custom of keeping the influenza patient in bed for a week, despite the insignificance of the symptoms, is due very largely to the belief that every case of influenza is a potential pneumonia and that the latter is

apt to assert itself if the patient is up and about. Of great importance is the relationship between pandemic influenza and ordinary seasonal winter gripe. The latter in most localities has been regarded as a legacy of the older pandemic of 1890, although winter gripe is known to have existed in certain localities, Minnesota, for example, long before that year. There are notable differences in epidemicity, for while winter gripe, as the term implies, is an affection peculiar to cold weather, true influenza appears just as readily in the spring, summer, and autumn as in winter. Winter gripe is not highly contagious, although in cold months there are better opportunities for the spread of a disease. In regard to the bacterial cause of winter gripe, four or five separate germs have been accused at different times, notably Pfeiffer's bacillus, the pneumococcus, streptococcus, micrococcus catarrhalis, etc. That is, each of these organisms seems capable at times of setting up a relatively benign epidemic catarrh without any special tendency to dangerous complications.

In pandemic influenza, none of the above organisms can be associated with the contagion of the disease, although its deadliness is due to the special virulence of the pneumo- and streptococcus, responsible for the peculiar type of fatal pneumonia so often seen. To explain the pandemic, we must invoke the existence of a highly diffusible contagious principle which in addition to smiting the great majority of those exposed further lowers the resistance to the ordinary ubiquitous disease-bearing germs, so that under the circumstances these acquire unusual virulence. The pandemic of 1918 lasted from May of that year to May, 1919. During this period, there were at least three distinct waves. The first, which occurred in late spring and early summer, was distinctly mild. The second wave, in late summer and early fall, was very severe, decidedly malignant. The third wave, in the winter of 1919, also was malignant, masking the ordinary seasonal gripe. Hence, judging from analogy, the virulence of the disease, at first mild, gathered force during the second and third outbreaks, as a result of continuous passage through human bodies. This law of increasing virulence is familiar in experimental and clinical pathology.

Did the pandemic of 1918 originate in Spain? There is no evidence to support this belief. Influenza was common in fighting troops during 1917; in the United States Army alone, more than 40,000 men were attacked, both at home and in France. Influenza of decidedly virulent type was seen again in March, 1918, in widely different parts of the world—America, France, and the Far East. The disease gradually gathered force and chanced to break out in Spain during May on a huge scale. The weight of evidence favors the belief that the scattered episodes in the United States early in 1918 played a major rôle in causing the European outbreak through the crowding of our soldiers at this period. We know that contagious diseases flourish when foreign troops are moved about. Influenza was often likened to the plague in deadliness, but this result is apparent only. Influenza may attack nearly every one, but the death rate does not usually exceed 2 per cent of those attacked; those attacked by pneumonia may have a death rate of 40 per cent. Plague pneumonia attacks relatively few, but with a mortality almost or quite 100 per cent. Since the pandemic, there has

been only a regular succession of outbreaks of seasonal grippé, varying in severity.

**INGE, Inj, THE VERY REV. WILLIAM RALPH** (1860- ). A British prelate and man of letters (see Vol. XII), dean of St. Paul's (London) since 1911. He was Commander of the Royal Victorian Order, Fellow of the British Academy, Honorary Fellow of Jesus and King's Colleges, Cambridge, and of Hertford College Oxford, Gifford lecturer (1917-18), and Romanes and Hilbert lecturer (1920), Rede lecturer (1922), and Hulsean lecturer (1926). In the front rank of contemporary British essayists, he is known, on account of his vigorous criticism of certain modern tendencies, as "the gloomy dean." His later writings were: *Types of Christian Saintliness* (1915); *The Philosophy of Plotinus* (1918); *Outspoken Essays* (1919), 2d series, (1922); *The Idea of Progress* (1920); *The Victorian Age* (1922); *Personal Religion and the Life of Devotion* (1924); *The Platonic Tradition* (1926); *England* (in Modern World Series, 1926); *Lay Thoughts of a Dean* (1926); *The Church in the World* (1927); and *Labels and Libels* (1929).

**INGELBRECHT, D. E.** (1880- ). A French composer and conductor, born in Paris. After his graduation from the Conservatoire he began to attract attention through his interpretation of impressionistic works, especially those of Debussy. In 1908 he became conductor at the Théâtre des Arts, and four years later went to the Théâtre des Champs Élysées. In 1925 he was appointed musical director of the Opéra Comique. A close personal friend of Debussy, he espoused the cause of impressionism also in his compositions. He wrote a ballet-opera, *Le Diable dans le Beffroi* (Paris, 1927); a symphonic poem, *Pour le Jour de la première Neige au vieux Japon*; *Le Cantique des Créatures de Saint François d'Assise*, for chorus and orchestra; *Rapsodie de Printemps, Automne et Trois Poèmes dansés*, for orchestra; *El Greco, évocations symphoniques*; a quintet for strings and harp; chamber music, piano pieces and several collections of songs. He also orchestrated a number of piano works of Couperin and Albeniz.

**INGLIS, ALEXANDER JAMES** (1879-1924). An educator and author of educational books; born at Middletown, Conn., and educated at Wesleyan University (Conn.). He became assistant professor of education in 1914, and in 1919, professor of education at Harvard University. During the World War and later, he was engaged as expert in important educational investigations and surveys for both the Federal and State governments. Besides textbooks for Latin courses, he wrote *Rise of the High School in Massachusetts* (1911); *Principles of Secondary Education* (1918); *Virginia Public Schools* (1919); *Intelligence Quotient Values* (1921); and *The Inglis Tests of English Vocabulary* (1924; rev. ed., 1927). He also edited a series of books on the theory and practice of education.

**INHERITANCE TAX.** See TAXATION IN THE UNITED STATES.

**INJUNCTION.** When Congress in 1914 passed the Clayton Act, greatly restricting the use of injunctions in labor disputes, its action was hailed by labor as an important victory in its long fight to curtail the use of injunctions. In the years immediately following, encouragement also was given to labor in State legislation. In 1917 an interesting tendency was disclosed in the Northwest to free strikes from

injunctions and at the same time to punish violence severely. Minnesota forbade the issuance of injunctions in trade disputes except to prevent irreparable injury to property and prohibited their issuance to prevent termination of employment. The act does not curtail the power of the courts if irreparable injury to business or property is threatened by violence or unlawful acts or acts involving criminal syndicalism. Utah passed a law similar to the Minnesota act, adding that injunctions must not interfere with "peaceful persuading." In 1919 legislation was passed in Iowa, North Dakota, Oregon, Washington, and Wisconsin to limit the use of injunctions. Nevertheless, the courts, both Federal and State, continued to issue injunctions in labor disputes in ever increasing numbers and in terms more and more strict.

While is it the established law in the United States that laborers may under no circumstance be enjoined from quitting work, still in some injunctions "conspiring to quit" was enjoined. The courts resorted generally to the conspiracy theory in issuing injunctions against acts not in themselves unlawful in labor disputes. In some notable injunctions, union officers were prohibited from advising or ordering workmen to go on strike or from paying strike benefits. A notable injunction of this type which aroused widespread interest was secured by the Federal Government during the bituminous coal-mine dispute of 1919.

More injunctions were issued in connection with labor disputes in 1922 than in any previous year. At least twice as many were issued by the Federal courts in this year as in the entire 10 years preceding. Included among the 1922 injunctions was a judicial order which prevented the officers of the Brotherhood of Railway Station Employees from calling a strike sanctioned by a referendum vote. Another was a judicial order, subsequently materially modified by a higher court, which enjoined the United Mine Workers from attempting to unionize a West Virginia coal district. But overshadowing all others was the injunction which the Attorney General of the United States secured from a Federal judge in Chicago against the railway-shop crafts. This injunction, which aroused a storm of public discussion, was so broad that it practically forbade the strikers from doing anything, peaceful or otherwise, toward winning the strike. The use of injunctions in labor disputes, which labor maintains is an abuse, was increasing to such an extent that by 1924 it had become a political issue of considerable importance.

The platform of the independent candidate, Senator Robert M. LaFollette, declared vigorously in favor of abolishing the use of injunctions in labor disputes, although the Republican and Democratic party platforms ignored the issue until 1928. Meanwhile, several States adopted minor regulations and Illinois and New Jersey passed so-called anti-injunction laws. Congress, in 1926, abolished the railroad labor board and repealed the Act of 1913 providing for arbitration of disputes between railroads and their employees and established therefor machinery for settlement of disputes which fail of adjustment by usual means of conference. The 70th Congress had before it for consideration the Shipstead Anti-injunction Bill. Extensive public hearings were held on this measure and the sub-committee

prepared an elaborate substitute bill which was referred back to the full committee but no further action was taken.

Important among recent court decisions is that handed down by the United States Supreme Court (Apr. 11, 1927) in the case of Bedford Cut Stone Company vs. Journeymen Stone Cutters' Association, as a result of which it must be regarded as settled law that all strikes against the use of non-union material are unlawful, and that, in most cases, the anti-trust laws can be invoked against them. More encouraging to labor is the case of Interborough Rapid Transit Co. vs. Lavin, et al., 247 N. Y. 65, upholding the right of a union representative to solicit membership among workers belonging to a company union and parties to a "yellow dog," or individual, contract.

**INMAN, SAMUEL GUY** (1877- ). A clergyman and writer on South American topics, born at Trinity, Texas, and educated at Columbia University. He engaged in educational and missionary work in Mexico in 1906, and after 1915 was secretary of the Committee on Cooperation in Latin America. He wrote *Christian Cooperation in Latin America* (1917); *Interconversion in Mexico* (1919); *Through Santo Domingo and Haiti* (1919); *South America Today* (1921); *Problems in Pan-Americanism* (1921); *Ventures in Inter-American Friendship* (1925); and other works on Latin America. He founded and directed the monthly magazine, *La Nueva Democracia*.

**INSANITY.** Insanity, to judge from reports of various localities since 1914, has been increasing more rapidly in the United States than the population, and the housing shortage cannot explain the overcrowding of institutions and the use of property intended for other purposes to shelter the insane. Kretschmer has shown that the individual who develops precocious dementia and he who becomes a victim of manic-melancholic insanity have opposite types of mind and physique. All men, in other words, have schizoid or cycloid characters. Others have taken up this teaching with modifications, notably Bleuler and Jung, and a large literature on temperament and character has sprung up.

True progress in the direction of the actual cure of forms of insanity generally regarded as beyond aid, including congenital mental defect, is naturally slow and uncertain; but within the past few years, progress has developed where most unexpected. The cure of paresis—a sequela of syphilis hitherto regarded as not only incurable but rapidly fatal—through inoculation with blood from a malaria patient, as originated by the Vienna alienist Wagner von Jauregg, has resulted in the cure of 30 per cent of all cases treated. Very recently, Doctors Lovenhart and Lorenz have devised a method which as yet has not been fully made public for rousing patients from katatonic stupor, a condition common to the endogenous insanities of youth. This method involves the use of an inhalant vapor and its details have not yet been sufficiently perfected for general discussion. While the actual gain is slight, it is possible that a new era is foreshadowed for the control of certain insanities. Another step forward seems to have been made by Dr. W. Timme in the improvement obtained by him after 10 years of experiment on children with Mongoloid idiocy, a condition hitherto regarded as hopeless. These results have been accomplished by the use of inter-

nal secretions and in a number of patients the mental condition passed from idiocy to a much higher intellectual plane.

**INSECTS AND INSECT CONTROL.** See ENTOMOLOGY ECONOMIC; and FORESTRY.

**INSTALLMENT SELLING.** What is known as installment selling, since 1914 has assumed a place of great importance in the American system of business practices and management. It has recently been estimated that of a total of about \$40,000,000,000 of merchandise annually sold at retail, probably \$8,000,000,000, to \$9,000,000,000, is annually marketed in this way. It is an undoubted fact that the adoption of this method of selling has greatly increased the volume of sales, and consequently in many cases, the rate of turnover and profits enjoyed by the enterprises which have adopted it. Accordingly, the new system of selling has made rapid progress, and has, of recent years, spread outside of the United States and into several European countries besides gaining a foothold in the Orient.

**Definition and scope.** By installment selling is meant, as the term indicates, the transfer of goods from seller to buyer, without full payment, either on the spot, or within a designated period, but instead, upon the basis of a limited cash payment made at the time of taking possession, followed by a series of cash payments at indicated periods, until the whole purchase price is liquidated. Prior to the adoption of the installment plan, prevailing methods of sale included chiefly transfers of goods for cash, transfers for signed obligations, such as notes or acceptances, and transfers on open account based, therefore, upon the buyer's general credit, and usually limited by the practice of the trade to such periods as 30, 60, or 90 days, according to custom. It is true that in a few lines of business, such as the sale of sewing machines, agricultural implements, and the like, a practice of allowing payments to be made at so much per week or month over long periods had been established. These were usually founded upon investigation of the income-earning power of the buyer, and were sometimes accompanied by liens upon wages, so that the payments really became an anticipation of wages. In a few instances, the buyer of such commodities signed an agreement to surrender the article in the event of default of any installment, even though the article might be very nearly paid for. Purchase of real estate was also generally made on a partial-payment system.

**Origin.** The installment plan is thus not new in conception, but is new in application and in the working out of its technique. Its growth in recent years has been largely due to two factors: (1) The increasing ability of manufacturers to cut unit costs by mass production, provided they could obtain a wide distribution, and (2) the increasing number of high-priced mechanisms which might be brought within the reach of a consuming public, liberally paid and generally employed, provided that that public could be induced to save for the purpose of buying a desired object. To these two factors might be added the increasing flexibility and ingenuity in the use of credit-extension devices which has resulted in the creation of numerous enterprises, designed to "carry" or finance obligations made by those who purchase on the installment plan.

The types of installment-plan selling vary somewhat, but may be classified under a few

main heads. (1) There still exists a considerable body of goods, in which delivery is made without the signature of any documents or execution of any obligations, but merely with the oral agreement on the part of the buyer to remit at stated intervals, usually monthly, until the entire purchase price is settled. (2) A more common variation of this plan is found in the execution by the buyer of a bill of sale of the commodity in favor of the seller, so that the latter is in a position to recover possession of the article at any time he sees fit, usually in the event of default on any installment. (3) A still further variation is afforded by the practice of requiring of the buyer the signature of a series of notes representing the amount of his various installments, while these notes are themselves secured by the bill of sale of the commodity or a chattel mortgage thereon. (4) In some cases, the buyer signs a qualified form of agreement in which he undertakes to make payment, but with the understanding that he may at any time discontinue the payments and turn in the article in its condition as then existing.

**Study of Credit Fundamental.** It is evident that the successful working of this plan implies rather careful scrutiny of credit on the part of those who make the sales. Accordingly, it generally necessitates a selling mechanism, in which actual sales are made and credit tested by a local representative or dealer. This representative or dealer may grant the credit on behalf of the producer of the article, or in other cases, he may be called upon to pay cash to the producer, and then grant the credit on his own responsibility. In the former case, the producing concern, if it succeeds in obtaining a large distribution, evidently has a very widely diffused body of assets, and a very complex problem of collection. In the latter case, its continued sales depend upon the prosperity of the local dealers, and upon their success in maintaining their sales upon a high level. This in turn necessitates provision of means whereby the dealers may succeed in disposing of, or "financing" the paper which they receive from their customers. The latter necessity has resulted in the organization of a large number of "financing companies," "acceptance corporations," and other enterprises of a similar character. In these concerns, a definite form of financing is arranged in behalf of the dealers who are selling given kinds of commodities to the public. These dealers are encouraged to sell to them the acceptances or notes growing out of their transactions (with or without their own indorsements as the case may be) and the company then undertakes to "finance" them. It has various ways of accomplishing this object. One way is to put in the hands of a trust company, the notes, chattel mortgages, etc. growing out of the operations of the dealers, and then to issue against these its own collateral notes which are sold to investors or banks. Such a buyer of these collateral notes then has as security: (1) the signature or obligation of the buyer of the commodity, (2) a mortgage upon the object which he has bought and is using, coupled with insurance thereon, (3) the endorsement or guarantee of the dealer to whom the note was originally given by the buyer, (4) the obligation, in many cases, of the acceptance or finance corporation which has purchased the paper and is reselling it to the investor.

**System Tested by Soundness of Paper.** It is evident that the general effect of the install-

ment finance system must eventually depend upon the character of this paper and the extent to which the credit system is soundly based. While there has been much talk of the "moral" effect of the installment system, of its alleged incitement to extravagance, etc., a careful analysis of the situation largely eliminates these fictitious elements in the discussion. Those who are disposed to be extravagant in one way are likely to be extravagant in another and vice versa, so that the question whether the credit has been soundly issued and used, appears to be in the last analysis the final test of the desirability of the procedure employed. Unfortunately, thus far, experience has not been long enough to afford a positive conclusion on this subject. Losses have been comparatively small. They have however been large enough to indicate where the danger lies.

This danger may be described somewhat as follows: Inasmuch as the sale of goods on the installment plan is practically nothing more than the anticipation of future income, or rather the appropriation of future income to specified objects, the real question clearly is whether there is a probability that future incomes will continue. The reply made by advocates of the installment-sale system is that, with a very wide distribution of sales, it may be expected that future income will be undisturbed. To this, the response is naturally made that while that may be true as a general assertion, the probability, or at least possibility, of periodically recurring business depressions renders it always within the bounds of reason that there may be a general condition of unemployment, in which case it is highly improbable that installment payments could be generally maintained. Further, since the security of the seller in cases of non-payment is found in the recovery of the object sold, and its resale at second hand, such sales would be likely to reach their peak at a time when public demand was smallest. The result might easily be that enterprises whose capital is very thinly spread out, in carrying industries financed on the installment-sales plan, would be unable to protect themselves against loss, and would be left with great numbers of half-used and half-worn goods as their only means of protection. In the case of articles which are to be regarded as semi-luxuries, rather than necessities, such for example as automobiles, this criticism applies with substantial force. On the other hand, in those industries which turn out goods not of very standard quality, or which lose a large fraction of their market value through a short period of use, such for example as clothing, furs, and the like, the possible protection to be obtained from recovery of the goods and resale is likely to be a small and unsatisfactory one. There is, therefore, a large possibility of failure in these lines whenever a great quantity of goods has been placed on the installment plan, followed by a period of relatively slack employment and poor collections.

**Banks and Installment Selling.** The danger arising out of installment selling on the credit side has been most pronounced when the installment paper was purchased by banks, and was by them used as the basis for protecting obligations supposed to have been founded upon liquid credit. Exactly how much installment paper is now held by banks is a matter of dispute, and there is no way of definitely determining it. The figure, however, has been set as \$2,500,000,000

or \$3,000,000,000, and these figures do not seem to be overestimates. Installment paper has figured in an important way in a good many bank failures, and has also been complained of, although without adequate or final proof, as an influential if not a decisive factor in enlarging the number of commercial failures, which has risen to unprecedentedly high figures of recent years.

There is thus no warrant for the assertion made by some economists that installment credit is a new discovery, or has the effect of such a discovery, inasmuch as it is a means of financing or providing for consumption. There has always been a disposition on the part of lenders to finance consumption whenever that could be safely done, and the point at issue has been whether the credit so granted could be protected in such wise as to render it reasonably liquid and sound. Modern installment selling does not present any new phase of the situation, in theory, but merely affords a slightly new technique, modified by the fact that through mass production and consumption, a much larger field of purchase and sale has been built up than has ever before been rendered available.

**Cost of System.** It also should be remembered that the effect of installment selling is to add very materially to the cost of goods. This addition is conservatively estimated at the present time at from 18 to 25 per cent. The cost of distributing goods is increased by that amount, and the consumer's ability to pay is correspondingly reduced, since so large a part of his resources is diverted into the bearing of excessive financial expense. The question, therefore is often raised whether the alleged advantages of installment selling to the consumer and the apparent advantages enjoyed by the seller, in consequence of greater turnover and larger volume of sales, are not in the long run more than offset by the reduction of the consumers' actual buying power, resulting from the extraordinary expense involved in the various safeguards necessitated by the process of disposing of goods through the installment plan. The question also is naturally raised, whether, when the consuming community shall have committed itself fully in the purchase of goods, with respect to future income, the assumed advantages in enlargement of business, believed to have existed during the early period of installment sales will not come to an end. In other words, serious doubt is felt whether the installment plan may not have very definite limits as a business builder, so that after the lapse of a moderate period of time, its capacity as a means of expanding sales may be exhausted. Opinion is undoubtedly swinging to the view that this in fact will be the outcome to be expected, so that as a result the installment method of disposing of goods will have proven merely a temporary expedient in enlarging the volume of sales. It remains true, no doubt, that in certain kinds of industry, installment selling would continue to be regarded as partially necessary because of the indisposition of consumers to save continuously for the purpose of making a single large cash expenditure for the purchase of some desired object.

As an economic device, therefore, installment selling still occupies a somewhat dubious position, with many arguments presented both for and against it, and, as already stated, the eventual decision probably dependent upon the outcome as to its effect upon credit, when this effect

shall have been thoroughly tested as a result of business recession or depression.

**Bibliography.** A large literature of fugitive character, much of it controversial, has developed with reference to the subject of installment selling. An elaborate study of installment selling will be found in the two-volume work, *The Economics of Installment Selling* (New York, 1929), prepared under the direction of Prof. E. R. A. Seligman, of Columbia University, at the request of the General Motors Acceptance Corporation. This work also contains an extensive bibliography.

**INSTINCT.** As used in psychology, the term indicates an inherited psychophysical disposition on the part of the organism which serves as a determinant of activity. As defined by McDougall, an instinct is purposive in character; that is, it goes out to accomplish a definite biological end. It is, therefore, distinct from the motor mechanism, which serves simply as a means for the accomplishment of the biological purpose. Under such a definition, there naturally would be as many instincts as there are specific hereditary purposes.

In McDougall's *Outline of Psychology* (1923) is given a list of 14 major instincts and a half-dozen minor instinctive responses so mechanical in their nature that they are not accompanied by any display of emotion. The list, including synonyms, is as follows: instinct of escape (of self-preservation, of avoidance; danger instinct); combat (aggression, pugnacity); repulsion (repugnance); parental (protective); pairing (mating, reproduction, sexual); curiosity (inquiry, discovery, investigation); submission (self-abasement); assertion (self-display); social or gregarious instinct; food seeking (hunting); acquisition (hoarding instinct); construction; laughter. Around these major instincts are grouped the corresponding primary emotions (such as fear, anger, disgust, etc.) and in this way, a certain air of system is given to the treatment of the affective life which is lacking in most other psychological textbooks.

In addition to these specific dispositions of the mind, McDougall postulates nonspecific tendencies and faculties. Included among these are intelligence, defined as "the capacity to improve on native tendency in the light of past experience," sympathy, etc. It is evident that the nonspecific dispositions serve as the link to bind up the isolated instinctive responses into the unified activity of the organism much as the general staff of an army directs the movements of the specific arms and branches.

Professor McDougall first formulated his general theory of instincts in 1908, in his classic *Social Psychology*. At that time, the only rival conception was that of Thorndike, who in his *Educational Psychology* conceived the instinct as a chain of reflexes, a very complicated chain of reflexes, but withal a mechanical system. Professor McDougall says of an instinct that "when brought into play, it generates an impulse, an urge, or a desire for some change in the situation that evoked it, an impulse which keeps the organism uneasy, restless, striving in this way and that so long as it is not inhibited by a stronger impulse or satisfied by the attainment of its natural goal, the changed situation of a specific kind." To Professor Thorndike, on the other hand, such a view smacks of "magic potency." He prefers to describe the operation of a particular instinct as a series of situations

and responses. These responses, because they are determined, are predictable in the same way that the reactions of chemical elements are predictable. No room is left for potentialities, for changes in fundamental reactions, or for profiting by experiences in the way that Professor McDougall allows. The Thorndike conception nevertheless has for its advantage, or for what may be claimed as an advantage, its scientific disinterestedness from morality, purpose, and value. McDougall's conception is a difficult one to employ in a scientific scheme modeled on a positivistic or rather a materialistic interpretation of physics and chemistry. It is a conception that fits in better with a practical system of moral conduct, preferably of the conservative sort.

Strange to say, the violent polemical discussions of the problem of instincts during the decade and a half following the publication of the *Social Psychology* were never able to get beyond the popular antithesis of mechanistic science and practical morality. On the mechanistic side, positions have been put forward even more radical than those of Professor Thorndike. Among these might be cited as typical the point of view of Z. Y. Kuo. Refusing to accept even the Thorndike conception of instinct as an integrated series or reflexes, he would explain all human activity on the basis of nonspecific "units of reaction." "The reaction units are what we find in the child's spontaneous activities and random acts. . . . Such spontaneous and random acts are all that we can credit to the native endowment of man. These are nonspecific instincts, for they are reflexes in character and involve few, if any, complex neural patterns."

In his emphasis on reflexes, Mr. Kuo was following the lead of Watson and the Behavioristic movement, but even Professor Watson assumed that, beyond the mere random reflexes, there exists a group of innate reactions, or instincts.

F. W. Allport (*Social Psychology*, 1924) may be said to occupy an intermediate position between the extremes represented by McDougall and Kuo, in which he substitutes the concept of groups of reflexes for instincts. Upon this concept, he builds a unique social psychology. (See R. S. Woodworth, "Social Psychology: A Review," *Journal of Abnormal and Social Psychology*, 1925, for a criticism of Allport's work.)

The notion that there exists any fixed entity as an acquisitive instinct naturally irritated those who had hoped to find in social psychology a support for their radical views on social progress, and at the same time it seemed to lend "scientific" color to the eternal necessity of a capitalistic order. The instinct of pugnacity, if taken with the same seriousness as the laws of mechanics, automatically condemns pacifism. Many similar difficulties arise in connection with the other instinctive concepts. For a long time, sociologists and social psychologists were in turmoil over the question whether there really existed any such instinct as the instinct for imitation, around which the French psychologist, Gabriel Tarde, had built up by a *tour de force* the entire scheme of social movement. And great was the relief when both Thorndike and McDougall legislated this instinct out of existence, McDougall preferring to explain the phenomena of imitation by the concourse of intelligence with the specific instincts.

Addressing the American Psychological Association in December, 1916, Prof. John Dewey

hailed the work of McDougall and Thorndike, between whose theories he drew no distinction, as laying the basis of a new social science. "Henceforth," he said, "our social psychology is placed on the sure ground of observation of instinctive behavior." Scarcely two years later in his Princeton lectures of 1918, published in book form under the title *Human Nature and Conduct* (1921), he expressly repudiated McDougall's theory in the interest of his own belief of social radicalism and did not see fit to adopt the Thorndike conception of reflexes. The view which he did elaborate, while admitting the probable existence of instinctive roots for human conduct, tried to explain this conduct on the basis of a succession of impulses and habits. The instinctive part of our habits, he appeared to maintain, does not come into being until the habits are formed under the stress of environment. In this manner, he avoided committing himself to McDougall's fixed classification of instincts, which had been the subject of much attack, without offering any other classification. The artifice of placing the chapter on instinct after the chapter on habit is open to criticism, inasmuch as, in mechanistically determined systems, potentialities are treated as fixed quantities long before they pass into the active state. The beauty of physical science lies in the fact that potential energy may be measured just as accurately as it is possible to measure kinetic energy, or energy in motion.

Almost any philosophy of instincts tends to undermine the prestige of the intellect and intelligence. A theory of mechanical reflexes tends of course to abolish intelligence altogether; but, under the conception of fixed instincts, the intelligence is reduced to the rôle of a helpless mediator between the imperious inborn tendencies of human nature. The notion of the sublimation of instincts, which has been so extensively used by the psychoanalysts and psychopathologists, consecrates anti-intellectualism into a dogma. It might be said that the metaphor of sublimation was invented in order that it might be misinterpreted. At any rate, it owes its popularity to the ease with which it lends itself to distortion. When the highest intellectual achievements of humanity are defined as mere sublimations of primitive instincts, it is only a short step in the popular mind to de-throning these achievements altogether and preferring "self-expression" via the so-called instinctive urges. In this respect, the genius of modern social psychology works directly opposite to the genius of dogmatic religion, which, while adopting an almost identical hierarchical division of human nature into instincts and faculties, regards the instincts as the domain of the devil and "sublimations" as the striving for divine perfection.

To sum up the present situation in the doctrine of instincts, we should say that there exist two dogmatic positions—the theory of specific instincts and the theory of mechanical reflexes. Of these two, the instinct theory is the more flexible and could be converted at will into a dogmatism for morality or into a dogmatism against good morals. Perhaps the larger number of present-day psychologists might be regarded as skeptics, vacillating between the acceptance of teleological instincts and the apparently more scientific concept of reflexes.

Philosophically speaking, the theory of teleological instincts and the notion of reflexes both

can be conciliated into the scheme of science if we throw out, on the one hand, the prejudice of purpose and, on the other, the prejudice of mechanical predeterminism. Neither of these has a place in a descriptive science. The instinct becomes the larger unit and for that reason harder to measure; the reflex is the smaller unit and more accurately determined, but it is too small for social computation. It is as if we were to try to formulate the principle of the pulley in terms of electronic vibrations. While the notion of purpose and inner striving is thus excluded from descriptive psychology, it need by no means be banished from the world of thought as a delusion and a fraud. It finds its place in those disciplines which aim to cultivate inner development: art; religion; the philosophy of religion. It is not necessary for the science of man to be religious in order to cooperate with the religious striving, just as it is not necessary for the science of physiology to be healthy in order to further the interests of health.

**INSULIN.** On account of the powerful action of this drug on the diabetic, it has been tested in a great variety of pathological states and some favorable reports have been published which will require further corroboration before they can be finally endorsed. Next to diabetes, the condition which seems most amenable to its action is emaciation in certain forms and there have been numerous miscellaneous reports of weight gain following a course of injections. Further experience has shown that insulin is no general anti-lean remedy and in all probability the field of its usefulness in this direction is a relatively narrow one. Attempts to give insulin and alleged substitutes by the mouth, thus dispensing with the hypodermic method, give results which are not very convincing, but the subject is still open. Since insulin is an impure mixture, many attempts have been made to isolate it in the pure state and in 1925 Abel and Keiling reported the first attempts to obtain an exact substance which might be synthesized, possibly with a great reduction of cost, for at present the supply of the drug is far from adequate to meet the needs of many thousand diabetics. In 1926 Abel announced that he had obtained insulin in crystalline form, but further information has been lacking. See also DIABETES; DIET; FOOD AND NUTRITION; SECRETIONS, INTERNAL; also SURGERY (insulin in shock).

**INSURANCE.** Since insurance, although an independent business activity, is a financial tool for the furtherance of the more fundamental economic processes, its development may be expected to follow closely the outstanding developments in those processes. The history of the business after 1912 illustrates this tendency.

Its volume increased with the rise in prices and the extension of general business activity. New forms of coverage were originated and old forms adjusted to changes in the need for protection. Within the insurance business, there was considerable activity in the organization of new companies and in the forming of groups of companies under a single management particularly in the property insurance field, where individual insurance interests aimed to offer as wide a variety of coverages as practicable. An important feature which for a time was most far-reaching in its influence on insurance, was the World War with its effects on prices of securities and property. During the World War and immediately following it, the Insurance Commissioners permitted insurance companies to adjust the valuation of their investments on the basis largely of intrinsic worth and thus avoid in some measure the unfortunate effects of market fluctuation. The increase in prices brought about a corresponding increase in the amount of insurance required to cover the risk of loss of property and of other values. The War also had a marked effect on the moral hazard; it tended, in general, to decrease the losses of insurance companies where property was covered whose loss would result in the cessation of large profits to business men. After the War, however, when a period of adverse conditions in business followed deflation, the preservation of property was less a matter of concern to its owners; consequently, there was an increase in insurance losses, which must also be attributed, in large measure, to the moral hazard which was in evidence for six years.

Governmental regulation of insurance steadily increased its scope and effectiveness. The National Convention of Insurance Commissioners, succeeded in offsetting in some degree the disadvantages of regulation by the individual States through its efforts toward uniformity in supervision and in laws; but much remained to be accomplished in this direction. After the recovery from deflation, the rise in market values of securities resulted in large profits to insurance companies other than life-insurance companies, and their stock advanced greatly in price. The public began buying insurance-company stocks eagerly with the result that they became widely distributed. Many established companies increased their capital and, especially in 1927 and 1928, organization of new companies on a large scale became active.

A feature of the period following the War was the increased interest in insurance education. Many institutions of higher learning added insurance courses to their curricula and various organizations of insurance men provided instruction for those engaged in the business.

**Life Insurance.** On Dec. 31, 1928, 311 legal reserve life-insurance companies had insurance in force amounting to \$93,888,281,725, as compared with \$50,290,710,180 in force in 286 companies at the end of 1922 and \$27,189,009,697 in force in 241 companies at the end of 1917. Thus, the increase in 11 years was 245 per cent. These figures are taken from the *Insurance Year Book*. A careful estimate made by the Association of Life Insurance Presidents placed the total amount of legal reserve life insurance in force at the end of 1928 at approximately \$95,000,000,000. By July 31, 1929, it was estimated that the total insurance in force had reached \$100,122,085,000. To meet their obligations as they become due,

these companies had admitted assets of \$15,947,093,594 at the end of 1928, as compared with \$8,652,318,490 in 1922 and \$5,940,622,780 in 1917. The amount of new legal reserve life insurance written and paid for increased from \$4,891,037,043 in 1917 to \$9,774,271,118 in 1922 and to \$17,135,458,992 in 1927, an increase of 299 per cent in 11 years.

Among the principal reasons for this increase in new business are the inflation of prices, necessitating the purchase of more insurance to provide a given standard of living to dependents; increased ability of policy holders to pay premiums; the discovery of new uses for the application of life insurance to both personal and business affairs, and a remarkable improvement in the selection and training of life-insurance salesmen. Except during the period of the influenza epidemic in 1918-1919, the general tendency of mortality has been downward. It has long been recognized that the American Experience Table of Mortality, on which the premium rates of American life insurance companies are largely based, is no longer accurate, as it indicates a considerably higher mortality rate, especially among younger lives, than the insurance companies are actually experiencing. The American Men Table of Mortality, reflecting more recent experience, has been worked out by eminent actuaries, and the State of Connecticut has authorized its use in computing rates and reserves, but other States will have to amend their laws before its use can become general. By reason of the fact that the actual mortality has been much more favorable than that indicated by the American Experience Table and the further fact that the rate of interest earned by life insurance companies since the War has been much in excess of that assumed when their premium rates were made, companies issuing participating policies have been able to make very liberal returns in dividends to policyholders and nonparticipating companies have been able to reduce their premium rates.

There has been a remarkable development of group insurance since it was introduced in 1911. While originally designed to insure employees under one policy, the premium on which was paid by the employer, the premiums on a vast amount of the group insurance more recently written are paid jointly by employer and employees, and group policies are now written covering members of societies, labor unions, and other organizations. As this insurance is written without medical examination and members of groups who are advanced in years are admitted, the system has extended the benefits of life insurance to great numbers of persons who otherwise would have been denied them. According to the *Insurance Year Book*, 2895 group policies for insurance aggregating \$1,010,939,193 were written in 1928 and at the end of that year 17,158 policies amounting to \$8,034,289,884 were in force.

More group insurance was written in 1928 than in any previous year, and a careful estimate placed the total amount of insurance in force at the end of that year at approximately \$8,000,000,000 on the lives of 6,000,000 persons. The figures given in reports published in 1929 by the Bureau of the Census of the U. S. Department of Commerce represent only member companies of the Association of Life Insurance Presidents, of which there are 44, comprising approximately 82 per cent of the life insurance in force, but these same companies handle an

equally large percentage of the group insurance.

The following table shows the number (A) and value (B) of group certificates issued 1913 to 1928 inclusive:

	A.	B.
1913	30,001	\$ 20,828,000
1914	49,083	45,474,000
1915	78,507	47,122,000
1916	140,870	78,720,000
1917	309,118	178,336,000
1918	315,196	246,656,000
1919	476,635	425,574,000
1920	461,894	425,787,000
1921	123,589	111,083,000
1922	256,124	274,616,000
1923	418,162	520,045,000
1924	358,994	597,765,000
1925	546,391	998,784,000
1926	752,280	1,050,605,000
1927	500,992	824,372,000
1928	599,453	1,336,328,000

Another important development in life insurance in the past few years has been the adoption by a number of companies of the practice of issuing policies for limited amounts on the lives of persons who have not been subjected to medical examination but have been recommended as fit by experienced agents in whom the companies have special confidence. Several companies have reported satisfactory experience under these policies and increased the limits.

The safeguarding of funds paid to beneficiaries under life-insurance policies has had much attention and within a few years the "life-insurance trust" has taken a prominent place. Many trust companies and leading life-insurance agents have coöperated in presenting to persons carrying large amounts of life insurance the advantages of making their life insurance payable to a trust company to be paid by it to the beneficiaries in such manner as the assured provides in the deed of trust.

**Fire Insurance.** Increase in the amount of property insured and increase in property values in terms of money resulted in an increase in the fire insurance in force in companies reporting to the New York Insurance Department from \$78,306,546,465 on Dec. 31, 1917, to \$121,552,779,774 on Dec. 31, 1922, and to \$177,145,140,742 on Dec. 31, 1928. Fire premiums written by these companies increased from \$454,135,118 in 1917 to \$635,542,309 in 1922 and \$769,869,664 in 1928. The fire losses paid by the same companies were \$209,895,691 in 1917, \$345,951,143 in 1922 and \$338,857,706 in 1928. Meanwhile, the admitted assets of these companies, had increased from \$896,728,088 on Dec. 31, 1917 to \$2,654,496,211 on Dec. 31, 1928. Their combined capital and surplus, however, increased in a greater ratio, rising from \$360,244,023 on Dec. 31, 1917, to \$1,076,643,548 10 years later, and to \$1,361,535,514 on Dec. 31, 1928. The period of the War and about three years following were very profitable as fire losses were low, moral hazard being almost entirely absent; but when deflation came, serious moral hazard developed, fire losses rose to a high point, and insurance companies suffered an underwriting loss. These conditions ceased only late in 1926.

In 1927 the losses decreased and in 1928 they were even lower than in 1927. The fire losses of the United States and Canada as compiled by the *Journal of Commerce*, of New York (those of the United States separately not being available), during this period were as follows: In 1917, \$267,273,140; in 1918, \$317,014,385; in

1919, \$269,000,775; in 1920, \$330,856,625; in 1921, \$332,054,950; in 1922, \$410,889,350; in 1923, \$389,192,200; in 1924, \$377,520,250; in 1925, \$373,500,550; in 1926, \$393,020,000; in 1927, \$320,595,600, and in 1928, \$301,267,580. While fire-insurance companies suffered a loss on underwriting from 1921 to 1926 inclusive, their earnings from investments were large, as securities rose in value and interest rates were good, and these earnings were the chief factor in increasing surplus although a large amount of capital has been invested in companies at a premium since the War.

One of the most remarkable developments in American fire insurance has been the affiliation of companies in groups, thus enabling one staff of officials and one office organization to serve a number of companies. But few companies of prominence are now without these affiliations. This system has been extended until many fire-insurance companies now also have casualty and surety companies affiliated with them. Recent years have witnessed unusual activity in the purchase of stock of fire-insurance companies by the general public. The various organizations working for the reduction of fire loss in the United States have been active and have made their efforts more effective.

**Marine Insurance.** For the year 1918, the total net premiums received for marine insurance within the United States were estimated at slightly less than \$110,000,000 by Dr. S. S. Huebner. The *Insurance Year Book* reports \$39,396,354 ocean marine premiums for 1922 and \$46,419,760 for 1928. Ocean shipping during the War was subject to new hazards, partly due to enemy activities, and developed a very large volume of war-risk insurance to cover the hazards not covered by ordinary ocean marine policies. The extent and even the nature of these hazards were unpredictable, and they could be assumed by insurance companies only to a limited extent. Governmental bureaus were established in the United States and in other countries to insure shippers against losses from war hazards. Without such aid, shipping by private interests would have been, in large part, necessarily discontinued. Increased activity in foreign commerce during and after the War led to the organization of many new marine-insurance companies and to the development of marine insurance by older companies. After a period of feverish activity, many of the new organizations disappeared. When international trade became depressed, the volume of available business was greatly reduced and the large number of insurance companies seeking it entered into fierce competition. Policy forms were broadened and inadequate rates were charged, resulting in severe underwriting losses. Through the efforts of leading companies, especially in Europe, conditions have been improved somewhat but they are still far from satisfactory. In 1919 Congress became concerned with the preponderance of alien interests in the marine-insurance business. An investigation was made, as a result of which a model marine-insurance law, designed for the encouragement of American marine insurance, was adopted for the District of Columbia. With the cooperation of the companies and of Congress, three syndicates were organized for the purpose of increasing marine-insurance facilities, largely in the interest of American carriers. Recently, New York and Pennsylvania have enacted laws to tax marine

insurance on the basis of profits and not of premiums written, thus lightening the burdens on American companies.

Inland marine insurance has been developing somewhat rapidly, the premiums, according to the *Insurance Year Book*, being \$23,644,089 for 1922 and \$39,688,160 for 1927, with only moderate losses.

**Miscellaneous Insurance.** Under this classification may be grouped the various kinds of insurance and bonds written by casualty and surety companies, the principal classes being accident and health, automobile, workmen's-compensation, liability, burglary and robbery, plate glass, steam boiler and machinery breakdown, credit and live-stock insurance, and the numerous classes of fidelity and surety bonds. Miscellaneous insurance has made a very large growth in a relatively short time, due largely to the enactment of workmen's-compensation laws and the great increase in the number of automobiles, making the driving of cars more hazardous and necessitating liability insurance for the protection of their owners against loss due to claims for personal injuries to others. According to the *New York Insurance Report*, in which are included the statements of most of the leading companies writing miscellaneous insurance, the premiums written by these companies in 1917 amounted to \$221,804,779, in 1922 to \$415,783,884, and in 1928 to \$759,146,160. The admitted assets of these companies increased from \$282,678,822 at the end of 1917 to \$629,301,966 at the end of 1922 and to \$1,289,751,253 at the end of 1928. There was considerable activity during the decade in organizing new companies, especially institutions to write automobile insurance.

## INTERNAL-COMBUSTION ENGINES.

Engines in which fuel is introduced into the cylinder and power is obtained by the resulting combustion of fuel and air make up 80 per cent of the total number of engines of all kinds in use in the United States. Each of the twenty million automobiles, the thousands of farm tractors, the innumerable motor boats, and many ocean-going vessels employ internal-combustion engines, making up a total of approximately 750,000,000 horse power. In fact, the average person is more familiar with the gasoline motor than he is with other forms of power.

The advent of the automobile brought with it a demand for engines of light weight, 5 to 10 pounds per horse power, and of extremely favorable balance. Consequently, for all save cheap farm units, the gasoline engine is built with cylinders placed vertically and ranging in number from 4 to 16, with a few having cylinders set in V style. Engine speeds vary, depending upon the service, from 60 to 3000 revolutions per minute. A modern automobile engine appears in the illustration. It will be observed that the most obvious characteristic is compactness, closely followed by that of accessibility. See MOTOR VEHICLES.

The present tendency is toward the en-bloc design, in which all the cylinders and the upper

part of the crank case is in one casting. This reduces the machining operations and also reduces the engine length without sacrificing the cylinder water-cooling space. Pistons are made mostly of cast iron, but for the better class of automobiles, especially when the engine has a high rate of revolution, the pistons are made of aluminum. Connecting rods are usually steel castings, although a few cars use steel drop forgings; in high-speed engines, duralumin rods are being used. Bearings are either babbit shells set into recesses in the frame and connecting rods or, in the cheaper engines, the babbit is cast into the recesses and is then reamed or

The increase of engine speed involved more than merely reducing the unbalance of the engine's reciprocating parts. As a mixture of fuel and air does not ignite instantaneously, there is always a lag between the appearance of a spark at the spark plug and the creation of a gas pressure in the cylinder. One of the best methods of increasing or accelerating combustion in automotive engines is by designs of cylinder heads to produce combustion chambers that will promote turbulence. A violent turbulence means a more thorough mixing of the liquid particles and the air stream, and engines employing this principle give better combustion, though in

FORMS OF AUTOMOTIVE ENGINE COMBUSTION CHAMBERS AND TYPICAL VALVE PLACING

At left: Head with side valve head and combustion chamber to promote turbulence. At right: Overhead valves to permit quick charging and exhaust of gases.

broached to size. Crank shafts are universally forgings of high-carbon steel. As there are always secondary forces to produce vibrations unless the cranks are balanced, the better grade of automobile engines has balance weights on the cranks. A few engines make use of dampeners to reduce the torsional vibration of the crank shaft.

some cases they do not permit of as heavy charges being inspired, because of the throttling effect of the passages through which the gas must pass in reaching the cylinder interior on the suction stroke.

For this reason, there is a return to the *L* design of cylinder head in which the valves are placed in at one side of the head, but instead of a narrow passage combining the valves and the cylinder space, the combustion cavity is shifted from the cylinder proper and is massed into a dome space over the valves. Ricardo is credited with the origination of this idea. Few of the modern engines use the overhead valves and plain combustion chamber, for the Ricardo design proved to be more efficient and permits carrying higher compressions without pre-ignition or "early spontaneous ignition."

Automobile engines, save those of the most modern design, compress the fuel-air mixture to a pressure of 90 pounds per square inch. As the efficiency *E* of the Otto cycle engine is expressed by the equation:

$$E = \frac{T_1 - T_2}{T_1}, \text{ when } T_1 \text{ is the absolute temperature at the end of the compression stroke and } T_2 \text{ the temperature of the charge at the beginning of the compression stroke, it is apparent that increasing } T_1 \text{ would increase the efficiency, or in other words, increase the horse power produced per gallon of fuel. The temperature of } T_2 \text{ depends upon the final compression pressure and the endeavor has been to raise this pressure from 90 pounds. The usual gasoline, however, will explode spontaneously if the compression is raised much beyond 90 pounds, save in extremely}$$

CROSS-SECTION OF AUTOMOBILE ENGINE

high-speed engines where the time interval is small. Consequently, scientists have spent much time in evolving a fuel that is free from pre-ignition and detonation. The addition of a small amount of tetraethyl lead to gasoline is said to permit of using twice the accepted compression pressure without pre-ignition and "knocking."

Others have found that special cylinder-head designs will permit higher compression, while still others use a small amount of benzol with the gasoline. Today, many automobile engines are using compressions ranging from 120 to 150 pounds, although this higher pressure will produce "knocks" if the engine is run at slow speed on a rich mixture, as when climbing a hill, which mixture ignites rapidly. On a lean mixture, such as exists when idling, the high-compression engines work satisfactorily.

**Aviation Engines.** The rapidity with which aviation has developed since the World War has taxed the ingenuity of the engineer in producing a satisfactory gasoline engine of high efficiency, light weight, and inherent reliability. The first aviation engine was a heavy two-cylinder opposed-cylinder type unit, which was quickly succeeded by engines with 6, 8, and 12 cylinders placed in line. During the World War, in order to produce a plane having high speed and lightness, engines were brought out with cylinders placed in either two or three rows, having the appearance of a V engine with an extra row of cylinders placed vertically, as shown in one of the illustrations.

different makes were used. Certainly the weight of the engine and accessories is naturally low.

In both these types, the number of cylinders range from three to nine when but a single row is used and up to 18 in double-row machines. It is necessary to have an odd number of cylinders in a row if a single crank is used, which is customary. The firing order will follow the direction of rotation in a radial engine with fixed cylinders and will be in the opposite direction in rotary-cylinder machines. In all cases, alternate cylinders are skipped in the firing order, so that it takes two complete revolutions of the cylinder assembly for all cylinders to fire.

The advantage of the rotary engine is first that air cooling is possible, thereby reducing the weight by 40 per cent. The length of the engine is much decreased, giving greater space in the fuselage. In addition, it is easier to mount and to dismantle. On the other hand, the overall diameter is greater, which necessitates the widening of the plane body. It uses more lubricating oil, for much drips into the cylinders from the crank. In large sizes, there is a considerable gyroscopic action, which is a hindrance in maneuvering, for the engine resists the change in direction of its plane of rotation. The fuel consumption also is greater than with the fixed-cylinder engine. The advantages, however, outweigh these several objections. Such engines are being built up to 300 horse power in single row units and 600 horse power in double-row designs. Where powers go over

ARRANGEMENT OF CYLINDERS IN AVIATION ENGINE TO SECURE COMPACTNESS OF DESIGN IN MULTIPLE CYLINDER FORMS

All of these engines employed water cooling and as the demand was for lightness, designers produced both rotary- and radial-cylinder engines that depend upon air cooling. While the "in-line" engine is still being built, the tendency is toward the universal acceptance of the rotary and radial engine, with the latter predominating. In the majority of recent long-distance flights, the radial engines of several

300 horse power, it is possible that the V type engine or the X type, such as the Packard, is better.

In 1929 the radial engine is the general favorite and has thrust the rotary type into the background.

Originally, automobile practice was followed and all cylinders and pistons were of cast iron. Improvements in materials, as well as in design,

took place during and after the War. Pistons are now made of aluminum, and the cylinder is generally a mild-steel tubing. The jacket for water cooling is formed by welding thin aluminum or steel sheets to the tubing. The upper end of the tube is threaded and the aluminum cylinder head is screwed on to the tube. With aluminum heads, the valve seats are steel rings placed in the mold when the aluminum is poured. As the exhaust-gas temperatures are high, ranging from 900 to 1800° F., cast-iron valves will not suffice. Modern engines employ valves of tungsten steel or chromium steel. Connecting rods are duralumin castings and the crank shaft is of high-carbon steel. Usually, the shaft is made from a single forging, but in the rotary engines, the crank is built up of three pieces to permit disassembling.

Aviation engines operating at other than low altitudes require a highly volatile gasoline that will vaporize at a lower temperature than will commercial gasoline. The carburetion of gasoline is difficult in an aviation engine for the reason that the ratio of fuel to air will vary with the altitude, so that at high altitudes the engine may cease firing although the gasoline lines are clear and the carburetor is in working order. The rate of flow of gasoline through the carburetor jet is dependent on the pressure drop between the atmosphere and the intake manifold. Even if the mixture is perfect at ground level, it may fall off at high altitudes; if the air density becomes one-half, the fuel feed drops probably 75 per cent. See AERONAUTICS.

**Superchargers.** Superchargers are especially valuable on air craft operating at high altitudes. As the engine reaches altitudes where the air is lighter, the weight of the charge decreases and the power is correspondingly reduced. This loss of power is stated to be very great in engines not equipped with superchargers. A Liberty airplane engine that will develop 400 horse power at sea level will deliver but 200 horse power at 15,000 feet and not quite 90 horse

DIAGRAM ILLUSTRATING THE OPERATION OF A TURBO-SUPERCHARGER

power at 25,000 feet. While reciprocating, rotary, and centrifugal air pumps have been suggested and experimented with, the centrifugal type is best adapted for air-craft motors because of its simplicity, lightness, and freedom from pulsation. The supercharger may be gear-driven by the engine to which it is attached, or it may be driven by a gas turbine using exhaust gas which otherwise would be wasted by discharging it directly into the air. The gas turbine-driven supercharger had been most successful to date.

The diagram herewith shows clearly the way such a supercharger operates. The exhaust gas from the engine is led through a manifold, *a*, into a nozzle box, *b*, containing a series of nozzles, *c*. Through these nozzles the gas expands and reaches a high velocity before entering the buckets of the turbine wheel, *d*, which it drives at high speed. Air enters the impeller, *e*, through inlets, *f*, at the centre and is thrown by centrifugal force to the tips of the blades. At this point, a series of vanes surrounding the impeller converts the velocity of the air into pressure and guides it in a spiral path to the supercharger outlet and then through the air-cooler into the carburetor intake, *h*.

**Explosion Turbine.** Some engineers believe that the explosion turbine offers possibilities for future development, because one of the drawbacks of reciprocating piston engines, i.e., the inefficiency due to incomplete expansion after ignition, is not inherently present. In some forms of explosion turbines, the mixture is drawn or forced into a special combustion chamber where it is exploded, and the pressure thus produced causes the gas to escape through a nozzle and impinge upon a turbine wheel. A sectional view of an internal-combustion turbine built and operated in Germany by Holzwarth is shown. The design is ingenious, as the turbine is directly connected with a generator. Owing to the possibility of expanding

SECTIONAL ELEVATION OF THE HOLZWARTH VERTICAL-EXPLOSION TURBINE

the gas to atmospheric pressure, this turbine would have a theoretical energy utilization about 67 per cent if the combustion and fuel-supply processes were the same as in a reciprocating piston engine.

One of the weaknesses of turbine design is that the compression of the charge prior to ignition does not take place in the explosion chamber but must be furnished by an outside compressor. Owing to the inefficiency of the compressors and the fact that a turbine rotor actuated by a gas with constantly falling pressure cannot be more than 60 per cent efficient, the theoretical thermal efficiency of a turbine drops from 67 per cent to a practically realized efficiency of but 13.8 per cent, or considerably less than that of the usual forms of reciprocating piston engines. Several inventors have tried to do away with compressors in gas turbines, or, if a compressor was used, to drive it by steam raised by the exhaust of the turbine. One of the advantages of the reciprocating type of engine is that the piston serves as a pump to draw in the gas; then as a compressor to compact the charge before ignition; then as a power element when forced down by the pressure of the exploded, expanding gas; and lastly as a scavenging medium, when it pushes the inert or exhaust gas out of the working cylinder. An explosion turbine is not a true internal-combustion engine, and its low efficiency makes its commercial prospects not particularly bright.

cylinder it is ignited by the temperature. The flow of oil is regulated by a needle valve, so that it enters comparatively slowly without increasing the pressure beyond 500 pounds. Any oil can be burned.

From the first engine of 60 horse power built in America in 1898, the use of the Diesel has extended until in 1928 over 400,000 horse power was sold, for practically every kind of power use. Of the Diesels so far built, 30 per cent is used for marine purposes. The "injection" or Diesel engine is broadly divided as to types into the two-stroke cycle and four-stroke cycle, both single and double acting. These broad divisions may be separated into *air-injection* and *pump-injection* types. In the former, air at 1000 pounds is used to blow the oil into the cylinder, while in the latter engines, a pump forces the oil through the spray nozzles at a pressure of about 5000 pounds per square inch. The air-injection type was the first to come into use, but at the time of writing (1929), the pump-injection engines represent about 75 per cent of the yearly sales.

Two distinct combustion processes are employed in pump-injection engines. For two-stroke-cycle engines, it has been found that the oil cannot be pumped directly into the cylinder. It is necessary to inject it into a cavity in the cylinder head, where it is partly vaporized and blows through an orifice into the cylinder proper. The separation of the oil and air gives time for the oil to be vaporized before combustion begins.

SCHEMATIC ARRANGEMENT OF DIESEL-ENGINE MECHANISM

**Diesel Engines.** The efficiency of any internal-combustion engine is dependent upon the final compression pressure. As gasoline, oil, or gas cannot be compressed beyond the extreme of 180 pounds per square inch on account of pre-ignition, Dr. Diesel proposed and built an engine in which nothing but air was compressed, and the fuel was not introduced until the piston had completed the compression stroke. As there was nothing but air in the cylinder, pre-ignition could not occur. The Diesel engine has a final compression pressure of approximately 500 pounds per square inch, and as the temperature raises with compression, the final temperature of the air in the cylinder is about 1200° F.; this is so hot that when the oil is sprayed into the

in four-stroke-cycle, pump-injection engines, the fuel may be injected either into a separate cavity or into the cylinder proper.

For powers up to 600 horse power, the solid-injection engine is used in preference to the air-injection engine, mainly because of first cost. Above this size, the air-injection engine's better performance offsets its higher cost at present. Beyond 3000 horse power, double-acting, air-injection engines are preferred. The largest Diesel built up to 1929 is a 9-cylinder air-injection engine installed in the Hamburg, Germany, light plant; pump-injection engines of 11,000 horse power were built in 1928 in Germany and Denmark. In the United States, the largest engine so far built is a six-cylinder, single-

acting, two-stroke-cycle unit with cylinders of 42-in. bore and 56-in. stroke, rated at 4000 horse power at 125 revolutions per minute.

As an example of novel designing, the accompanying illustration gives a sectional elevation through one of the cylinders of a three-cylinder, double-acting, two-cycle engine. This power plant has a cylinder bore of  $17\frac{3}{32}$  inches and a stroke of  $27\frac{3}{32}$  inches and delivers 850 horse power at 120 revolutions per minute. The problem of packing the piston rod against the explosion pressure is met by a very ingenious and carefully worked-out stuffing-box which permits the piston rod to reciprocate through the head of the lower cylinder. The stuffing-box is very deep and contains 11 sections of metallic packing; grooved rings divide them, to facilitate the distribution of lubricating oil. Each section consists of two rings split in halves which fit closely around the rod without springs, but they are kept close to the rod by a spring-clip ring carried in a retaining ring clear of the rod. The 11 sections are entered into the stuffing-box and held in position by the gland ring.

The fuel consumption of the average Diesel engine is 0.45 pounds per brake horse power per hour. This is much better than the gasoline engine, few of which type show a better performance than 0.75 pounds, but high-compression aviation engines have developed a horsepower-hour at an outlay of 0.5 pounds of gasoline, which fuel, however, has a greater heat value, 20,000 B.t.u. per pound, as compared to fuel oil with 18,000 B.t.u. Gasoline costs 17 to 20 cents per gallon and fuel oil but 4 to 6 cents.

Until recently, the Diesel operated at slow

speed, 150 to 250 revolutions per minute. At present, many engines operating at speeds up to 1200 revolutions per minute are being built. The special fields of applications of these high-speed engines are shovels, excavators, rail cars, and locomotives.

The attempts to build light-weight Diesels for aviation have not been an entire success. To bring the engine weight down to 2 or 3 pounds per horse power, it is necessary to use high-unit stresses. As combustion cannot be controlled at high speeds, the cylinder pressures at times reach 1800 pounds per square inch, and certain parts are stressed almost to the elastic limit. In Germany, the Junkers' opposed-piston, two-stroke-cycle Diesel promises to be a successful venture for aviation work. In the United States, none of the engines built up to 1929 had been successful, but the Packard Motor Company in 1929 built a 9-cylinder radial air-cooled Diesel that operated satisfactorily in flight tests. For lighter-than-air craft, where lightness of engine is not so imperative, several Diesels are suitable and have been used. Ultimately, a light-weight Diesel will be produced, because it offers, for aviation application, the advantages of less fuel used and less fire risk, but has the disadvantage that it is less responsive to the throttle.

**Compound Diesels.** Various attempts have been made to compound the Diesel since Dr. Diesel's original patents on compounding. Almost invariably, the designer has confused the oil and steam engine. Because a steam engine is more economical when compounded, by reason of the decreased cylinder condensation, many engineers feel the same applies to the Diesel. This, however, is not true; for in the internal-combustion engine, it is necessary to cool the engine to prevent burning of the metal. The only advantage that compounding offers is the better applications or use of the metal in the engine. The final compression reaches 500 pounds per square inch and the pressure exists during part of the working stroke, the remainder of the stroke takes place at a falling pressure, but the entire engine must be built to withstand the 500-pound pressure. If the low-pressure part of the compression and expansion could be carried on in a separate cylinder, this cylinder could be made less heavy and the high-pressure part of the stroke would take place in a smaller cylinder. On the surface, compounding seems feasible, but the disadvantages of high internal temperatures in the high-pressure cylinder, due to the burning of a heavy charge of fuel in a small volume of dense air, and that of the heating of the transfer valve more than offset its advantages. So far, no success has attended the scores of compound engines that have been built and tested.

The Sperry compound oil engine, also illustrated, is still in the experimental stage. The arrangement of the engine consists of two high-pressure, four-cycle cylinders and a simple low-pressure cylinder. The high-pressure pistons are of plain-trunk type. The low-pressure piston has an extension of smaller diameter than the main piston. The annular space between this extension and the main piston serves as an air pump. The pump compresses air from atmospheric to a moderate pressure into a small receiver. On the down or inlet stroke of the high-pressure pistons, air under pressure from the receiver passes through the inlet-valve sleeve

A THREE-CYLINDER, DOUBLE-ACTING, TWO-CYCLE 850-BRAKE-HORSE-POWER DIESEL ENGINE

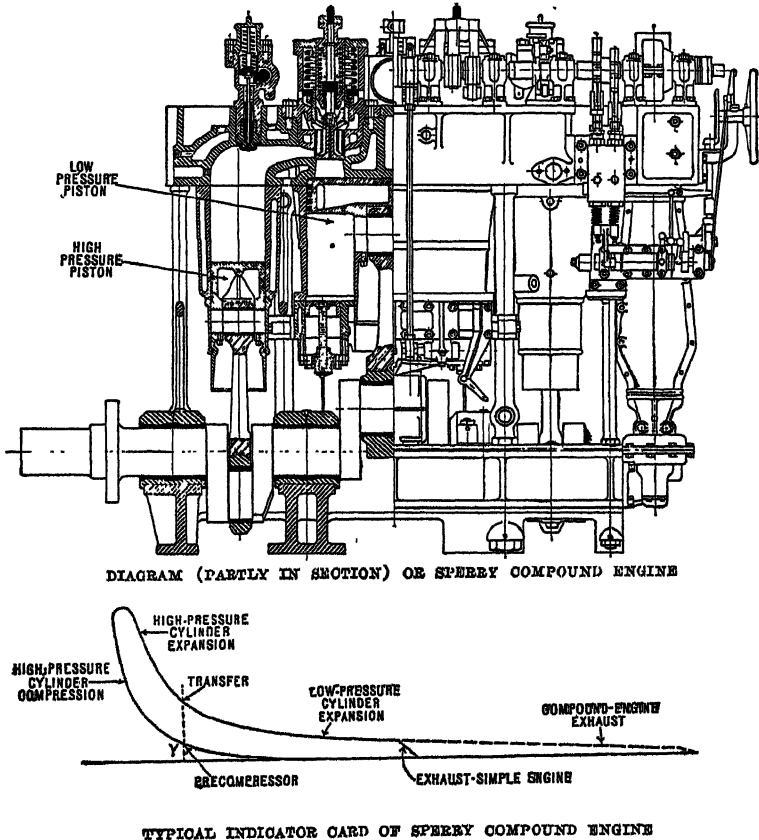

and cools it, until the pistons are at the end of the stroke. The air is then compressed on the up-stroke to about 500 pounds per square inch when fuel is injected.

The resulting combustion and expansion of the gases drive down the high-pressure piston to the end of its stroke, when the low-pressure piston, which is on the beginning of its working stroke, receives the gases from the high-pressure cylinder through the transfer port that has been opened by lifting the transfer valve from its seat into a water-jacket cavity so that only its lower surface is washed by the passing gases. To prevent any serious drop in pressure between the high- and low-pressure cylinders when the transfer takes place, the exhaust-valve is closed somewhat before the low-pressure top centre and the gases are cushioned to a pressure equal to

value; so the point where the greatest gain can be made is in fuller utilization of exhaust gases.

In many installations, when hot water is needed, it is possible to take the jacket-cooling water and, after passing it through an exhaust-gas heater to further increase the water temperature, to use it. It is possible to recover in this way about 4500 B.t.u. per horse-power-hour developed by the engine. If steam instead of hot water is needed, it is possible by passing a part of the warm water from the jacket through an exhaust-gas boiler to obtain 1.25 pounds of steam at 50 pounds pressure per horse-power-hour developed in the engine.

**Still Oil-Steam Engine.** An attempt to utilize the waste heat of the exhaust gas is the Still engine, which combines steam and oil power so advantageously that the brake thermal effi-

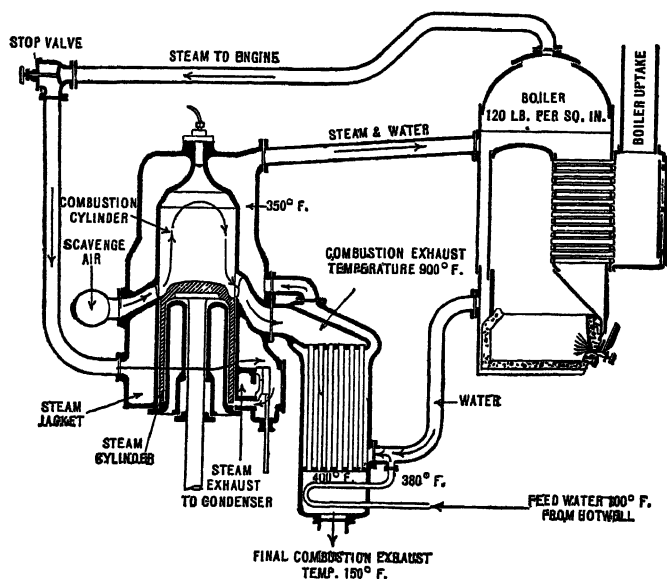

that being transferred from the high-pressure cylinder. The cranks of the two high-pressure cylinders are set together and 180 degrees from the low-pressure crank. The high-pressure cylinders fire and transfer alternately into the low-pressure cylinder, so that every down-stroke of that cylinder is a working stroke.

**Waste-Heat Recovery.** In internal-combustion engines of either the constant-volume or constant-pressure type, the combined heat losses in radiation, cooling water, and exhaust gases range between 65 and 75 per cent. It will be evident that any practical attempt to utilize the waste heat will increase the thermal efficiency. Heat losses due to the cooling water or radiation cannot be reduced beyond a certain minimum

efficiency of such an engine may go as high as 44 per cent. Its primary object is not to use the waste heat for raising steam, but first to use it in improving the thermal conditions of the working cylinder and so to insure the maximum efficiency from the fuel burnt within it and as a consequence, to diminish the heat lost in that operation. Since the maximum efficiency is obtained when the jacket losses are at a minimum, it is evident that the larger the quantity of steam which can be generated per horse power developed by the combustion cycle, the lower must be the heat efficiency of the whole machine.

In the Still engine, the jacket and cooling water form part of the circulating system of a steam generator, which may be an integral part

STILL COMBUSTION AND STEAM-ENGINE ACTION

of the engine or external to it. The cooling water therefore enters and leaves the jacket at a constant temperature, regulated by the pressure of the steam; the cooling is effected by converting the water into steam without raising its temperature. Excluding the radiation losses, which are kept low by lagging, all the heat which passes through the walls is thus usefully recovered in the water as steam. During compression, because of the walls being at steam temperature, the incoming charge picks up heat instead of losing it, during the greater part of the stroke. This is an advantage of the greatest value to the heavy-oil types of Still engine, where an air charge is taken in at the full out-stroke and is compressed to a pressure where its increased temperature insures the certain ignition and combustion of the fuel which is injected into it. During combustion and expansion, the uniform and higher mean temperature of the wall reduces the heat lost to the jacket water. Some of the heat thus economized adds to the useful work on the piston, the remainder passing out in the exhaust gases for recovery. The steam developed is directed to a special steam cylinder, that may be the lower end of the oil engine or may be a separate engine. It is believed that there is a future for the combination of the steam and combustion cycles. It has the disadvantage, however, of extremely high first cost and with the present cost of fuel oil does not seem to be commercially advantageous. See MOTOR VEHICLES; CHEMISTRY, APPLIED; PETROLEUM.

**INTERNATIONAL LANGUAGE.** The initiative in establishing a sort of clearing house for all questions connected with the problem of a world language belongs to the International Research Council. They created a Committee on International Auxiliary Language, located in Washington, D. C., under the direction of Dr. Nichols and Dr. Cottrell, which undertook to send out information generously to any serious inquirer. In 1924 the two chief solutions were an arrangement that would favor living languages, and an artificial language. The basis for discussion of an established living language to be used as an international language remained the "Projet Chappelier," suggesting an agreement between English- and French-speaking countries, that the first require in all their schools the teaching of French, and the second the teaching of English. This would force other nations to teach at least one of the two, and thus the goal would be reached. Famous men gave their support to the idea, among them Wells, Richet, and the great linguist, Bréal. The best explanation of the plan is found in Dauzat's *Le Français et l'Anglais, Langues Internationales* (1910). It is unfortunate that Dauzat hurt his cause considerably by indulging in very unintelligent criticism of other solutions of the problem; nobody can see in him an impartial student. The plan was from 1915 endorsed by the well-known critic, Ernest Charles, and by the American philosopher, Mark Baldwin. For some details and references, see the various issues of the *New International Year Book*.

There were, of course, many projects of artificial languages before the public, but three really counted: Esperanto (for information in America, address Esperanto Association, Boston, Mass.); Ido (American headquarters in Pittsburgh); and Esperantido (Washington, D. C.). In 1922 the Institute of International

Education launched a movement in favor of a modernized Latin, not so much, it seems, because of belief in it, but rather out of fear that an auxiliary language might otherwise triumph. From the first weeks of the World War, Esperanto rendered extremely valuable service both in the Red Cross divisions, and in the work of the prisoners' camps. At the same time, the Germans took advantage of Esperanto to spread much propaganda among neutrals, which naturally hurt the cause of Esperanto in the eyes of the Allies (who were slow at hitting back with the same arm). In 1916 the Chappelier plan was seriously revived, and Dauzat suggested some interesting modifications to it. In some quarters, the end of the War was expected for the end of 1916 or beginning of 1917; in view of this, the Board of Trade of London favored the study of the question of an international language to help business to pick up rapidly. At the same time, the Germans, seeing things take a favorable turn for them, began to talk about German as an international language, and spoke of a "Welt-deutsch," a natural organ for Pan-Germanism. But the War went on, and remarkable headway was made in 1917 and 1918 by artificial languages, especially Esperanto, in the Far East. Then, as the War ended, a lively race began between the chief rivals, Esperanto and Ido. Esperanto seemed to see a chance for victory in winning to its cause the exploited classes and even the Russian Soviets, while the Idoists seemed to prefer to win the intellectuals. Lord Northcliffe, in England, and the philologist, Meillet, in France, agreed that, as a language, Ido was superior to Esperanto. This discussion of actual *linguistic* superiority prompted Dr. René de Saussure, of Berne, Switzerland, to offer his system, combining, he maintained, the excellent points of both Esperanto and Ido, and which he called Esperantido. Later, in 1925, he withdrew his new plan to rally to Esperanto—not because he thought the latter perfect, but for the sake of a united front. The plan of a simplified Latin, proposed that same year by Professor Peano of the University of Turin, had a moderate following.

Together, these groups tried to bring the question before the Peace Council in Paris, and having elicited a note of "interest" from Wilson, worked with more vigor than ever. After the Peace Council, the League of Nations was approached several times. In 1921 the League delegated Dr. Nitobe to the Congress of Esperanto that was to be held in Prague, August 29 to September 6. The report, made on September 12, brought about the nomination of a committee to investigate the matter. The problem was finally turned over to the committee on intellectual coöperation, of which such persons as Bergson, Einstein, and Mme. Curie were members; and these finally decided, in a report of Aug. 1, 1923, not to recommend an artificial language. Meanwhile, the International Research Council, which had met in Brussels in 1919, appointed a committee to investigate the matter of an artificial language "of the type of Esperanto" and which would be "placed under scientific control." After that time, the committee on international auxiliary language, at Washington, became active. They asked the Philological Association and the Modern Language Association to appoint committees. Both made cool replies, but Washington went on. The question was brought up and discussed

at the meeting of the American Association for Advancement of Science at Toronto, in December, 1922, and again at their meeting at Cincinnati in December, 1923. The study of the problem was endorsed. Some meetings in New York, April, 1923, with a view to fostering the cause, and counting among their supporters several names famous in the scientific world, must also be recalled. The artificial languages received severe rebukes in 1925, in Ann Arbor, and in 1926, in Cambridge, Mass., at the meetings of the Modern Language Association—not officially as a body, but by individual members; in December, 1925, it was in the president's speech, Dr. Collitz, of Johns Hopkins; in 1926, it was at the hand of Professor Mykl, of Marquette University. In 1925, thanks to a gift of \$2,500,000 by Mrs. Dave H. Morris, an International Auxiliary Language Association (Iala) was formed at Columbia University with Prof. H. N. Shenton, as secretary. It amounts to a sort of clearing house—with sales service and information service—for all ideas connected with the problem of international language. Its first *Bulletin*, was published in May, 1925. That year also witnessed a continuation of the endeavors to gain ground in Geneva, the seat of the League of Nations. An elaborate Esperanto Congress took place there in August, promptly followed by an Ido Congress; while G. de Reynold tried to ward off both in advocating Latin once more, in a vigorous article of the *Revue de Genève*. This was—up to 1929—the last flare-up of the cause. The annual congresses of Esperanto and Ido still take place, but arouse little interest; the attempt to use radio did not succeed much; and the attempt on the part of some women (even women's colleges such as Vassar and Mount Holyoke, see *New International Year Book*, 1925) to make it one of their goals, seems to have harmed the cause rather than helped it. Owing to the political prestige of the United States, English is gaining more and more adherents as a future world language.

The most interesting bibliographical material bearing partly on this problem includes the very suggestive book of A. Meillet, of the Collège de France, *Les Langues de l'Europe Nouvelle* (1918), last chapter; A. L. Guérard, *Short History of the International Language Movement* (London and New York, 1922); a very valuable article by Professor Sapir, in the *Romanic Review* of June, 1925 (claiming that both Esperanto and Ido could stand serious improvement); Henriette Roumigiùère, "Le français dans les relations diplomatiques," forming No. 4 of vol. xii of the University of California *Publications in Modern Philology*, 1928; which gives, however, often less than F. Brunot in his *Histoire de la Langue Française*, or Scott in his book on the same subject—and in much briefer form. See PHILOLOGY, MODERN.

**INVESTMENT TRUSTS.** The term "investment trust" has been well known in Great Britain for a good deal more than half a century. In that country, active development of invest-

ment trusts as a means of applying and collecting comparatively small sums under conditions of relative safety proceeded vigorously after the year 1860 and has finally reached the highly developed stage in which the resources of British investment trusts of all classes (land and finance) were estimated at £400,000,000. In the United States, the term "investment trust" was hardly known prior to the close of the World War (the first recorded instance of such a trust dating only from 1907). Since the year 1920, a substantial growth of investment trusts has taken place, partly as the result of foreign investment in the United States, and partly because of the constantly widening interest of American investors in stocks and bonds as a means of applying savings. Estimates made as of June 30, 1928, showed fully 199 trusts then operating with \$1,200,000,000. Later estimates, based on the great growth which occurred during 1928-29, indicate a tentative total of at least \$1,000,000,000 more added during the year closing June, 1929. Probably most of those that have been established in the United States, however, have headquarters, or at all events, an office, in New York City.

The investment trust is what its name implies—a trust fund established by contributions from individual investors who want to turn over the business of managing their funds to others. The management of an investment trust may thus be individual or corporate. In the latter case, a management corporation is formed whose purpose it is to receive, invest, manage, and eventually to distribute the earnings of, moneys placed in its hands by investors. There are still various cases in which persons have merely acted in their individual capacity as trustees for funds deposited with them by others which they have pooled as received and have used for the purchase of securities which, in their opinion, were sound.

In order to establish confidence, the individual or management corporation engaged in operating an investment trust often follows the plan of placing the securities growing out of successive operations with a recognized trustee institution—usually, under American law, a trust company. An indenture specifying the conditions under which funds will be received, investments made, and the resulting securities set aside and from time to time withdrawn and sold, is drawn up and, upon the basis of this indenture, the trust company which has been selected as holder of the securities "accepts" the trust, agreeing to carry out the provisions of the indenture in so far as the holding and disposing of securities are concerned. This leaves the management company, with its board of directors, responsible for altering the securities of the trust, taking in the resultant proceeds, determining what securities to buy, making the purchases, placing stocks and bonds thus acquired with the trust company, and from time to time determining upon a withdrawal and sale (if so permitted by the indenture). But the funds may be, and often are, retained in the hands of the management company.

In its simplest form, the investment trust assumes the shape of a so-called "fixed fund" which is invested in a specified list of securities. Titles to ownership are represented by shares, or certificates. Thus, for example, the investment trust may undertake to purchase 100 shares each of 10 named companies and to de-

posit the whole 1000 shares with a trust company, thereafter selling, let us say, 1000 shares or certificates each of which entitles its holder to a proportionate share or ownership in the entire body of securities so deposited. In this case, management is reduced to a minimum, since the purchases are made in a specified way, and it is usual to provide that in the event a given issue of stock is retired or must otherwise be disposed of, the resulting funds shall be reinvested in the remaining securities of the original list. The holder of the investment trust shares, or certificates, thus becomes entitled merely to his pro-rata share of the entire receipts and to a corresponding pro-rata distribution of the proceeds at the time when the trust matures or ends, or is dissolved.

A more complex form of undertaking is afforded by a so-called "managed" list of investments. In such a trust, the management company merely undertakes to buy any securities it pleases and to sell them when it thinks fit. This form of management may be accompanied by published statements of holdings from time to time, as a matter of good faith, or may be of the "blind pool" type, in which the managers are obviously stock-market operators, buying and selling when and as they deem best. Of course, in such a case, the investment trust usually announces, or at all events guides itself, by an "investment policy" which may involve merely more or less mechanical diversification, such as (in one actual case), the keeping of the funds in not less than 400 different securities distributed in specified proportions between industrials, rails, government issues, and other types of obligations. Most of the recent discussion of investment trusts has centred around this question of investment policy and method of using and accounting for the funds received. The latest development of the investment trust in the United States has been its use for the placing of funds in certain fields such, for instance, as oil shares, chain-store stocks, and the like, dividing them among the more promising enterprises in these fields.

It should be noted that in many investment trusts, particularly of the English type, the practice of depositing with a trust company is omitted. In this case, the management corporation either increases its stock from time to time; so that the investor becomes a stockholder of the management corporation (and buys no certificates or debentures), or else it issues debentures which bear a fixed rate of interest and in some cases are accompanied by warrants entitling the holder to receive shares in the corporation, junior to those of the organizers and contributors of capital. In this case, the debenture holder gets a fixed rate of interest first of all and then a division of profits is made between him and the managers of the corporation who presumably hold its senior stock, or a substantial share of the junior stock, or both.

It is evident that whether the latter type or one of the other forms be employed, the profit to the managers of the investment trust comes from the fact that they sell participating rights (in income or capital) to investors at a figure higher than is necessary to acquire the securities which are bought for the trust. In the best-managed and most straightforward investment trusts, the actual cost to the investor is usually made plain. It may run from 6 to 7 per cent of income, and varying percentages of gain

up to any amount to which managers can induce investors to assent. The remainder of earnings from appreciation may, in some cases, be continuously reinvested in securities, thereby enhancing the worth of the main body of the trust, or may be periodically declared as dividends to stockholders.

One of the latest and also the most regrettable developments of the investment-trust movement is its use by the bond and security-issuing houses as a means of relieving themselves of left-over or unsalable fag-ends of issues not fully disposed of to the public. These remnants of unsalable issues are dumped into an investment trust controlled by the issue house, and the certificate or stock issues representing it are then sold to the buyer of investment-trust obligations. This procedure naturally neutralizes the expected effects of diversification and careful investment choice.

Investment policy is a vague phrase which has no well-defined meaning. In general, its objects are to obtain the maximum return which is consistent with safety. The object of the investment trust, however, is not primarily safety in the ordinary sense of the term, but is that of enabling the owner of small resources or the man who is too much occupied with his own affairs to give thought to the question of investment to obtain access to the earnings which come from business profits, rather than to be obliged to content himself with mere interest on his "money." The protection of the investor is thus found in wise investment, or wise use of funds, and there is danger that success will be taken as the only test of wisdom, so that investment-trust managers who speculate successfully will be regarded as the soundest elements in the profession. Recognizing this danger, most investment-trust managers deem it wise to make a plain statement at the outset as to the general direction in which they propose to apply their funds, as well as to the markets in which they intend to operate.

In some cases, they also commit themselves as to policy with respect to the purchase of dividend-paying securities and as to the course they intend to follow in using earnings derived from appreciation of capital—whether in distribution or in improving and enlarging the value of the main body of the trust. Diversification in some one of its many forms is thus at the bottom of investment policy of most of the trusts, while other questions bearing upon the methods of selection are dealt with in varying ways. American trusts on the whole have emphasized turnover and rapid profit from sales and purchases, while British trusts have in the main laid emphasis upon making good individual choices, relying on the directors' information and purchasing for a "long pull."

The so-called Edge Act, adopted in 1919 as an amendment to the Federal Reserve Act, provides for the organization of Federal investment trusts, but only one such trust existed in 1928. State laws, for the most part, have reference only to conditions of trusteeship and provide little regulation of the operations of the management companies. The Attorney General of New York, after a lengthy investigation in 1927, published a report containing a variety of suggestions for investment-trust control, none of which was seriously considered, and none of which has resulted in positive action. The management of investment trusts also was seriously discussed

by the Investment Bankers Association during the year 1928, but without practical results.

**Bibliography.** Among recent books dealing with investment trusts may be mentioned Fowler, *American Investment Trusts*; Grayson, *Investment Trusts, Their Origin, Development and Operation*; Robinson, *Investment Trust Organization and Management*; Keane, *Manual of Investment Trusts*; Speaker, *The Investment Trust*; and Steiner, *Investment Trusts, American Experience*.

**IORGA**, yôr'gă, NICOLĂE (1871- ). A Rumanian historian and political leader (see Vol. XII). As head of the National Party, he followed an independent course, refusing to unite with the new National Peasant Party formed following the World War. He continued his activities as editor of the *Neamul Românesc*, the weekly organ of his party, and in 1916 also became editor of *Revista Istorică*, a historical review. In 1929 he was director of the Rumanian School of Paris. His later works included *Histoire des États Balcaniques à l'époque moderne* (1914).

**IODINE.** See FOOD AND NUTRITION; and GOITRE.

**IOWA.** The twenty-fourth State in size (56,147 square miles) and the sixteenth in population; capital, Des Moines. The population increased from 2,224,771 in 1910 to 2,404,021 in 1920, a gain of 8.1 per cent; estimated population, 1928, 2,428,000. The white population rose from 2,209,191 (1910) to 2,384,181 (1920); Negro, from 14,973 to 19,005; native white, from 1,935,707 to 2,158,534. The foreign-born white population showed a decrease, from 273,484 to 225,647. The urban population mounted from 680,054 to 875,495, while the rural fell from 1,544,717 to 1,528,526. The population of the principal cities increased as follows: Des Moines (q.v.), 86,368 to 126,468; Sioux City, 47,828 to 71,227; Davenport, 43,028 to 56,727; Cedar Rapids, 32,811 to 45,566.

**Agriculture.** As Iowa is one of the chief agricultural States, conditions in the period since the World War have reflected fluctuations in production and values which marked the epoch. (See AGRICULTURE, CORN, and WHEAT.) The number of farms changed but slightly, from 213,439 in 1920 to 213,490 in 1925; the acreage declined from 33,474,896 to 33,280,813 in 1925. The improved land in farms embraced 28,606,951 acres in 1920. Crop land totaled 21,997,075 acres in 1925. The total value of farm property rose from \$3,745,860,544 in 1910 to \$8,524,870,956 in 1920, but declined to \$5,602,077,895 in 1925; the average value per farm was \$17,259 in 1910, \$39,041 in 1920, and \$26,240 in 1925. Prices of farm land increased greatly in the war period, stimulated by prices of products. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. The total percentage of land used for agricultural purposes decreased from 95.4 in 1910 to 94.1 in 1920, and 93.6 in 1925. Of the total number of farms in 1925, 116,444 were operated by owners; 1650, by managers; and 95,396, by tenants. The corresponding figures for 1910 are 133,003; 1926; and 82,115. The white farmers in 1920 numbered 213,330, compared with 216,843 in 1910; colored farmers, 100, compared with 201. Farms reported as under mortgage numbered 66,096 in 1920; 64,781 in 1925. The total number of cattle in 1920 was 4,557,708; in 1925, 4,-

264,493; dairy cows numbered 1,519,510 in 1920 and 690,411 in 1925; swine, 7,864,304 in 1920 and 8,567,131 in 1925; sheep, 1,092,095 in 1920 and 818,403 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 476,012,000 bushels; wheat, 8,270,000; oats, 240,040,000; barley, 27,068,000; potatoes, 10,935,000; and hay, 4,516,000 tons. Comparative figures for 1913 are corn, 338,300,000 bushels; wheat, 10,395,000; oats, 168,360,000; barley, 10,000,000; potatoes, 7,200,000 bushels; and hay, 4,440,000 tons.

**Mining.** The principal mineral products of Iowa are coal, cement, gypsum, and clay products. There is practically no metal mining in the State. The coal production during the period starting with 1914 showed considerable fluctuation, as will be noted from the following figures: 1914, 7,451,022 short tons, valued at \$13,364,070; 1917, 8,965,830, \$21,096,408; 1918, 8,192,195, \$24,703,237; 1919, 5,624,692, \$17,352,620; 1920, 7,813,916, \$30,794,000; 1921, 4,531,392, \$17,256,800; 1922, 4,335,161 tons; 1926, 4,625,487 tons, \$14,214,000; 1927, 2,949,622 tons, \$9,304,000. The decreases in 1921-22 and 1927 were due to the protracted coal-miners' strikes which affected all the Middle Western coal fields. Shipments of cement rose moderately during this period. They ranged from 4,224,076 barrels in 1914 to 3,188,669 in 1918 to 4,421,783 in 1920 and 5,415,144 in 1927. The value virtually doubled in the period of the World War because of the decreased purchasing power of money and the consequent higher prices. Clay products fluctuated from the value of \$6,401,745 in 1914 to \$5,313,394 in 1918 and \$4,459,724 in 1926. Gypsum is one of the most important mineral products: there were produced in 1914, 480,404 short tons; 1918, 327,927; 1920, 571,895; and in 1926, 802,910. In addition to the minerals noted, the State produces mineral waters, sand, and gravel. The total value of the mineral products in 1926 was \$35,971,787, compared with \$57,250,480 in 1920; \$37,882,183 in 1919; \$38,742,009 in 1918; and \$26,287,115 in 1914.

**Manufactures.** Although Iowa is not one of the most prominent of the manufacturing States, it is of considerable industrial importance. There are 18 cities having a population of more than 10,000. These form 25.1 per cent of the total population of the State, and in 1919 they reported 78.4 per cent of the total value of its manufactured products. There were in the State, in 1909, 5528 manufacturing establishments; in 1919, 5683; in 1925, 3219; in 1927, 3061. The wage earners in manufacturing numbered 80,551 in 1919, 74,257 in 1925, and 73,692 in 1927; and the capital invested amounted to \$171,218,604 in 1909, and \$403,205,513 in 1909. The value of the products in 1909 was \$259,237,637; in 1919, \$745,472,697; in 1925, \$746,320,586; in 1927, \$769,340,610. The chief industry in point of value of product is that connected with slaughtering and meat packing, with a value of \$59,045,000 in 1909; \$226,865,000 in 1919; \$213,741,084 in 1925; and \$212,353,210 in 1927. The manufacture of butter, cheese, and condensed milk ranks second: in 1919, \$25,850,000; in 1919, \$57,800,000; in 1925, \$78,110,309. Car construction and repair, in third place, had products valued in 1909 at \$10,269,000; in 1914, \$11,434,000; and in 1919, \$33,099,000. Flour-mill and gristmill products were valued, in 1909, at \$12,871,000; 1914, \$14,337,000; 1919, \$21,-

325,000; and 1927, \$13,288,322. The increase in value of products about 1919 was due largely to changes in industrial conditions brought about by the War, and therefore cannot properly be used to measure the growth of manufactures. An increase, however, in the number of wage earners from 63,113 in 1914, indicated a decided growth in manufacturing activities. The chief manufacturing cities are Cedar Rapids and Des Moines. There were in Des Moines, in 1909, 387 establishments, with a product valued at \$23,585,000; in 1919, 379, with \$59,831,000; in 1925 335, with \$83,624,093; in 1927, 300, with \$76,108,331. In Cedar Rapids, there were 153 establishments in 1909, with a product of \$24,824,000; 170 in 1914, with \$34,989,000; and 208 in 1919, with \$92,118,000. Other important manufacturing cities are Council Bluffs, Dubuque, Fort Dodge, and Muscatine.

**Education.** No State has devoted more attention to education than has Iowa. The result of this is indicated by the fact that it is lowest in percentage of illiteracy and that although the enrollment in the public schools decreased after 1900, as the State lost in population, the average daily attendance showed a large increase. Particular attention was given to rural-school problems, and in the supervision of rural schools great improvement was shown. The General Assembly established the Standard School as a means of taking care of children and teachers in the rural schools, the Evans-Smith Law making an appropriation of \$100,000 annually to help the one-room school. The consolidated school had been in operation in the State for about 15 years, but only latterly had rapid development begun in it. From 1918 to 1922, the number of consolidated schools practically doubled. Vocational education was introduced as a part of the educational system and work started in agriculture, trades and industry, home economics, and teacher training; and in connection with this work, civilian rehabilitation was carried on. In 1922 courses in vocational agriculture were given in 43 high schools. A law enacted by the 38th General Assembly requires that the subject of American citizenship shall be taught in all public and private schools in the State. In 1900 there were enrolled in the public schools 566,223, and in 1925-26, 556,270, students, when the average daily attendance was 445,935, as against 373,474 in 1890-1900. Of the total enrolled in 1925-26, 444,376 were in elementary, and 111,894 in secondary, grades. Expenditures for public day schools in 1925-26 were: current, \$50,996,065; outlays, \$6,284,000. The percentage of illiteracy decreased from 2.2 in 1910 to 1.4 in 1920; among the foreign-born whites from 10.3 per cent to 10.2; among the Negroes, from 15.9 to 11.2.

**Finance.** State expenditures in the year ending June 30, 1928, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$22,504,088 (of which \$796,987 was aid to local education); for interest on debt, \$888,503; for permanent improvements, \$17,255,799; total, \$40,648,389 (of which \$18,322,415 was for highways, \$3,908,499 was for maintenance and \$14,413,916 for construction). Revenues were \$41,183,371. Of this, property and special taxes formed 27.8 per cent; departmental earnings and charges for officials' services, 13.8 per cent; and sales of licenses and a tax on gasoline, 38.0 per cent. Property valuation was \$1,495,674,319;

State taxation thereon, \$9,610,800. Net State funded debt on June 30, 1928, was \$18,847,990.

**Political and Other Events.** As the chief interest in the State is agriculture, which was greatly affected by conditions following the War, the radical group which demanded legislation for the benefit of the farmers developed great power. It succeeded in electing its candidates for the United States Senate and other offices. In 1914 Henry Vollmer, a Democrat, was elected to the House, and George W. Clarke, Republican, was elected governor. Senator Albert B. Cummins was reelected. The political campaign in 1916 was particularly bitter, and local interest, to a large extent, superseded interest in the presidential election. W. L. Harding, Republican candidate for governor, was elected, together with the entire State Republican ticket. For President, the vote was 280,499 for Hughes and 221,669 for Wilson. In 1918 W. L. Harding was reelected governor. In 1920 elections were held for governor and other State officers and for United States Senator. Albert B. Cummins was reelected to the Senate, and N. E. Kendall, Republican, was elected governor. For President, W. G. Harding received 634,674 votes and J. M. Cox 227,921. In 1922 William S. Kenyon, United States Senator, resigned to become Federal judge, and Charles A. Rawson was appointed to succeed him. Smith W. Brookhart, the candidate of the radical Republicans, defeated the Democratic candidate, Clyde L. Herring. Governor Kendall was reelected for a second term. The people at this election voted in favor of the soldiers' bonus. John Hammill was elected governor in 1924; D. F. Steck, Democrat, defeated Brookhart for senator in an election followed by a protracted contest. Brookhart, however, gained the States' other Senate seat in 1926, when Hammill was reelected governor. In 1928 the presidential vote was: Hoover, 623,818; Smith, 378,936. Hammill was again elected governor.

**Legislation.** The most important acts of the Legislature in the period from 1914 are noted below. The Legislature of 1915 passed several measures relating to liquor reform and liquor regulation. The so-called "muley liquor law" was repealed. A bill providing for the submission of the question of prohibition to the people was passed, and also a measure providing for the submission of a woman-suffrage amendment in 1917. The Legislature also enacted a stringent child-labor law and abolished the contract prison labor system. In 1916 the Legislature provided a moratorium for men in the military and naval services. The Legislature of 1919 passed special provisions permitting women to vote for President; it also passed statutes defining and punishing criminal syndicalism and sabotage. In 1923 the Legislature passed a measure making a crime of the possession of drugs illegally obtained. It also enacted a law assembling activities relating to crime into a single department and a measure making the sale of narcotics a felony; it abolished distinctions in voting between men and women. The law against the sale of cigarettes was modified by permitting the sale of cigarettes to adults in the State. The Legislature in 1927 transferred responsibility for roads from the counties to the State, and in 1928 provided for a \$100,000,000-road-bond issue.

**IOWA, UNIVERSITY OF.** A State institution of higher learning for men and women, at Iowa

City, founded in 1847. The student enrollment increased from 2669 in all departments in 1913-14, to 9249 in 1927-28. The summer-session registration in 1928 totaled 4473. The faculty in the autumn of 1928 consisted of approximately 600 members, as compared with 275 in 1914; the library was increased during the same period from 174,000 to 279,575 volumes in the general library and 47,866 in the law library. The income for 1927-28, including revolving funds, was \$6,440,898. The period under review brought many improvements to the University campus, including: a dentistry building erected in 1917; a men's dormitory in 1919; the Children's Hospital, the Psychopathic Hospital, and a nurses' home in 1921; and a chemistry building in 1923. In the latter year, the restoration of the first Statehouse of Iowa, the university's administration building, was nearly completed, and a large recitation hall of Bedford limestone was begun. The campus also was increased during this period from 50 to nearly 300 acres. In 1925 a university observational school building was completed and put into service, a large medical laboratories building was under construction, and plans formulated for the construction of a new hospital to bring the capacity of the hospital up to about 1200 beds; the first unit of the Iowa Memorial Union was under construction in the same year, as well as the Quadrangle with a capacity of 700 men. In 1927 two wings of the nurses' home, a new field house, second unit of the Iowa Memorial Unit, and second unit of the chemistry building were under construction or completed; and in the following year, the new \$5,000,000 general hospital was completed and occupied.

By gifts of the General Education Board and the Rockefeller Foundation, matched by equal amounts appropriated by the State Legislature, the sum of \$4,500,000 became available in 1922 for the extension and reconstruction of the plant of the medical school, making possible the construction of the new laboratory, and the increase in floor space in the Children's Hospital, construction of new nurses' homes, and the construction of the above-mentioned general hospital. In 1917, the Iowa Child Welfare Research Station was established for the scientific study of normal children, and in 1921 the school of commerce was reorganized as the college of commerce. Thomas H. Macbride, Ph.D., LL.D., retired from the presidency in 1916, and was succeeded by Walter Albert Jessup, Ph.D., LL.D.

**IOWA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS.** A State coeducational institution at Ames, Iowa; established in 1868. The total number of students in attendance rose from 3458 in 1914 (including short-course students) to 4022 regular students in the autumn of 1928, with an additional registration of 2353 in the summer sessions, and the faculty from 217 to 373; the library was expanded from 45,000 to 160,000 volumes; and the annual income increased from \$3,000,000 to \$4,267,000. The endowment in 1928 amounted to \$695,000. The following buildings were among those erected during the period: Four women's dormitories, plant propagation building and greenhouse, science building, hospital, armory, animal husbandry laboratory, agricultural engineering building, poultry laboratory, dairy judging pavilion, sheep, horse, hog, and dairy barns, a library of 250,000 volumes' capacity, a home economics building, a dormitory for women, and

in 1928, a dairy industry building, chemical engineering building, and memorial union. President, R. M. Hughes.

**IRAQ (Mesopotamia).** A British mandate territory, lying between the Tigris and Euphrates rivers and made up of the former Turkish vilayets of Bagdad, Basra, and Mosul. Area, 143,250 square miles; population in 1920, 2,849,282. The population is largely Arab by race and Mohammedan by religion. Turks, Kurds, Jews (in the towns), Christians belonging to Roman Catholic and Syrian Catholic churches, and some Persians were also to be found. By religions, the population was divided into 1,146,684 Sunnis and 1,494,015 Shiah (both Mohammedans), 87,488 Jews, 78,792 Christians, and 42,302 others. Basra, at the head of the Persian Gulf, is the chief town; Bagdad is next in importance.

**Industry and Trade.** Agriculture is the leading activity of the population, and wheat, barley, and rice are grown in considerable quantities. Irrigation is indispensable even in the northern regions and is a constant concern of the Government. There is an Irrigation Department which operates canal systems, while pumps are worked by private individuals or tribes, irrigating some 800,000 acres. In 1919 the ancient canal, Saqlawiyah near Felliyah on the Euphrates, was reopened for the service of some 70,000 acres in winter and 36,000 acres in summer. Other canals opened after the War were the Yousoufieh to serve Bagdad, the New Khalis from the Dial River, the Beni Hassan, and the Georgivah, both from the Euphrates. Agricultural experiments indicated the feasibility of cultivating cotton, tobacco, and groundnuts. Dates, as always, figure in the economic life of the country, and sheep are tended in the Mosul region. The lack of farm labor and limited funds retard development. Local industries, concerning themselves with tanning and weaving, are to be found in the towns. Into the export trade, dates, grains, carpets, and wool, of the native products, enter largely, while piece goods, carpets, sugar, and tea are re-exported from Bagdad particularly via the caravan routes. Total imports for 1927-28 were valued at 3,455,242 rupees; total exports, 61,540,544 rupees.

**Communications.** River transportation continued to occupy a prominent place even after the War; particularly extensive improvements were made in the Tigris. The navigation of the two rivers is as before, controlled by a British company. Basra was the scene of great harbor developments as well. In 1927, 740 vessels of 3,943,892 gross tons entered this port. Up to 1914, the only railway line was the standard-gauge branch of the Bagdad Railway from Bagdad to Samarra (75 miles). However, military exigencies caused the construction of the following: Basra to Nasiriyah (140 miles), Basra to Amara (109 miles), Kut-el-Amara to Bagdad (105 miles), Bagdad to the vicinity of Khanikin (103 miles), and thence to the Persian frontier. The Bagdad Railway line was extended to Tekrit, and then, after the Armistice, on to Qalat Sharqat (total 186 miles). In all, some 1100 miles of line were built for military purposes. An outstanding event was the opening of the line from Basra to Bagdad (354 miles) in January, 1920, which made possible a comfortable train ride of 22 hours from city to city. The line from Bagdad to the Persian frontier at once

reduced freight rates and thus facilitated intercourse. On Mar. 31, 1928, the total route mileage was 752 with 182.52 miles of siding in addition. Railway earnings for 1927-28 were 9,802,330 rupees and operating expenses 8,546,803 rupees. Bus and airplane services are being rapidly introduced and developed.

**Minerals.** Oil is known to exist in rich quantities north from Mandali to Bagdad. The Anglo-Persian Oil Company obtained concessions to work some of these fields. Wells were sunk at Quaiyarah, but in 1929 the yield was still inconsiderable. Asphalt is found at Hit on the Euphrates.

**Government.** Revenues for 1918-19 were £2,080,000 and expenditures, £1,117,000; for 1926-27 revenues were 56,700,473 rupees and expenditures, 53,071,711 rupees. Customs revenue which forms about half the annual receipts amounted in 1927-28 to 22,929,835 rupees. The British forces stationed in the country are under the control of the Air Ministry. While there is in addition an Iraq Army, comprising 3 cavalry regiments, 2 field batteries and 3 pack batteries, 7 infantry battalions, and technical and depot troops.

**History.** This Turkish province had been a field for Anglo-German imperialist rivalry from about 1899, but in the summer of 1914 secret agreements were reached whereby a compromise disposition of interests was made. The outbreak of the World War, however, preceded and prevented the necessary ratifications. On Mar. 11, 1917, British and Indian troops occupied Bagdad, the capital of Mesopotamia or Iraq. In the occupied area, the British courted the favor of the native Arabs by making concessions to native customs, by tactful treatment of Mohammedan religious interests, and by generous promises to Arab nationalism. After occupying Bagdad, General Maude issued a proclamation inviting the people to participate in the government, so that they might unite with the Arabs of other regions in realizing their political aspirations. Meanwhile, however, by the secret Sykes-Picot Treaty of 1916, Great Britain and France had made an anticipatory division of the spoils, assigning Mesopotamia to Great Britain. The unratified peace Treaty of Sévres (1920), and likewise the definite Treaty of Lausanne (1923), deprived Turkey of sovereignty over Mesopotamia; and the latter treaty left for future solution the problem whether the Mosul vilayet, reputed rich in oil, should be included in the ceded area. Mosul had been allotted to France by the Sykes-Picot Treaty, but transferred to England by another Anglo-French bargain in December, 1918. At the San Remo Conference of April, 1920, the Allies conferred on Great Britain a Class A mandate over Mesopotamia, including Mosul, though Turkey claimed the latter area on the ground of national self-determination. See MANDATES. At the same conference, an Anglo-French oil agreement was concluded, whereby a 25 per cent share of the future oil output of Mosul was granted to France, and a pipe line was to be constructed through Syria as an outlet for Mesopotamian oil.

Against this oil agreement, the United States government entered a vigorous protest, in a note dated Nov. 20, 1920; at the Lausanne Conference in 1923, the American delegation blocked a British attempt to obtain Turkish confirmation of the predominantly British-Turkish Petroleum Company's monopolistic concession. The contro-

versy regarding the Mosul oil field was further complicated by the Chester Concession and by claims advanced in behalf of Abdul Hamid's heirs. The British oil interests conciliated Washington by offering several American claimants minor shares in Mesopotamian oil. In the meantime, the uncertainty prevailing in regard to the future status of the country had encouraged the development of a strong Nationalist agitation by young Arab officers, who quoted Wilson's speeches and various English and French manifestoes to prove Mesopotamia's right of self-determination. Popular antipathy to the efficiency of British tax collectors, to forced labor on irrigation works, and to British disregard of tribal and religious leaders, provided additional fuel for the smoldering fires of discontent which burst into open rebellion in 1920. The British Army of 60,000 men had to be increased to 90,000 before the revolt was quelled, in December, 1920.

Under these unfavorable circumstances, the British endeavored to create the administrative machinery to fulfill their mandate. In the autumn of 1920, the Council of State was set up, under the tutelage of Sir Percy Cox, the British High Commissioner. Insistent Arab demands for a native government, reinforced by equally insistent protests by English taxpayers against the large military expenditures in Mesopotamia, whose cost, from the Armistice to the end of 1921, was estimated at £100,000,000, led the British government to consider favorably the claims of Prince Feisal, son of the King of Hedjaz. The Council of State on July 11, 1921, unanimously offered him the crown, and after an almost unanimously favorable but hardly democratic plebiscite, 96 per cent for Feisal, he was officially proclaimed King of Iraq, at Bagdad, Aug. 23, 1921. See FEISAL.

From this time on, the British gradually withdrew their forces, the last British battalion leaving in March, 1927. One Indian battalion and five air squadrons of 12 planes each remained, in addition to an Iraq Army of about 10,000 men. The new Kingdom of Iraq, nominally a sovereign state, was nevertheless subject to British supervision under the mandate, and to clarify this relationship, a 20-year treaty was signed on Oct. 10, 1922 (not ratified by Iraq until June, 1924), by which Iraq agreed to be guided by the advice of the British High Commissioner in financial, military, and international matters, and Great Britain promised to facilitate Iraq's entry into the League of Nations, in due course.

A subsequent protocol, signed Apr. 30, 1923, provided that the treaty was to terminate either on the entry of Iraq into the League, or in any case not later than four years after the ratification of peace with Turkey (i.e., 1928).

The independence granted to Iraq was evidently of a very limited nature. The British continued to supervise native administration in the vital departments, a British Civil Administration continued to function temporarily side by side with Feisal's government, and the British Royal Air Force remained in military control of the country. In 1922, to give one instance of British policy, the Minister of the Interior was exiled to Ceylon because of his too pronounced Nationalist views. The constitution, or Organic Law, drafted in 1923, approved by the Council of Ministers, and accepted by the Constituent Assembly in June, 1924, made Mo-

hammedanism the state religion and Arabic the official language, but assured equal civic rights to all, regardless of creed or race. Its political clauses provided the customary machinery of parliamentary government, with a responsible cabinet and a bicameral legislature. This legislative body consists of two Houses, the Senate composed of 20 "Elder Statesmen" appointed by the King, and the Lower House of 88 elected deputies. The first Parliament, with 52 Progressives and 33 Nationalists, met July 16, 1925.

In 1924 the dispute with Turkey over the Mosul frontier was referred to the League of Nations. The League decided in December, 1925, in favor of Iraq, provided England's tutelage of the kingdom were extended 25 years. Accordingly, the new Anglo-Iraq Treaty was signed Jan. 13, 1926, extending the duration of the original treaty of 1922 for another 25 years from Dec. 16, 1925. It was to terminate, however, at any time before its normal expiration, if Iraq became a member of the League.

Throughout 1927, then, there was agitation in Iraq to secure its admission to the League. The Iraq government favored the introduction of conscription, so that it could guarantee the preservation of internal order and protection against foreign aggression. In the fall of 1927, King Feisal and Prime Minister Jafaar Pasha went to London to try to convince the English authorities of the need for conscription and another revision of the treaty. The result was the treaty of December 14, in which Iraq was recognized as an "independent sovereign state." England, furthermore, promised to support her candidature for admission to the League in 1932 if all "things go well in the meantime."

The treaty caused dissatisfaction in Iraq, as did also the new Prime Minister's (Jafaar Pasha) attempt to push through conscription. But Jafaar resigned on Jan. 9, 1928, to be succeeded by Saadun Pasha, who pledged adherence to the treaty and dropped all talk of conscription. In the elections of May, 1928, the Government received 70 seats out of the 88 in the Lower House. On Jan. 21, 1929, Saadun resigned over the question as to whether Iraq should pay part of the cost of the maintenance of the British forces in the land. Toward the end of April, 1929, Tausiq Bey became Prime Minister, the twenty-first in eight years. In a speech to Parliament on May 6, he promised an attempt at speedy settlement of the difficulties with England, a census, reorganization of the army, and attention to such matters as housing, irrigation, and education.

In foreign affairs, Iraq's chief difficulties have been with Nejd and Persia. The Nejd Wahabis were making life miserable for the Iraqis who live near the border, but a conference held between British, Iraq, and Nejd officials toward the end of 1928 was thought likely to improve conditions. Iraqi-Persian difficulties resulted from an attempt of some southern Iraqis to acquire Persian citizenship in order to escape conscription, from a quarrel over the treatment of Persian subjects in Iraq, and from Persia's claim that Iraq is a refuge for Persian bandits and rebels. In April, 1929, however, Persia finally recognized Iraq and relations between the two neighbors are improving steadily. The British High Commissioners in Iraq have been Sir Percy Cox to 1923, Sir Henry R. C. Dobbs from 1923 to 1929, while Sir Gilbert Clayton was appointed in March, 1929.

**IRELAND.** An island of the British Isles with an area of 32,586 square miles. The population in 1911 was 4,390,219. No census was taken in 1921. By the Government of Ireland Act (1920), as amended by the Irish Free State Act (1922), Ireland was divided politically into two parts, Northern Ireland and the Irish Free State. The former remains in the United Kingdom; the latter has constitutional status as a dominion. For statistical information and recent history, consult articles on **IRELAND**, **NORTHERN**, and **IRISH FREE STATE**.

**History.** On the eve of the World War, which was destined to affect the fortunes of Ireland no less decisively than those of Europe, three-quarters of the Irish population were solidly backing Redmond's Nationalist Party in its agitation for home rule, while the rest, defiantly Unionist, were ready to take up arms against the British government, if need be, rather than permit that government to include Protestant Ulster in an autonomous Ireland. For loyal support of Asquith's Liberal cabinet, the 84 Irish Nationalists in the Commons had been rewarded with the introduction, by the Premier himself, of the Government of Ireland Bill (the famous Home Rule Bill), Apr. 11, 1912, which had been passed by the Commons twice, twice rejected by the peers, and passed a third time by the Commons in the spring of 1914. Under the terms of the Parliament Act, this bill could now be promulgated by the Crown as law, notwithstanding the Lords' veto, but the Prime Minister, moved doubtless by either the threats or the entreaties of the Unionists, decided with characteristic indecision to compromise on a middle course. Accordingly, he introduced an Amending Bill, which would permit the Ulster counties, at their option, to exclude themselves provisionally, for six years, from the proposed Irish government. Feeling ran high, in Parliament and above all in Ireland.

After the English declaration of war on Germany, the Nationalists vied with Ulster Unionists in protestations of loyalty; but when in September, 1914, Premier Asquith decided to put the Home Rule Bill on the statute books, and simultaneously to pass a Suspending Act to suspend it for 12 months, or until the termination of the War, he at once angered Ulster and weakened Redmond's control over the extremists in his party. The organization, known as Sinn Fein ("we ourselves"), led by Arthur Griffith, had originally designed to promote a Nationalist cultural risorgimento, but now republican in aim, organized a separate body of "Irish Volunteers," captured the Gaelic League, spread its anti-British propaganda through hamlet and heath, and prepared for the day of independence. Sinn Fein, however, was still but an active minority when in April, 1916, the Easter Rebellion occurred in Dublin. Members of Irish Volunteers and the Citizen Army seized the Post Office, the Four Courts, and other buildings in the heart of the city, and proclaimed Ireland a republic. British machine guns and field artillery soon compelled the republicans to surrender. Swift and heavy was England's vengeance. Some 3400 men and 79 women were arrested as suspects; Padraic Pearse, Thomas Macdonagh, and 13 others were condemned by court-martial and summarily executed; and about 100 were sentenced to imprisonment, while over 1800 were interned. Sir Roger Casement, who was landed on the Irish

coast from a German submarine on the eve of the rising, was tried for high treason and hanged on August 3. The executions, far from settling the matter, aroused such a storm of indignation on both sides of the Irish Sea that Premier Asquith promised to investigate conditions in Ireland personally. A few days' visit convinced him that the government there had completely broken down, and he accordingly delegated Lloyd George to arrange for the immediate application of the Home Rule Act of 1914; but the negotiations begun by Lloyd George met shipwreck when it became known that the Government had promised Sir Edward Carson the definite exclusion of the six Ulster counties from the act.

When Lloyd George became Premier of Great Britain in December, 1916, he announced that he could not force home rule on any part of Ireland to which it was repugnant, but in May, 1917, he offered either to grant immediate home rule excluding six Ulster counties for five years or to summon an Irish Convention to propose a solution. As the former alternative was unpopular, the Premier succeeded with the second, although Sinn Fein repudiated it in advance.

The Convention was composed partly of elected delegates and partly of Catholic and Protestant clergy, merchants, labor leaders, representatives of Irish parties, and two Irish peers, nominated by the British government; it was to be an inclusive rather than a democratic body. During its protracted deliberations, from July 25, 1917, to Apr. 5, 1918, the economic reasons for Ulster's intransigence figured even more prominently than religious or political factors; and the final report, recommending a united Parliament for Ireland, without control of excise and customs taxes, was passed only by 44 to 29 votes, with Ulster and several Nationalists in the opposition. This report was of course disregarded. For its part, the British government in April, 1918, extended the conscription law to Ireland, heedless of warnings. Thereupon the Nationalists, led by John Dillon, successor of John Redmond, who died in March, walked out of the Westminster Parliament and joined Sinn Fein in a protest against the draft. Sinn Fein, by this time, had become a puissant organization; at its convention in October, 1917, representing 12,000 Sinn Fein clubs with 250,000 members, it had voted a republican constitution for Ireland and elected as President Eamonn de Valera, the only surviving leader of the Easter Rebellion. De Valera was imprisoned in May, 1918, escaped in February, 1919, and spent the years 1919-21 in America, where he won sympathy and raised funds for the "Irish Republic." In the general election of December, 1918, Sinn Fein won 73 out of the 105 seats in the British House of Commons, while the almost defunct Nationalist Party retained only 6, and Unionists filled 26. Considering this victory as a plebiscite for Irish independence, the Sinn Fein M. P.'s, instead of proceeding to Westminster, met at Dublin as the "Dail Eireann" (Irish Assembly), adopted a formal Declaration of Independence in January, 1919, and nominated delegates to the Paris Peace Conference.

The refusal of the Peace Conference to recognize these delegates, and President Wilson's unwillingness to demand their admission, turned Irish and Irish-American sentiment against Wilson, the Peace, and the League, and led

disappointed Sinn Feiners in Ireland to resort to violence as their one remaining weapon. With increasing frequency, attacks were made on the Royal Irish Constabulary, the British troops, and British officials, while British troops began wrecking shops and burning villages by way of reprisal.

Under such disquieting circumstances, Premier Lloyd George persuaded his Parliament to enact, in December, 1920, a new Home Rule Bill, creating separate parliaments and ministries for the six Ulster counties of Northern Ireland and the remainder, inaccurately styled Southern Ireland, with a joint Council of Ireland to harmonize the two. Neither Parliament was to have power to control customs and excise duties, army and navy, treaties, titles, external trade, cables, coinage, trademarks, or religion. Ulster accepted the law forthwith, elected its Parliament in May, 1921, organized its cabinet under Sir James Craig, and was congratulated by King George in person. Southern Ireland likewise held elections in May, but the Sinn Feiners elected by all constituencies except Dublin University were pledged not to accept mere home rule. Encouraged, Sinn Fein intensified the irregular warfare it had been waging against the British and especially against the "black-and-tans," ex-service men enrolled as auxiliary police and clad in khaki with black hats and black armbands. The shooting of British soldiers and constables and seizures of arms by Sinn Fein troops increased, and the burning and pillaging of Irish towns and villages by the British grew more frequent. Sinn Fein courts and police were organized, and "Castle" government, the British government, ceased to have any real functions of administration.

At length, Premier Lloyd George in desperation invited the Sinn Feiners, hitherto regarded as rebels, to negotiate with him. Through the mediation of General Smuts, a "truce" was signed, July 10, 1921. England's offer of Dominion status, at first rejected by de Valera and the Dail Eireann, was ultimately accepted in principle as the basis for a tripartite conference of Sinn Fein, Ulster, and British delegates, October to December, and incorporated in a definite treaty dated Dec. 6, 1921. Article 1 conferred on the Irish Free State the same constitutional status as that of Canada and other dominions. Ireland was to have her own Parliament and an executive responsible to it (Article 1), its own army (Article 8), and, in short, the almost complete independence of a dominion (see BRITISH EMPIRE), but with a strict proviso against religious discrimination (Article 16) and transitional fiscal and naval restrictions (Articles 5-6 and 10). Ulster was permitted either to accept inclusion in the Free State, with local autonomy, or to continue as a part of Great Britain with the Northern Ireland Parliament retaining the rights granted by the Home Rule Act of 1920. Naturally, Ulster chose the second alternative, and the government of Northern Ireland remained precisely as established in 1921. The provisions of the 1920 Act regarding a joint Council for Ireland also remained in force, as a result of Ulster's choice (Article 12).

This treaty, liberal as it was, compared with earlier British offers, failed to placate President de Valera and other Sinn Fein irreconcilables, who still cherished the ideal of a united

independent republic, and bitterly assailed Article 4 of the treaty, requiring members of the Free State Parliament to swear allegiance to King George. On the other hand, Arthur Griffith, Michael Collins, and other Sinn Fein leaders who had signed the treaty believed it to be as much as could practically be obtained, and persuaded the Dail Eireann to accept it by 64 to 57 votes. De Valera indignantly resigned from the Presidency, to which Griffith naturally fell heir, in January, 1922, and the Southern Irish Parliament formally ratified the treaty. As Great Britain also had ratified, the Free State came into being on January 10; its provisional government, with Michael Collins as Premier, took over Dublin Castle from the British administration and joyfully watched 60,000 British soldiers depart from Ireland. Soon, however, de Valera's uncompromising Republican adherents took up arms against the provisional government, and Ireland was once more in the throes of guerilla warfare. The death of President Griffith on August 12 and the killing of Premier Collins on August 22 by Republicans might well have discouraged the Free State forces, but the latter event seemed to have the contrary effect of arousing indignation against the Republicans. William T. Cosgrave succeeded Collins as head of the Government. Meanwhile, a provisional Parliament favorable to the treaty had been elected in June, and in the autumn, this body adopted a constitution on October 11, making Gaelic the official language of the Free State, guaranteeing personal and religious liberty, and creating the bicameral Free State Parliament (Oireachtas) with the Executive Council or cabinet of ministers responsible to the Lower House. The House of Representatives (Dail Eireann) of 153 members was to be elected for four years, unless dissolved, by universal suffrage of men and women over 21, with proportional representation. The Senate (Seanad Eireann) of 60 members was to be chosen, one-fourth every three years, by a vote of citizens aged 30 and over, with proportional representation, from a list of prominent citizens nominated by the Irish Parliament. The constitution was confirmed by the British Parliament early in December, 1922, and the new Government was at once established; the provisional Parliament now became the first House of Representatives, and the first Senate was chosen, half by the House and half by the President of the Executive Council. Cosgrave became President of the Executive Council, and Timothy Healy was appointed by the Crown as Governor General, an almost purely honorary post.

The Republicans, meanwhile, had proclaimed a rival government, and though obviously in a minority, refused to abandon their irregular warfare against the Free State until thousands had been killed or wounded, 15,000 Republicans imprisoned, and scores executed in reprisal for Republican deeds of violence. In April, 1923, de Valera ordered a truce, in view of approaching elections; he was, however, arrested on August 14, to be subsequently released in the July following. Though large numbers of Republicans were released in course of time, several thousand were held in jail regardless of hunger strikes. By 1924 the country was fairly well pacified, and the Free State government was functioning in an orderly fashion. Elections for the House held on Aug. 27, 1923, had given

the Cosgrave government 63 seats; Republicans, 44; Labor, 15; Farmers, 15; Independents, 16. As the 44 Republicans absented themselves when the new Parliament met in September, the Government had a working majority and addressed itself earnestly to the difficult tasks of extending peasant proprietorship and balancing an unbalanced budget. On Sept. 10, 1923, the Irish Free State was admitted to the League of Nations, and the once despised Gaelic tongue was heard as a national language in the assembly of nations at Geneva. See IRISH FREE STATE.

**IRELAND, JOHN** (1879—). An English composer, born at Inglewood, Bowden, Cheshire. He was a pupil in composition of Stanford at the Royal College of Music. From 1901 to 1909, he wrote several choral works with orchestra, orchestral works in the larger forms, and much chamber music, all of which he later discarded. His principal works, published after 1909, included a prelude for orchestra, *The Forgotten Rite*; a symphonic rhapsody, *Mai-Dun*; two piano trios; two violin sonatas; a 'cello sonata; pieces for piano; and songs.

**IRELAND, NORTHERN.** The official name of that part of Ireland remaining in the United Kingdom of Great Britain and Ireland. It is made up of the following counties and county boroughs: Antrim, Armagh, Belfast (County borough), Down, Fermanagh, Londonderry, Londonderry (County borough), Tyrone. Its area is 5238 square miles; its population in 1911 was 1,250,531; on Apr. 18, 1926, 256,561. Estimated population on June 30, 1928, was 1,248,000. See GREAT BRITAIN; IRELAND.

**IRIGOYEN, HIPÓLITO** (1850—). A President of Argentina, who was born in Buenos Aires and entered Congress in 1880. After the Revolution of 1890, he became the leader of the Radical Party and struggled to wrest power from the rich landowners. In 1911 he got a law passed which provided for compulsory and secret voting in elections, and in 1916 he was elected President by two votes, having refused to campaign for himself. In spite of great popular feeling for war with Germany in 1917, he rejected this course because he felt that war would interrupt his labor reforms. In 1922 he retired, as required by law, but in 1928 he was reelected for the term 1928-34, again without campaigning and without a platform, by a two to one vote. He lived simply, refusing to occupy the presidential palace while in office, gave his salary to charity, and was considered almost a prophet by the masses.

**IRISH FREE STATE.** A dominion of the British Empire, with an area of 26,592 square miles and a population, in 1911, of 3,139,688. According to the census of 1926, the population was 2,971,992.

The Irish Free State is essentially an agricultural country. In 1927 there were 4,047,013 cattle, 1,177,737 swine, 3,120,308 sheep, 185,810 goats, 428,502 horses, 197,004 asses, and 19,065 mules. The principal crops are hay, potatoes, oats, turnips, barley, and wheat. The completion of the Shannon River hydroelectric plant in 1929, which was to develop 90,000 horse power, was expected to assist materially in the industrialization of the country. Industries, such as exist, are confined chiefly to the preparation of dairy and meat products, boot and shoe making, and brewing and distilling.

In the calendar year 1927, the exports of the Irish Free State were valued at \$214,701,000

and the imports at \$295,565,000. The adverse trade balance in that year was the smallest in the four years since separate trade statistics had been maintained, imports having declined slightly and exports having gained by nearly \$15,000,000, or 7 per cent, as compared with 1926. Exports in 1926 were valued at \$200,087,000, and imports at \$295,896,000. Great Britain supplied 66.8 per cent of the imports in 1927 and purchased 84.6 per cent of the exports.

The budget for the fiscal year ending Mar. 31, 1929, carried revenues of £22,914,000 and expenditures of £26,080,681. The public debt on Mar. 31, 1927, amounted to £17,074,300. There are approximately 3028 miles of railway line in the country. In 1927, 13,494 vessels of 9,262,000 net registered tons entered the ports of the Free State in the foreign trade, and 13,368 vessels of 9,282,000 tons cleared.

**History.** Outstanding events in the history of the Irish Free State after its establishment were the settlement of the boundary dispute with Northern Ireland in 1925, the rise of Eamonn De Valera's new Republican Party, the Fianna Fail, as the principal opposition party in the Dail Eireann, and the pacification and stabilization of the Free State in the status of a British dominion.

Provision for the settlement of the boundary question by a special commission had been made in the Anglo-Irish Treaty of 1921, but the commission had not been established and the question remained a fertile source of animosity between the people of the Free State and Ulster. Several times civil war appeared imminent. The Free State government laid claim to the counties of Tyrone and Fermanagh in Ulster and several towns along the border in which Roman Catholics were in the majority. The Ulster government, contending that it had no part in the treaty of 1921 and that the six northern counties had been placed within its jurisdiction by the Government of Ireland Act of 1920, repeatedly refused to appoint a representative to the commission.

The commission was finally established in 1924 through the intervention of the British government. The Free State member, Professor John MacNeill, resigned toward the end of 1925, shortly before the report was to have been submitted, asserting that the other two members had failed to respect the provisions of the Anglo-Irish Treaty in their deliberations. It was forecast that the commission would not only reject the Free State claim to the extension of its boundary but would also allot a portion of Donegal to Northern Ireland. At this juncture, the issuance of the report was forestalled by an agreement for the settlement of the dispute which was signed Dec. 3, 1925, after the premiers of both the Free State and Northern Ireland had conferred with Premier Baldwin in London. The agreement amended the treaty of 1921, revoked the powers of the boundary commission, and fixed the boundary permanently as it had been fixed provisionally in the Northern Ireland Act of 1920. The financial obligations assumed by the Free State toward the British government under the Anglo-Irish Treaty were remitted in consideration of the payment of £5,000,000 as compensation for damages done in the Free State area during the Anglo-Irish struggle after Jan. 21, 1919. The agreement was ratified by the British, Free State, and Northern Ireland parliaments but was repudiated by the Irish Republicans.

The refusal of the Republicans originally

elected to the Dail to take the oath of allegiance left the Government without effective opposition until August, 1927, when De Valera and his Fianna Fail deputies decided to accept the oath and take their seats. They announced, however, that they did not consider the oath binding. Fianna Fail was organized by De Valera in January, 1926, when he broke with Sinn Fein over tactical measures for securing the abolition of the oath of allegiance. In the election of July 9, 1927, he doubled his 22 members in the old Dail, largely at the expense of the Sinn Fein Republicans, who lost 18 of 23 seats. The Government, which lost 12 seats, was no longer able to command a majority.

Premier Cosgrave continued in office, however, and was reelected president of the Executive Council. The seating of the Fianna Fail deputies was followed by an attempt to form a coalition government of Labor and National League members with the support but not the participation of Fianna Fail. The defection of one National League deputy saved the Government. Shortly afterward Premier Cosgrave called a new election, which was held September 15. The two main parties gained at the expense of minor groups, the Government and Fianna Fail winning 61 and 57 seats, respectively. With the aid of the Farmers' Group and the Independents, the Government continued with a small but safe majority over Fianna Fail and Labor during 1928 and most of 1929. In the latter year in several important by-elections, Government candidates defeated their Fianna Fail opponents. While denying sympathy with a wave of political terrorism which swept the country early in 1929, De Valera and his chief lieutenants declared that violence would probably continue as long as candidates for the Free State Parliament were required to take the oath of allegiance to the British King.

Internal peace was disturbed early in 1924 by a mutiny led by officers in protest against the reorganization and reduction of the Free State Army. The Government failed to deal firmly with the situation and in the following December was obliged to discharge a number of soldiers and civil servants who had continued the agitation. Republican raids upon police barracks and rioting occurred again in November, 1926, apparently as a result of the Government's participation in the British Imperial Conference held at that time. The Public Safety Act, establishing a virtual state of siege, was put into effect in the affected districts, some fifty arrests were made, and the disturbances quickly subsided.

On July 10, 1927, at the conclusion of the bitter political campaign, the country was aroused by the assassination of Kevin O'Higgins, vice president of the Executive Council, by three men believed to be agents of an unknown secret society. The Government adopted drastic measures against political crime, including the death penalty for the carrying of arms. After an interval of peace these were repealed in December, 1928. In October of that year, a few days before Princess Mary paid a visit to her husband's estate at Portumna, County Galway, incendiaries attempted unsuccessfully to burn Portumna Castle. There was a revival of political terrorism early in 1929; jury members were threatened, injured, and murdered and armed guards were assigned to protect the members of the Government. The Government again adopted severe measures and appealed for popular support but barely carried a

by-election in North Dublin fought on this issue.

Early in 1928 Premier Cosgrave visited the United States and Canada and was enthusiastically received. The same year Government spokesmen declared that the cabinet did not favor an Irish republic, believing that greater freedom and security could be found within the British Commonwealth of Nations. Governor General Timothy M. Healy resigned in December, 1927, after completing his five-year term, and was succeeded by James McNeil, Free State High Commissioner in London. Timothy Smiddy, Free State Minister at Washington, was then appointed High Commissioner in London, being replaced at Washington by Michael McWhite. The Free State was one of the original signatories of the Kellogg-Briand Treaty for the renunciation of war and the pact was ratified by the Dail on Feb. 22, 1929, although opposed by members of the Fianna Fail. In August, 1929, Charles Bewley, of Dublin, was appointed the first diplomatic representative to the Vatican City.

**IRON AGE.** See ANTHROPOLOGY.

**IRON AND STEEL.** Since 1913 the iron and steel industry of the world has furnished a notable illustration of the intimate relation of the development of natural resources and modern industrial activity to the maintenance of conditions of civilization. The importance of iron and steel manufactures to modern civilization was generally realized before the World War, but if any further proof were needed, it was found in the demands made on these industries during the great struggle. The forced operation of the iron and steel industries on a war basis, and the possession of raw materials for these industries was naturally an important military asset. After the Armistice, France secured the return of the valuable iron basin in Lorraine. As a result, the importance of France as an iron- and steel-producing nation has shown an appreciable relative increase.

A feature of the European iron and steel trade during the post-war period has been the general adoption of the cartel idea of production control and, within the individual nations, the widespread tendency toward industrial rationalization. Despite the loss of important raw-material-producing regions in the geographic and economic readjustments that followed the War, Germany was in some respects in better position than either France or Belgium, whose industrial plants were, in large part, within the zone of operations, and required complete rehabilitation.

The United States has been the leading producer of iron and steel for many years. In 1913 the world's production of pig iron was 77,174,000 long tons, of which the United States produced 30,653,000 tons; Germany, 19,000,000; Great Britain, 10,260,000; France, 5,126,000;

#### UNITED STATES PRODUCTION OF PIG IRON AND STEEL, 1916-28

Year	Pig iron	Steel ingots
	Gross tons	and castings (Gross tons)
1916	39,432,797	42,773,680
1917	38,621,216	45,060,607
1918	39,054,644	44,402,432
1919	31,015,364	34,671,232
1920	36,925,987	42,132,934
1921	16,688,136	19,783,787
1922	27,219,904	35,602,926
1923	40,361,000	44,943,706
1924	31,405,800	37,931,900
1925	26,700,500	45,393,500
1926	339,101,000	48,294,000
1927	30,289,000	44,935,000
1928	37,400,000	51,544,180

and Russia, 4,536,000. In 1921 the world's production of pig iron was only 37,401,000 long tons, of which the United States produced 16,500,000; France, 9,890,000; Great Britain, 6,630,308,000; Great Britain, 2,616,000; and Russia, 112,000. A new world-production record was established in 1928, when the output totaled 86,130,000 long tons. Of the 1928 total, the United States produced 37,400,000 tons; Germany, 11,500,000; France, 9,890,000; Great Britain, 6,630,000; Belgium, 3,815,000; and Russia, 3,290,000.

The production of steel ingots and castings has shown a much greater increase since 1913 than that recorded by pig iron. In 1913 the world's production of steel ingots and castings amounted to 74,687,000 long tons. The leading contributors to this total were the United States with 31,301,000 tons; Germany, with 18,632,000; Great Britain, 7,664,000; France, 4,614,000; and Russia, 4,181,000. In 1928 the leading contributors to the record output of 107,210,000 long tons were the United States, with 51,400,000 long tons; Germany, 14,000,000; France, 9,170,000; Great Britain, 8,495,000; Russia, 4,150,000; and Belgium, 3,865,000.

In Great Britain, the failure of the iron and steel industry to assume a position of relative importance in the world trade similar to that held prior to the War has been a great disappointment. The general strike of 1926 naturally resulted in a decrease in productive operations in the iron and steel industry of Great Britain,

**BRITISH IRON AND STEEL OUTPUT AND EXPORTS DURING PEACE YEARS**  
(In Gross Tons)

Year	Pig iron	Steel	Exports
1912	8,748,000	6,792,000	4,807,200
1913	10,260,000	7,688,000	4,969,200
1919	7,404,000	7,896,000	2,223,200
1920	8,034,000	9,067,200	3,250,800
1921	2,611,200	3,625,200	1,706,400
1922	4,899,600	5,880,600	3,400,800
1923	7,440,000	8,481,600	4,320,000
1924	7,318,800	8,221,200	3,852,200
1925	6,236,400	7,396,800	3,730,800
1926	2,441,500	3,497,000	2,987,700
1927	7,320,000	9,170,000	4,220,000
1928	6,630,900	8,542,000	4,205,000

for not only was the industry directly affected by the walk-out but it was indirectly affected for several months after the general strike ended by the continued unsettled conditions in the coal industry. The immediate result of this stopping of production was to throw open the domestic market to continental steel, which, imported in unprecedented tonnages during and immediately after this period was, of course, exceedingly difficult to dislodge once it had attained an extensive foothold. Exports of iron and steel products from the British Isles reached their highest point since the War in the 1927 trade—a circumstance due, no doubt, to the intensely stimulated production accomplished in the early months of the year and to the presence of a number of orders held over from 1926 which the British steel makers had been unable to fill over the duration of the coal strike.

In 1928 the leading political and industrial factors apparently began to realize that the condition would be permanent unless corrective measures were taken within the industry. Consequently, steps were taken to reduce operating and manufacturing costs, numerous consolidations were reported and, as unfavorable trade barriers and foreign tariffs took more and more from the British export trade, agitation and propaganda for a tariff to protect the home trade

was started. Early in 1929, it seemed inevitable that some step in this direction would be taken.

The German iron and steel industry reported that iron and steel production costs have grown substantially since 1923 and 1924, so much so that in 1928 they practically balanced the economies attained by the rationalization of the industry. A favorable report of the reparations committee, meeting in Paris in the early months of 1929, seemingly was needed to assure any marked future expansion or prosperity for the German industry. An appreciable decrease in production was recorded in 1928, as compared with 1927, largely accounted for by the labor disturbances resulting in a lockout in the Rhenish-Westphalian district late in 1928. These differences were patched over and productive operations were resumed at the beginning of 1929, but the fundamental controversial point remained unsolved and it seemed likely that further disturbances might be expected.

The iron and steel industries of France and Belgium have experienced steady growth since the Armistice. In considering this record, however, it should be remembered that France gained vast resources from Germany at the close of the War. On the other hand, many of the existing plants in France and in Belgium were razed by the Germans during the period of hostilities and, as a result, post-war reconstruction was expensive and time-consuming. The improvement in operating conditions is largely attributable to the control to which continental iron and steel makers have submitted themselves with respect to production. Industrialists in France and in the neighboring countries also have adhered to a number of agreements with regard to the sales of their products in their respective countries that did something toward removing barriers between continental nations owing to the complicated tariff system.

**United States Iron and Steel Industry.** Despite the fact that a vast excess of capacity for iron and steel production and manufacturing had been developed in the domestic industry during the War, the larger corporations in the trade made a practice of turning back large shares of their profits into additions to plant equipment up to 1927. The advisability of this procedure seemed highly questionable at the time, but the great increase in consumption recorded in 1928 and 1929 utilized, in large part, all the existing production capacity.

A feature of the domestic industry since the War has been the numerous mergers and consolidations, so that, in 1928, over 90 per cent of the entire ingot production of the United States was controlled by 10 companies. About 45 per cent of the entire capacity is controlled by the United States Steel Corporation, with the Bethlehem Steel Corporation next, with slightly over 15 per cent. The Youngstown-Inland interests, a consolidation not entirely completed by 1929, is next in size with about 10 per cent, and Jones & Laughlin follow with about 6 per cent. Other companies of the first 10 are the Republic-Trumbull companies, American Rolling Mills Company, Central Alloy Steel Corporation, Wheeling Steel Corporation, Colorado Fuel & Iron Co., and the Corrigan, McKinney Steel Company.

The year 1928 was a remarkable one for the steel industry in the United States, remarkable for its high production rate, in the stability of the market under increased output, in a steady

ness of demand which permitted an unusually uniform and thus more economical operation of mills, and finally in the almost unprecedented scale of steel output in the summer months. Rated in figures, 1928 was an 86 per cent production year, while 1927 was a 75 per cent year, and 1926 was an 81 per cent year. A new record in steel output featured the year despite the poor railroad demand.

In an effort to surmount barriers set up by the abolition of Pittsburgh plus, steel producers took greater advantage of water transportation in 1928. Among the unusual cross movements were shipments of steel from Buffalo to Chicago and Detroit by the Great Lakes; transportation of wire products from Pittsburgh to Minneapolis via the Ohio and Mississippi rivers and heavy loadings of pipe and other products from Pittsburgh mills to Memphis and New Orleans.

*Iron ore produced in 1927.* The iron ore mined in the United States in 1927, exclusive of ore that contained 5 per cent or more of manganese in the natural state, was, according to the U. S. Bureau of Mines, 61,778,000 gross tons, a decrease of 9 per cent as compared with that mined in 1926. The ore shipped from the mines in 1927 is estimated at 61,232,473 tons, valued at \$151,125,820, a decrease of 12 per cent in quantity and of 13 per cent in total value, as compared with the figures for 1926. The average value of the ore per gross ton at the mines in 1927 was estimated at \$2.47; in 1926 it was \$2.51. The stocks of ore at the mines, mainly in Michigan and Minnesota, increased from 9,565,880 tons in 1926 to 10,104,673 tons in 1927.

About 83 per cent of the iron ore shipped in 1927 came from the Lake Superior district, in which 52,357 gross tons were mined and 51,183,000 tons were shipped. The ore shipped in 1927 was valued at \$130,453,000. The ore is chiefly hematite. The average value of the ore at the mines in the Lake Superior district in 1927 was \$2.55 a ton; in 1926 it was \$2.56. The southeastern States, which constitute the second largest iron-ore-producing area, including the Birmingham and Chattanooga districts, mined 6,455,061 gross tons of iron ore in 1927, a decrease of 6 per cent, as compared with 1926. It is mainly hematite and brown ore. The average value of the ore produced in these States in 1927 per gross ton was \$2.04; in 1926 it was \$2.07.

The northeastern States, which include the Adirondack district, New York, and the Cornwall district, Pennsylvania, in 1927 mined 2,248,000 tons of iron ore and shipped 2,269,000 tons valued at \$7,649,000, increases of 16 per cent in quantity mined, 16 per cent in quantity shipped, and 19 per cent in value of shipments, as com-

pared with 1926. The stocks of iron ore in this group of States decreased from 403,742 tons in 1926 to 366,000 tons in 1927. These stocks are considerably less than usually carried over at these mines, being about 201,000 tons below the average for the preceding five years. The average value of the ore in these States in 1927 per ton was \$3.37; in 1926 it was \$3.28.

The Western States that ordinarily produce iron ore named in the order of their importance are Wyoming, Utah, New Mexico, Colorado, Montana, and California. Occasionally, Idaho, Nevada, and Washington contribute small quantities. All the ore from Wyoming, New Mexico, and Colorado and most of that from Utah is used for the manufacture of pig iron. Much of the remainder is used as a flux in smelting copper and lead ores. Reliable estimates indicate that the Western States mined and shipped in 1927 approximately 1,007,000 tons of iron ore, valued at \$1,523,000. The ore comprises hematite, magnetite, and brown ore.

b Includes value for States entered as (\*) above.

As is generally known, the ore after being mined is transported to blast furnaces where it is made into pig iron. A part of the pig iron is utilized in the production of rolled and

wrought-iron products, and for the manufacture of castings in iron foundries. The greater part, however, is utilized in the making of steel by the open hearth, Bessemer, electric, and crucible processes, which produce ingots, blooms, billets, bars, and slabs which are then rehandled by the rolling mills, forges, and presses, by which various products such as rails, sheets, pipe, etc., are derived. The proportion of iron ore to be treated by one or more of the various methods of beneficiation in common use continues to increase. In 1927, for example, about 38 per cent of the ore shipped from the Mesabi Range of Minnesota was beneficiated; most of this was crushed merely, a lesser amount than usual was washed, some was dried, and none was magnetically separated.

tures, \$83,662,000 of steel mill products classed as finished manufactures, \$82,558,000 of advanced manufactures, excluding machinery and vehicles, and \$861,000 of ferro-alloys. Imports of iron and steel semi-manufactures and of steel-mill products in 1928 were valued at \$28,174,000, a slight decrease from 1927, while advancing iron and steel manufactures imported totaled \$8,835,000, an increase of 23 per cent over the 1927 total. Ferro-alloying materials valued at \$13,886,169 were imported in 1928, as compared with \$10,440,003 in 1927. The most important raw material imports were iron ore, \$5,428,000; manganese ore, \$5,396,000; ferro-manganese and other manganese alloys, \$4,806,000; chrome ore or chromite, \$1,705,000. Pig iron, structural shapes and building forms, steel bars, iron and

*Imports and Exports.* The imports of foreign iron ore into the United States in 1928 were 2,452,646 gross tons against 2,620,717 tons in 1927, and 2,190,697 tons in 1925. Over 75 per cent of all the imported ore came from the Bethlehem Steel Corporation mines in Chile and Cuba and was consumed at their plants. Most of the balance of the imported ore came from Northern Africa and Sweden. The exports of iron ore in 1928 amounted to 1,282,306 gross tons, as compared with 898,793 tons in 1927, and 630,521 tons in 1925.

As in the other years, practically all export iron ore was shipped to Canadian furnaces. The exports of iron and steel products from the United States in 1928 were 2,889,546 tons, or 687,577 tons greater than they had been in 1927, while the imports at 774,213 tons were higher than the previous year by 52,438 tons. The increase in exports over 1927 was generally reflected by the trade as a whole and, as in former years, the bulk of the exported iron and steel products was taken by Canada. Japan was the next largest purchaser of steel, followed by China, Argentina, and Italy.

The total tonnage of imports of iron and steel products in 1927 decreased almost 25 per cent from that of 1926; in 1928 imports increased slightly in tonnage over 1927. Belgium attained the lead in export of iron and steel to the United States during 1927, with 209,126 tons; followed by France, with 132,878; and Germany, with 129,103. These three countries shipped about 63 per cent of the iron and steel imported into the United States.

In 1928 the total value of iron and steel exports was \$267,872,000, as compared with \$238,379,000 in 1927, \$189,255,000 in 1922, \$663,280,000 in 1920, and an average of \$139,440,000 in 1910-14. Of the 1928 total, \$4,798,000 consisted of iron ore, \$95,993,000 of semi-manufac-

steel scrap, cast iron pipe, and manganese alloys in the order named provided the largest tonnage among imports. The bulk of the exports consisted of iron and steel scrap, structural steel, steel sheets, rails, tin plate, piping, steel bars, pig iron, and skelp iron or steel.

An important development in 1928 was the beginning of a joint effort, on a large scale, to develop American foreign trade in iron and steel. To cultivate markets abroad more effectively, the United States Steel Corporation joined with the Bethlehem Steel Corporation to form a common export organization, the Steel Export Association of America, thereby providing a single outlet for 75 to 80 per cent of the rolled steel shipped out of this country.

*Electric Steel.* Prior to 1913, only two or three countries made any electric steel. As early as 1908 and 1909, steel was being produced in electric furnaces, particularly in Germany and France, and in the United States. In 1913 when the industry first really attained any magnitude, Germany was easily the leader. The peak in production up to and including the close of the War was in 1918, when 1,149,600 tons were produced.

In 1913 Germany produced over 50 per cent of all the electric steel made in that year. In 1925 the German production was less than 12 per cent. In Italy, the electric-furnace steel industry has expanded about 300 per cent in the period since the War. Japan has shown about the same percentage of growth. In Sweden also, large gains have been made though the country's industry as a whole has not yet regained its pre-war volume in either pig iron or steel.

A satisfactory and complete up-to-date statistical review of the electric-furnace steel industry for the last few years is impossible, as adequate information is not available. However, it is known that the electric-steel industry

in the United States is growing more or less in direct proportion with the iron and steel industry as a whole. In 1927, for example, the production of electric steel in the United States totaled 660,087 long tons of which 371,278 tons were ingots, and 294,809 tons were castings.

**Working Conditions.** The long hours which had prevailed in the iron and steel industry for certain classes of labor were almost completely abolished by the end of 1923. President Harding was perhaps the leading factor in securing this change. The principal objection against making the change had been the probability of a shortage of labor. When the change from the two- to the three-shift day was actually placed in effect in 1923, conditions were quite favorable to making the change, as most of the plants were not operating at capacity, and consequently, though there was a shortage of labor, it was not a preponderating condition in the industry. Since the change became operative, its effect has been most apparent. In the last few years, considerable work has been done along the lines of mechanizing operations in the hope of cutting costs, but the high rate of productive operations has obviated the possibility of an unemployment problem. General conditions among the industry's labor appear to be highly satisfactory.

**IRRIGATION.** See DAMS; RECLAMATION.

**IRWIN, WALLACE** (1876– ). An American humorous writer, born at Oneida, N. Y., brother of William Henry (Will) Irwin. He studied at Leland Stanford, Junior, University, 1896–99, and became editor of the *Overland Monthly Magazine* in 1902. As a writer of burlesques and topical verse, he drew wide attention, especially by *The Love Sonnets of a Hoodlum* (1902). Other successes soon followed, including *Nautical Tales of a Landsman* and *At the Sign of the Dollar* (1904), and *Chinatown Ballads* (1905); but the most widely cited of his writings was the humorous series of papers dealing with an imaginary Japanese youth called Togo and collected as *Letters of a Japanese Schoolboy* (1909) and *Mr. Togo, Maid of All Work* (1913). Among his later books may be mentioned: *Pilgrims into Folly* (1917); *Venus in the East* (1918); *The Blooming Angel* (1919); *Suffering Husband* (1920); *Seed of the Sun* (1921); *More Letters of a Japanese Schoolboy* (1923); *Lew Tylor and the Ladies* (1928).

**IRWIN, WILLIAM HENRY (WILL)** (1873– ). An author and war correspondent, born at Oneida, N. Y., brother of Wallace Irwin. He graduated at Leland Stanford, Junior, University in 1899 and was on the staff of the *San Francisco Chronicle* in 1901–04, and of the *New York Sun*, 1904–06, and managing editor of *McClure's Magazine*, 1906–07. After 1908 he was mainly engaged in writing for the magazines. During the World War, he was with the Allied Armies as correspondent for the various American periodicals, 1914–15, and for the *Saturday Evening Post*, 1916–18. Among his books may be mentioned: *The Hamadryads* (verse, 1904); *The City That Was* (1907); *Old Chinatown* (1908); *Confessions of a Con Man* (1909); *The Readjustment* (1910); *Where the Heart Is* (1912); *Men, Women, and War* (1915); *Latins at War* (1916); *The Thirteenth Chair*, a play, with Bayard Veiller (1916); *A Reporter at Armageddon* (1918); *The Next War* (1921); *Christ or Mars?* (1923); *Highlights of Manhat-*

*tan* (1927); *Herbert Hoover: a Reminiscent Biography* (1928); and *The House That Shadows Built* (of Adolph Zukor and the motion-picture industry, 1928).

**ISHERWOOD SYSTEM.** See SHIPBUILDING.

**ISMET PASHA** (1884– ). A Turkish soldier and Prime Minister, born in Smyrna. He served in the Turkish Armies throughout the World War, rising to the rank of corps commander, and in 1920–22 was commander-in-chief of the Western Turkish Army in Asia Minor which routed the Greeks. He was Turkish delegate to the Mudania Conference in 1922 and in 1923 was chief of the delegation to the Lausanne Conference. He was successful in negotiations there and shortly after his return was named Prime Minister, serving through 1924. He again became Prime Minister in 1928. He is president of the People's Party, a radical, nationalist, protectionist party founded by Kemal Pasha in 1923. The abolition of the caliphate and of the sultanate took place during his first term as Prime Minister. See *TURKEY*, under *History*; *CALIPHATE*.

**ISOSTASY.** See GEOLOGY.

**ISOTOPEs.** See CHEMISTRY; PHYSICS.

**ITALIAN LITERATURE.** A retrospective glance cast over Italy from the dawn of the twentieth century up to the present time discloses, first of all, a loosely organized but courageous government struggling to lay the foundations to a nationalistic régime which resulted in a conscious and intensified nationalism during the World War, and culminated eventually into aggressive nationalism striving for recognition on a par with the leading nations of Europe. Parallel with the political and national readjustment is the development of philosophical thought which is constructed to a marked degree along a "nationalistic consciousness." Contemporary thought finds its impetus in the historical idealization or neo-idealism of Benedetto Croce which in turn gives rise to "activism" and reaction. What characterizes all the branches of Italian thought since 1900 is an evident self-assertiveness gained through the careful examination of its social, political, and intellectual life. We might call it a period of re-orientation and reconstruction of its historical, traditional, and intellectual heritage.

If the first 15 years of the twentieth century in Italian literature were distinguished by the development of Crocean thought, we may say that the following years were dominated by Benedetto Croce and by the men, such as Giovanni Gentile, who either continued and perfected his philosophy or reacted against it. Croce's most novel and influential ideas were in the field of aesthetics, which, furthermore, he approached from the angle of literary criticism. His *Philosophy of the Spirit* had had the effect of making virtually all educated Italians under 45 years of age amateur philosophers and professional literary critics. At any rate, the balance of literary production was shifted in the later years in the direction of "thought" and away from what might be called "creation."

The typical Italian experience had been that of Giovanni Papini, as portrayed in his autobiographical confessions published in 1912, *Un uomo finito* (*The Failure*). This is a record of a strenuous philosophical life. The problem of the young man is to find his place in the universe, acquire a satisfactory solution of the

questions that life puts to him. The mood is one of passionate research, with ups and downs of exalted hope and anguished disillusionment. What distinguishes the European mind in general and the Italian in particular from a common American outlook on life is the sense of individual impotence before the weight of tradition, the feeling of being caught in an unescapable fixity. The young Italians had made and were making frontal attack on this situation. The yearning for freedom, in Papini among others, takes on violent and almost incoherent forms; and it furnishes the motive for much of that thinking of a neo-idealistic character which, inspired by Croce and perfected by Gentile, is fashionably known as "activism."

This is one characteristic that tends to separate the young from the old, the new from the old, in Italian literature; a gap, or rather a rift more or less perceptible, of which the War is made to serve as an unsatisfactory marker. The men who came forward in the decade proclaimed their denial of the "three crowns" of the generation preceding: of Carducci, of Pascoli, of d'Annunzio—we may even add Fogazzaro. It is a denial, one must understand, not so much of these masters themselves, as of their followers and imitators, and of the influence, tending to express itself in precept, which they exert on the future.

The spirit of revolt is variously formulated. The young poets (conveniently presented in Olindo Jacobbe's anthology *Le più belle pagine dei poeti d'oggi*—The Poets of Today) raise the standard of "pure art"—an art that is pure impression, pure image, pure "intuition" (to use a Crocean phrase), as distinguished from the art of Carducci, which is thought of as "parasitically exploiting" various practical emotions engendered by the liberal and national risorgimento. Carducci, in fact, expresses in poetical form an ideal of Italian citizenship; and he glorifies the Italian past to sustain that ideal of citizenship. How much of his fame does the poet owe, therefore, to his morality and how much to his poetry? The indictment of Carducci was drawn, curiously enough, by a critic who had stood aloof from the Crocean tradition and had even been scorned by the young men for his fogynism: by Enrico Thovez, a Piedmontese writer, author of *Mimi dei moderni* (Mimes of the Moderns), *Il pastore, il gregge e la zampogna* (The Shepherd, the Flock, and the Reed), *Il viandante e la sua orma* (The Trail of the Wayfarer), *L'arco d'Ulisse* (The Bow and Quiver of Ulysses), and various volumes of verse.

The poets who may be taken as objectifying this reaction are, among others, Sergio Corazzini (1887-1907), author of *Liriche* (Lyrics); Ettore Cozzani, author of *Orazione ai giovani* (An Address to Youth), *La siepe di emeraldo* (The Emerald Hedge), *Le sette lampade accese* (The Seven Lighted Lamps), and other things; Aldo Palazzeschi, author of *I cavalli bianchi* (The White Horses), *Lanterna* (The Lantern), *L'incendiario* (The Incendiary), and a famous whimsical romance, *Il codice di Perelà* (The Code of Perelà); Corrado Govoni, author of 11 volumes of verse, and in the later years of novels and short stories; Luciano Folgore, a Futurist, and Guido Gozzano (1883-1916), who, with Corazzini, was regarded as among the greatest of these. No review of Italian poetry could, of course, omit Filippo Tomaso Marinetti, author of *Mazurka*, of a play, *Il tamburo di fuoco* (The

Fiery Drum), and various manifestoes of Italian futurism of which he was founder and publicity agent.

In prose writing, "activism" expressed itself as a kind of anti-d'Annunzianism—a preference for "substance" as against "rhetoric," for "things" as against "words," d'Annunzio being taken as a symbol for "rhetoric" and "words." A keen contemporary critic, Adriano Tilgher, had pointed out that d'Annunzio's sensual dilettantism, with its passionate affirmation of the autonomy of the individual spirit, is really closer to the new moods of the Crocean era than had been supposed. In fact, d'Annunzio is the man who connects this later period with its roots in the old romanticism. However, both the kind of life that d'Annunzio seemed to exemplify, and his florid, splendidous, gold-dripping sentence no longer pleased. The younger men set up the plain, solid, meaty novels of Giovanni Verga (1840-1922, author of the cycle called *I vinti*—The Vanquished) as a better expression of the Italian literary ideal; just as they leaped over Fogazzaro to go back to Manzoni, to find a congenial expression of a religious ideal. As significant of the changing trend as these "revivals" are one or two rehabilitations of living men: of Alfredo Panzini (born 1863) who reached maturity in the Carduccian spirit, but won the favor of the young men (his best novel, *Il padrone sono io!*—The Boss? That's me!); and of Luigi Pirandello, whose *Il fu Mattia Pascal* (The Late Mattia Pascal) sold to 2000 copies in 20 years, and later to 100,000 in five years.

Not that the young men produced much that is truly exceptional in the field of the novel. The closest approach to an artistic sensation was the *Filippo Rubè* (Rubè) of the critic-scholar-poet-journalist, G. A. Borgese, who reviewed the pre-Fascisti period of Italian reconstruction in the manner of Stendhal and with something of the sweep of imagination with which Stendhal, a century before, reviewed post-Napoleonic reconstruction. But the promise of *Rubè* was hardly kept in Borgese's subsequent *I vivi e i morti* (Living and Dead). So a temporary excitement welcomed Gino Rocca's *L'uragano* (Hurricane). Much was expected from Rosso di San Secondo after the collection of tales called *Ponentino* (West Wind); but apart from a certain lubricious perversity in *Le donne senza amore* (Women without Love) and some pretty pages in *La fuga* (Flight), his novels had proved in no sense as interesting as his plays (see below).

Some faithful workers and accomplished technicians came forward in the latter years: Marino Moretti, in, for example, *La voce di Dio* (The Voice of God), *I puri di cuore* (The Pure of Heart), and *Il trono dei poveri* (The Kingdom of the Poor); Mario Puccini, in *Dov'è il peccato è Dio* (The Miracle); Salvatore Gotta, in *Il figlio inquieto* (The Restless Child); Corrado Govoni, more famous as a poet, in *La terra contro il cielo* (Earth Against Heaven); and Virgilio Brocchi, in *Il posto nel mondo* (His Place in the World), and *Il sapore della vita* (A Taste of Life) which is a departure from the author's optimistic view on life.

For the rest, the public that reads for amusement continued to depend upon older writers of established reputation who had not indulged to any great extent in poses of novelty: Luciano Zuccoli, in two of his best things, *L'amore di*

*Loredana* (The Love Affair of Loredana), and *Le cose più grandi di lui* (Things Bigger Than He); Grazia Deledda, in *Il dio dei viventi* (The God of the Living), and *Annalena Bilsini* (Country Folk). Deledda is enjoying a real eminence in her declining years; she was awarded the Nobel Prize in 1926; Antonio Beltramelli, whose patient studies among the customs of Romagna gained a certain actuality from the triumph of Mussolini, a Romagnolo—see *Gli uomini rossi* (The Reds and the Blacks); Annie Vivanti, a woman of international culture—having lived in New York and Wyoming, as well as in Ireland, England, and Germany—who continued her gaiety and humor in *Zingaresca*, in *(Gioia)* (Joy), and in *Mea culpa* (My Fault). Guido da Verona, in spite of everything, has to be regarded (see *La vita comincia domani* (Life Begins Tomorrow) as one of the masters of the European novel of large canvas and close-worked detail, who, as Tilgher again has said, has expressed certain European states of mind in enduring form and even created moods of life which hosts of people have imitated. Da Verona's vogue was waning, and perhaps his power too; though *La mia vita in un raggio di sole* (My Life in a Ray of Sunshine) is worth reading.

The real recent discovery in the field of the novel was Federico Tozzi (1890–1920), whose premature death did not prevent the revelation of a great genius in the style of Dostoevski in *Tre croci* (Three Crosses), *Il potere* (The Farm), *Ad occhi chiusi* (With Eyes Closed), and *Amore* (Love).

In the world of the theatre, the old and the new came into self-conscious conflict, with new authors, new styles, and a new criticism combating old authors, old styles, old conceptions of the drama. The critic who emerged in this connection is Adriano Tilgher (*Studies on the Contemporary Drama*, trans., New York), whose works are fundamental for a knowledge of the new tendencies (see also *Riconoscimenti—Reconnaisances*). Tilgher connects the Italian movement with its romantic origins and with the French drama of Sarment, the Belgian drama of Crommelink, the German "expressionistic" theatre, the Russian plays of Andréev, and the English work of Synge (*The Playboy of the Western World*).

To strike the contrast: the "old" Italian drama, as represented by Roberto Bracco, Sabatino Lopez, Dario Niccodemi, Marco Praga, Salvatore di Giacomo, etc., was more or less the "bourgeois" drama of Paris, reformed by Ibsen (see especially the works of E. A. Butti, who died in 1907). It accepted the social organization of Europe as a fixed organism and pressed the dramatic emotion from the conflict of the individual with the unbreakable restriction that hemmed him in: he could evade them—the ever-recurring salacious comedy of the triangle; he could succumb to them—the ever-recurring "drama," or tragedy, of sentimental motivation. The new drama, in keeping with the revival of Hegelian idealism (Croce-Gentile), but also influenced by Bergson (anti-intellectualism and the "dynamic spirit"), by American pragmatism ("the world is what we make it") and by the forces of which Einstein is at once an interpreter and a creator (relativism), is a philosophical approach to life: What is reality? What is personality? What is morality? Where the old drama looked primarily at what is fixed and unchanging, the new centres its attention

on life's contradictions, incoherences, mutations: life is a flux—therefore reality is never fixed, even people are not today what they will be tomorrow and what they were yesterday. We are phantoms labeled with a name: we are, as Pirandello says, "one, no one, a hundred thousand."

The dramatists of the new tendencies are numerous: Luigi Chiarelli, in *La maschera e il volto* (The Mask and the Face); Rosso di San Secondo in *Marionette—che passione!* (Love's Puppets) and *La bella addormentata* (The Sleeping Beauty); Fausto Maria Martini, in *Ridi Pagliaccio* (Laugh, Clown, Laugh); Pensuti, *L'uomo di legna e la donna di cera* (The Wooden Man and the Wax Woman); and Cavacchioli, author of a host of plays; but overtopping them all for the power and variety of his production, for success at home and international fame, Luigi Pirandello: *Six Characters in Search of an Author*; *Henry IV*; *The Pleasures of Honesty*; *Right You Are*; *Naked*; *Nach in His Own Way*; *Think It Over*; *Gimpy*; which are known in every capital of the Western world.

Fad or permanent contribution as the new theatre might be, it bore witness to an activity which had proved stimulating to all factions of the theatre. Nino Berrini and Giovacchino Forzano came forward in a type of poetic, post-romantic historical drama in which Sem Benelli was still a recognized master, though Benelli had never surpassed his old *La signola* (Bookworm), and *Arrigogolo* (The Hour Glass) is inferior to his sensational *La cena delle beffe* (The Jest). One real masterpiece, moreover, distinguished a new type of fantastic classical drama—the *Glauco* of Ercole Luigi Morselli (1881–1921), author also of *Orione*, of three one-act plays and the very readable *Parole per i re d'oggi* (Fables for the Kings of Today). The epigrams of *Glauco* are already numerous: let us mention only *La tela di Penelope* (The Return of Ulysses), of Raffaele Calzini.

Two historical dramas of distinction have been contributed in Enrico Corradini's *Julius Caesar*, and Gellio Cassi's *The Paule of San Casciano* (a play on the life and political activity of Machiavelli). Both these plays have been written in the nationalistic vein and have been dedicated to the Fascist régime.

However, in the Italy of this period, we are confronted with a fascinating insurgence of new forces of which the political manifestations assounded everybody in the triumph of Fascism, and of which the literary manifestations constituted, as was said above, the most distinctive feature of recent years. Aristocracy as against democracy, nationalism as against liberalism and internationalism, discipline and obedience as against the "rights of man"; counter-Reformation as against Reformation, "spirit" as against "stomach," Latinism as against Anglo-Saxon industrialism, materialism, and hygienic "civicism"—such ideas and slogans were being bandied about by young Italians with genius or without genius, in a language full of the strangest and wildest technicalities and in a style taut with straining cerebration. With these youngsters, logic is in bad repute. What one must do is "experience." Struggle is the law of life! *Lottiamo!*

If the War helped to individuate these new tendencies and give them distinctiveness, they go back fully 20 years to self-conscious movements dating from the first lustrum of the century. The first corollary drawn from Crocean idealism by Papini and Giuseppe Prezzolini

(founders, in 1903, of the review called *Leonardo*, and later *La voce*) was that life must be lived or created and not accepted or taken for granted: hence rebellion against passive politics, passive religion, passive culture. Here are to be found the remote origins of Fascism, as indeed the immediate origins of proletarian insurrectionism (the Mussolini of that day), of anti-parliamentarianism (the Mussolini of the present), of Catholic modernism (Ernesto Bonaiuti). In this connection also there were revivals and rehabilitations: if philosophical thought was influenced by Croce, political thought found its Old Testament in the *Sociology* of Wilfred Pareto (1844-1923) and its New Testament in *La rivolta ideale* (The Ideal Revolt) of Alfredo Oriani, who lived in the last half of the nineteenth century and who was also the author of *La lotta politica in Italia*, a history of Italian revolutions and of an influential novel, *La disfatta* (The Defeat). Over against a militant proletariat inspired by Karl Marx, there thus developed in Italy a militant middle class which accepted the class struggle in socialistic terms and fought the Socialists on their own grounds with their own weapons.

This mental unrest may be sensed most fully in Papini, as above suggested—read in addition to *The Failure*, *Il crepuscolo della filosofia* (The Twilight of Philosophy); and *Four and Twenty Minds*, especially if Papini's world-famous *Life of Christ* is to be appraised with any understanding. But hardly less important is the painter-poet, Ardengo Soffici, author of *Lemmonio Boreo* (a novel that anticipates Fascism to the letter), of *Arieochino* and many critical and political essays. Domenico Giulietti, author of a frantic and paradoxical Catholic diatribe—*L'ora di Barabba* (The Hour of Barabbas)—well styles himself the "wild man" in the *Dictionary of a Wild Man* which he wrote in collaboration with Papini. Giulietti's histrionic violence stands out in contrast with another Catholic writer of a real mystic temperament, Giosuè Borsi (1888-1915), author of *Letters from the Front*. Certain characteristic and influential states of mind may be found in Curzio Suckert, *L'Italia vivente* (The Living Italy). Though in this connection we must not forget the speeches and editorials of Mussolini himself now collected in volume form, with his war diaries.

But when the tumult and the shouting dies, a certain bulk of unquestionably sound and coherent achievement will be left as the permanent record of this Italian period. Already the *Letters* and critical essays of Renato Serra (1881-1915) had acquired an almost classic prestige. Giuseppe Prezzolini (read *La cultura italiana*—Italian Civilization) lived all his life of thought and passion and worked it into a literary product that has judgment and fairness and character, as well as brilliancy. He has made two important contributions in *I maggiori* (Most Important Authors of Italian Literature), and *Machiavelli*, an appreciation on the life and milieu of the Florentine statesman. Mario Missiroli is a publicist who saves himself many palinodes by thinking before he writes. Gaetano Salvemini entered political and social polemics with the sobriety of the historian and the courage of a warrior.

In pure literature, we may mention the work of Massimo Bontempelli, *I sette savi* (The Seven Sages); *La vita intensa* and *La vita*

*laboriosa* (The Strenuous Life and The Laborious Life); the tales of Ferdinando Paolieri (the real successor, perhaps, of Renato Fucini in the Tuscan spirit), the varied work of Enrico Pea, *Spaventaccio* (The Scarecrow), and a play, *Judas*, and the delicate humor of Giuseppe Zucca, *Il morbo della virtù* (The Disease of Virtue). A young critic from whom something was to be expected was Piero Gohetti (see *La frusta teatrale*, The Theatrical Whip).

And now, collecting some loose but important ends, we may add that Lorenzo Viani throws an enigma in the recent literary output in his novel, *Angiò, uomo d'acqua* (Angiò, Man of the Seas) which deals with a wonderful picturization of sea dregs that know no law except that of instinct; no reality except that which borders on tragedy and on the grotesque. Another puzzling author is Achille Campanile who has thrown Italian critics into confusion in his two books, *Ma che cosa è questo amore?* (What is This Thing Called Love?), and *Se la luna mi porta fortuna* (If the Moon Brings Me Luck). Both are humorous novels abounding in comic situations and libertine observations. Critics are at variance with regard to Campanile's humor which has been denounced, for the most part, with unsavory adjectives such as, "slapstick," "in the manner of Charlot," "asinine." In the meantime the public has "devoured" close to a hundred thousand copies of his two books. The Roman poet Trilussa (Carlo Alberto Salustri) has continued, in his screamingly funny sonnets in Roman dialect, the more recent traditions of Pascarella (author of *The Discovery of America* and *Villa (floria)*), Augusto Sindici, and the immortal Oronzo Marginali (Luigi Lucatelli, a prose "columnist," and author, for instance, of *Come ti erudisco er pupo*—Bringing up the Kid; and *Così parlano due imbecilli*—Thus Spake Two Fools, translated by Maurice Bishop as *Theodore the Sage*). The great "dime novelists" still remained, Mario Mariani, Pittigrilli, and Carolina Invernizio (1857-1917). Authors of children's books, since the classic Pinocchio of Collodi, were Vamba, Beltramelli, and Barzini. One of the best works of historical scholarship is Corrado Ricci's *Beatrice Cenci*. The editor Formigginio of Rome has published an Italian Who's Who—*Chi è?* (It is curious to note that in the notices on the important women, as a special courtesy, the date of birth is not given). The best foreign study on contemporary Italian literature is Benjamin Crémieux' *Panorama de la littérature italienne contemporaine* (Paris). And last but not least among the loose ends is the *Notturmo* (Nocturne) of Gabriele d'Annunzio.

In conclusion we may write a few words with regard to the ever-increasing activities and efficient reorganization of the publishing houses. These houses are not only offering a steady market and lucrative returns to the *letterati* of established reputation, but are actually rendering invaluable service to the young men by opening their doors to them, even though frequently they speculate with losses in giving the youngsters a chance. The houses vie with one another in establishing prizes for the different literary genres, thereby stimulating directly the production in general. Indirectly, they are contributing in no small degree to the establishment of a vast reading and discriminating public without parallel in the history of Italian publication. The Fascist cry of "ef-

iciency" has reached the publishers with the result that their systems have been completely recast. For the first time in the history of their existence, the Italian publishing houses have dared detach themselves from their sterile and traditional policies, and, if you please, have dared be enterprising and original. The influence which Italian editors will have on the future output will not pass unnoticed. This is a period of stimulation, of work, and results—a period of literary production supported by a government made up of members of the same family, a family of *politico-letterati*.

**ITALIAN SOMALILAND.** See SOMALILAND.

**ITALY.** A constitutional monarchy of southern Europe; area before the World War, 110,632 square miles; population (census of 1911), 34,671,377; population for the same area by the census of 1921, 37,276,738; population per square mile (1921), 336.9. The annexed territories by the Treaty of St. Germain were: Venezia Tridentina, area 4027 square miles, population (1921) 648,208; Gorizia and Gradisca and districts, area 1138 square miles, population (1921) 310,642; Trieste, area 37 square miles, population (1921) 238,655; Istria, area 2035 square miles, population (1921) 342,079; Zara and islands annexed from Dalmatia, area 113 square miles, population (1921) 18,719. Total area in 1921, 117,982 square miles; total population, 38,835,941; estimated, at the beginning of 1928, 40,796,000. Comparative vital statistics for the period discussed were as follows (figures for 1912 and 1922, based on ratio per 1000 of population and applying only to pre-war boundaries): marriages, 7.6 and 8.74; living births, 32.38 and 28.55; deaths, 18.15 and 16.66. The influenza epidemic of 1918 raised the mortality to 32.97 per 1000 inhabitants (exclusive of war deaths). The average number of births from 1923 to 1927 was 27.8 per 1000 inhabitants; deaths, 16.5 per 1000. Emigration, which had reached its peak in 1913 with 872,598, fell off during the war years, dropping to its lowest level in 1918 with 28,311; but by 1921, emigration had once more mounted to 255,166, and in 1927, to 228,052. Whereas, in 1913, almost two-thirds of the emigrants had migrated overseas, in 1927 only a few more than one-half did so. In 1927 emigrants overseas totaled 136,094; to Europe, etc., 91,958. This was occasioned by the fact that many Italians sought work in the devastated French areas, although the restriction imposed on immigration into the United States was a contributing cause. Before the War, the ratio of immigrants (i.e., returning Italians) to emigrants varied from one-third to one-half. In 1927, 140,625 Italians returned, of which number 43,787 were from the United States and Canada. The population of the large cities in 1921 (1911 figures in parentheses) were as follows: Naples, 780,220 (678,000); Milan, 718,304 (599,000); Rome, 691,314 (542,000); Turin, 502,274 (427,000); Palermo, 400,348 (341,000); Genoa, 300,784 (272,000); Catania, 255,394 (211,000); Florence, 253,565 (233,000); Bologna, 210,969 (173,000); Messina, 176,794 (127,000); Venice, 171,665 (161,000); Bari, 131,143 (104,000); Leghorn, 114,813 (105,000). Principal cities in the annexed territories were: Trieste, 238,655 (1921); Pola, 49,900; Trento, 35,125; Gorizia, 25,576.

**Local Government.** Following the census of 1921 there were certain changes in the local gov-

ernment of Italy and several small communes were annexed to the older communes so that on Aug. 20, 1928, there were 7915 communes. In all of the various communes there is a *podestà* at the head of the communal organization, except in the cases of Rome, which has a governor, and Naples, which has an extraordinary royal commissioner. The *podestà*, nominated for five years by royal decree in the larger communes, may be assisted by one or two vice-*podestàs* or deputies; while associated with him the prefect of the province may nominate for a corresponding term a municipal council drawn from persons designated by the local syndical associations. The nomination of such a council, the function of which is advisory and concerned with such subjects as the budget, imposition of taxes, etc., is obligatory in communes which are the capital of provinces, or have a population of more than 20,000.

**Education.** In recent years, the State has applied itself seriously to the problem of illiteracy and in 1919 set up a national institute for the instruction of illiterate adults. Many districts, notably in the provinces of Novara, Turin, Como, and Cuneo, could record the fact that all young people 20 years of age were able to read and write. Under Mussolini, educational legislation, while frequent, took on a reactionary tinge. Compulsory religious education, conducted by teachers receiving the approval of the Church authorities, and the displaying of the crucifix in all schools, were ordered. Limitations were also placed on the number of free students, and, to this end, severe competitive examinations were fixed. In all elementary schools, public and private, there were 4,523,183 pupils in attendance in 1915-16. The increase was slight over the previous recorded year, 1907-08, as is indicated by the fact that there were 3,002,168 attending public elementary schools in 1907-08, and 3,167,245 in 1915-16. In all government and private secondary schools, the enrollment in 1919-20 was 346,218. The increase in technical schools was particularly noteworthy, attendance in government schools in 1919-20 being 173,296 as compared with 103,118 in 1910-11. The eagerness for higher education was even more marked in the universities, for the attendance increased from 21,615 students in 1911-12 to 41,176 in 1919-20. The number of pupils enrolled in elementary public schools in 1926-27 was 3,690,698, and the number in other educational institutions of all grades, other than infant schools, was about 525,000.

**Agriculture.** Recovery in the field of agriculture was rapid after the War, though government requisitions of crops in 1919 and 1920 made resumption somewhat tardy. The table on page 822 furnishes a basis for comparison.

Orchards, yielding large crops of oranges, lemons, chestnuts, pomegranates, quinces, apples, and pears, as well as walnuts and almonds, continue to flourish, though by 1929 the crops had not yet reached pre-war levels. Silk culture, after a period of decline, assumed its pre-war importance in 1923. In the three-year period, 1910-12, the silk-cocoon crop averaged 41,200 metric tons. In 1922 it was 31,000 tons; but in 1923, 755,100 tons. The decline prior to 1923 was due to the destruction of the mulberry trees in Piedmont, Lombardy, and Venetia—the chief centres. After the War, the factory capacity of the silk mills similarly declined, as

## CROPS: AREA, PRODUCTION, AND YIELD PER

Crop	Area (thousands of acres)		Production (thousands of units—bushels except as indicated)	
	1909-1913	1927	1909-1913	1927
	1913		1913	
Wheat	11,793	12,320	184,393	195,808
Rye	346	807	6,317	5,987
Barley	647	583	10,638	9,443
Oats	1,276	1,203	37,537	30,720
Corn	4,090	3,755	102,676	87,378
Rice	358	351	23,273	34,102
Potatoes	759	874	67,514	71,476
Sugar beets	130	219	1,799	2,026
Olive orchards	5,702 <sup>b</sup>	5,668 <sup>c</sup>	47,283 <sup>b</sup>	39,110 <sup>d</sup>
Grapevines	10,983 <sup>b</sup>	10,574 <sup>c</sup>	1,215,621 <sup>b</sup>	941,769 <sup>e</sup>

<sup>a</sup> Unit, metric tons.<sup>b</sup> Within former boundary.<sup>c</sup> Includes land carrying also one or more other crops.<sup>d</sup> Unit, gallon of oil.<sup>e</sup> Unit, gallon of wine.

many plants were sold during the War for their metal. Live-stock figures for 1926 revealed (1908 figures in parentheses): horses, 1,001,000 (955,878); asses, 505,000 (1,238,000); mules, 955,000 (1,230,060); cattle, 7,150,000 (6,198,861); pigs, 2,750,000 (2,507,928); sheep, 12,170,000 (11,162,926); goats, 3,130,000 (2,714,878). The wool yield maintained an average of 33,000 tons and had to be supplemented by importations.

**Mining and Manufacturing.** The capacity of the hydroelectric plants of Italy in 1926 was 2,117,000 kilowatts (equal to about 2,839,000 horse power) as compared with 1,239,000 in 1922. The output in 1926 was 7,281,000,000 kilowatt-hours. In addition, there are steam-electric plants with a capacity in 1926 of 555,000 kilowatts and an output of 363,000,000 kilowatt-hours. In view of the fact that Italy produces practically no coal, the hydroelectric developments are of great importance. The potential capacity of the waterfalls of the country, developed and undeveloped, is estimated at 3,800,000 horse power.

According to the industrial census of Oct. 15, 1927, there were in Italy 728,150 establishments employing 3,965,500 wage earners. The number

## MINERAL AND METAL PRODUCTION

Product	1913	1926	1927
Iron ore	603,116	504,556	411,300
Lead ore	44,654	54,208	52,380
Zinc ore	158,378	177,932	173,790
Iron pyrites	817,334	594,479	604,300
Lignite	701,079 <sup>a</sup>	1,181,342	1,075,220
Sulphur, crude and ground	406,406	305,012	338,000
Asphalt rock and crude bitumen	171,490	313,525	386,000 <sup>b</sup>
Metallic mercury	1,004	1,871	1,990
Marble	509,342	634,162	730,970
Granite and porphyry	389,015	441,660	173,000
Talc and soapstone	24,001	43,085	32,000
Pumice	14,973	45,308	38,000
Lead	21,674	23,590	22,850
Salt, marine	585,028	461,116	416,895

<sup>a</sup> Including anthracite, etc.<sup>b</sup> Not including crude bitumen.

## INDUSTRIAL PRODUCTION

Product	1913	1926	1927
Pig iron	metric tons 426,755	513,425	596,100
Crude steel	do 933,500	1,779,519	1,530,600
Ferro alloys	do 4,700	45,111	.....
Coke, metallurgical	do 498,442	591,528	.....
Silk, raw	1000 lbs 10,366	9,825	9,887
Rayon	do 331	37,000	48,400
Cotton yarn	do 886,956	431,772	404,844
Cotton fabrics	1000 yds 710,450	1,022,320	983,700
Woolen fabrics <sup>a</sup>	do 71,000	98,370	88,533

<sup>a</sup> Estimates.

of employees by principal industries was as follows: Textiles, 636,687; transport and communications, 514,729; clothing 490,798; machinery and related industries, 468,699; foodstuffs, 339,520; construction, 328,734; lumber and wood-working, 284,931.

The total value of mineral production proper, in Italy in 1926 was \$29,773,000. The value of the principal metallurgical and mineral products in that year was as follows: Pig iron, \$14,383,000; crude steel, \$61,286,000; coke, \$7,031,000; mercury, \$3,639,000; and lead, \$3,685,000.

**Commerce.** Imports in 1913 were valued at \$707,664,101; in 1927, at \$1,051,000. Exports in 1927 were \$806,000,000, as against \$500,241,667. (The 1927 figures are converted from the average exchange rate for the year.) In 1913 countries of origin of Italian imports ranged in the order: Germany, Great Britain, United States, France. In 1927 the order was: United States, Germany, Great Britain, and France. Countries taking Italian exports in 1913, in order, were: Germany, Switzerland, United States, France, Austria-Hungary, Great Britain. In 1927 the order was, Germany, United States, Great Britain, France. In 1927 the United States' sales to Italy amounted to \$204,252,000; purchases from Italy amounted to \$84,873,000. Italian imports continue to be such basic raw materials as wheat, raw cotton, metals and minerals, mineral oils, hides, tobacco, lard, and bacon. This dependence on foreign countries for wheat and scrap iron, particularly, continually operates to Italy's disadvantage. The tendency after the War for nations to restrict their exports of important articles or to charge higher prices abroad than those asked at home, accounted for a bitterness of feeling that often was publicly voiced. Leading exports were, in order of value (1927), cotton manufactures, raw silk, silk manufactures, hemp, spun cotton, automobiles, wines, hats, etc. Leading foodstuffs exported were lemons, olive oil, cheese, fruits, vegetables, tomato conserve. In 1914 the Italian merchant marine consisted of 644 steamers of 1,534,738 gross tons and 523 sailing vessels of 237,821 net tons; in 1927 the marine consisted of 1329 steamers of 2,072,672 gross tons and 3064 sailing vessels of 187,290 gross tons. During the War, Italy's shipping losses were the severest, proportionately, of all the combatant nations. Thus, 677,207 tons were lost by sinkings alone, while in all, 1,076,171 tons were lost, made up of sinkings, sale to foreigners, those broken up for material, etc. However, Italy was compensated by the accretions of Austro-Hungarian ships, as well as the active building carried on over the whole of 1915-27. In 1911, 173,437 vessels of 56,056,306 tons had entered Italian ports; 173,353 vessels of 56,082,448 tons had cleared. Nothing indicates better the tardy commercial recovery than the fact that in 1919 only 98,189 vessels of 24,093,639 tons entered and 98,144 vessels of 24,143,487 tons cleared Italian ports. In 1927 243,378 vessels of 67,810,006 tons entered and 243,231 vessels of 67,542,887 tons cleared.

**Communications.** In 1913 there were 11,015 miles of railway; in 1928, 13,355 miles. In 1913, 8540 miles were under government management; in 1927, 10,300 miles. A serious concern after the War was the sad state of disrepair into which the railways had fallen. The loss and depreciation of railway stocks, the

overmanning of the entire system (employees had increased 46.6 per cent between 1914 and 1920), the eight-hour day and the lowered efficiency of the workers, all contributed to a general deplorable condition. The deficit of the fiscal year 1920-21 was 1,034,000,000 lire, and of 1921-22 was 966,000,000 lire; this in spite of the continually rising tariffs. (Freight rates from 1915 to 1922 increased 400 per cent.) Electrification of railways was a theme of continual discussion, though the unfavorable financial situation militated against any extensive projects. It was proposed to electrify nearly 4000 miles of line. As a way out, the Mussolini government expressed itself as favoring the resurrection of private management, but, while extensive reforms and reductions of personnel were carried out, no definite move, by 1929, was made toward private operation, possibly because by that time the State railways were on a paying basis.

**Finance.** Italian budget estimates for 1928-29 showed an estimated surplus of 271,000,000 lire. The estimates for both revenues and expenditures indicated a considerable reduction from the estimates of the 1927-28 period and a still greater decline from the actual returns for the 1926-27 period. The revenues were placed at 17,643,000,000 lire and expenditures at 17,372,000,000 lire. The public debt at the beginning of 1929 was 86,500,000,000 lire.

GOVERNMENT RECEIPTS AND EXPENDITURES  
(Millions of Lire)

\* Including 1,500,000,000 lire, estimated additional sum to be collected in paper lire to cover duties assessed on gold basis.

b Not available.

**History.** Although Italy had been linked with Germany and Austria-Hungary in the Triple Alliance since 1882, the Italian government, on Aug. 3, 1914, declared its neutrality in the War, on the grounds, first, that since the War had been caused by the aggression of the Central Powers, the *casus foederis* provided for in the strictly defensive Triple Alliance had not arisen; and, second, that by failing to acquaint Italy, in advance, with the terms of the note to Serbia, Austria-Hungary had disregarded the terms of the Alliance. As a matter of fact, by secret agreements with France (1902) and Russia (1909), Italy had pledged herself not to aid Germany and Austria-Hungary in an aggressive war. Moreover, the entrance of Great Britain into the struggle removed all thought of participation against the Entente. The neutralist attitude at first was strongly championed.

The low state of the finances and the fact that Italy had not fully recovered from the Libyan War (see LIBYA) together with a belief that hostilities against her erstwhile allies must be contemptuously regarded, were the more important factors contributing to this view. Some measures were taken to relieve the stringency that war conditions brought in their train. Exports of cereals were prohibited; a moratorium was declared; and steps were taken to further a ready importation of raw materials. Meanwhile, the war establishment—five classes had been mobilized—necessitated great outlays of money, and a cabinet crisis precipitated over the need for tapping new sources of revenue resulted in the formation of something like a coalition government with Baron Sonnino at the Foreign Office.

As the War, however, took on ever-increasing proportions and as the intrigues about the Italian Foreign Office became more numerous, it began to appear that a change had taken place in Italian public and official opinion. The character of the sentiment, with 1915, took on a more bellicose hue; Italy meant to join the Entente, every one saw, at a price. The recovery of the northern provinces had of course always had a certain appeal to popular sentiment, but that Italy's entry into the War was to be purely a matter of diplomatic arrangements was not to be concealed. Germany, sensing this, sent the astute Prince von Bülow to Rome in order to keep Italy neutral if possible. Austria was urged to satisfy Italian demands for territory as far as she was able. Protracted negotiations were carried on between Austria and Italy, but neither of Austria's offers came up to the minimum of Italy's demands. See TYROL, GERMAN SOUTH. The result was, Sonnino terminated the conversations and turned to the Entente. On April 26, the secret Treaty of London was signed. By it, for full participation in the War, Italy was to receive the Trentino and South Tyrol to the Brenner Pass, the city of Trieste, Gorizia, Istria, Dalmatia as far as Cape Planka, Valona (which had already been occupied on Oct. 30, 1914), the Adriatic islands, and the Dodecanese including Rhodes. Other promises of territory included a sphere of influence in Asia Minor, and grants in Africa.

That the anti-war party was still strong was shown when Premier Salandra resigned because of the failure of Giolitti and his followers to approve of his policy; but war demonstrations and the agitations of d'Annunzio had touched the popular temper with the result that Signor Salandra once more assumed the reins of office, and boldly asked the Parliament for a war declaration. On May 20, 1915, the Chamber invested the Government with complete powers; on May 23, the army was ordered mobilized; and on May 24, war was declared against Austria. Later in the year, Italy declared war on Turkey and Bulgaria, but it was not until August, 1916, that she broke relations with Germany.

Italy's rôle in the World War, at least down to the latter half of 1918, was hardly glorious. Her loss in men was 650,000 killed, with close to another quarter-million permanently incapacitated. By November, 1918, however, Italian troops occupied all the territories assigned to Italy by the London Treaty. See WORLD WAR.

In the discussions of the peace, Italian public opinion centred not only in the necessity for the rectification of the northern frontier line

(in spite of a preponderance of alien populations in some sections) but also in the need for retaining Fiume and Dalmatia, which had been occupied at the close of the War. On this matter, the hostility of the Yugoslavs was encountered so that the settlement of the question continued to absorb Italian attention for the next three years. Italy's representatives at the Peace Conference were Orlando, Sonnino, Salandra, Barzilai, and Salvago-Raggi. These readily acquiesced to the partition of the German Africa colonies between France and Great Britain, accepting, by way of compensation for Italy, only promises of slight additions to Libya and the Italian Somaliland, but on the questions of Dalmatia and Fiume, they stood firm. Yugoslavia, however, had gained a friend in President Wilson. On Apr. 23, 1919, after protracted conversations among the Big Four had yielded no results, President Wilson issued a public statement to the Italian people in which he counseled renunciation of Fiume and Dalmatia. Instead of having the desired result, President Wilson's action only served to solidify all branches of opinion. Orlando, having withdrawn from the Peace Conference, received an overwhelming vote of confidence in the Chamber, even the Socialists and the Laborites giving him their support. The failure, however, of the delegates to gain any concessions on this point resulted in a negative vote of confidence in the ministry with the result that Orlando was compelled to resign on June 19, 1919. Signor Nitti accepted the Premiership. The increasing difficulties at home because of the lack of raw materials and the ever-recurring labor disturbances only added to the trials of the Government, but interest, in large part, was diverted by the Adriatic question.

The failure of the Peace Conference to bring out a settlement that could be acceptable to Italian opinion strengthened the hand of the irreconcilables, with the result that d'Annunzio, on September 12, entered Fiume at the head of a small force and confronted the peace-makers with a *fait accompli*. Public support rallied to him at once. In spite of Nitti's official disavowal, the heated protests of the Peace Conference, and the frequent clashes between Yugoslavia and Italians, d'Annunzio stayed on. Even the very favorable treaty with Austria, signed at St. Germain on September 10, by which Italy gained her northern frontier, elicited no real enthusiasm: Fiume was the question of the day.

On Nov. 16, 1919, the new elections were held. The results marked the entry of a new force into Italy's political life, for 103 members were elected who belonged to the (Catholic) Popular Party. For the first time since 1870, therefore, the Catholics as an official body took their place in the country's political activities. Their programme resembled in large part the typical proposals of the Centrist and Christian Socialist parties with which continental Europe already was familiar. The Socialists were the only other well-integrated force, and succeeded in electing 160 members. Their stand was frankly revolutionary: they looked to Russia for inspiration, and the economic chaos of the moment gave them strength.

The opening session of the Parliament was a noisy one, and the King's speech from the throne was greeted with derision; but in spite of the weaknesses of the constitutional parties, Nitti,

by maintaining a precarious balance of power, continued in office. The year 1920 was characterized by an intensification of the same problems. The question of the Fiume settlement was no nearer a solution. The hard feeling engendered by President Wilson's insistence upon his scheme of a Fiume Free State and the fact that Italy's counter-proposal, though acceptable to the Supreme Council, was wholly rejected by Yugoslavia, were elements that made the tangle more and more snarled.

The revolutionary disorders of the year, accompanied by rioting and anarchistic outbreaks, and the mounting cost of living, indicated that Italy was living on a volcanic crater. These uncertainties were reflected in the political life. A cabinet crisis in the spring forced a reconstruction of the Nitti government; on May 12, the Premier was compelled to resign, and after several unsuccessful manoeuvres, was supplanted by Signor Giolitti. The entrance of the Albanian question into prominence involved Italy in another international controversy. In 1917 Italy had proclaimed Albania her protectorate, but the status had been refused recognition by her allies. Up to 1920, an army had been maintained in the country to the general dissatisfaction of the populace, with the result that fighting broke out between Albanians and Italians in the summer. The universal attention given to the controversy, together with the support the Albanian cause found among the Italian Socialists, forced Giolitti to open negotiations with the Albanians. The result was the evacuation of the country, Valona, which had been held since 1914, being given up on Sept. 2, 1920.

It was not until late in the year that the settlement of the Adriatic dispute appeared a possibility. The disappearance of President Wilson from the scene, and the realization by both Italy and Yugoslavia that an understanding could more easily be reached by agreement between themselves, led to the signing of the Treaty of Rapallo (Nov. 12, 1920). By it, Italy gave up Dalmatia and restored to Yugoslavia two small territories lying to the southeast of Istria, but received the town of Zara. On their part, the Yugoslavs agreed to an Italian frontier enclosing all of Istria and extending as far as Monte Nevoso. Fiume was made a Free State and was connected with Italy on the west by a territorial corridor along the sea. It was also stipulated that the city of Susak (together with the small Baros Basin) was to be joined by Yugoslavia. Ratification immediately followed. It was necessary to apply force before d'Annunzio could be dislodged. In June, 1921, Italy and Yugoslavia signed an agreement for the creation of a port board to regulate the commerce of Fiume and other harbors in the territory. For the ultimate solution of this dispute, see Fiume-ADRIATIC CONTROVERSY.

There were other foreign problems which occupied the attention of the Government in 1920 and 1921. Italy in August, 1920, signed the later discredited Treaty of Sèvres with Turkey by which Italy received important concessions in Anatolia and the right to exploit the Hieraclea coal mines. In turn, Italy, by a separate understanding, agreed to relinquish the Dodecanese to Greece, except that Rhodes and two others were to be held for 15 years. A plebiscite was to determine their disposition later. In 1921 a commercial agreement was signed with Soviet Rus-

sia and the Ukraine and treaties also were concluded with Germany, Czechoslovakia, and Poland.

Between Italy and France an ever-widening breach, not surprising in the light of the old hostility, was becoming perceptible. A French decree which denied Italian citizenship to the many Italians residing in Tunis was bitterly resented, the ill feeling manifesting itself in the attacks on the French military mission which visited Italy in October, 1921. These matters, naturally, were overshadowed by the grave internal situation which developed in 1920. Throughout the whole of the year, Italy was in the grip of disputes that took on the character of civil war: the seizure of the factories, the agrarian uprisings, the street fighting, and the local disturbances that, in Bologna in particular, took on all the familiar forms of a people torn by internal dissension, contributed to the general feeling of uncertainty.

In the light of these happenings, it was inevitable that a violent form of dissidence should manifest itself. Armed bands, strongly nationalistic in spirit, and bearing the name Fascisti, appeared in the industrial cities of the centre and north and openly attacked Socialist and labor halls and assemblies. In Bologna, where Socialists controlled the local government, hostile attacks destroyed the labor exchange and forced into flight the Socialist officials. The same events took place at Modena, Ferrara, and elsewhere. Fascisti were meeting Socialists on their own ground, with the result that blood was frequently spilled. The reaction made itself felt in the internal policies of the Socialist Party. In January, 1921, the reformist Socialists and the Communists parted company, the points of disagreement being adherence to Russia and the espousal of violent means. The Communists and the Fascisti now came into conflict at Florence, Palermo, and Spezia. There was fighting in Rome in July and again in November, but everywhere it began to appear that Fascisti and not Communists were gaining the upper hand. The events of the next year were being foreshadowed with remarkable clearness.

Meanwhile, the Government was in difficulties. The price of bread, still fixed by the Government, which was compelled to make purchases abroad at great losses, was the greatest cause for dissension. This and the feeling that Parliament no longer represented the country, hastened Giolitti's decision to dissolve the Chamber. The new election, held on May 15, 1921, did not produce any startling results. Of the 535 members, 107 returned were Catholics, 122 were Socialists, 16 Communists, and 275 Constitutionalists of various shades. In the new Parliament, the Government's foreign policy met with the sharpest criticism, with the result that Giolitti resigned. Signor Bonomi now constituted a cabinet that represented all parties except the Socialist. His stay was not long, for criticisms appeared from all quarters. The failure to secure participation in the Four Power Treaty, the inability to cope with the economic problems and the ever-present lawlessness of Communists and Fascisti, and the antagonism that greeted what seemed a too friendly attitude toward Catholicism, precipitated a crisis. On Feb. 2, 1922, Bonomi resigned and only with difficulty could a new ministry be formed. Signor Facta eventually constituted a cabinet

which fell on July 10 but was compelled to return because no other group could gain the confidence of the Chamber. The menace to the state was not Communism now, but Fascism. See FASCISM.

The strength of the Fascisti waxed greater as the year progressed. Fascisti and Communists continued their warfare openly amid a general helplessness. There was fighting in Rome, Bologna, Genoa, Trieste, Alessandria, and Parma, and a Fascisti force took Fiume and drove out the provisional government (March 3). New recruits were continually filling out the ranks. On Aug. 21, 1922, the syndicate of railway men went over to the Fascisti; in the same month, with the connivance of the transport workers, Fascisti seized the ports of Genoa and Naples. On September 1, a body of 4000 moved on the town of Terni and captured it. In October, the Fascisti took it upon themselves to Italianize the German populations of the Trentino which had been accorded racial autonomy. The schools were closed and the local councils dismissed while the military was unable to intervene.

It was thus evident that Fascism was exerting a force far superior to that of the constituted authorities. Signor Mussolini, the leader of the movement, demanded for his party the cabinet portfolios of Foreign Affairs, War, Navy, Labor, and Public Works. An offer of several minor cabinet posts was tartly refused, and at the annual convention of the Fascisti at Naples, Signor Mussolini declared, "Either the government of the country must be given peacefully to the Fascisti, or we will take it by force." As the cohorts of black-shirted Fascisti began to mobilize against the capital, Premier Facta bowed before the impending storm and resigned office, October 26. Thereupon, Mussolini, summoned by the compliant King, entered Rome in triumph, formed a cabinet on October 30, and declared, "Today Italy has not only a cabinet, but a government." His successful intimidation of the Chambers gained him a vote of complete authority.

In the ensuing years, the career of Mussolini was, in large part, the history of Italy. The conciliatory tone of the new government surprised many, and the strong measures for the economic reconstruction of the country gave a new impetus to manufacturing and trade. Opposition was stilled, the fear of the swift arm of the black-shirted Fascisti succeeding in overawing dissident groups. On December 16, Mussolini, not as head of the state, but as leader of the Fascisti, moved against all armed organizations through the creation of a newly nationalized militia of 80,000 men. Fascisti organs frankly advocated the suppression of the freedom of the press and the death penalty for the opponents of Fascism. Throughout the year 1923, Mussolini's hold tightened. The parade of reforms executed made a brave show. The desperate financial situation was manfully tackled and the budget for 1923-24 showed a smaller deficit than any previous post-war year; the middle classes were conciliated by the abolition of 9 out of the 13 sources of direct taxation; the inheritance tax was dropped; many onerous duties on necessities were removed; expenditures were cut down through the elimination of useless functionaries and the dismissal of extra employees, on the railways in particular. In the field of public works, sums

were allotted for the rebuilding of Messina, the construction of aqueducts in Sardinia, the rebuilding of the harbor at Naples, and for constructing new railways in Sicily. Railways, something unheard of before, ran on schedule time, notable reforms were achieved in the Department of Justice, as many as 500 local courts and four of the five courts of cassation being suppressed. In educational matters, the changes were far-reaching. Religious education was made compulsory; vocational guidance was stressed; and, as a move against too zealous an application of the democratic dogma, a limit was placed on the number of free students in state institutions.

The state, too, proceeded to relinquish its participation in industry. Several state monopolies, notably the match industry, some telephone services, and concessions for building railways, were surrendered. In administration, the process of centralization went on speedily: five ministries concerned with internal affairs were consolidated into one, as were also the ministries of Finance and the Treasury; the former practice of ministerial reports to Parliament was replaced by a single message for all the departments from Mussolini himself; the rule of merit was applied to promotions; working conditions for state employees were improved. Never were relations between Italy and the Vatican more cordial. In short, in every field of activity the new administration could point with pride to some just change or some alleviation of old distresses. Whether, however, reforms of this character had any claims to permanency or whether they had the whole-hearted approval of the Italian population, it was impossible to say, at least in 1923, for the free exercise of opinion and the give and take through which a democracy functions were almost wholly lacking.

The Communists were moved against with severity. On February 10, leaders of the party were seized and arrests in all parts of the country followed. On January 25, on a charge of interfering in politics, the General Workers' Union of Turin was dissolved; and in March, the editor of the radical Socialist *Avanti* was arrested by order of the Prime Minister. At Venice, Rome, and Florence, Communist disorders were put down with a high hand. A general order prohibited the publication by newspapers of false or biased reports, or reports tending to excite class hatred, or subvert the respect due to national institutions, the Pope, and the State. By the passage of an electoral reform measure in July, 1923, Fascism's hold was strengthened, for the act gave the party polling a plurality of the votes in an election two-thirds of the seats in the Chamber. On December 10, a decree, was promulgated dissolving the Chamber and ordering a new election. Mussolini made it plain on that occasion that he would request a renewal of his dictatorial powers from the new Parliament.

In the domain of foreign affairs, the same resoluteness of purpose was marked. It became increasingly evident that Mussolini's foreign policy was aimed at a speedy intimidation of Yugoslavia and the establishment of Italy in a commanding position not only in the Adriatic but in the Mediterranean as well. Several events pointed to this end. The murder on Greek soil, in August, 1923, of Italian officers on their way to participate in the delimitation

of the Greco-Albanian frontier was immediately followed by a drastic ultimatum to Greece which demanded full apologies and an indemnity of 50,000,000 lire. Greece's desire to discuss the matter first, before yielding up, as she believed, her national honor, was sternly rejected, with the result that an Italian fleet was sent to Corfu and ordered to open fire. In the bombardment of the island, 20 refugees were slain and 30 others wounded. Mussolini's refusal to consider the matter as lying within the jurisdiction of the League of Nations and his defiance of Great Britain even in the face of a threat to cut off his coal supply, for the moment seemed to threaten an international crisis. For a week, uncertainty prevailed, when Mussolini was induced to accept the Council of Ambassadors as arbiter. On September 7, the Council decided in favor of practically all of the Italian claims: apologies were to be rendered to the Allied representatives as well as naval salutes to the flags of the Allied ships; official mass for the dead was to be celebrated at Athens; and military honors bestowed on the Italian victims. Inasmuch as the search for the murderers had been carried on half-heartedly, Greece was ordered, on September 26, to pay the 50,000,000 lire demanded as an indemnity. On the other hand, Italy agreed to evacuate Corfu before October 1.

Toward Yugoslavia, Mussolini applied something of the same methods. The execution of the Treaty of Rapallo he regarded as a surrender of Italy's just claims and upon Yugoslavia's insistence that the matter be brought to a close, Mussolini on August 30 dispatched a peremptory note to Belgrade in which he declared that the only settlement acceptable to Italy would be the inclusion of Susak (including the Baros Basin) in the Fiume Free Port area. Yugoslavia refused to be intimidated. The result was the dispatching of an Italian force into Fiume on September 16 and the establishment of a military protectorate. It is true that this did not change matters any, for it merely gave official approval to what had been a virtual Italian occupation by the Fascisti over the previous 18 months. In the face of so trying an incident, the Yugoslav government remained cool, contenting itself with the statement that the matter was to be submitted to the League of Nations which had, only shortly before, registered the Treaty of Rapallo. The crisis, however, was settled without recourse to the League. Direct negotiations led to the signature at Rome in January, 1924, of a treaty whereby Fiume was yielded to Italy and the River Eneo fixed as a boundary. Porto Barros, however, was included in Yugoslavia, and arrangements were made to facilitate Yugoslav commercial access to the sea through Fiume and Porto Barros. Furthermore, each nation pledged neutrality in case the other should be attacked by a third power; and both agreed to maintain the peace settlement. See FIUME-ADRIATIC CONTROVERSY.

In the eastern Mediterranean, the same success attended Italy's efforts. In the fall of 1922, as Turkish success over Greece seemed assured, the Italian government repudiated the Treaty of Sèvres by which it had consented to the evacuation of the Dodecanese and indicated that it meant to prolong its occupation of the islands. The Treaty of Lausanne of 1923 put the stamp of approval on this act. By it, the 13 islands in question, including Rhodes, were yielded up

to Italy and not to Greece, in spite of the pre-vaillingly Greek population. Other incidents of the year pointed to the fact that Italy meant to assume a more important position in world affairs. In November, the Spanish royal family, accompanied by Rivera, was received at Rome and the conversations carried on pointed to the fact that both nations meant to adopt a common Mediterranean and South American policy. This was indicated by the insistence of Italy on representation at the Tangier Conference, and later, in January, 1924, by the sending of a mission to South America for the creation of a more cordial attitude toward both Italy and Spain.

That Italy was drawing away from France and once more assuming her traditional hostility was evident. On November 16, Mussolini declared that his Government was opposed to further occupations of German territory; on November 30, he indicated that he was sympathetically disposed toward granting Russia *de jure* recognition. By the adoption throughout 1923 of commercial treaties with Spain, Albania, the Baltic States, Russia, Switzerland, Austria, Canada, and Czechoslovakia, it was seen that attempts were being made to shake off the old economic dependences and turn to new sources for raw materials.

The year 1924 opened auspiciously for Fascism. Italy, by the Treaty of Rome, had gained Fiume and was firmly established in the Adriatic. Mussolini's foreign policy continued to meet with triumph after triumph. First Yugoslavia, then Russia (which was granted *de jure* recognition, February 7), then Poland (which was promised, in April, a loan of 400,000,000 lire), then Czechoslovakia (as a result of the treaty of friendship of May 17), were drawn into the Italian European system and the hold of France on central and eastern Europe greatly weakened; also, Mussolini, in June, had come to an amicable understanding with Great Britain over the Jubaland question (see AFRICA) and negotiations were under way with Rumania for the settlement of the long-standing dispute over the repayment of the Italian loan. In internal affairs, Fascism seemed firmly entrenched. In the election of April 6, the Fascisti polled 65 per cent of the vote cast and returned 375 seats to the new Chamber. The Opposition was hopelessly divided, being made up of 40 for Popular Party, 25 Socialists, 22 Maximalists, 17 Liberals, 17 Communists, 12 for Constitutional Opposition, 11 Social Democrats, 7 Republicans, 3 for Peasant Party, 2 Slavs, 2 Germans, 2 Sardinian autonomists. The new Parliament was opened with the old pomp, May 24, and King, Court, and Mussolini basked in the approbation openly manifested by the Roman populace.

Trouble soon developed. The chief opposition in Parliament was led by the Socialists at whose head stood Signor Matteotti. In June, 1924, Matteotti was murdered after it was rumored that he would uncover instances of graft touching members of Mussolini's cabinet. The murder caused a storm of indignation throughout Italy since it was only the worst case in a series of acts of violence or "squadristism." Mussolini quieted the storm by dismissing those connected with the scandal and by promising various reforms. Hereupon, he proceeded to make himself supreme in Italy by forbidding Parliament to initiate legislation; making the Prime Minister solely responsible to

the King; ordering Parliament to empower him to issue decrees which would have the force of law; establishing complete press censorship; abolishing secret societies, and, in 1926, abolishing all opposition parties.

Further, a law of 1928 vested supreme power in the Fascist Grand Council, controlled by Mussolini. This council was empowered to draft all new legislation, fill its own vacancies, and name the successors both of Mussolini and Victor Emmanuel. By a policy of "purification," all anti-Fascist lawyers and professors were disbarred, and prominent opponents, like Signor Nitti, forced into exile. All children's organizations, even the Catholic Boy Scouts, were suppressed, and replaced by the Balilla organization which includes boys between the ages of 8 and 14. At 14 the boys transfer to the Advance Guard where they receive military training. When they reach 18, some of the members of the Advance Guard are taken in as regular members of the Fascist Party.

In 1926, too, the process whereby Italy was to be converted into a "corporate state" was begun. A law of Apr. 3, 1926, recognized as legal 13 syndicates or associations—6 of employers and 7 of employees, including one of the nonmanual workers. These syndicates were grouped into seven "corporations," each corporation including the employers and workers of the particular industries. Thus, there is the Agriculture Corporation, the Industries Corporation, the Maritime and Aërial Transport Corporation, etc. The same law prohibited strikes and lockouts, and established a labor court to settle disputes. To further improve labor conditions, a "Fascist Charter of Labor" was promulgated April 21, 1927. It asserted the state's undisputed right to exercise complete control over labor and capital and all the forces of production in the interest of the nation, the Fascist state. And then, under a law of May 21, 1928, Italy's transformation into a corporate state was completed by provision for a legislative body based directly on economic representation. According to the terms of this law, all Italy was formed into one single constituency with the right to elect 400 deputies. The candidates, to the number of 800, are nominated by the 13 syndicates, each syndicate nominating a definite number. From this list of 800 nominees, the Fascist Grand Council chooses 400. The Council's list is then submitted to the people who may vote yes or no on the whole list. If a majority of the votes cast is in favor of the list, the 400 men take their seats in the Chamber of Deputies. If a majority of the votes opposes the list, then new elections must be held under a complicated and round-about system. Universal suffrage was abolished and certain qualifications for voters set up. In the first elections held under this new law (March 24, 1919) the list presented by the Government received about 99 affirmative votes out of every 100 votes cast. See FASCISM.

Mussolini continued to follow a strong, and at times blustering, foreign policy. An incessant Italian propaganda campaign for a greater population, together with a host of oblique references to Italian rights in certain areas bordering on the Mediterranean, caused much uneasiness to various statesmen in the Balkans, in North Africa, and elsewhere. A vigorous and oftentimes unreasonable policy of Italianization among the quarter-million Germans in the South Tyrol (see TYROL, SOUTH GERMAN) led to several

protests from Austria, Bavaria, and Germany, notably in 1926 and 1928. This area remains one of the chief sore spots of Europe.

Relations with France approached a breaking point in 1927 over the Garibaldi incident. Garibaldi was an Italian who migrated to France ostensibly because he was hostile to the Fascist régime. But the French police discovered that he was a Fascist secret agent sent by Italy to see what France was doing for Italian émigrés. A break was averted by Briand who preferred to smooth the matter over, and in the same year the two countries came to an agreement over the question of Italian emigration to France. Relations were still further improved in the spring of 1928, when Italy was allowed to share in the international government of the free city of Tangier on the west coast of Morocco.

Mussolini further fortified himself by a number of treaties of conciliation and arbitration concluded with Great Britain, Switzerland, Yugoslavia, Austria, Hungary, Germany, Spain, Rumania, Czechoslovakia, and Albania. The latter country almost became an Italian protectorate in 1925. In that year, President Ahmed Zogu of the Albanian Republic called upon Mussolini for financial aid to help him put down numerous revolts. Italy acquiesced with alacrity and then, in June, 1926, handed Zogu a treaty which would have given her complete control over Albania. Zogu refused to sign at the time, but after another serious revolt in northern Albania, he finally affixed his signature to what became known as the Treaty of Tirana, on Nov. 27, 1926. Under the terms of this treaty, Italy could land troops in Albania whenever Zogu so requested, and Zogu really became but a puppet of Mussolini—much to the chagrin of Yugoslavia. See ALBANIA.

On Feb. 11, 1929, the representatives of the Kingdom of Italy and of the Holy See signed three documents comprising the Lateran Accord which apparently solved the seemingly eternal "Roman question." This question of the relations between the Kingdom and the Pope dated from the occupation of Rome by Italian troops on Sept. 29, 1870. Mussolini, however, realized that the support of the Church was invaluable to the continued dominance of Fascism, and in 1926 he authorized conversations with a Papal representative with a view toward some settlement of the outstanding differences between the Church and the State. As a result of these negotiations, a treaty of reconciliation, a concordat, and a final convention were drawn up and then signed by Mussolini for Italy and

Cardinal Gasparri for the Pope. The Accord set up a sovereign state known as the City of the Vatican, under the exclusive jurisdiction of the Holy See. As a result of this settlement, the Italian government secured the coöperation of the Church in Italy, thus adding materially to the strength of Fascism. A concrete example of this coöperation was afforded in the elections of March, 1929, when the clergy advocated the acceptance of the list of candidates presented by the Fascist Grand Council, and the priests and bishops set an example by going to the polls in large numbers. Moreover, the Fascist Party could now feel fairly safe from attack by the ecclesiastical power—which, in Italy, was a real power.

**IVANOV**, è-vü'növ, VYATCHESLAV I. (1866- ). A Russian poet, historian, philologist, and philosopher. Joining the Decadents as a critic and essayist, his first volume of poems, *Guiding Stars*, was published in 1903. He published three later volumes, the last one in 1917. After Pushkin, he was perhaps the greatest mold of the Russian language; in his earlier poems, he used Greek words and syntax to a point of incoherence, but his later works, the majority lyrical, showed no trace of this pedantry. His models were Pushkin, Dante, Petrarch, and especially Goethe. The sonnet was his favorite poetic form. Besides verse, he wrote essays and tragedies. Consult *The Path of the Modern Russian Stage and Other Essays*, by Alexander Bakshy (trans. 1926).

**IVOGÜN**, MARIA (1891- ). A Hungarian coloratura soprano, born in Budapest. In 1907 she became a pupil of Irene Schlenner-Ambros at the Vienna Akademie, where Bruno Walter discovered her and secured her engagement for the Mozart Festival in Munich in 1913, at the Staatsoper. Her extraordinary success led to a permanent engagement there and she remained until 1925. Richard Strauss was so much impressed with the rare beauty of her voice and the flawless technical execution that he rewrote the difficult coloratura rôle of Zerbinetta in his *Ariadne auf Naxos* and engaged her for the première of the revised version in Vienna (1916). He even made her engagement as guest a condition for all performances of that work in all Austrian and German theatres. In that rôle, she made her London début in 1924. Her American début was made with the Chicago Opera Company as Rosina in Rossini's *Barbiero di Siviglia* (Jan. 14, 1922). Her success as a concert singer has been equally remarkable. In 1921 she married the tenor, Karl Erb.

**JACKSON, A (BRAHAM) V (ALENTINE) WILLIAMS** (1862- ). An American Orientalist (see Vol. XII), professor of Indo-Iranian languages at Columbia University since 1895. He traveled in India, Persia, and Central Asia between 1901 and 1918. In 1926 he again made a journey of research in India, Afghanistan, Baluchistan, and Eastern Persia. He is editor of a *History of Persia* and, among other works, of *Early Persian Poetry* (1920).

**JACKSON, CHEVALIER** (1865- ). An American laryngologist, born at Pittsburgh, Pa. He obtained his medical degree at Jefferson Medical College in 1887 and was appointed professor of laryngology in the University of Pittsburgh, resigning in 1916 to accept the chair of laryngology at Jefferson Medical College. He was also professor of bronchoscopy and esophagoscopy at the University of Pennsylvania. Dr. Jackson is one of the pioneers in the new development of laryngology known as tracheo-bronchoscopy, having studied under Professor Kilian of Germany, the inventor of the bronchoscope, an instrument which is of great value not only in diagnosis but in the location and removal of foreign bodies in the deep air-passages. He has been a prolific contributor to periodical literature in various subjects which pertain to laryngology, bronchoscopy, rhinology, otology, etc. His first textbook, *Tracheobronchoscopy*, appeared in 1907; *Peroral Endoscopy and Laryngeal Surgery* in 1914; and *Bronchoscopy and Esophagoscopy* in 1922. In 1923, there appeared in French the volume *Endoscopie et chirurgie du larynx*.

**JACKSON, FREDERICK JOHN FOAKES** (1855- ). A British-American theologian, born at Ipswich, England. He graduated from Trinity College, Cambridge, in 1879, and was fellow of Jesus College from 1886, and dean and assistant tutor at the same college from 1895 to 1916. In the latter year, he was appointed Briggs graduate professor of Christian institutions at the Union Theological Seminary. In 1916 he was also Lowell lecturer in Boston. He was a member of several learned societies and was the author of *The Christian Church* (1891); *Biblical History of the Hebrews* (1903); *St. Luke and a Modern Writer* (1916); *Introduction to Church History* (1921); *Anglican Church Principles* (1924); *Studies in the Life of the Early Church* (1924); *Life of St. Paul* (1926); *Rise of Gentile Christianity* (1927); *Peter, Prince of Apostles* (1927). He also edited several theological works.

**JACKSON, HENRY EZEKIEL** (1869- ). An American clergyman and author, born in Chester County, Pa., and educated at Lafayette College and Princeton Theological Seminary. He was ordained to the Presbyterian ministry in 1896, and after holding several pastorates, the Community Organization of the United States Bureau of Education at Washington, D. C., secured his services as special agent, which

post he held from 1916 to 1920. He became president of the National Community Board at Washington, D. C., and later president of the Social Engineering Institute of New York. His writings include: *Benjamin West, his Life and Work* (1900); *Great Pictures as Moral Teachers* (1910); *The Legend of the Christmas Rose* (1914); *The New Chivalry* (1915); *A Community Center, What It is and How to Organize It* (1918); *The League of Nations* (1919); *A Community Church* (1919); *What America Means to Me* (1920); *Robinson Crusoe, Social Engineer* (1922); *The Thomas Jefferson Bible* (1923).

**JACKSONVILLE.** A city of Florida. The population increased from 57,699 in 1910 to 91,558 in 1920 and to 140,700 in 1928, by estimate of the Bureau of the Census. A new charter was granted by the State Legislature in 1917 providing for an elected council of 21 members and a commission of five members. The mayor is elected for two years. In 1921 a bridge 3800 feet long with a vertical lift draw was built across the St. Johns River at a cost of \$1,250,000. The city owns and operates its electric-light plant, thereby offering one of the lowest electric-light rates in the South. Through its natural harbor, which has a 30-foot channel depth at low water, Jacksonville carries on an extensive deep-sea and foreign commerce. Its total foreign commerce in 1927 was 494,429 tons.

Jacksonville is the financial, manufacturing, and jobbing centre of the State and next to the largest naval-stores market in the world. It has more than 400 manufacturing establishments that produce commodities valued at approximately \$142,000,000 annually. Some of the major industries are naval stores, lumber and wood products, fertilizers, cigar manufacturing, coffee roasting, shipbuilding, and steel and stone products. The resources of Jacksonville's 10 banks in 1927 were \$96,764,600; the deposits were \$86,120,449. The assessed valuation of property in 1928, according to local estimate, was \$99,004,820. All property is assessed on a basis of 50 per cent of the fair market value, the city tax rate being 24.5 mills. The net debt in 1927 was \$14,939,000.

**JACOBI, FREDERICK** (1891- ). An American composer, born in San Francisco. He studied in New York, piano under Gallico and Joseffy, and composition under R. Goldmark and E. Bloch. During 1912-17 he was assistant conductor at the Metropolitan Opera House. His works include *Assyrian Symphony*; a symphonic poem, *The Pied Piper*; a symphonic prelude, *The Eve of St. Agnes*; an orchestral suite, *California*; *Festival Prelude*; *Nocturne*, for string quartet; and a string quartet on Indian themes.

**JACOBS, THORNWELL** (1877- ). An American educator, born at Clinton, S. C. He was graduated from the Presbyterian College, Clinton, S. C., in 1894, and from Princeton Theological Seminary in 1899. In the same year, he was

ordained to the Presbyterian ministry and was pastor in North Carolina for several years following. In 1915 he founded at Atlanta, Ga., Oglethorpe University, and was its president from that date. He is the author of *The Law of the White Circle* (1908); *Midnight Mummer*, poems (1911); *The Oglethorpe Story* (1916); *Life of Plumer Jacobs* (1918); *The New Science and the Old Religion* (1927); *Islands of the Blessed* (poems, 1928).

**JACOBS, WILLIAM WYMARK** (1863- ). An English novelist and writer of short stories of the sea (see VOL. XII). His later novels include *The Castaways* (1916); *Deep Waters* (1919); and *Sea Whispers* (1926). He also wrote, in collaboration, *The Monkey's Paw* and other plays.

**JACOBSON, YÄ'KÖP-SÖÖN, SIEGFRIED** (1881-1926). A German writer. He was born in Berlin and studied at the university there. He became dramatic critic of *Die Welt am Montag* and in 1905 founded his own magazine devoted to the drama, *Die Schaubühne* (changed in 1918 to *Die Weltbühne*), through which he exercised considerable influence over the theatrical life of Germany. He was also dramatic correspondent for *Die Zeit* and other Viennese papers. He wrote *Das Theater der Reichshauptstadt* (1904); *Mao Reinhardt* (1910); *Der Fall Jacobson* (1913); and *Die ersten Tage* (1917).

**JACOBY, HENRY SYLVESTER** (1857- ). An American engineer, born at Springtown, Pa. He was graduated from Lehigh University in 1877. During 1879-85, he was chief draftsman in the United States Engineer's Office in Memphis, Tenn. In 1886 he returned to Lehigh, where until 1890 he was instructor of civil engineering; he then accepted a call to Cornell, where in 1897 he became professor of bridge engineering. He retired in 1922. Besides numerous papers on his specialty of bridge engineering, he wrote *Notes and Problems in Descriptive Geometry* (1892); *Outlines of Descriptive Geometry* (part 1, 1895; 2, 1896; 3, 1897); *Text Book in Plain Lettering* (1897); with Mansfield Merriman, *Text Book on Roofs and Bridges* (1890-98); with R. P. Davis, *Foundations of Bridges and Buildings* (1914); and *Structural Details, or Elements of Design in Timber Framing* (1919).

**JADWIN, EDGAR** (1865- ). An American military engineer and army officer (see VOL. XII). He held the temporary rank of brigadier general in the World War and organized and commanded the 15th U. S. Engineers, the first American regiment to pass under arms through England in 1917. He was at first director of light railways and roads for the A. E. F. in France and later directed a general construction programme employing 160,000 men. He was a member of the American Mission to Poland and observer in Ukraine in 1919. Returning to the United States, he became engineer of the 8th Corps Area at San Antonio, Tex. (1920-22), division engineer of the Southeast Division at Charleston, S. C. (1922-24), assistant to the Chief of Engineers, with the rank of brigadier general (1924-26), and in 1926, Chief of Engineers with the rank of major general. In that capacity, he formulated the Mississippi River flood-control plan that bears his name. He was retired Aug. 7, 1929, with the rank of lieutenant general. He was senior member of the American section, Joint Engineering Board, St. Lawrence Waterway Project.

**JAENSCH, ERICH R. F.** (1883- ). A German philosopher and director of the psychological institute and philosophical seminary at Marburg. He strove for a closer relation between philosophy and psychology and has written among other works *Einige allgemeine Fragen der Psychologie und Biologie des Denkens* (1920).

**JAGGAR, THOMAS AUGUSTUS** (1871- ). An American geologist, born in Philadelphia, Pa. He was graduated at Harvard in 1874, (Ph.D. in 1897) and also studied at Heidelberg and at Munich. In 1895 he became an instructor and later assistant professor of geology at Harvard. In 1906 he accepted a call to the Massachusetts Institute of Technology, where he was professor of geology (1904-17) and head of the Department (1906-12). During 1898-1904 he also served the United States Geological Survey as an assistant geologist. He was director of the Hawaiian Volcano Observatory (1912-19) and in 1919 became volcanologist to the United States Weather Bureau, stationed in Hawaii. He has studied the volcanoes of the Aleutian Islands, Hawaii, Japan, Italy, New Zealand, and Central America, to most of which he has made expeditions and descriptions of which he has published. Since 1926 he has been chief of the section of volcanology of the U. S. Geological Survey. In 1928 he led the National Geographical Society's Paulof expedition.

**JAGGER, CHARLES SARGEANT** (1885- ). A British sculptor, born in Yorkshire and trained at Sheffield and the Royal College of Arts. His works include the British memorial to Belgium in Brussels; the Royal Artillery memorial, Hyde Park Corner, London; the Great Western Railway memorial, Paddington Station; a statuette of the Prince of Wales. In 1924 he was awarded the Rome Prize in sculpture and in 1926 the gold medal of the Royal Society of British Sculptors.

**JAGIC, YŮ'GICH, VATROSLAV** (1838-1923). An Austrian philologist (see VOL. XII). His recent works are *Beitrag zur Erforschung der altkirchenslavischen Evangelientexte: Evangelium Bucovinense* (1916) and *Zum altkirchenslavischen Apostolus* (1919-21). He also edited Johannes Paprek's *Slavische Brautwerbungs- und Hochzeitsebräuche* (1914).

**JAGOW, YŮ'GÖ, GOTTLIEB VON** (1863- ). A German diplomat (see VOL. XII). He was State Secretary for Foreign Affairs from 1913 to 1914, and was retired in 1916. He added to the literature of the World War with his *Ursachen und Ausbruch des Weltkrieges* (1919).

**JAHN, YŮN, GEORGE MAX** (1885- ). A German political economist, professor at the University of Halle since 1924. He was born in Leipzig and studied history, philosophy, and political science at the universities of Leipzig and Jena. He was director of the municipal high school for girls in Jena and lecturer on political economy at Leipzig and at the technical high school of Braunschweig. He is the author of: *Die Gewerbepolitik der deutschen Fürsten vom 16. bis zum 18. Jahrhundert* (1909); *Verstaatlichung und Vergesellschaftung* (1919); *Grundzüge der Volkswirtschaftslehre* (1920); *Sozialpolitik* (1926); and *Der Studienplan der Nationalökonomie* (1927).

**JALOUX, EDMOND** (1878- ). A French novelist who was born in Marseilles. In 1927 he became editor of the *Revue des arts asiatiques*. In 1920 he won the Grand Prix de Littérature. His works include: *L'Agonie de*

*l'amour* (1899); *Les Sangsues* (1904); *Le jeune homme au masque* (1905); *L'École des mariages* (1907); *Le Démon de la vie* (1908); *Le Reste est silence* (1909); *Le Boudoir de Proserpine* (1910); *L'Éventail de Crêpe* (1911); *Fumées dans la campagne* (1915); *L'Incertain* (1918); *Les Amours perdues* (1919); *Vous qui faites l'endormie* (1920); *L'Ennemi des femmes* (1921); *L'Escalier d'or*; *Les profondeurs de la mer*; *Les Barricades mystérieuses*; *Le Roi Ophétua* (1922); *Le coin des cyprès* (1925); *Pierre Laprade*, a critical study (1925); *O toi que j'eusse aimé!* (1926); *Soleils disparus* (1927); *La branche morte* (1928); and a volume of literary criticism, *De Pascal à Barrès*.

**JAMAICA.** An island of the British West Indies; area 4450 square miles; population in 1921, 858,118 and in 1927, 953,768. According to the census of 1921, the East Indian population was 17,494, as compared with 17,380 in 1911, and the Chinese 3696, as compared with 2111. Kingston, the capital, had 62,707 inhabitants in 1921 and 57,379 in 1911. The leading activity of the population is agriculture. Sugar cane is of great importance, the acreage under cane being 43,605 in 1927-28 (31,753 in 1912-13). Other crops with their acreage in 1927-28 are (1912-13 figures in parentheses): bananas, 88,974 (81,071); coffee, 19,195 (22,275); coconuts, 39,070 (17,377); cocoa, 4782 (11,236); ground provisions, 56,238 (99,632). The values of imports in 1912 and 1927-28, were, respectively, £3,040,500 and £6,001,768. Exports for the same years were valued at £2,709,283 and £4,257,750. There has been no change in administration. Women were enfranchised in 1919. Government accounts for 1927-28 follow (1912-13 figures in parentheses): revenue, £2,275,094 (£1,432,400); expenditure, £1,980,888 (£1,549,667); public debt, £4,922,330 (£3,843,974).

**JAMES, HERMAN GERLACH** (1887- ). An American lawyer and author, born at Philadelphia, Pa. He was graduated from the University of Illinois in 1906 and studied law at the Harvard Law School. In 1909 he was admitted to the bar and after official service in Santiago, Chile, was lecturer at the University of Leipzig in 1911. From 1912 to 1925, he was professor of government in the University of Texas. He was a research associate of the Carnegie Institution of Washington to study Brazilian government, 1922-23, and since 1925 has been professor of political science and dean of the college of arts and sciences, University of Nebraska (dean of the graduate college since 1926). He was the author of *A Handbook of Civic Improvement* (1915); *Municipal Functions* (1917); *Local Government in the United States* (1921); *The Constitutional System of Brazil* (1923); and *Brazil after a Century of Independence* (1925). He was editor of the *Southwestern Political Science Quarterly*, 1923-25.

**JAMES, MONTAGUE RHODES** (1862- ). A British classicist, who was educated at Eton and King's College, Cambridge. He was director of Fitzwilliam Museum (1894-1908), provost of King's College (1905-18), vice chancellor (1913-15), and Schweich lecturer before the British Academy (1927). He compiled catalogues of the manuscripts at Peterhouse, Trinity (4 vols.), Emmanuel, Pembroke, Clare, Christ's, and Queens colleges, Gonville and Caius College (2 vols.), Corpus Christi College (7 parts), St. John's College, and various other public and private collections. Other publications include *Ancient*

*Libraries of Canterbury and Dover* (1903); chapters in the *Cambridge Modern History*, the *Cambridge History of English Literature*, *Cambridge Medieval History*, and *Medieval France*; *Biblical Antiquities of Philo* (1927); *The Apocryphal New Testament* (1924); *Life of St. Alban* (1924); *The Carew MSS.* (1927); *Eton and King's, 1875-1925*, and many other translations and descriptions of ancient documents.

**JAMESON, JOHN FRANKLIN** (1859- ). An American historian (see Vol. XII). He retired as director of the department of historical research of the Carnegie Institution of Washington and also as managing editor of the *American Historical Review*, in 1929. Since 1929 he has been connected with the Manuscripts Division of the Library of Congress. He projected the *Dictionary of American Biography*. He wrote *Privateering and Piracy* (1923) and *The American Revolution Considered as a Social Movement* (1926).

**JAMMES, FRANCIS** (1868- ). A French poet and novelist, born in Tournay (Hautes-Pyrénées). His prose was almost as poetic as his verse, and in both he was usually a chronicler of the country side. *Feuilles dans le vent* (1914) contained the best of his first-period poetry. His other poetry includes *Clairières dans le ciel* (1906); *Géorgiques chrétiennes* (3 vols., 1911-12); *Oeuvres de Francis Jammes*, some of his poetry (1913); *La vierge et les sonnets* (1919); *Épithèses* (1921); *Le tombeau de Jean de la Fontaine*, followed by *Poèmes mesurés* (1921), and *Quatrains* (3 vols., 1923-24). His novels and other prose include *Clara d'Ellébeuse* (1899); *Le roman du lièvre* (1903); *Ma fille Bernadotte* (1910); *Le rosier au soleil* (1916); *M. le curé d'Ozéron* (1918); *Le poète rustique* (1920); *Le livre de Saint Joseph* (1921); *Mémoires* (3 vols., 1921-23); *Oloches pour deux mariages* (1923); *Brindilles pour rallumer la foi* (1925); *Ma France poétique* (1926); *Cardinal Lavigerie* (1928); and *Divine douleur* (1928). In 1925 his works were published in two volumes. Consult *Six French Poets*, by Amy Lowell (1915); *Les chapelles littéraires: Claudel, Jammes, Péguy*, by Pierre Lasserre (1920); *Choix de poèmes*, with a study, by Leon Moulin (1922); and *Francis Jammes*, by E. Pilon (1924).

**JANÁČEK, LEOS** (1854-1928). A Czech composer, born at Hukvaldy, Moravia. He received his musical education at the Organ School in Prague and at the conservatories of Leipzig and Vienna. After unsuccessful efforts to win a reputation as a piano virtuoso, he settled in 1881 in Brünn, as conductor of the Philharmonic Society. In the same year, he opened there his own Brünnner Orgelschule and in a short time he was recognized as a teacher and choral conductor of exceptional ability. When the Brünn Conservatory was founded in 1919, he became professor of composition there, retaining that post until his death. In 1884 he wrote his first opera, *The Beginnings of a Romance*, followed, in 1887, by *Sarka*. Unable to secure their performance, he became discouraged and turned to the composition of choral works, which immediately found great favor with his countrymen and established his reputation as the foremost national composer. For almost twenty years, he made no further attempts at opera, until the very effective text of *Jenufa* aroused his interest. However, the première of this work at Brünn, in 1904, passed almost unnoticed, and during the

next 12 years only sporadic performances on provincial stages can be recorded. But when *Jenufa* was heard at Prague, in 1910, it scored an overwhelming success, so that from then on the composer devoted his energies chiefly to the stage. After numerous productions in Austria and Germany, *Jenufa* was produced at the Metropolitan Opera House, New York, (Dec. 6, 1924), but failed to make an impression. Janáček's musical idiom is, in the main, impressionistic, with a strong admixture of Czech folk elements producing a certain individuality. The operas following *Jenufa* are: *Fate* (written 1905, not produced); *The Adventures of Mr. Bruckek* (two parts: *Mr. Bruckek's Excursion to the Moon*, and *Excursion into the Fifteenth Century*, Prague, 1920); *Katya Kabanova* (Brünn, 1921); *The Sly Little Viven* (Brünn, 1924); *Sarka* (written 1887; Prague, 1925); *The Makropulos Case* (Prague, 1926), and *The House of the Dead* (completed just before his death, not yet produced). The principal non-dramatic compositions are the choral works with orchestra, *Amarus, Our Father, The Eternal Gospel*; the symphonic poems, *The Musician's Child, Taras Bulba*, and *The Ballad of Blánik*; *Sinfonietta*; a string quartet; a sextet for woodwind; male choruses; a cycle of 22 songs, *The Day-Book of One Who Vanishes*; piano pieces and songs.

**JANET, zhà'nâ', PIERRE** (1859- ). A French psychologist, born in Paris. Like Freud, he was the pupil of the great French alienist, Charcot, but he developed the latter's theories along lines much more sober than those of his Viennese colleague. After teaching philosophy in a lycée at Le Havre, he began to devote himself to a clinical observation of psychopathic cases. His first work, *L'Automatisme psychologique* (1889), singled him out as a leader in this field. Then followed in succession researches on hysteria, *L'Etat mental des hystériques* (2 vols., 1893) and on neuroses, *Névroses et idées fixes* (2 vols., 1898). On the death of Ribot, he succeeded to the latter's chair at the Collège de France (1896), and in 1903 he founded the *Journal de Psychologie*, which he directed. He was elected in 1918 to the Académie des Sciences Morales et Politiques. Professor Janet made two visits to the United States. On his first visit, he delivered a course of lectures on *The Major Symptoms of Hysteria* (published 1908).

Without building a system, M. Janet oriented his psychology around the notion of a hierarchy of states of consciousness, ranging from conscious reflection to a biological automatism that is almost indistinguishable from the mechanism of a machine. No attempt is made to "construct" consciousness, but all analyses are made from within conscious experience.

Besides the works mentioned above, his works include *Les Obsessions et la psychasténie* (2 vols., 1903); *Les Névroses* (1909); *Les Médications psychologiques*, translated as *Psychological Healing* (3 vols., 1919-21); *La Médecine psychologique*, translated as *Principles of Psychotherapy* (1923); and *De l'angoisse à l'estase*, Vol. 1, *Un délire religieux, la croyance* (1926), Vol. II, *Les sentiments fondamentaux* (1928). See **PSYCHOLOGY, ABNORMAL**.

**JANEWAY, THEODORE CALDWELL** (1872-1917). An American physician, son of the late Dr. E. G. Janeway. He was born in New York City, took his bachelor's degree at Yale and re-

ceived his medical degree from Columbia (College of Physicians and Surgeons) in 1895. He followed in the footsteps of his father as diagnostician and consultant, was visiting physician to St. Luke's Hospital and in 1907 became professor of the practice of medicine at the College of Physicians and Surgeons, resigning in 1914 to occupy the chair of medicine at Johns Hopkins, where he was also physician in chief of the University Hospital. Dr. Janeway did much to promote the study of blood pressure. His only publication in book form is *Clinical Study of the Bloodpressure* (1904).

**JANIS, (BIERBOWER), ELSIE** (1889- ). An American actress born in Columbus, Ohio. She first appeared on the stage as Cain in *The Charity Ball* (1897); played in vaudeville (1898-1903); then starred in *The Belle of New York* (1904). She appeared later in *The Fortune Teller* and *The Duchess*, and starred in *The Vanderbilt Cup* (1906-08). Under the management of Charles B. Dillingham, she took the leading rôle in *The Hoyden, Fair Co-ed, The Slim Princess*, and also in *Elsie Janis and Her Gang* (1920), of which she is the author. A revue by Miss Janis, *Puzzles of 1925* was produced in New York.

**JAN MAYEN ISLAND.** Located at about 71° north latitude and 8° west longitude, this desolate isolated island of only 142 square miles is dominated by the semi-active, ice-clad volcano, Beerenberg. Probably known to the Norsemen, Jan Mayen was a centre for Dutch whaling activities in the early part of the seventeenth century. After the extinction of local whaling, only occasional explorers visited the island until 1921 when Norway established a wireless and meteorological station to aid in forecasting storms on the mainland. Jan Mayen is considered by Norway to be within her sphere of interest.

**JANSON, yân'son, KRISTOFER NAGEL** (1841-1917). A Norwegian author (see VOL. XII). Among his last works were: *Aspasia*, novel (1914); *Norske Eventyr som ætelskister* (1915), and *Mangeslags kjaerlighed*, published in 1923.

**JANTZEN, HERMANN** (1874- ). A German writer, who was born at Breslau and studied at the university of that city. He was director of the Victoria Institut of Breslau (1900-05), then went in the same capacity to the Königin Luise Institut at Königsberg. His works include: *Geschichte des deutschen Striagedichts im Mittelalter* (1896); *Gotische Sprachdenkmäler* (1898); *Sawo Grammaticus* (1901); *Deutsche Literaturgeschichte* (1904); *Königin Luise* (1910); *Ostpreussische Sagen* (1912); *Von deutscher Schule und Erziehung* (1915); *Ueber Erziehung und Unterricht* (1918); *U. S. A. Poetry and Prose*, an anthology (1923); *Ein altschlesisches Osterspiel* (1925); *Hartmann von der Aue und Gotfried von Strasburg* (1925); *Wolfram von Eschenbach* (1925). He also edited: *Literaturdenkmäler des 14. und 15. Jahrhunderts* (1903); Goethe's *Egmont* (1914); Hobbels *Nibelungen* and *Agnes Bernauer* (1919).

**JAPAN.** An Empire of the Far East. It consists of Japan proper, made up of the islands of Honshu (mainland), Shikoku, Kyushu, and Hokkaido (Yezo), and of Chosen (Korea), Taiwan (Formosa), Karafuto (Sakhalin), as well as 600 smaller islands, including the four archipelagoes, the Pescadores, Agasawara (or Bonin group), Okinawa (or Linchu group), and Chishima (or Kuriles). The total area is 265,129

square miles. The total population of Japan, according to the census of 1925, was 83,456,629, an increase from 76,988,379 in 1920, distributed as follows: Japan proper, 59,736,822; Formosa, 3,993,408; Karafuto, 203,754; Korea, 19,524,945. The population of Japan proper at the end of 1926 was 83,006,595, or a density of population of 428 to the square mile. About one-sixth of the land is under cultivation, and the population is predominantly rural. According to the census of 1920, 41 per cent of the people live in villages of between 2000 and 5000 inhabitants, 19 per cent in towns of between 5000 and 10,000 inhabitants, and 9 per cent in towns of between 10,000 and 20,000 inhabitants. Only 12 per cent of the population were in cities of over 100,000 inhabitants. In 1926 there were 640,099 Japanese residing abroad: 267,191 in Asia; 3360 in Europe; 229,734 in America; and 148,734 in Oceania, principally in the Hawaiian Islands. Principal cities with population in 1925: Tokyo, 1,995,567; Osaka, 2,114,804; Kobe, 644,212; Nagoya, 768,558; Yokohama, 405,888; and Kyoto, 679,963.

**Agriculture.** In 1926 there were in Japan, out of a total area of 94,289,000 acres, 7,269,000 acres of rice fields, 6,765,000 acres of upland farms, 4,099,000 acres of moors and pastures, and 20,980,000 acres of forests. All agricultural statistics here presented are for Japan proper unless otherwise noted. Agricultural conditions were more favorable in 1927 than in the previous year. The rice crop, by far the most important, was officially estimated at 317,952,000 bushels of brown rice (550,175,000 bushels of rough rice) an increase of 11.7 per cent, compared with 1926, 7.6 per cent above the five-year average, and the largest crop since 1920. The production of rice in Chosen and Taiwan also showed an increase over 1926. The wheat crop was larger than the year before, but production of barley showed a decrease, partly on account of reductions in area planted. Under normal conditions, large crops in Japan tend to increase the purchasing power of the landlords and farmers who constitute approximately one-half of the total population. Returns from agriculture in 1927 were greatly reduced, however, as farmers had difficulty in financing their crops because of a bank crisis and were forced to sell at low prices.

The production of silk cocoons was 610,275,000 pounds in 1924; 701,060,000 pounds in 1925; 717,350,000 pounds in 1926; and 753,309,000 pounds in 1927. On Dec. 31, 1926, there were in Japan proper, 1,465,000 cattle, 621,000 swine, 18,000 sheep, 179,000 goats, and 1,444,000 horses.

copper, \$23,921,000; coal, \$108,867,000; crude petroleum, \$7,055,000.

MINERAL AND METAL PRODUCTION (Japan Proper)			
Product		1913	1926

Coal	1000 met. tons	21,316	31,427
Crude petroleum	1000 bbls.	1,922	1,698
Sulphur	met. tons	58,448	47,775

\* Including the production in Chosen and Manchuria.

**Fisheries.** The annual catch of Japan is valued at about 250,000,000 yen. In 1926 the total catch was valued at 227,291 yen, while manufactures of fish amounted in value to 183,204 yen, including edible preparations, fish manure, and fish oil.

**Industries.** The industrial population of Japan was slightly over 5 per cent of the total adult labor power of 31,000,000, amounting in 1921 to 1,686,353 people and 916,252 in 1913. Of this 1921 total, 945,788 were engaged, as against 609,638 in 1916, in textile factories; 249,102 in machine and tool factories, compared with 146,477 in 1916; 171,249 in chemical works and 105,139 in 1916; 143,554 in breweries, tea-drying establishments, flour and rice mills, compared with 44,908 in 1916; and 154,908 in printing, woodenware, gas and electric works, and foundries, compared with 79,188 in 1916. Government works employed 15,752 in 1921, a tremendous reduction from 157,902 in 1916, most of whom were in military factories. Wages paid laborers ranged in 1921 from 40 cents per day paid female silk spinners to \$1.50 per day for bricklayers. In 1913 the former were paid 14 cents per day and the latter 55 cents. Japanese labor was relatively inefficient compared with European and American labor, four or five persons being required, as a rule, to do the work of one skilled Western workman. Hydroelectric power is of large and growing importance in Japanese industry. The potential water-power resources, developed and undeveloped, in Japan, are estimated at 4,500,000 horse power. The capacity of water wheels and turbines in central electric plants in 1926 was 1,082,000 horse power, in factories, 21,000, and in mines 80,000 horse power, representing one-third the total capacity of prime movers in these three classes of establishments, which amounted

#### CROPS: AREA, PRODUCTION, AND YIELD PER ACRE (Japan Proper)

Crop	Area (thousands of acres)				Production (thousands of units—bushels except as indicated)			
	1909-1913	1921-1925	1926	1927	1909-1913	1921-1925	1926	1927
Wheat	1,179	1,197	1,146	1,159	23,635	26,903	28,430	29,248

\* Unit, pound.

**Minerals.** The total value of mineral products in Japan proper has been as follows: 1913, \$72,719,000; 1925, \$175,687,000; 1926, \$200,710,000. The value of the leading mineral products in 1926 were: Gold, \$6,016,000; silver, \$2,838,000;

to 3,271,000 horse power. Nearly all the water power and much of the steam power is applied electrically, the capacity of electric motors in electric plants, factories, and mines, in 1926, being 2,681,000 horse power.

PRINCIPAL MANUFACTURED PRODUCTS (Japan Proper)					Value (thousands of dollars)			
Product	Quantity	1914	1925	1926	Product	1914	1925	1926
Cotton yarn	1000 lbs.	726,001	908,763	1,043,097	Cotton fabrics	57,799	288,521	350,250

° 1915.

**Communications.** In 1927 Japan had 185,256 miles of telegraph, and 2,165,243 miles of telephone wire in operation, all under government ownership, compared with 121,677 miles of telegraph and 503,302 miles of telephone in 1914. Japanese-owned cables connected Japan with China, Siberia, the Philippines, Guam, and the outlying possessions in the Pacific. Danish and American-owned cables entered Japan, but the Government operated the radio stations. Japan had 300,000 miles of roads, but few were highways wide enough to permit use of automobiles, most of them being built for narrow-tread native carts and rickshaws. The 351,000 bridges, except those on the 1600-mile Tokkaido highway, extending from Nagasaki to Tokyo, and a few other wide roads, were mostly too narrow and too light for motor vehicles. An extensive programme of road construction along standard specifications was under way. There were 11,345 miles of railway in Japan in 1927, 3337.58 miles, mostly short lines, being privately owned, and the balance, mostly trunk lines, being government owned. Only a few miles were as yet electrified. In 1913 there were 5987 miles of railroad. There were in 1927 2042.11 miles of municipal and private electric tramway lines. Canals are important only in the areas around Tokyo and Osaka, which are located on plains near shallow bays. Canal systems in these cities are important transportation factors.

**Shipping.** In 1927 Japanese steamer tonnage amounted to 4,033,304 compared with 1,513,000 tons in 1913 and sail tonnage to 1,259,934 compared with 487,000 tons in 1913. After 1920, Japanese shipping was greatly affected by decrease in tonnage which had fallen to Japanese ships as a result of withdrawals of European ships during the War. In 1922, 13,451 steamers and 447 sailing vessels entered Japanese ports, representing 35,795,276 and 65,037 tons, respectively. During the same year, 13,421 steamers and 489 sailing vessels cleared, representing 35,556,897 and 69,561 tons, respectively. In 1927, 16,899 steam vessels of 49,294,455 net registered tons and 126 sailing vessels of 17,819 tons entered Japanese ports. In the same year 17,031 vessels of 49,811,000 tons cleared the ports of the country.

**Foreign Trade.** In 1927 Japan's foreign trade amounted to \$1,981,443,735, or \$96,991,086 less than the 1926 figure. Exports during 1927 totaled \$946,350,653, against \$961,022,109 in 1926, while imports were valued at \$1,035,089,082, against \$1,117,417,712 in 1926—thus developing a decrease of 7.4 per cent in imports and 1.5 per cent in exports as compared with the preceding year. The leading exports in order of value in 1927 were raw silk, cotton and silk textiles, cotton yarn, and fish; the leading imports, raw cotton, iron and steel, lumber, wool, and oil cake. Japan's exports to the United

States during 1927 amounted to \$398,057,022 against \$404,613,872 in 1926, and imports from the United States were valued at \$320,000,805 as compared with \$319,687,308 in 1926.

**Finance.** Because of the failure to pass a budget law for 1928-29, the 1927-28 budget providing for a total expenditure of over 1,730,000,000 yen was to be in force for another year. There was also a supplementary budget of 16,000,000 yen provided to cover the expenses of the Emperor's coronation. The national debt increased about 4 per cent during 1927, entirely in internal debt. On Mar. 31, 1928, the total debt was 5,397,866,581 yen (equivalent at par to \$2,689,000,000). The state revenues estimated for 1928-29 were 1,484,305,834 yen ordinary receipts and 301,163,679 yen extraordinary receipts, while ordinary expenditures were 1,199,986,070 yen and extraordinary 509,139,579 yen. The table shows receipts and expenditures for earlier years.

#### GOVERNMENT RECEIPTS AND EXPENDITURES (Thousands of Yen)

	1913-14,	1925-26,	1927-28,
	actual	actual	estimated
<b>Ordinary receipts</b>	575,428	1,443,235	1,458,151

Extraordinary expenditures	78,762	253,586	286,360

**Effects of the Earthquake.** On Sept. 1, 1923, Japan was visited by one of the greatest catastrophes in history. An area 50 miles square was completely devastated by an earthquake and a much larger area severely affected; most of the buildings were injured or destroyed, and many were burned, while the rails on the railway were twisted and telephone and telegraph wires were thrown down. The total losses were officially estimated at from \$3,500,000,000 to \$5,000,000,000. They included the total destruction by fire of the City of Yokohama and the destruction of 70 per cent of

Tokyo. Property in these cities insured to the extent of \$950,000,000 was a total loss to its owners because of the so-called "earthquake clause" in insurance contracts protecting the insurance company against "fire resulting from earthquake." It was estimated that 150,000 persons were killed by the quake and at least half a million houses were burned and a like number wrecked. The chief economic result of the disaster was the necessity for Japan to find immediately large supplies of lumber, iron and steel, hardware and other construction materials abroad. In the four months after September, 1923, import statistics indicated a purchase of nearly \$150,000,000 of these materials. Early in 1924, Japan floated two new foreign loans, one for \$150,000,000 in the United States, with a share subscribed in dollars in Europe and one for £25,000,000 in England. All of the £25,000,000 loan and about \$60,000,000 of the dollar loan were to be set aside to take up two outstanding issues of 4½ per cent municipal bonds of the City of Tokyo coming due early in 1925. The gold holdings abroad of the Government and the Bank of Japan on Jan. 15, 1924, were \$227,500,000, and this, together with about \$90,000,000 of the dollar loan, was to be used to finance purchases of raw materials for reconstruction. A reconstruction programme was adopted by the Japanese Diet in December, 1923, calling for expenditures for widening streets in Tokyo, providing for fire-prevention zones, rebuilding walls, and paving streets. This was to cost \$350,000,000 covering a period of five years, or \$70,000,000 a year.

The earthquake also profoundly affected Japan's foreign policy, both economic and diplomatic. Money for the exploitation of Manchuria would not be available for some years, and the markets in China for Japanese cotton goods and in the United States for raw silk became such important factors in maintaining a volume of reconstruction materials, that the good will of these markets had to be assiduously cultivated. The result was apparent, in the studious forbearance from any action that might tend to affect good will toward Japan in either China or the United States. The fact that 65 per cent of Japan's exports were marketed in China and the United States and that in neither case were the commodities making up most of this amount of such a nature as to prove essential, or incapable of substitution in time of war or boycott, was a tremendous factor leading Japan, dominated by military clans, along the path of peaceful settlements.

## HISTORY

**Domestic Affairs.** Social unrest and the demand for constitutional government and democratic reform grew apace in Japan with the increasing modernization and industrialization of the country. This tendency became strongly manifest in the beginning of 1914, when a widespread opposition to proposed naval increases was intensified by the exposure of extensive corruption among high naval officials. The scandals forced the resignation, on March 24, of the Yamamoto government. On April 16, Count Okuma formed a cabinet with a programme calling for economic reform, the elimination of corruption and true constitutionalism. When the Lower House in December, 1914, rejected the budget increases for the army induced by the

events of the War, it was dissolved by Imperial Decree.

Following the complete victory of the ministerial party in the elections of the next March, the budget was adopted by a large majority. The opposition first attacked the Government's Chinese policy and then charged it with corruption. When the latter charge was partially substantiated, in particular through the disclosure of the bribing of deputies by a cabinet member, Count Okuma resigned (July 30), but on the insistence of the Mikado resumed office with a reconstructed cabinet. However, he was finally forced out in the summer of 1916. As his successor, he designated Viscount Kato, leader of the newly formed Kenseikai, or Constitutional Party, which had a majority in the Diet; but the Genro, or Elder Statesmen, who wielded the real power in the Japanese Empire, brought about, on October 9, the appointment of Marshal Terauchi, Governor General of Korea, who had the reputation of being an arch-militarist. This disregard of constitutional rule highly incensed the Diet, whose sharp opposition brought its dissolution early in 1917. The following elections of April 20 resulted in a victory for Marshal Terauchi and the military party.

The Terauchi government remained in undisputed power until the fall of 1918, when a political explosion occurred which in many ways signified the evolution of a new Japan irreconcilably opposed to the party and the spirit which the ministry represented. Japan had enjoyed an era of great prosperity during the World War. Manufacture of war materials for the fighting nations had greatly expanded Japanese industry, bringing also social and industrial complications and a demand for democratic reform. In the early fall of 1918, a shortage of rice and its high price, causing great suffering among the poor, loosed the accumulated forces in a storm of serious disorders known as the "Rice Riots," which with other manifestations of unrest brought about the fall of the Terauchi cabinet on September 29. The appointment of Takashi Hara was a concession to this new spirit. Hara was the first commoner to become chief of the cabinet and he was, moreover, the leader of the Seiyukai, the party which had for a long time opposed the war policy and the Siberian policy of the Japanese government.

Already in March, 1918, popular demand had brought an extension of the franchise lowering the property qualifications for voters and increasing the electorate from 1,500,000 to 3,000,000. Since this latter figure, however, represented only one-twentieth of the total population, this measure failed to satisfy the people, who early in the following year renewed their loud demands for universal suffrage. In various ways, the Hara government showed itself sympathetic, but when the opposition in 1920 offered bills for universal suffrage, the ministry opposed them as premature, and on that ground dissolved the Diet by Imperial Decree when the bills came up for final consideration on February 26.

In the elections of May, 1920, the government party won 280 seats against 199, 39, and 29 for the three opposition parties, but notwithstanding the victory and the vote of confidence given the Government on the question of national defense in February, 1921, active agitation for universal suffrage continued throughout the country.

On Nov. 24, 1921, the Crown Prince Hirohito was appointed Regent, the Emperor Yoshihito

having been long incapacitated by illness. The Regent was born in April, 1901, had been proclaimed Heir Apparent in 1912 on the accession of his father to the throne, and had been consecrated Crown Prince in 1916. Already, in May, 1920, his father had handed over to him certain functions and had sent him on a mission to Europe.

After holding office for three years, Prime Minister Hara was assassinated on Nov. 4, 1921, at a time when the Washington Conference was about to begin and problems of the utmost importance for Japan were pending. A new ministry was formed by Baron Takahashi, who had been Minister of Finance in the Hara cabinet and who continued in substance the policy of his predecessor. Lack of harmony among the ministers brought about the early fall of the Takahashi cabinet in June, 1922. Thereupon, Admiral Tomosaburo Kato, a member of the Liberal Party and an opponent of the militarists, agreed to head a new government, constituted on a nonpartisan basis, on the condition that the army leaders submit to a reduction of the army budget by 40,000,000 yen. After some minor reductions before that time, the Government took final steps on Nov. 25, 1922, for the retirement of 60,000 men and an annual saving of the before-mentioned sum. At the same time, Japan, having ratified the Washington Treaties on July 6 of the same year, reduced its naval budget on assurance from the United States government that its own naval budget would be framed in accordance with the treaties of the Washington Conference. In pursuance of this policy of retrenchment, further substantial economies in connection with military and naval expenditures were made in the budget for 1923-24. An important forward step in juridical reform was a measure for the introduction of a limited jury system. The bill was laid before the Lower House on Feb. 10, 1923, and passed the Upper House on March 10. Its provisions, however, did not go into effect until Oct. 1, 1928.

On August 28, Admiral Baron Kato died and it devolved upon Foreign Minister Count Uchida to conduct the government as prime minister, ad interim. Count Yamamoto undertook immediately the formation of a new cabinet and he was still engaged upon this task when Tokyo and surroundings were visited, on Sept. 1, 1923, by one of the most disastrous earthquakes in the history of the country.

The earthquake affected an area extending some 80 by 120 miles, and the resulting destruction to life and property was terrific. Yokohama was practically wiped out by the disaster and Tokyo was partially destroyed. The toll in killed and missing amounted to nearly 150,000 lives. The Government which at the time was in process of formation, and which held its first meeting in the open air amid smoking ruins, now faced the vast problem of reconstruction. The people and officials alike put themselves to the task and in a surprisingly short time reconstruction was begun. The whole nation, from the Imperial Family down to the last laborer, rallied heroically to the assistance of the Government and by generous contributions helped in allaying misery and repairing the losses. Relief poured in from all parts of the world, especially from the United States. The Capital Restoration Council and the Restoration Board, established by an Imperial edict, took under consideration immediately plans for the

rebuilding of the destroyed cities on a greater and more modern scale. The supplementary estimates, amounting to 468,438,849 yen, for the preliminary work of reconstruction for the period 1923-29, were passed by the Diet, as was also a bill concerning the organization and procedure for town planning in Tokyo and Yokohama. The plans for rebuilding these cities were drawn up with the assistance of the American expert, Dr. Charles A. Beard, who came to Japan for this special purpose by invitation of Minister Baron Goto. In a statement to the Diet, the Minister of Finance estimated the damage caused by the earthquake at between seven and ten billion yen.

On Dec. 27, 1923, an unsuccessful attempt was made on the life of the Prince Regent as he was on his way to the Diet to deliver a speech from the throne. Since no such attack on the Imperial House had occurred in modern times, the entire ministry felt compelled in consequence to hand in its resignation. The Prince Regent refused to accept it, but the cabinet persisted and its resignation was finally accepted on Dec. 29, 1923. The position of the Yamamoto government had been precarious for some time, due to the opposition of the Seiyukai. A new cabinet, formed by Viscount Kiyoura on a nonpartisan basis, came into office on Jan. 1, 1924. It received little support in the Diet and its early fall would have been certain, had not a split occurred in the Seiyukai and had not the seceding group, which adopted the name of Seiyuhonto, or Original Constitutional Party, and mustered 148 votes in the Lower House, thrown its support to the Kiyoura cabinet. As a result of the attempted wrecking of a railroad train which had three opposition leaders aboard, a storm broke loose in the Diet which led to the dissolution of the Diet on Jan. 31, 1924.

The first loan placed by Japan on the American market since the Russo-Japanese War was offered on February 11. The American share of this loan was to be \$150,000,000 and another section offered to the English public amounted to £25,000,000. Both issues were greatly oversubscribed. The proceeds of the American and English shares of this loan were intended to be used for the retirement of the remainder of sterling 4½ per cent bonds and the balance was to be applied to the financing of reconstruction measures growing out of the earthquake disaster, the total cost of which was placed at approximately \$700,000,000.

Elections for the Lower House were held on May 10 and resulted in the defeat of the Seiyuhonto, the newly-formed party supporting Premier Kiyoura. The returns were reported as follows: Kenseikai, 146; Seiyuhonto, 120; Seiyukai, 101; Kakushin Club, 30; Business Men's Party, 8; Independents, 57. An outstanding feature of the election was the defeat of many members of the preceding Diet and the return of 250 deputies without parliamentary experience. The resignation of the Kiyoura cabinet, necessitated by the adverse vote, was postponed until after the celebration of the wedding of the Prince Regent on June 5. Since no party commanded a majority in the Diet, Viscount Kato formed subsequently a coalition cabinet which represented the Kenseikai, the Seiyukai and the Kakushin Club.

The new American immigration policy and the discrimination against Japanese resulting therefrom aroused a storm of indignation in

Japan. Protest meetings were held, five Japanese patriots committed hara-kiri in protest, and the anti-exclusion organization, called the "Kokumin Taiheikai," was formed. A boycott of American moving-picture films, which had been instituted in retaliation, had to be subsequently abandoned as a failure. On the whole, the American measures had the effect of creating a wave of anti-American feeling in Japan which the Government strove earnestly to keep within bounds so as to prevent any untoward incidents which might further strain Japanese-American relations. Japanese indignation was not so much aroused by the general exclusion policy of the United States as by the special discrimination between Japanese and other aliens and by the placing of members of the proud Japanese nation on the same level with other Asiatics whose governments did not sit at the council table of the great powers of the world. The feeling of friendship and gratitude generated by American generosity on the occasion of the earthquake was seriously impaired by the policy of the United States. While the Immigration Bill was under consideration, the Japanese government took steps to bring about, and actually effected in July, 1924, a change in the laws of citizenship whereby the "dual citizenship" was abolished and Japanese nationals would henceforth lose their Japanese citizenship upon naturalization in another country. It was a measure of the deep hurt inflicted on Japanese national pride that for years the issue continued to be a live one, and as late as 1929 was discussed in the premier's official statement of policy. On July 1, 1925, a day of "national humiliation" was observed, that date being the anniversary of the day on which the American law went into effect. The attitude of people and Government alike remained one of refusing to consider the matter as permanently closed.

In the evolution of Japanese political and social life, it became manifest that the ideals of Western democracy were making continued headway, while at the same time the populace retained its strong sense of loyalty to the Imperial tradition and on the other hand were not greatly swayed by communist doctrine. The outstanding political change of the first post-war decade came in March, 1925, when the long-demanded measure for universal manhood suffrage was adopted. It increased the electorate from about 3,000,000 to 14,000,000, giving the right to vote to every male over 25 years of age who had lived in his locality one year prior to the election, and the right to become a candidate to every male over 30. Property qualifications for voters were practically abolished, and voting was to be by secret ballot.

While this was a striking advance toward a more democratic practice, full parliamentary government was still a matter of future development. The ministry continued to be responsible to the Emperor alone, although in practice cabinets did not continue in office in the face of a vote of no confidence by the Diet. The step in the direction of political liberalism was accompanied by severe restrictions against radical economic agitation.

In March, 1925, a law was passed providing severe penalties for organizing or belonging to a party which attacked private property or the established social and political system centring in the Imperial house. Under this "peace-preservation" law, a new party representing

labor and agriculture was dissolved in the fall of 1925. It was reorganized in the following spring, professing purely constitutional aims, but enlisting only lukewarm support, and two years later it faded away. A new Labor Party with a yet more moderate programme was organized in 1928.

In July, 1925, Viscount Kato reconstructed his cabinet by accepting the resignations of the Seiyukai members over a question of tax reduction. Baron Tanaka succeeded to the leadership of the Seiyukai Party when that position was relinquished by K. Takahashi and attempted without success to unite it with the Seiyuhonto Party in a coalition which was intended to displace the controlling Kenseikai Party. In January, 1926, Premier Kato died. R. Wakatsuki, Home Minister, assumed the premiership, retaining the Kato cabinet and policies, and he also became the leader of the Kenseikai Party. The ministry's position in the Diet was somewhat precarious, as it could obtain a majority only with the help of a part of the Seiyuhonto Party. In June, the premier sought to strengthen his cabinet by a reorganization, but it remained entirely of Kenseikai complexion.

Perhaps the most prominent piece of legislation enacted under this government was the new land act made effective in November, 1926. It gave to aliens the right to acquire land in Japan, except in certain defensive areas, where the consent of the army and navy heads was required. Aliens of countries which discriminated against Japanese in extending land-ownership rights might be similarly restricted in Japan, but only by Imperial edict. Among the other legislative enactments of this period were an act prohibiting the employment of children under 14 in factories, an act providing for large increases in the duties on wheat and flour, and the grant of increased subsidies for education.

On Dec. 25, 1926, the nation was saddened by the death of the Emperor Yoshihito, after a long illness, at the age of 47. Elaborate funeral ceremonies were held in February, and the rest of the year was observed as a period of mourning.

While the nation rested in the shadow of this event, it was confronted with disaster in the shape of the severest financial depression it had ever known. For a long while, a number of factors had combined to bring ever nearer a widespread liquidation. The reaction from abnormal war activity in industry brought a continuing instability to many lines of manufacture and trade, and this was sharply accentuated by the disastrous earthquake. Early in the year 1927, many commercial failures were reported. The crisis came in March and April, reaching its peak on April 5 in the failure of Suzuki Company, Ltd., with gross liabilities of \$250,000,000. The crash led to the fall of the Wakatsuki government, whose proposal to extend aid to the Bank of Taiwan, heavily involved in the Suzuki crash, was disapproved by the Privy Council. The cabinet resigned on April 17 and on the following day Baron Tanaka, leader of the Seiyukai Party, took over the reins of government, with a cabinet drawn entirely from his own party except for the portfolios of War and Navy.

The new ministry, representing the Conservatives, could number among its assured supporters only a minority of the Lower House, the Kenseikai on March 1 having united with a part of

the Seiyuhonto to form a new Liberal Party, the Minseitō, which controlled some 30 or 40 more votes than the Government. Party lines, however, were not strictly drawn and the cabinet could count on support for its emergency measures in the special session which was called in May. These included an immediate moratorium of three weeks and the providing of funds by which the banks could receive help through the Bank of Japan. A heavy increase in the note issue of the Bank of Japan, made possible by the high gold reserve it had previously maintained, helped supply desperately needed financial aid. Conditions slowly improved, although the strain on the financial structure had been so severe that, one year after the April crash, a large number of the banks affected had not reopened.

The Tanaka government continued in power after the short special session of the Diet in May had adjourned, but a ministerial crisis was expected when it should meet in the following January, as the opposition controlled a clear majority against the cabinet. On January 21, the first day of the session, however, the premier was able to secure a vote dissolving the Diet and making new elections necessary. These were held on February 20. The Government appealed for indorsement of its domestic policy of extending aid to banks and business houses during the panic and its foreign policy of assuming a strong "positive" attitude toward China, and the electorate responded by giving the Seiyūkai Party a small plurality but not a majority. It won 221 seats as against 214 for the Minseitō. The Independents won 16, Labor 8, the Business Men's Party 4, and the Shinsei Club 3.

The election was the first under the new manhood suffrage law, and the interest of the new voters was shown by the fact that four-fifths of the eligible electorate went to the polls. While the Government could command a slender majority on major issues, it could not prevent the opposition from forcing out Mr. Suzuki, the Home Minister, in April. In August, the premier's hand was strengthened by the secession of T. Tokonami and some 30 followers from the Minseitō Party. In November, party politics were momentarily forgotten in the three weeks of festivities beginning November 10, that marked the coronation of the new Emperor, Hirohito.

An item of much concern to the Government in 1928 was the continued activity of communist elements. In February, 84 Koreans were sentenced to prison for communist plotting in the previous summer, and in the spring and summer months many arrests were made because of alleged plots against the Government. In June, the Emperor by ordinance made the maximum sentence under the peace-preservation law the death penalty instead of 10 years imprisonment, and the Diet in its 1929 session readily confirmed the amendment. A special police organization was set up to ferret out offenders. Wholesale arrests of communists following the 1928 elections resulted in the sentencing of 99 persons to prison terms.

On July 2, 1929, Premier Tanaka and his cabinet resigned. The action was precipitated not so much by any single issue or occurrence as by a rising liberal sentiment throughout the country which objected to the "strong" policy toward China. There was also an undercurrent of dissatisfaction over the premier's maladroit

handling of a number of incidents in such a way as to appear too careless about preserving the Imperial dignity. He was succeeded by Yuko Hamaguchi, president of the Minseitō Party and formerly Minister of Finance and Home Minister. The new cabinet brought Baron Shidehara back to the direction of Foreign Affairs. The ministry faced a very uncertain future, as the Shinto Club, a minor party, held the balance of power in the Diet. Late in July, it was reported that it had joined the opposition, and general elections were freely presaged for the near future.

**Foreign Policy.** In 1914, before the outbreak of the War, Japan was confronted with two great international problems, the effects of the unsettled conditions in China on Sino-Japanese relations and the difficulties with the United States arising from the treatment of Japanese citizens on the American Pacific Coast. The outbreak of the War pushed these issues temporarily into the background and supplied the astute statesmen of Japan with a great opportunity for which they had been patiently waiting for a long time. Within a fortnight after the commencement of hostilities between Great Britain and Germany, Japan delivered an ultimatum to the latter demanding the immediate withdrawal of all German warships from Chinese and Japanese waters and the surrender of Kiaochow to Japan, with a view to the eventual return of this territory to China. A week later, Japan declared war on Germany and on Nov. 7, 1914, the German force at Tsingtao capitulated to the Japanese Expeditionary Force. Already, during the previous month, Japan had occupied the Marianne, Caroline, and Marshall Islands in the Pacific. The rapidity of this move came rather as a surprise to the Germans, and even to other nations, in view of the well-known German sympathies in certain influential Japanese circles. As its reason for entering the War, the Japanese government cited its treaty obligations with Great Britain.

A more convincing reason, however, was the Japanese desire to dislodge a Western power from a position that was dangerous to Japanese hegemony in the Far East. Ever since 1895, when the combined action of Russia, Germany, and France compelled Japan to forego part of the spoils of the War with China, guaranteed to her by the Treaty of Shimonoseki, she had been biding her time. In the case of Russia, the opportunity had come with the Russo-Japanese War, and the outbreak of the European conflagration presented now the occasion to hold a reckoning with Germany. Behind the screen of the Anglo-Japanese Alliance, Japan used the preoccupation of the Western Powers in Europe to establish herself in a practically impregnable position in the Far East. No doubt Japan fulfilled faithfully the obligations arising out of the Anglo-Japanese Alliance, helped in removing all vestiges of German power from the Pacific, and even sent a naval squadron to the Mediterranean for convoy duty; but with much more faithfulness did she apply herself to the task of emerging from the War as the Power in the Far East, and of using her position of economic vantage as best she could, with the result that the close of the War found her financially in excellent condition and industrially greatly developed. See **WORLD WAR, DIPLOMACY OF THE.**

Ostensibly, Japan had seized Kiaochow to restore it eventually to China; but when China

demanding the territory, Japan peremptorily presented the well-known Twenty-One Demands, and when China failed to act on them sent an ultimatum which forced the signing, on May 25, 1915, of treaties and agreements embodying fifteen of the twenty-one. In the meantime, Japan constantly increased her military forces on Chinese territory. Such serious encroachments on Chinese sovereignty could hardly be reconciled with Japan's previous declarations of the absence of aggressive intentions and aroused the suspicions even of her own allies. By a number of secret treaties, as well as open agreements, Japan now consolidated her position. In 1916 the last of four secret treaties with Russia following the Treaty of Portsmouth stated that "the vital interests" of the two countries required "the safeguarding of China from the political domination of any third power whatever having hostile designs against Russia and Japan."

In the autumn of 1917, through the Lansing-Ishii Agreement, the United States recognized the special interests of Japan in China arising out of geographical propinquity. Secret agreements with China provided for a common military defense against Soviet Russia (May, 1918) and for far-reaching railroad concessions to Japan in China. These agreements, which were not disclosed officially to the other Allied Powers until after the opening of the Peace Conference, caused great resentment in China when they became public and also proved injurious to the Chinese claims at the Peace Conference. Of far greater significance, however, were the secret agreements concluded between Japan and the Allies early in 1917, whereby the British, French, Russian, and Italian governments, which were at the time greatly in need of Japanese naval assistance, pledged themselves more or less unconditionally to support at the Peace Conference the Japanese claims with regard to the disposal of the former German rights in Shantung and the Pacific Islands north of the equator.

The military collapse of Russia and the Russian Revolution not only delivered Japan from her greatest rival in the Far East, but also gave her an opportunity to pursue a policy of her own with regard to Siberia. Already early in 1918, Japan had landed troops in Vladivostok for the protection of Japanese nationals and interests. In the subsequent Allied intervention in Siberia during the fall of 1918, Japan was an active participant, but at no time did she manifest any genuine concern for the establishment of a strong and stable anti-Bolshevik government. In fact, she refused to extend her intervention to the region east of Lake Baikal where she had no special interest. At the same time, there was strong evidence of Japanese unacknowledged dealings with such semi-independent Cossack leaders and notorious brigands as Semenov and Kalmikov who were far more of a liability than an asset to the White Russian movement and served to further materially the designs of Japan in Siberia. Thus Japan, by her policy of obstruction, seems to have contributed materially to the final collapse of the anti-Bolshevik government and to the failure of Allied intervention in Siberia. See *SIBERIA*.

At the Peace Conference, Japan was represented by a strong delegation headed by Marquis Saionji. The Japanese representatives took part in all the important sessions on a footing of equality with those of Great Britain, France,

Italy, and the United States; and Japan was one of the powers which formed the all-powerful Council of Ten. The Japanese delegates presented two separate claims. Of these, the demand for the recognition of racial equality met with strong opposition, primarily on the part of the United States, and hence was eventually rejected (see *PEACE CONFERENCE*). Japan was more successful in her claims with regard to Shantung and the former German islands in the Pacific north of the equator. The arguments advanced by the head of the Japanese delegation in favor of retention of these territories were in substance as follows: Japan had taken these places from Germany during the War in fulfillment of her treaty obligations; she held them in occupation at the time; they should form Japan's just compensation for her contribution to the Allied victory. After much delay and discussion, the former German rights in Shantung were finally awarded to Japan on Apr. 30, 1919. The withdrawal of Italy from the Conference had given Japan an opportunity to threaten with a refusal to sign the Peace Treaty unless her claims with regard to Shantung were favorably considered. It was then that Messrs. Clémenceau and Lloyd George voted in accordance with the pledges given to Japan in the secret agreements of February and March, 1917, and thus overrode the opposition of President Wilson, who declared he was ignorant of these understandings. See *PEACE CONFERENCE*. On May 7, 1919, the Council awarded to Japan the islands in the Pacific north of the equator to be administered under the mandatory system.

The Japanese sovereignty over the Island of Yap, contained within this group, was disputed by the United States, which based its objection on the ground that it had never ratified the Peace Treaty of Versailles. A final adjustment of the matter took place at the Washington Conference at the end of 1921, in the form of an agreement whereby the United States recognized Japanese sovereignty over Yap and was accorded in return full rights and facilities in connection with the cables and other matters. See *YAP* and also *WASHINGTON CONFERENCE*.

The allocation of German rights in Shantung to Japan caused a storm of protest in China and general indignation throughout the world, coupled with apprehension at the manner in which astute Japanese statesmanship had grasped more or less firmly a vast territory in the Far East comprising Eastern Siberia, Sakhalin, Kamchatka, Manchuria, Inner Mongolia, and Shantung. Post-war history marks Japan's gradual retreat from these territories partly as the result of international public opinion and partly because of a reorientation of Japanese foreign policy. On May 7, 1920, Japan announced her readiness to withdraw her reservations in Mongolia and Manchuria, bringing these territories under the authority of the Chinese Loan Consortium consisting of American, British, French, and Japanese banking groups.

Far greater difficulties were encountered in the settlement of the Shantung problem. Repeated attempts of Japan to negotiate with Peking were blocked by China's steadfast insistence that the territory and the rights connected with it must be returned to her before the subject could be discussed. A treaty was finally signed at the Washington Conference on Feb. 7, 1922, by which the former German port and concessions were to be immediately returned

to China in return for the payment of a monetary compensation and the grant of certain rights to Japan. See SHANTUNG; also WASHINGTON CONFERENCE. At the same time, Japan signed the Treaty of the Open Door in China by which she gave up other reservations there, but refused to abandon her hold on Manchuria and Mongolia (see WASHINGTON CONFERENCE). She also bluntly refused a Chinese request of May 10, 1923, to negotiate for a modification or abrogation of the Treaties and Agreements of May 25, 1915.

In spite of various declarations and promises, Japan did not participate in the withdrawal of the Allied Expeditionary Force in Siberia after the Kolchak debacle early in 1920, but consolidated her position east of Lake Baikal. Representations by the United States and, more particularly, the progress of Soviet power in Siberia caused the Japanese in the following years slowly to retrace their steps and withdraw to the Maritime Province and Vladivostok, and then to prepare for total evacuation. However, they occupied northern Sakhalin in retaliation for the Nicolaievsk massacre early in 1920. Following the failure of a lengthy conference between the Japanese and representatives of the Far Eastern Republic in Dairen, Japan announced her intention of withdrawing her troops from the mainland of Siberia by the end of October, 1922.

Another conference at Changchun, in Manchuria, with representatives of the Far Eastern Republic and Moscow in September, 1922, broke up because of Japan's refusal to evacuate northern Sakhalin and recognize the Soviet government. However, when the latter soon thereafter took over control of the whole mainland of Siberia and adopted a definite policy with respect to Mongolia, China, and the Far East in general, signs began to appear that Tokyo and Moscow were seeking a *modus vivendi*. Thus, the year 1923 was taken up with private and semi-official conferences between Russian and Japanese high officials looking toward the conclusion of a Russo-Japanese commercial treaty, the recognition of the Soviet government by Japan, and the evacuation of northern Sakhalin, the last-named issue being the chief stumbling block.

On July 24, 1924, the Japanese cabinet adopted a plan submitted by Foreign Minister Shidehara embodying, in addition to these three provisions, the granting of concessions to Japan for exploiting oil and minerals in northern Sakhalin, apology for the Nicolaievsk massacre, and recognition by Russia of the Portsmouth Treaty. Negotiations continued during the rest of 1924. On Jan. 20, 1925, a convention was finally signed which with attached protocols contained all the above provisions. It was put into effect on February 26 and Japan completed her evacuation of northern Sakhalin by May 15. In July, 1925, a Japanese delegation visited Moscow to arrange for the concessions granted by the treaty in Sakhalin and on Dec. 14 contracts were signed for Japanese exploitation of oil and coal fields there. In April, 1927, a further concession was given to a Japanese syndicate to exploit more than 2,700,000 acres of timber land on Tartar Strait. Following these agreements, relations between Japan and Russia were marked, in some aspects, by an almost cordial friendship. In certain other respects, however, sharp differences appeared, notably in connection

with proposed railway development in Manchuria and with Soviet propaganda in China, which Japan vigorously opposed.

Japan was one of the chief participants in the Washington Conference, Nov. 12, 1921-Feb. 6, 1922, in which agreements of outstanding importance to Japan were arrived at. The treaties and agreements affecting Japan, aside from those specifically relating to China—such as the Shantung agreement, the Nine Power Treaty of the Open Door in China, the treaty pertaining to the Chinese tariff, the agreement relative to the withdrawal of foreign control of post offices in China—were the Four Power Treaty, dealing with the problems of the Pacific; the Five Power Naval Treaty, and the agreement between the United States and Japan relating to the status of the island of Yap. The Four Power Treaty aimed at the settlement of problems arising out of Japan's need for expansion in the Pacific by an agreement between the contracting powers for the mutual protection of island possessions and dominions in the Pacific. The Five Power Treaty provided for naval limitation on the basis of the 5-5-3 naval ratio, Japan limiting herself thereby to the maximum of 10 capital ships of 312,700 tons, as against 20 of 582,540 tons for Great Britain and 18 of 525,850 tons for the United States. On the part of Japan, these treaties represent a sincere effort at an amicable understanding with the view of preventing questions arising out of Japan's astonishing growth as a power within the last 10 years from developing into armed conflict. A further manifestation of this spirit was the faithful carrying out of the Washington agreements and the adoption by the Japanese government of a policy of military and naval retrenchment.

A direct result of the Washington Conference was the cancellation of the Lansing-Ishii Agreement in March, 1922, because in view of the Nine Power Treaty, a new understanding had become possible. By the Four Power Treaty, the Anglo-Japanese Alliance was definitely superseded. Subsequently, there occurred in Great Britain much criticism of Japan and apprehension at the growing power of that country in the Far East. Concentration of British naval units in the Pacific and the drafting of a plan for a naval base at Singapore caused increased watchfulness on the part of Japan.

Perhaps the most serious factor in Japanese foreign relations was the status of Japanese in the United States and especially their treatment in the Pacific States. Difficulties arising therefrom had been to some extent regulated by the "gentlemen's agreement" concluded between Japan and the United States. After a comparative lull in the situation due to the exigencies of the War, new friction arose in 1920 with the passage by California on November 2 of an act by which "ineligible aliens" forfeited all rights of holding land in that State. This was followed by anti-alien land legislation in other Western States. With the Washington Conference, the generous extension of aid to Japan by the United States on the occasion of the great earthquake, in 1923, and the manifestation of sincere gratitude on the part of the Japanese government and people, an era of better understanding between the two countries seemed to be approaching. But whatever ground for hope in that direction might have existed was hopelessly blighted by decisions of the United States

Supreme Court on Nov. 12 and 19, 1923, sustaining in full the alien land laws of California and Washington.

Much more serious, however, was the effect of the new American immigration law, effective July 1, 1924, which carried a Japanese exclusion clause and amounted to an abrogation of the "gentlemen's agreement." This measure caused a storm of indignation in Japan. The Japanese government, however, proceeded with caution and did everything in its power to avoid cause for conflict. It prevented too extreme expression of public indignation and took steps to abolish "dual nationality." On April 10, Masumao Hamihara, Japanese Ambassador in Washington, wrote a letter to Mr. Hughes in which he referred to the "grave consequences which the enactment of the measure" would inevitably bring upon the otherwise happy and mutually advantageous relations between the two countries. This statement provoked hostile criticism in the United States. On May 31, the Japanese Ambassador presented a lengthy note of protest of his Government to the American government. Secretary Hughes's reply was well received in Japan but failed to satisfy public opinion. The departure of the Japanese Ambassador to Japan on June 11 was interpreted in many circles as a direct result of the Immigration Bill. Whatever right the United States might have possessed to pursue such a policy and whatever merits the bill had from the standpoint of American domestic policy, there can be no doubt that the new policy seriously impaired the beneficial results of the Disarmament Conference, in spite of the fact that the Japanese government preserved a very calm front. It was significant that the Japanese Minister of the Navy declared on July 7 in the Diet that a decided expansion of the Japanese naval air forces, "necessitated by recent developments at home and abroad," was contemplated. While public feeling continued highly sensitive on the subject for many years and officials felt it necessary to continually reaffirm their position that it remained an open question, no further diplomatic moves had been made up to the summer of 1929.

Influenced by the pressure of world opinion and by the general drift toward democratic ideals following the War, Japan adopted an attitude toward China much more liberal than that initiated by the Twenty-One Demands. For the most part, this attitude was maintained during the chaotic years throughout which China was struggling for national unity. In 1924 Foreign Minister Shidehara declared the policy of Japan to be noninterference in the domestic affairs of China with concern only for the maintenance of Japanese rights in that country and the extension of Japan's aid if desired. He professed close adherence to the spirit of the Washington treaties.

In the following year, he reiterated these sentiments in his address before the Diet in January. In May, however, a long period of anti-foreign disturbances in China began with disorders at Shanghai occasioned by the killing of a Chinese workman in a Japanese cotton mill, and Japan was obliged to make many moves with armed forces to protect her nationals. During the Shanghai strike Japan declared a policy of "watchful waiting," and sent destroyers to the city, later landing marines along with other foreign powers. The boycott against Japanese

goods following the Shanghai incident did great damage to Japanese merchants and manufacturers, but did not materially alter the Government's attitude, which the opposition criticized strongly as too mild.

In October, 1925, Japan took part in an international conference for the purpose of readjusting Chinese customs tariffs prescribed by the various treaties with foreign countries. The conference readily agreed to grant China full tariff autonomy, beginning in 1929, but in the controversy over ad-interim rates, Japan stood out firmly against high surtaxes which would affect her trade more than that of any other country. While the conference sessions continued, attention was diverted from them to Manchuria, where civil war broke out between Chang Tso-lin and Kuo Sung-ling. Japan immediately increased her forces in Manchuria and occupied Mukden in December. Replying to protests from many quarters over her apparent military intervention in Manchuria Japan denied any purpose of violating the Washington treaties. At the close of the year, Chang Tso-lin achieved an unexpected victory and it was charged that Japanese aid had made it possible.

Early in 1926 the additional troops sent to Manchuria were withdrawn and Mukden was evacuated. During the warfare between North and South in China, Japan attempted at first chiefly to safeguard her commercial interests and the lives and property of Japanese residents in China, making a show of force only when obviously necessary. One such occasion arose when the Taku Fort was captured in March, 1926, by the warring Chinese factions. Japanese destroyers were fired upon and a number of casualties resulted. Japan sent a cruiser to Taku and demanded apologies, and with the other Powers forced the evacuation of the fort and the freeing of the river it commanded.

On Jan. 17, 1927, Foreign Minister Shidehara, in his address to the Diet, declared that Japan's whole policy toward China might be summarized by saying that Japan would "respect the sovereignty and territorial integrity of China and scrupulously avoid all interference in her domestic strife; promote the solidarity and economic rapprochement between the two nations; entertain sympathetically and helpfully the just aspirations of the Chinese people and cooperate in efforts of realization of such aspirations; and maintain an attitude of patience and toleration in the present situation in China and at the same time protect Japan's legitimate and essential rights and interests by all reasonable means at the disposal of the Government."

This conciliatory policy was the object of vigorous attack from the opposition. When the financial crisis brought Baron Tanaka to the helm in April, 1927, a more assertive policy was assured, as he was known to be a Conservative with strong militarist tendencies. He immediately took steps to strengthen Japan's hand in China. Military forces were sent to Tsiungtao and Tsinanfu with the avowed object of protecting Japanese interests there, but in September, they were withdrawn from the latter city. Japan demanded the restoration of the Japanese consulate at Nanking, which had been looted and occupied in March without reprisals from Japan. In June, a Japanese consulate was re-established there.

In Manchuria, the Japanese government initiated a "forward" policy, emphasizing Japanese

interests and the right to protect them as against other foreign interests. Reprisals were threatened for the continued anti-Japanese boycott, which was seriously injuring Japanese trade. Troops were sent from Tsingtao to Tsinanfu and from Manchuria to Tsingtao, supplies were landed at the latter port, and military railway and telegraph men were sent there from Tokyo. On demand of the Peking government, however, the troops were removed from the two cities. In Manchuria, an ambitious plan for extending the South Manchuria Railway was projected and negotiations begun for a large loan by J. P. Morgan & Co. to a Japanese syndicate for that purpose. Violent opposition arose among the Chinese. The Nanking government charged that the loan was in direct furtherance of Japanese imperialism and protested by cable to Secretary Kellogg. The plan was finally abandoned.

In 1928 the final victorious campaign of the Nationalists in China brought a number of clashes with Japanese forces. When Chiang Kai-shek advanced into Shantung in the spring of 1928, Japan, proclaiming the need for protecting her interests in the province, once more sent troops to Tsinanfu and Tsingtao. On May 1, Chiang's army captured Tsinanfu, and two days later fighting began between his forces and the Japanese stationed there. It continued intermittently for a week, resulting in several hundred casualties. The Nationalists were finally driven out on May 11. Four days later, the Japanese government forbade all military activity within seven miles of the Shantung Railway, and demanded an apology from Chiang Kai-shek and the punishment of subordinate officers. Fearing a general uprising against Japanese throughout China as a result of the fighting in Shantung, Japan rushed a full war-strength division of troops to the province and sent two cruisers and 27 destroyers to the Yangtze to protect Japanese nationals.

The occupation of Shantung did indeed provoke wide protest among the Chinese but no anti-Japanese action more violent than a number of incipient boycotts occurred. The fighting, however, had a pronounced and possibly a decisive effect in crystallizing Chinese opinion in favor of the Nationalist cause.

With the occupation of Peking early in June the civil war practically ended, and Japan was presently able to recall part of both the land and naval forces in China. Meanwhile, Japan had also taken a firm stand in Manchuria, warning both the Peking and the Nanking governments on May 18 that no extension of the civil war into Manchuria would be tolerated. Early in June, Chang Tso-lin, ruler of Manchuria, was killed on his retirement from Peking when his train was bombed as it approached Mukden. Japanese troops guarded the section of the railway where the bombing occurred and circumstances pointed strongly to official Japanese connection with the affair; but if Japan intended to remove Chang Tso-lin as a preliminary to establishing a protectorate over Manchuria, the aroused hostility of public opinion prevented. From the date of the Nationalist occupation of Peking, in fact, Japan saw whatever dreams she may have had of hegemony in China fade rapidly. She abandoned them reluctantly. In Manchuria, Japanese influence for many months held back the new ruler, young Chang Hsueh-liang, from openly joining fortunes with the new republican government; but on Dec. 29, 1928, the Nation-

alist flag was raised over the government buildings in Manchuria, which thus became an integral part of the Chinese Republic.

When the Nanking government demanded the abrogation of the "unequal" treaties with various countries, all acquiesced except Japan. Japan's refusal to agree to full tariff autonomy for China was continued up until the day before the new tariff rates went into effect, Feb. 1, 1929. Although Japanese forces in Shantung were progressively reduced following the ending of the civil war, it was not until May 20, 1929, that the last transport sailed. This evacuation was in accordance with an agreement reached on March 28 on the issue of the Tsinanfu incident of the preceding May, the settlement also providing for a commission to pass on claims for damage by both sides.

On May 30 Japan formally recognized the new Government of China. The end of the forceful militaristic policy of Japan toward China, for the time being at least, came with the fall of the Tanaka government on July 2, 1929, and the accession of the Minseito or Liberal Party to power. The new cabinet included Baron Shidehara as Foreign Minister and it was expected that his policy of conciliation and friendship toward China would again prevail.

While Japan readily accepted in principle the Kellogg Treaty for the outlawry of war, a considerable delay in ratifying it occurred because of the phrase, "in the names of their respective peoples" as applying to signatories. This was held to reflect on the Imperial prerogative for concluding all treaties. The Emperor, however, finally ratified the treaty on June 27, with an accompanying statement that the phrase in question did not apply to Japan. In the abortive three-power naval conference at Geneva in 1928, Japan's attitude was favorable to naval reduction, and in 1929 the Government continued to maintain consistently an attitude strongly favoring disarmament.

**JAPANESE BEETLE.** See ENTOMOLOGY, ECONOMIC.

**JARDINE, WILLIAM M.** (1870- ). An American agronomist and public official, born in Oneida County, Idaho. He was graduated from the Agricultural College of Utah in 1904 and took postgraduate studies at the University of Illinois. In 1904 he was appointed assistant in agronomy at the Agricultural College of Utah, and became professor in 1905-06. He was agronomist at the Kansas State Agricultural College and Experiment Station in 1910, and in 1913 was acting director of the Experiment Station and dean of agriculture at the Kansas State Agricultural College. Professor Jardine was director and dean of agriculture at that institution from 1913 to 1918, and from 1918 to 1925 was its president. He was Secretary of Agriculture in the cabinet of President Coolidge, 1925-29.

**JASPAR, HENRI** (1870- ). A Belgian lawyer and Prime Minister, born in Schaerbeek. In 1919 he was elected to the Chamber as an anti-Flemish Catholic member for Liège, and from 1920 to 1924, he was Foreign Minister, following a policy of close coöperation with France, which included the joint occupation of the Ruhr by that country and Belgium in 1923. On May 22, 1926, when one government after another fell because of the distressing financial situation, he formed a Ministry of Public Safety consisting of four Catholics, four Socialists, and one Liberal, thus reducing the number of ministers from

fourteen to nine. In the middle of 1927, the Socialists resigned because of the military service bill and M. Jasper formed a new government in November. See BELGIUM, under *History*.

**JASTROW**, yās'trō. IGNAZ (1856- ). A professor of the science of government at the University of Berlin (see VOL. XII). His works after the World War deal mainly with economic problems. They include: *Kriegszustand* (1914); *Mitteluropäische Zollannäherung und Meistbegünstigung* (1915); *Geld und Kredit im Kriege* (1915); *Die Handelspolitische Zukunft Deutschlands* (1917); *Völkerrecht und Wirtschaftskrise* (1917); *Volkvermögen im Kriege* (1920); *Reform der staatswissenschaftlichen Studien* (1924).

**JASTROW**, JOSEPH (1863- ). An American psychologist (see VOL. XII). He retired from his professorship at the University of Wisconsin in 1927. His later work comprises analytic studies of the sentiments and higher mental complexes. His published works include *Character and Temperament* (1915) and *The Psychology of Conviction* (1918).

**JASTROW**, MORRIS, JR. (1861-1921). An American philologist and Orientalist (see VOL. XII). His last published works were *The Civil Law of Babylonia and Assyria* (1915); *The War and the Bagdad Railroad* (1917); *The War and the Coming Peace* (1918); *A Gentle Cynic*, an abbreviated translation of the Book of Koheleth or Ecclesiastes (1919); and *The Eastern Question and its Solution* (1920).

**JAVA**. See DUTCH EAST INDIES.

**JAY**, PETER AUGUSTUS (1877- ). An American diplomat, born in Newport, R. I. He was graduated from Harvard College in 1900 and in 1902 entered the diplomatic service as third secretary of the American Embassy in Paris. He served as secretary at several embassies, including Constantinople and Tokyo. From 1909 to 1913, he was diplomatic agent and consul general at Cairo. He served as secretary of the American Embassy in Italy in 1913, and at the same time was counselor at that embassy. He was Minister at Salvador in 1920; Minister to Rumania, 1921-25; and Ambassador to Argentina, 1925-27. In the latter year, he resigned from the diplomatic service.

**JAZZ**. Immediately after the close of the World War, a new kind of popular music made its appearance in the United States and at once attained enormous vogue, taking complete possession of the dance halls, the theatres, the moving-picture houses, and the hotels. Jazz is a natural development of the older rag-time, which finally became transformed through the amalgamation of various elements. During the War, the soldiers amused themselves by doing "stunts" on their musical instruments. Some one discovered that very funny effects could be produced by laughing, catcalling, wailing, or uttering short exclamations through brass instruments. After their return to civilian life, these ex-soldiers introduced these stunts into the dance orchestras. The circus bands contributed their weird imitations of Oriental music. Real Oriental effects were contributed by musicians who had played in orchestras in San Francisco and other Western cities. The influence of the Negro melodies of the South also is very noticeable. Even Futurism is responsible for some queer harmonic combinations. Some attempts have been made to trace the origin of jazz to African tunes. Comparison, however, at once establishes the

fact that the aboriginal African melodies are characterized by the absence of any regular periodic structure and the presence of several cross-rhythms, whereas jazz clings to regular four- or eight-bar periods supported upon one predominating rhythm.

The first jazz compositions, which appeared in 1919, were crude enough; in fact, little more than degenerate rag-time. This is not surprising, when one considers that these pioneers were men who elaborated their tunes by ear on the piano and required the aid of some musician to fix them in musical notation. As these tunes quickly superseded, and even drove out, the older dances, the dance orchestras naturally became the principal factor in the development of jazz. To remedy to some extent the crudities of the printed score, embellishments of various kinds were introduced *ad libitum* (vulgarly called "libbin'") during actual performance. The conductors soon began to realize the necessity of reducing to a system this free improvisation by a number of players, if the performance was not to degenerate into chaotic noise. Thus, there sprang up a group of regular arrangers, skilled musicians, able to recognize the possibilities of certain jazz tunes and capable of altering, harmonizing, and embellishing, so as to render them acceptable to the popular ear.

From this point on, it was the arranger, rather than the composer, who became the important factor in the development of jazz. Effective orchestral coloring became a prime consideration, and this brought about a radical revolution in the constitution of the former monotonous dance orchestra, so that the jazz band is capable of a considerable variety of tonal effects. The average combination of instruments for a small band is a piano, two or three saxophones (the typical jazz instrument), a violin, two trumpets, a trombone, a tuba, a banjo, and drums. Finally, large symphonic jazz orchestras were formed which consisted of the almost complete classical symphony orchestra with the addition of the indispensable saxophones. Briefly, jazz may be described as light music with melodious themes elaborately embellished and adapted to some popular dance rhythm. A very common practice is to give the principal theme to the violin, against which the saxophone executes a counter-theme. Several arrangers have not hesitated to jazz themes of famous composers (Beethoven, Wagner, Schubert, Saint-Saëns, etc.), a practice that has called forth violent protests from lovers of serious music.

A special form of jazz, which had its origin in Memphis, is the "Blues," so-called from the fact that the music illustrates a text describing some melancholy tale of disappointed love. On the musical side, this form derives directly from the Negro spirituals, and its special characteristic is a triplet appoggiatura before the bass note of the principal accent in each measure. In recent years, otherwise serious American composers have introduced occasional jazz rhythms into their works and George Gershwin even wrote a Jazz Concerto in F for piano and orchestra, which he played with the New York Symphony Orchestra under Walter Damrosch (1925). Of the innumerable jazz bands throughout the country, that of Paul Whiteman won a national reputation on two transcontinental tours. A European tour in 1925 was responsible for creating a veritable craze for jazz in

Germany, so much so, that several modernistic German composers were tempted to try their hand at the new idiom. One of the extremists, Ernest Křenek, wrote a jazz opera, *Johnny spielt auf*, which, after its première in Leipzig (1927), successfully made the rounds of a number of German stages, found its way to Paris (1928), and was produced even at the Metropolitan Opera House (Jan. 19, 1929).

**Bibliography.** Consult: H. O. Osgood, *So This is Jazz* (Boston, 1926); A. Coeuroy and A. Schaeffner, *Le Jazz* (Paris, 1926); P. Bernhard, *Jazz: Eine musikalische Zeitfrage* (Munich, 1927).

**JEANS, SIR JAMES HOPWOOD** (1877- ). A British astronomer and mathematician, educated at Trinity College, Cambridge. He was university lecturer in mathematics at Cambridge (1904), professor of applied mathematics at Princeton University (1905-09), Stokes lecturer in applied mathematics at Cambridge University (1910-12), Haley lecturer at Oxford University (1922), and research associate at Mt. Wilson Observatory (1923). For his astronomical work, he was awarded the royal medal of the Royal Society (1919) and the gold medal of the Royal Astronomical Society (1922). His publications include *The Dynamical Theory of Gases* (1904); *Theoretical Mechanics* (1906); *The Mathematical Theory of Electricity and Magnetism* (1908); *Radiation and the Quantum Theory* (1914); *Problems of Cosmogony and Stellar Dynamics* (1919); *Atomicity and Quanta* (1926); *Astronomy and Cosmogony* (1928) and *Eos, or the Wider Cosmogony* (1929). He was knighted in 1928. See ASTRONOMY; PHYSICS.

**JEBEL SHAMMAR.** See ARABIA.

**JELlicoe, jèl'ik-ò, THE RT. HON. JOHN RUSHWORTH, FIRST EARL AND VISCOUNT BROCAS OF SOUTHAMPTON** (1859- ). An English naval officer (see VOL. XII). Shortly after the outbreak of the World War, he was placed in command of the Grand Fleet, and in 1915 was created a full admiral. He was in supreme command of the British Fleet at the Battle of Jutland (May 31, 1916), and in November of that year became First Sea Lord, Admiral Beatty succeeding him as Commander of the Fleet. Lord Jellicoe established the anti-submarine division of the Navy Staff, became Chief of Staff (1917), and Admiral of the Fleet (1919). He was Governor General and Commander-in-Chief of the Dominion of New Zealand from 1920 to 1924, when he retired. Among the many honors he received were the Order of Merit (1916), and the Freedom of the City of London, with a sword of honor (1920). He was made Viscount Jellicoe of Scapa (1918) and Earl in 1925. He wrote *The Grand Fleet, 1914-16; its Creation, Development, and Work* (1920), and *The Crisis of the Naval War* (1920).

**JELLIFFE, SMITH ELY** (1866- ). An American neurologist (see VOL. XII). In addition to editorial supervision of the *New York Medical Journal*, *Journal of Nervous and Mental Diseases*, and *Psychoanalytic Review*, and of translations and new editions of books on psychiatry, etc., Dr. Jelliffe collaborated with Dr. W. A. White in the preparation of a textbook, *Diseases of the Nervous System* (1915).

**JELLINEK, yèl'li-nèk, KARL W. K.** (1882- ). An Austrian professor of analytical chemistry at Danzig Technical High School. He wrote textbooks on analytical chemistry; *Welt-engeheimnis*, a work on the harmonious union

of philosophy, art, and religion (1920); and *Weltäther und Relativtheorie* (1922).

**JENKINS, BURRIS ATKINS** (1869- ). An American clergyman, born in Kansas City, Mo. He was graduated from Bethany College in 1891 and took postgraduate courses at Harvard. Ordained to the Christian (Disciples) ministry, he was pastor in Indianapolis from 1896 to 1900. He was president of Kentucky University from 1901 to 1907, and from the latter date was pastor in Kansas City. He was editor and publisher of the *Kansas City Post*, 1919-21. He wrote *The Man in the Street and Religion* (1917); *It Happened Over There* (1918); *The Brace-Girdle* (1922); *The Beauty of the New Testament* (1925).

**JENKS, ALBERT ERNEST** (1869- ). An American anthropologist. He was born in Ionia, Mich., and studied at Kalamazoo College, the University of Chicago, and the University of Wisconsin. He has been chairman of the department of anthropology at the University of Minnesota since 1918. He has contributed to anthropological and ethnological magazines and has published, among other works, *Indian-White Amalgamation: an Anthropometric Study* (1916), and *Chart of Prehistoric Man and Culture* (1927).

**JENKS, JEREMIAH WHIPPLE** (1856- ). An American economist and educator (see VOL. XII). He founded and was director of the Far Eastern Bureau from 1913 to 1921. In 1917 he became research professor of government and public administration and director of the division of Oriental commerce and politics of New York University. Since 1918 he has been a member of the High Commission of Nicaragua, also director of the Pacific Railways of Nicaragua and the National Bank of Nicaragua. His later books include *Business and Government* (1917); *Jesus' Principles of Living*, with C. F. Kent (1920); *Great American Issues*, with John Hays Hammond (1921); *Science of Business* (1927). He was a frequent contributor to periodicals on literary, economic, and political questions.

**JEPSON, WILLIS LINN** (1867- ). An American botanist. He was graduated from the University of California in 1889 and took postgraduate studies at Cornell and Harvard universities, and in England and Germany. He was appointed assistant in botany at the University of California in 1891, and was successively assistant professor, associate professor, and after 1919 professor. He explored the remote mountains and desert regions of California and conducted botanic expeditions in Alaska and the Bering Sea. He was a member of many scientific societies and the author of: *Flora of Western Middle California* (1901); *The Trees of California* (1909); *The Silva of California* (1910); *A Flora of the Economic Plants of California* (1924); *An Illustrated Manual of the Flowering Plants of California* (1925).

**JERITZA, MARIA** (1893- ). An Austrian dramatic soprano, born at Brünn. She attended the Musikschule there and studied singing privately with Professor Krejci, then continued her lessons with Professor Auspitzer for three years. After her début as Elsa in *Lohengrin* at Olmütz, in 1910, she sang there for five months, when she was engaged for the Volksoper in Vienna, where she rapidly rose to prominence, so that Strauss chose her to create Ariadne in the world première of his *Ariadne auf Naxos* at Stuttgart (1912). In the same

year, while still in her teens, she was engaged for leading rôles at the Vienna Hofoper, at first as guest, but from 1913 as regular member, after the Hofoper had paid the forfeit for her unexpired contract with the Volksoper. In 1917, she was made Kammersängerin, being the last artist on whom that title was bestowed. She created the principal rôles in most of the novelties produced at the Hofoper, which in 1919 became the Staatsoper. On Nov. 19, 1921, she made her American début, with sensational success, at the Metropolitan Opera House as Marietta in the American première of Korngold's *Die tote Stadt*, establishing herself immediately as a prime favorite. In addition to continuing with the Metropolitan Opera Company, she enjoyed a notable reception in Vienna in 1929. While her voice is one of rare beauty and power, she fascinates her audience primarily through her unusual talent as an actress. Her repertory comprises more than 50 rôles. Consult W. von Wymetal, *Maria Jeritzu* (Vienna, 1922) and her autobiography, *Sunlight and Song: A Singer's Life* (New York, 1924).

**JEROME**, jër'um, JEROME K (LAPKA). (1859-1927). An English humorist and novelist (see VOL. XII). His health was broken by having driven an ambulance on the Verdun front during the early part of the World War. His later works include *The Great Gamble* (1914); *Malvina of Brittany* (1917); *Cook* (1917); *All Roads Lead to Calvary* (1919); *Anthony John* (1923); *A Miscellany of Sense and Nonsense*, a selection from his writings (1924); *The Soul of Nicholas Snijders*, a mystery play (1925); *The Celebrity*, a play (1926), and *My Life and Times, an Autobiography* (1926).

**JERSEY CITY**. The second city of New Jersey in population and the chief seaport of the State. The population increased from 267,779 in 1910 to 298,103 in 1920 and to 324,700 in 1928, by estimate of the Bureau of the Census. The port, which forms part of New York Harbor, has 11 miles of waterfront. During the World War, it was a shipping point of great importance, and its need of larger dock capacity was greatly emphasized in this period. Since 1922 various dock and harbor improvements have been carried out, and about 26,000 lineal feet on the western waterfront of the city has been made available for steamship docking facilities. Jersey City is a terminal for 9 trunk railroads and 50 steamship lines. Among the municipal improvements which have been carried out since 1920 are the opening of Pershing Field, a great park and recreation centre embracing a large area of what was previously waste land; the development of Journal Square by the enlargement of the Pennsylvania Railroad station at a cost of \$1,000,000 and the construction of several bank and office buildings, including the new Labor Bank and Trust Company of New Jersey buildings; and the repaving of a large mileage of streets and laying of sewers, so that in 1929 Jersey City had 204 miles of streets within the city's limits and 145 miles of sewers. During this period the health department also was active. The City Hospital was enlarged and made a Community Health Centre from which the various health activities of the city were directed. In 1929 a 17-story extension was added to the hospital and an 11-story extension, to the Nurses' Home.

The same year the Lackawanna Railroad erected a new dry-storage warehouse costing \$13,000,000. Jersey City is one of the most im-

portant manufacturing cities on the Atlantic Coast, the principal industries being metals, oils, foods, and chemicals. In 1925, 30,607 persons were employed in approximately 1300 manufacturing establishments and received \$42,496,000 in wages; the value of products manufactured was \$340,735,000. On May 2, 1929, the Claremont Bank and the Trust Company of New Jersey were consolidated, bringing about the formation of the second largest banking institution in the State. The total combined resources of Jersey City's banks, as of Dec. 31, 1928, was \$371,004,961 and deposits were \$303,417,062. In 1928, 1457 new buildings were erected at a cost of \$15,400,000. The assessed valuation of property in 1927 was \$614,399,000; the net debt was \$66,547,000. The Jersey City municipal airport is located at Droyer's Point and constitutes one square mile of reclaimed meadow land. On Nov. 13, 1927, the Holland Vehicular Tunnel between New York and Jersey City was put into operation and functioned successfully. This tunnel was erected at a cost of \$48,400,000 half of the expense of construction and maintenance being borne by each State. It consists of two tubes, the north tube accommodating west-bound traffic and the south tube, east-bound traffic. See TUNNELS.

**JESPERSEN**, yës'për-sën, (JENS) OTTO (HARRY) (1860- ). A Danish philologist (see VOL. XII), rector of the University of Copenhagen (1920-21) and president of the Modern Humanities Research Society (1921). In 1925 he retired as professor of philology at the University of Copenhagen. His later works, besides tracts of the Society of Pure English, include *Negation in English and Other Languages* (1917); *Language, its Nature, Development, and Origin* (1922); *The Philosophy of Grammar* (1924); *Mankind, Nation, and Individual* (1925); *Modern English Grammar* (1928); and *An International Language* (1928).

**JEWETT**, FRANK BALDWIN (1870- ). An American electrical engineer, born at Pasadena, Calif. He was graduated from Throop Polytechnic Institute in 1898, and then became a research assistant at the University of Chicago, receiving his Ph.D. there in 1902. During 1902-04 he was instructor of physics at the Massachusetts Institute of Technology, then entered the service of the American Telegraph and Telephone Company as transmission and protection engineer. In 1912 he joined the Western Electric Company of which he became chief engineer in 1916 and vice president in 1922. During the World War, he was a lieutenant colonel in the United States Signal Corps, receiving in 1919 a Distinguished Service Medal. In 1925 he became president of the Bell Telephone Laboratories, Inc. He was chairman of the Division of Engineering and Industrial Research of the National Research Council, 1923-27.

**JEWISH NATIONAL HOME**. See PALESTINE.

**JEWS AND JUDAISM**. The period from 1914 brought a radical transformation in the position of Jewry throughout the world. The two chief gains resulting from the War were the recognition of the Jews as citizens in countries such as Russia, Poland, and Rumania, where they had hitherto been legally oppressed, and the creation of a national Jewish homeland in Palestine. On the other hand, the distress and turmoil incident to the War wrought great havoc among the communities of eastern Eu-

rope which had always contained a majority of the race and caused the destruction of much life and property. The situation of the Jews in the war areas of eastern Europe during the actual military operations was, from an economic and political standpoint, little less than desperate. The suffering in Galicia and Russian Poland in 1915 worked especial hardships on the Jewish populations of those regions. The economic misery and commercial ruin continued in 1916 and was emphasized by the entrance of Rumania into the War and by the invasion of Bukowina and a greater part of Galicia by the Russians. In Russia, however, they enjoyed a freedom which they had not hitherto known. In that country, numerous schools were established for the children of refugees in interior cities. Further promise of better conditions in Russia accompanied the Russian Revolution, which emancipated 5,000,000 Jews within the boundaries of the Empire. The revolutionary Government abolished all restrictions on Jews and granted them full liberty and equality; but the activities against the middle class affected the Jews particularly and there was much distress in the cities. The Bolshevik government made efforts to give land to the unemployed, but as the financing of such an agrarian programme necessitated large funds, progress was slow.

Beginning with 1921, there were some evidences of improvement. The Soviet governments, working in close coöperation with the American Joint Distribution Committee, began to settle Jewish families in agricultural colonies in white Russia, the Crimea, and the Ukraine. By 1928, more than 35,000 Jewish families were tilling the soil in 160 of these colonies. In 1928 the Soviet governments announced they would contribute \$10,000,000 toward the extension of this work if Americans would match the sum; Julius Rosenwald immediately pledged a personal contribution of \$5,000,000.

Indeed, the year 1929 saw improved conditions in almost all of central and eastern Europe, with the exception of Hungary and Rumania. Up to 1925, the lot of the Jew in Poland had been hard, but from thence on a conciliatory spirit evidenced itself. Under the Pilsudski regime, official anti-Semitism abated, the *numerus clausus* in the universities was rescinded (1927), the State announced that it would support Jewish schools, a Jewish chair was created at the University of Warsaw, and a more liberal attitude was adopted toward the Jewish artisan and small merchant. By 1928 the Jewish bloc had disappeared in the Polish Sejm and Jews had rejoined their old parties. There was a decided increase in the number of Jewish members in the municipal councils. In Rumania, however, the State made few attempts to suppress the anti-Semitism of the student societies and excesses against Jews were characteristic of the whole period. At the close of 1927, a student assembly at Oradea viciously attacked the Jewish population and desecrated synagogues. In Hungary, the situation was very much the same. The *numerus clausus* prevented Jewish students from studying at the universities and so flagrant did official anti-Semitism become that in 1925 Hungarian Jews appealed to the League of Nations for relief. In 1928 the Government promised to remedy the situation, but student riots at Budapest and other places showed that the situation was not in hand.

In the United States, attacks against the Jews were largely the work of Henry Ford's *Dearborn Independent*, but these came dramatically to a close in 1927, when Henry Ford made a public apology to Louis Marshall for his having published the old slander of a secret Jewish conspiracy that was worldwide in its efforts (the so-called "Protocols of the Wise Men of Zion"). Henry Ford had been considerably embarrassed because of a libel suit for one million dollars that Aaron Sapiro, the leader in the movement for the creation of agricultural coöperatives, had at that time been successfully prosecuting against him. Ford's recantation put an instant end to the public attacks on Jews in the country. Anti-Semitism nevertheless continued to exist, but covertly. Jews, for instance, found it hard to obtain positions on college faculties, were barred from many clubs and summer hotels, etc. The result was a necessity to maintain a complicated communal machinery for the protection of their interests.

**Relief Work.** The Jews of the United States made extraordinary efforts to relieve the distress of their kinsmen in the regions of eastern and central Europe that had been devastated by the War. The chief American agency for the carrying on of this work was the United Jewish Campaign, which from 1915 to the close of 1926, had raised and expended almost \$65,000,000. By the end of 1929, more than \$80,000,000 will have been spent according to plans announced in the spring of the year. Up to 1921, the programme frankly was concerned with relief. It was estimated that the homes of fully 50 per cent of the Jews in eastern Europe had been destroyed; that immediately after the War there were 50,000 refugees in Poland, 60,000 in Rumania, etc. In Poland, in one year (1925), the United Jewish Campaign helped 165,000 persons with small loans, spent \$35,000 on the feeding of unemployed workmen, spent \$52,000 on the feeding of school children, and distributed free milk to 151,000 nursing children. After 1921, the campaign concentrated its activities on the laying out of a programme of rehabilitation. It financed Jewish coöperatives, helped in the building up of industries, and made possible the settlement on the land of 35,000 Jewish families in Russia. It also interested itself in the economic restoration of Palestine. In 1926 the campaign announced the launching of a drive for another \$25,000,000 for the continuance of these projects, and, by 1928, \$21,000,000 of this had been raised.

**Statistics.** It was estimated by the *American Jewish Year Book* that there were 15,324,515 Jewish persons in the world. The following were the more important Jewish populations: Austria, 350,000; Canada, 126,196; British Empire, 514,442; Czechoslovakia, 354,342; France, 200,000; Germany, 564,379; Great Britain, 279,000; Hungary, 473,310; Lithuania, 155,125; Palestine, 157,800; Poland, 2,854,000; Rumania, 900,000; Russia (U.S.S.R.), 2,820,429; and United States, 4,228,029. In 1915 the Jewish population of the United States had been placed at 2,500,000. In 1927 New York City had 1,765,000 Jews (one-third of the city's population), Chicago had 325,000 and Philadelphia, 270,000. An interesting phenomenon of the period under survey was the gradual dispersion of the Jews over the United States. The result was the disappearance of the old ghettos and the settlement of Jews in newly-developed middle-class areas.

This was notably true of New York City. The same tendency resulted in the movement of Jewish families to smaller communities. See ZIONISM; PALESTINE, under *History*.

**JOFFRE**, zhôfr', JOSEPH JACQUES CÉSAIRE (1852- ). A French soldier (see VOL. XII). He was Commander-in-chief of the French Armies on the western front from the outbreak of the World War until December, 1916, when he was transferred to Paris as "technical adviser to the Government" and made a Marshal of France, the first to receive that title since 1870. In the spring of 1917, he was sent on a mission to the United States, then to the Far East, and after the War, to Spain and Rumania. In 1920 he returned to the Higher War Council. He was elected a member of the Académie Française in 1918, received the British Order of Merit in 1919, and wrote *La Préparation de la Guerre et la Conduite des Opérations (1914-15)* (1920). Consult *Maréchal Joffre et ses batailles*, by Reoully (1916) and *Joffre*, by Hanotaux and Fabry (1921).

**JOHN**, AUGUSTUS EDWIN (1878- ). A British painter (see VOL. XII), president of the National Portrait Society. With his vivid manner of portraiture and his ability to catch unerringly some striking and usually unfamiliar aspect of his subject, he superseded Sargent as England's fashionable portrait painter. He was commissioned by Canada during the World War to paint Canadian soldiers on the western front. In 1921 he was made an associate of the Royal Academy, and in 1928 a member. Among his later works may be mentioned "Symphonie Espagnole," "Robin," "The Mumpers," "The Tinkers," and "Madame Suggia," which was presented to the British nation by Sir Joseph Duveen.

**JOHN**, SIR WILLIAM GOSCOMBE (1860- ). A British sculptor, who was born at Cardiff and trained at the Cardiff School of Art, London School of Art, the Royal Academy Schools, and in Paris. His principal works include the statues of Edward VII at Cape Town; Prince Christian Victor at Windsor; David Lloyd George at Carnarvon, and equestrian statues of Edward VII at Liverpool; Viscount Wolsey, Horse Guards Parade, London; and General Sir Stanley Maude at Bagdad. Also the memorials to the Marquis of Salisbury and the Earl of Cromer in Westminster Abbey; Dean Vaughan in Llandaff Cathedral; Viscount Leverhulme in Christ's Church, Port Sunlight; Sir Arthur Sullivan in St. Paul's Cathedral, and numerous others. His works are in the Tate Gallery, London; Glasgow Art Gallery; National Museum, Cardiff. He was knighted in 1911.

**JOHNS HOPKINS UNIVERSITY**. This non-sectarian institution for men and women (women are excluded from some undergraduate courses) at Baltimore, Md., was founded in 1876. The student enrollment increased from 1374 for the summer and autumn sessions of 1914-15 to 5575 in the autumn, and 1107 in the summer sessions of 1928; during the same period the faculty increased from 208 to 575. The library was increased from 174,777 to 300,000 bound volumes, the productive funds from \$6,226,287 to \$24,947,011, and the income from \$521,205 to \$2,110,221. The School of Hygiene and Public Health was established by the Rockefeller Foundation in 1916 and opened in 1918; in 1922 the Foundation gave \$800,000 to the school for endowment and building funds. Fire destroyed

the pathological laboratory in 1919 and a larger building was completed in 1923 through a gift of \$400,000 for this purpose from the General Education Board. An alumni memorial dormitory and a women's clinic were also built in the same year. In the summer of 1923, construction was started on a chemical laboratory to cost approximately \$500,000; a new building for the School of Hygiene and Public Health, constructed at a cost of \$1,000,000, was occupied in September, 1925; and the new Welch Medical Library, for which Dr. William H. Welch spent two years in Europe selecting books, was the outstanding addition to the physical plant in 1928. This building houses the libraries of the school of medicine, hospital, and school of hygiene and public health.

Joseph de Lamar, who died in 1919, bequeathed \$2,500,000 for instruction and research in medicine, and the General Education Board added \$100,000 to the William H. Welch Endowment for Clinical Education and Research in 1917, in order to make possible more work in the department of pediatrics, and also gave \$250,000 to strengthen the work in the laboratory departments of the medical school. The William H. Collins Vickers chair in archaeology was founded in 1920; \$200,000 was received from the estate of Eugene Mergenthaler for scientific research; and \$20,000 from the estate of Mrs. J. A. J. Creswell, for instruction and research in international law. During 1925 friends of Dr. William H. Wilmer made a gift of \$3,000,000 to establish at the Johns Hopkins Hospital an ophthalmological clinic and at the school of medicine a department of ophthalmology. The Rockefeller Foundation also made a gift for the establishment of the Institute for Biological Research, and in the following year, the General Education Board gave \$175,000 for this institute, as well as \$200,000 to establish a professorship in the history of medicine. In the autumn of 1928, the new Institute of Law was established, President, Frank Johnson Goodnow, LL.D. resigned in 1929 and was succeeded by Professor Joseph Sweetman Ames, Ph.D.

**JOHNSON**, ALLEN (1870- ). An American historian and editor, born at Lowell, Mass. He was graduated from Amherst College in 1892 and took postgraduate courses in Germany and in France and at Columbia University. He was appointed professor of history at Iowa (now Grinnell) College in 1898, serving until 1905, and from that year to 1910 was professor of history and political science at Bowdoin College. In the latter year, he became Larned professor of American history at Yale. He resigned that position to become editor of the *Dictionary of American Biography* in 1926. His published writings include: *The Intendant Under Louis XIV* (1899); *Stephen A. Douglas* (1908); *Readings in American Constitutional History* (1912); *Union and Democracy* (1915); *Jefferson and His Colleagues* (1921); *The Historian and Historical Evidence* (1926); *Readings in Recent American Constitutional History* (with W. A. Robinson, 1927). From 1918 to 1921, he was editor of *Chronicles of America*.

**JOHNSON**, ALVIN SAUNDERS (1874- ). An American economist (see VOL. XII). From 1912 to 1916, he was professor of economics at Cornell University, and from 1916 to 1918 was professor of political science at Leland Stanford, Junior, University. After 1917, he was also editor of the *New Republic*, New York City,

and after 1923 director of the New School for Social Research there. His later books include *The Professor and the Petticoat*, a novel (1914); *John Stuyvesant, Ancestor* (1919). Since 1927 he has been assistant editor of the *Encyclopædia of the Social Sciences*.

**JOHNSON, DOUGLAS WILSON** (1878- ). An American geologist, born at Parkersburg, W. Va. He was graduated from the University of New Mexico in 1901 and received his Ph.D. at Columbia University (1903). After teaching in public schools, he entered the United States Geological Survey as a field assistant (1899), and was later an assistant professor of geology at the Massachusetts Institute of Technology until 1907. He was also lecturer in physiography at Harvard University during 1906-12. Returning to Columbia in 1912, he became associate professor of physiography and after 1919 was professor. During the World War, he was connected with the intelligence work of the American Expeditionary Forces with the rank of major; and also served with the American Commission to Negotiate Peace. In addition to many scientific papers and bulletins, he is the author of *Lettre d'un Américain à un Allemand* (1916); *Topography and Strategy in the War* (1917); *Perils of Prussianism* (1917); *My German Correspondence* (1917); *Shore Processes and Shoreline Development* (1919); *Battlefields of the World War* (1921); *The New England-Adian Shoreline* (1925).

**JOHNSON, EDWARD** (1881- ). A dramatic tenor, born in Guelph, Canada. He studied in New York under Frank Dossert and J. A. Galloway and began his career as a concert singer in 1908. The next year he went to Florence, where he continued his vocal studies under Lombardi, and made a most successful operatic debut at Padua as Andrea Chénier (January, 1912), under the stage-name of Edoardo di Giovanni. In the same year he won triumphs in several Italian cities, so that in the fall of 1913 he was engaged for La Scala, in Milan, where he created the title rôle in the Italian première of *Parsifal*, under Toscanini (Jan. 1, 1914). In 1916-17 he sang in Buenos Aires, São Paulo, Rio de Janeiro, and Montevideo, and the next year was heard in Madrid and Lisbon. He made his American début with the Chicago Opera Company as Loris in Giordano's *Fedora* (Nov. 20, 1919) and remained with that organization until 1922, since when he has been a member of the Metropolitan Opera House. On coming to Chicago, he resumed his real name. He ranks among the foremost oratorio and concert singers of the day. In 1920 he was made Officer of the Crown of Italy. Among the many rôles that he created are the principal tenor rôles in Montemezzi's *Amore dei tre Re* and *La Nave*; Puccini's *Tabarro*, *Suor Angelica*, and *Gianni Schicchi*; Pizzetti's *Fedra* and *Fra Gherardo*; Taylor's *The King's Henchman*.

**JOHNSON, EMORY RICHARD** (1864- ). An American educator (see Vol. XII). Since 1919 he has been dean of the Wharton School of Finance and Commerce, University of Pennsylvania. He was assistant director of the Bureau of Transportation of the War Trade Board and also acted as expert and adviser to several other important government boards during the World War. His later books include *History of Domestic and Foreign Commerce in the United States* (1915); *The Panama Canal and Commerce* (1916); *Principles of Railroad Transporta-*

*tion* (1916); *Principles of Ocean Transportation* (1917); *The Ocean Freight Service* (with G. G. Huebner, 1925); *Interpretative Essays on China and England* (1927); *Principles of Transportation* (with Grover G. Huebner, and G. Lloyd Wilson, 1928).

**JOHNSON, HIRAM WARREN** (1866- ). An American lawyer and legislator (see Vol. XII). He served as Governor of California for the term 1911-15 and was reelected for the term 1915-19, but resigned in 1917 following his election as United States Senator from California for the term 1917-23. He was reelected in 1922 for the term 1923-29 and in 1928 for the term 1929-35. Senator Johnson was a leader of the Progressive element of the Republican Party in the Senate and in 1920 was one of the leading candidates for the Republican nomination for the Presidency. He was also a candidate in 1924 for the nomination, but practically abandoned his efforts in April of that year.

**JOHNSON, JAMES WELDON** (1871- ). An American editor and author, born at Jacksonville, Fla. He was graduated from Atlanta University in 1894 and took postgraduate courses at Columbia University. After acting as principal of a high school for colored pupils in Jacksonville, he was admitted to the Florida bar in 1897. In 1901 he began practice in New York. He served as United States Consul in Venezuela and in Nicaragua from 1906 to 1912, and then became secretary of the National Association for the Advancement of Colored People. With his brother, J. Rosamond Johnson, he wrote for the light-opera stage. He was awarded the Spingarn Medal in 1925. His publications include *The Autobiography of an Ex-Colored Man* (1912); *Fifty Years and Other Poems* (1917); and *The Book of American Negro Poetry* (1921); *The Book of American Negro Spirituals* (1925); *Second book of Spirituals* (1926); *God's Trombones* (poems, 1927).

**JOHNSON, MARTIN (ELMER)** (1884- ). An American explorer, who has recorded the wild animal life of Africa in moving pictures. He was born at Rockford, Ill., and attended the public schools of Independence, Kan. Since 1910 he has made, with his wife, Osa Helen Lighty Johnson, six expeditions around the world. He lived many years in the South Sea Islands and in Africa. He was the only member of Jack London's *Snark* expedition to complete the voyage in 1917. In 1924-29 he made a film record of the vanishing wild life of Africa for the American Museum of Natural History, New York. He is the author of *Through the South Seas with Jack London* (1912); *Cannibal Land* (1917); *Camera Trails in Africa* (1924); *Safari* (1927); and *Lion* (1929).

**JOHNSON, ROBERT UNDERWOOD** (1853- ). An American poet and editor (see Vol. XII). During the World War he organized and was chairman of the American Poets' Ambulance in Italy. This organization presented 112 ambulances to the Italian Army in four months. In 1918-19, he was president of the New York Committee of the Italian War Relief Fund of America. Since 1919 he has been director of the Hall of Fame (New York University). He served as Ambassador to Italy from April, 1920, to July, 1921, and represented the United States as observer at the San Remo Conference of the Supreme Council of the League of Nations, in April, 1920. For his War services, he was decorated by the Italian, French, Belgian, and Serbian

governments. His later books include *Poems of War and Peace* (1916); *Italian Rhapsody and Other Poems of Italy* (1917); *Collected Poems* (1919); *Remembered Yesterdays* (1923).

**JOHNSON, TREAT BALDWIN** (1875- ). An American chemist, born at Bethany, Conn. He was graduated in 1898 from Yale, where he also received his Ph.D in 1901. He became an instructor of chemistry at the Sheffield Scientific School of Yale and in 1908 was advanced to the assistant professorship of organic chemistry of which branch he became full professor in 1913. He has published papers on organic synthesis as applied to therapeutic substances, on phrenanthrene and its relation to morphine, an account of new local anesthetics, histamin, tyramin, and cyclic polypeptides. He is a member of the National Academy of Sciences. In 1915 he received the Nichols Medal of the American Chemical Society.

**JOHNSON, WALTER** (1888- ). Professional baseball player, born at Humboldt, Kan. He is recognized as one of the most effective pitchers the American National game has ever known. After a brief sojourn in an obscure Rocky Mountain league, he joined the Washington Club of the American League in 1907 and has been the mainstay in the box for that club ever since, contributing much to the winning of the world's championship by his team in 1924.

**JOHNSON, WILLIAM EUGENE** (1862- ). An American publicist and reformer, born in Coventry, N. Y. He was educated at the University of Nebraska and for several years was engaged in newspaper work. As chief special officer of the U. S. Indian Service (1908-11), he earned the sobriquet of "Pussyfoot" by securing more than 4400 convictions, chiefly of persons selling liquor to Indians. He edited several prohibitionist newspapers and after 1919 was director of the London office of the World League Against Alcohol. He lost an eye at a prohibition meeting in London in 1919 when struck by a missile. He has written several books and over 40 brochures on the alcohol problem.

**JOHNSON, WILLIS FLETCHER** (1857- ). An American editor, born in New York City. He was graduated from New York University in 1879, was on the editorial staff of the *New York Tribune* and its successor, the *New York Herald Tribune* (1894- ). He was also its literary editor (1917-20) and a contributing editor of the *North American Review* (1914- ). After 1914, he was honorary professor of the history of American foreign relations at New York University. He was a member of many societies and was the author of *Four Centuries of the Panama Canal* (1906); *America's Foreign Relations* (1916); *America and the Great War for Humanity and Freedom* (1917); *Life of Warren G. Harding* (1922); *Political and Governmental History of the State of New York* (1923).

**JOHNSTON, SIR HARRY HAMILTON** (1858-1927). An English public official and author (see Vol. XII). His later books include *A Gallery of Heroes and Heroines* (1915); *The Truth About the War* (1916); *The Black Man's Part in the War* (1917); *The Study of Bantu and Semi-Bantu Languages* (vol. i, 1919, vol. ii, 1922); *The Gay-Donbays* (1919); *Mrs. Warren's Daughter* (1920); *The Veneerings* (1922); *Little Life-Stories* (1923); *The Story of My Life* (1923), and *Relations* (1925).

**JOHNSTON, JOHN** (1881- ). An American chemist, born at Perth, Scotland. He was a Carnegie scholar at St. Andrews, Scotland, and also studied at Breslau during 1905-07. Coming to the United States, he was a research associate in physical chemistry at Massachusetts Institute of Technology in 1907-08, and during 1908-16, chemist at the geophysical laboratory of the Carnegie Institution of Washington. He had charge of the research department of the American Zinc, Lead, and Smelting Company during 1916-17 and was chemist to the United States Bureau of Mines in 1917-18. In 1919-27 he was professor and chairman of the department of chemistry at Yale. Since 1927 he has been with the Department of Research and Technology of the U. S. Steel Corporations. During the World War, he served as secretary to the National Research Council. His original investigations have had to do with topics in geochemistry and physical chemistry on which he has published the results of his studies, notably in the *Journal of the American Chemical Society*.

**JOHNSTON, MARY** (1870- ). An American novelist (see Vol. XII). Her later books include: *The Fortunes of Garin* (1915); *The Wanderers* (1917); *Poes* (1918); *Michael Forth* (1919); *Sweet Rocket* (1920); *Silver Cross* (1922); *1492* (1922); *Croatian* (1923); *The Slave Ship* (1924); *The Great Valley* (1926); and *The Exile* (1927).

**JOHORE.** See MALAY STATES, NON-FEDERATED.

**JONES, EDGAR DEWITT** (1876- ). An American clergyman and author, born at Hearn, Texas, and educated at the University of Missouri and Illinois Wesleyan University. He became a minister of the Disciples of Christ denomination in 1901 and held pastorates in Kentucky, Ohio, Illinois, and at Detroit. During 1915-16 he was president of the Illinois Convention of the Disciples, and from 1917 to 1919 of the International Convention of the Disciples. From 1922 to 1928, he was on the staff of the *Detroit News*. Since 1927 he has been a member of the *Christian Century* staff. His writings include: *The Inner Circle* (1914); *The Wisdom of God's Fools* (1916); *Fairhope, the Annals of a Country Church* (1917); *The Tender Pilgrims* (1917); *Ornamented Orthodoxy* (1918); *When Jesus Wrote on the Ground* (1924); *The Wisdom of Washington and the Learning of Lincoln* (1924); *Roses of Bethany and Lilies of Arimathea* (1928).

**JONES, HENRY ARTHUR** (1851- ). A British dramatist (see Vol. XII). His later works include the plays *Cock o' the Walk* (1915), and *The Pacifists* (1917); and the books *Theatre of Ideas* (1915); *Shakespeare and Germany* (1916); *Patriotism and Education* (1918); *My Dear Wells* (1921, 2d. ed. 1922); *What is Capital?* (1925).

**JONES, HILARY POLLARD** (1863- ). An American naval officer, born in Virginia. He graduated from the United States Naval Academy in 1884, served in the Spanish-American War, and was in command of the Navy Yard in Washington from 1906 to 1909. He served on shore and afloat in many important capacities, and in 1917 was made commander of Squadron One, Patrol Force, Atlantic Fleet. In the same year, he was appointed commander of Division One, Cruiser Force, Raider Guard, of the Atlantic Fleet, and was director of the Naval Overseas

Division from January to July, 1919. He was vice admiral of the 2d Battleship Squadron of the Atlantic Fleet, from 1919 to 1921. He became an admiral on July 1, 1921, and from the latter date was commander-in-chief of the Atlantic Fleet and during 1922-23 of the U. S. Fleet. He was appointed Minister to Brazil on a special mission in 1922, a member of the General Naval Board in 1923, and delegate to the Conference for Limitations of Naval Armaments at Geneva in 1927. He was retired from active service in 1927.

**JONES, LAUDER WILLIAM** (1869- ). An American chemist, born at New Richmond, Ohio. He was graduated at Williams College in 1892, and received his Ph.D. from the University of Chicago in 1897. In the same year, he became an assistant in chemistry at Chicago, where he remained until 1907. From 1907 to 1918, he was professor of chemistry at the University of Cincinnati, and from 1918 to 1920, he was dean of the School of Chemistry at the University of Minnesota, after which he accepted a call to the chair of chemistry at Princeton. He has devoted his attention chiefly to organic chemistry and has published papers on nitro-paraffin salts, alkyl derivatives of hydro-oxylamin, preparation of hydroxamic acids from hydroxylamin of organic acids, electron conception of valence, and preparation of electromeres. During the World War, he served with the Chemical War Service as chief of the research section of offense. Dr. Jones is the author of *A Laboratory Outline of Organic Chemistry* (1911).

**JONES, ROBERT EDMOND** (1887- ). An American artist born in Milton, N. H., and educated at Harvard University. He started his career of designing for the theatre in New York City in 1911, and among his notable works are his designs for *The Man Who Married a Dumb Wife*; *The Jest*; *Richard III*; *The Birthday of the Infanta*; *Macbeth*; and *Redemption*.

**JONES, ROBERT TYRE, JR.** (1902- ). An American golfer. He was born at Atlanta, Ga., and in childhood was handicapped by a poor physique. Engaging in outdoor sports, and especially in golf, at an early age, he became sturdy so that at fourteen he was able to compete successfully with older players. In 1923 he won the American Open Championship in golf, in 1924 and 1925, the American Amateur Championship, and in 1926 the American Open and the British Open Golf Championship, being the first amateur in twenty-nine years to gain that coveted honor. In the following year, he again took the British Open as well as the American Amateur Championship. In 1928 (at the age of twenty-six) his record was summarized as follows: He had won eight national titles at match and medal play and a total of twenty-three out of twenty-four matches in which he had competed. He thus held first place among living golf players. In the meantime, he had completed a course at Harvard (S.B., 1924), engaged in the real estate business, and studied law. He has since practiced in Atlanta. In collaboration with O. B. Keeler he wrote *Down the Fairway: Golf Life and Play of Robert T. Jones, Jr.* (1927).

**JONES, WESLEY LIVSEY** (1863- ). A United States Senator (see VOL. XII). He was elected to the Senate from the State of Washington as a Republican for four terms (1909-33) and was chairman of the Senate Committee on Commerce. In 1929 he was the author of the

Jones Act increasing penalties for violation of the Prohibition Law.

**JONES LAW** (MERCHANT MARINE ACT OF 1920). See SHIPPING.

**JONGEN, JOSEPH** (1873- ). An eminent Belgian composer, born in Liège. While a student at the Conservatory there, he won prize after prize, finally carrying off the Prix de Rome with his cantata *Comala* (1897). The next four years he spent in further study in Berlin, Munich, Dresden, Leipzig, Paris, and Rome. In 1903 he became professor of harmony and counterpoint at the Conservatory of Liège, but resigned the following year and settled in Brussels, devoting his entire time to composition. At the outbreak of the World War, he fled to England, where he remained till 1919. In 1920-25 he was professor of counterpoint and fugue at the Brussels Conservatory, and then became its director. As a composer, he strives to follow the ideals of César Franck, but has not been able to withstand the influence of impressionism. His works comprise a symphony; two symphonic poems, *Lalla Roukh* and *Impressions d'Ardennes*; *Tableaux pittoresques* and *Fantaisie sur deux Noëls wallons* for orchestra; *Sinfonia concertante* for organ and orchestra; a concerto for violin and one for 'cello; *Fantaisie rhapsodique* for 'cello and orchestra; a mimo-symphonic legend, *S'Arka* (Brussels, 1912); and numerous works for chamber music.

**JONNART, zhōn-ār, CÉLESTIN AUGUSTIN CHARLES** (1857-1927). A French diplomat, who was born at Fléchin, Pas de Calais, and educated in the law. In 1882 he entered upon his political and diplomatic career by becoming chief of the cabinet of the Governor General of Algeria. He subsequently was director of Algerian affairs in the Ministry of the Interior, Minister of Public Works, a deputy from the Pas de Calais, president of the general council, Governor General of Algeria (1903-1911), and Minister for Foreign Affairs (1918). During the World War, he was the Inter-Allied High Commissioner in Greece, and was instrumental in causing King Constantine's abdication and bringing Greece into the War on the side of the Allies. In 1917 he left the Chamber for the Senate, was Minister of Blockade until the Armistice, again Governor General of Algeria, and chairman of the Reparations Commission. In 1921 when the French government resumed relations with the Vatican after 17 years, he was made Ambassador at the Holy See, but Herriot withdrew the Ambassador and he was recalled in 1924. He was elected to the French Academy of Political and Moral Sciences in 1918, and to the French Academy in 1923. Consult *M. Jonnart en Grèce et l'abdication de Constantin*, by Recouly.

**JONNESCO, THOMAS** (1861-1926). A Rumanian surgeon for many years professor of surgery in the University of Bucharest. He was known especially for his attempts to cure certain diseases by dividing some part of the cervico-thoracic sympathetic nerve and reported cures of angina pectoris—usually regarded as purely a degenerative affection—by this resource. His major writings comprise *La Rachianesthésie Générale* (1919), and *Le Sympathique Cervico-Thoracique* (1923). The division of the sympathetic nerve by his technique is known as Jonnesco's operation.

**JOSLIN, ELLIOTT PROCTOR** (1869- ). An American physician and authority on diabetes, born at Oxford, Mass. He received degrees in

arts and science at Yale (1890-91) and in medicine at Harvard (1895). He was assistant professor of theory and practice of medicine at the Harvard Medical School from 1912 to 1922, when he became clinical professor. His standard books, *The Treatment of Diabetes* (1916), and *A Diabetic Manual* (1918) have gone through several editions.

**JOUVENEL, GABRIELLE SIDONIE** (MME. HENRI) DE. See COLETTE.

**JOWETT, JOHN HENRY** (1864-1923). A British-American Presbyterian clergyman (see VOL. XIII). In 1918 he returned to England from New York, where he was Minister of the Fifth Avenue Presbyterian Church (1911-18), and became minister of Westminster Chapel. His later writings include *The Spirit of Christmas* (1914); *My Daily Meditation for the Circling Year* (1914); "Come Ye Apart," *Daily Exercises in Prayer and Devotion* (1920); *The Eagle Life and Other Studies in the Old Testament* (1922); and *The Friend on the Road and Other Studies in the Gospels* (1922). Consult *John Henry Jowett*, by Arthur Porritt (1924).

**JOYCE, JAMES** (1882- ). An Irish author, who was born and educated in Dublin, but spent his manhood in Rome, Trieste, Zurich, and Paris. His works were few: *A Portrait of the Artist as a Young Man* (1914); *Chamber Music*, a book of lyrics; *Exiles*, a play (1918); *Dubliners*, a collection of short stories about the slums of Dublin; *Ulysses* (1922); and *Pomes Penyeach*, poems, (1927). His first novel, *A Portrait* was well received; it contained lyrical powers and a dignity and honesty that marked it off: but it was *Ulysses* that made him the storm-centre of a bitter literary controversy. The novel has almost 500,000 words, little plot in the accepted sense, telling only of one day in the life of Mr. Bloom, and marks a violent break with the current technique. It was attacked for its crudities and its formlessness; and it was extolled for its frankness and the epic quality of its portraiture. He became a leader of Surrealisme, which held that one should write very quickly and never rewrite.

**JOYNSON-HICKS, RT. HON. SIR WILLIAM, FIRST VISCOUNT** (1865- ). An English public official, who was born Hicks but assumed his present name on marrying Miss Grace Joynton in 1895. A Unionist, he stood for Parliament twice before he was elected in 1908. He was defeated in 1910, and reelected in 1911. He was active in church affairs and transportation and air problems, serving on many committees dealing with these matters. He was created a baronet in 1919, a member of the Privy Council in 1923, and a viscount in 1929. In 1922 he entered the Cabinet as Parliamentary Secretary of the Overseas Trade Department, and in the next year was successively Postmaster General and Paymaster General, Financial Secretary to the Treasury (with a seat in the Cabinet), and Minister of Health, holding the latter office until the resignation of the Baldwin government in January, 1924. In November of the same year, on the return to power of the Conservatives, he became Home Secretary. In this position, he had an important part in the conditions and orderliness of the country during the coal and general strikes of 1926, in the Arcos raid of 1927, which led to the break between Russia and England, and in the Prayer Book dispute. Besides temperance pamphlets, he wrote *The Law of Traction on Highways*; *The Command of the*

*Air*, speeches delivered in the House of Commons (1916); and *The Prayer Book Crisis* (1928).

**JUDAH, NORLE BRANDON** (1884- ). An American soldier and diplomat. He was born at Chicago, trained in the public schools of that city, and graduated from Brown University (1904). After a law course at Northwestern University (LL.B., 1907) he was admitted to the bar. In 1911-12 he was a member of the Illinois Legislature. He was commissioned first lieutenant of Illinois Field Artillery at San Antonio, Tex., in 1916 and promoted to the rank of captain in the same year. In the World War, he served as major of the 149th Field Artillery, 42d Division, becoming lieutenant colonel in 1918. He was also assistant chief of staff, 1st Army Corps, A. E. F. He received the D.S.M., Legion of Honor, and Croix de Guerre with Palm. He engaged in law practice at Chicago (1919-27) and in December, 1927, was appointed Ambassador to Cuba. He resigned that post in June, 1929.

**JUGOSLAVIA.** Yugoslavia, or as it is officially known, "The Kingdom of the Serbs, Croats, and Slovenes," comprises the old kingdoms of Serbia and Montenegro, combined with certain provinces originally belonging to the Austro-Hungarian Monarchy. The country is situated in southern Europe, bordering on the Adriatic Sea; area, 96,134 square miles; population, census of 1921, 12,017,323. Yugoslavia is primarily an agricultural state, the great bulk of its population being agrarian, and most of its income is derived from farming and stock raising. Racially, the population is divided into Jugoslavs, 10,900,000; Germans, 560,000; Magyars, 450,000; Albanians and Turks, 550,000; Rumanes and Vlachs, 200,000; the remainder consisting of Italians and other nationalities. There is no dominant religion in the country, and freedom of worship is guaranteed. The majority of the people, however, are either Orthodox or Roman Catholic. The population is distributed by religions as follows: Orthodox, 5,602,227; Catholic, 4,735,154; Moslem, 1,337,687; Protestant, 235,000; and Jewish, 64,159. Cities of over 20,000 are Belgrade, 250,000; Zagreb, 150,000; Ljubljana, 60,000; Sarajevo, 75,000; Novi Sad, 45,000; Spalato, 35,000; and Nish, 30,000.

**Agriculture.** In 1926 there were 15,080,000 acres of arable land, 24 per cent of the total area; 11,239,000 acres of permanent meadow and pasture; 1,366,000 acres of trees, shrubs, and bushes, and 18,745,000 acres of forest. While there are many small landowners, there are still many large estates, particularly in the provinces of Slovenia, Vojvodina, and Slavonia. The problem of the breaking up of these large holdings is the chief problem of the agrarian reform. Pre-war grain yields in bushels were: wheat, 63,666,000; rye, 10,142,000; barley, 20,280,000; oats, 33,500,000; and corn, 111,892,000. The crops of all these cereals declined, as was shown by the 1927 production, wheat being then 56,568,000 bushels; rye, 5,923,000 bushels; barley, 14,449,000 bushels; oats, 20,114,000 bushels; and corn, 84,344,000 bushels. This decline in yield may be accounted for through the conversion of the land to other uses, principally fruit growing and stock raising. Besides the principal cereals enumerated, Yugoslavia also cultivates, in lesser quantities, buckwheat, millet, rice, lentils, beans, and peas. There are also increasingly large crops of tobacco and sugar beets, tobacco production having grown from

3,000,000 pounds, pre-war, to 14,748,000 pounds in 1927. Production of sugar beets in 1927 was 691,000 metric tons.

**Mining.** Mining was little developed in Yugoslavia in 1929, although a great diversity of minerals was known to exist. The industry only began to assume any real importance within the last century, with the exception of the provinces of Slovenia and Croatia (formerly parts of the Austro-Hungarian Empire). There were, however, many traces of old workings for gold and copper dating back to the days of the Roman Empire, and also to the Middle Ages. The principal minerals found in the country are brown coal, anthracite, bauxite (used in the manufacture of aluminium), lead, iron, copper, sulphur, antimony, silver, and gold. Petroleum and asphalt also occur in various parts of Yugoslavia, but not in large quantities. The large coal deposits are of great advantage to the industries of Yugoslavia, the principal mines being located in the provinces of Slovenia, the only drawback being that they consisted almost entirely of brown coal and lignite, which is inferior to the British, Belgian, and Silesian black coal, and in many cases is unsuitable for industrial consumption. All coal so far mined in Slovenia, Croatia-Slavonia, or Bosnia is of this inferior quality, the only anthracite being found in Serbia. Coal production for 1928 was 5,051,800 metric tons; for 1921, it was 2,949,103 metric tons. Production of iron ore in 1928 was 439,480 metric tons, copper ore was 327,800, and bauxite 49,260 metric tons, as compared with 101,000 in 1927, and 132,000 in 1926.

**Forest.** The forests of Yugoslavia cover about 32 per cent of her entire area, lumbering being one of the principal industries of the country. The forests are particularly valuable assets to the country because of their close proximity to the Mediterranean, whereas most of the other countries bordering on it had been more or less deforested, and the demand for Yugoslav timber is constantly increasing and exports of construction wood in 1928 were valued at \$1,184,000. The principal varieties of trees found are birch and oak, and in lesser quantities, fir, pines, and spruce. The provinces of Bosnia and Slovenia are the principal timber sections of the country.

**Industry.** The manufacturing industry of Yugoslavia is still in the early stages of its development and consists principally of flour-milling, weaving, tanning, boot making, pottery manufacturing, and iron foundries. In view of the immense water-power resources of the country, a great development in this phase of the industrial life is hoped for. One of the greatest difficulties in the development of manufacturing is the lack of proper railway facilities. In 1927 there were 6200 miles of railroads all owned by the state with the exception of 636 miles. In 1927 telegraph had 55,911 miles of line and telephone, 98,818 miles of line.

**Commerce.** The foreign trade of old Serbia in 1911 was: imports \$22,277,000, and exports \$22,564,000. These figures, however, do not afford a proper basis of comparison with statistics on foreign trade for post-war years, in view of the much greater present area of the country. Imports for 1928 were \$137,900,000. Exports for the same year were \$113,400,000, making for the second consecutive year an unfavorable trade balance. The principal countries of origin of imports are Czechoslovakia, Austria, Germany,

Italy, Hungary, and Great Britain. The principal countries of destination of exports are Italy, Austria, Czechoslovakia, and Hungary. Exports to the United States were valued at \$1,048,000 and imports from the United States at \$6,784,000. The principal items of import are textiles, metals and metal products, machinery and vehicles, and chemical and pharmaceutical products. The principal items of export are lumber, grain, cattle, meat products, eggs, and dried prunes.

**Shipping.** When the merchant marine of the former Austro-Hungarian monarchy was divided between Italy and Yugoslavia, the latter country obtained about 100,000 gross tons of shipping, though failing to secure any of the large steamers of important steamship companies. This merchant fleet had increased until by the end of 1928 it totaled approximately 300,000 gross tons. The various shipping companies receive subventions from the state, the total in 1927-28 amounting to 36,360,000 dinars (the dinar being valued at \$0.0176). The merchant marine early in 1928 in Yugoslavia aggregated 153 vessels with a combined gross tonnage of 242,000. Of this total number, 22 vessels of 110,000 tons, each over 4000 tons formed 45.2 per cent of the total. There are seven important steamship companies which control approximately 66 per cent of the total tonnage, the largest having 22.9 per cent in its fleet of 14 vessels.

**Finance.** Bank-note circulation at the end of 1927 was 5,743,000,000 dinars; gold reserve, 89,000,000 dinars. Average exchange rate of the dinar, 1913, \$0.193 (par); 1921, \$0.0237; 1922, \$0.0133; 1927, \$0.1762. The foreign pre-war debt, converted at par, was \$156,445,000 in 1927, but would be much less if discharged in paper currency of the several countries, due to their depreciated currencies. War debts to the British, French, and American governments, at par, were \$564,077,000; pre-war debts of Austria and Hungary (assumed), converted at agreed exchange rates, \$23,074,000. In addition, there were several foreign loans negotiated after the War. The total debt was approximately \$862,140,000 in 1926. Government receipts for the fiscal year 1927-28 amounted to 10,772,030,400 dinars and expenditures to 10,513,128,300 dinars while the budget for the year 1928-29 contemplated revenues of 11,555,794,000 dinars and expenditures of 11,592,794,000 dinars. For 1929-30 corresponding figures are 12,158,721,000 dinars and 12,158,672,800 dinars.

**Education.** Elementary education is compulsory and in the schools under the Ministry of Education is free. In 1926, there were 7208 elementary schools with 17,576 teachers and 786,324 pupils; number of secondary schools was 173, with 3595 teachers and 83,399 pupils; there are three universities located at Belgrade, Zagreb, and Ljubliana, with a total of 360 professors and 10,320 students.

**Government.** Yugoslavia is a constitutional monarchy, whose ruler in 1929 was Alexander I, former King of Serbia. The present constitution was adopted on Jan. 1, 1921, and provides for a single chamber called Narodna Skupština, consisting of 313 representatives elected for four years on the basis of one member for every 40,000 inhabitants. The military defense of the country is provided for by a peace-time army of 7000 officers and 120,000 men recruited on the basis of universal service. Compulsory service is en-

forced for men between the ages of 21 and 45 in the first line, and for men between 18 and 21 years and 45 and 50 years for the second line defense. The navy consists of 12 torpedo boats, 6 mine layers and 2 submarines.

**History.** While the new kingdom of the Serbs, Croats, and Slovenes did not become a reality until December, 1918, the idea of a unified Yugoslavia had been broached at intervals throughout the nineteenth century. Yugoslav unity, however, had suffered a serious setback in the creation of Austria-Hungary, which country played off Serbs against Croats and treated Serbia practically as a fief, and at the beginning of the twentieth century the idea was completely submerged. But from 1905 on, it grew steadily, fostered in the Dual Monarchy by Serbian influence. It was further promoted by Serbian victories in the Balkan War, and the hot-headed proposals of the student organizations, to which the assassins Princip and Cabrinovitch belonged, brought on unnecessary excesses. Throughout the War, Slavs in Austria-Hungary suspected of any sympathy with the patriotic propaganda were treated with the utmost cruelty. Thousands died in internment camps, wholesale confiscations occurred, and except in Croatia, every semblance of government disappeared from the provinces.

Abroad, the Yugoslav Committee headed by Dr. Trumbitch and Mr. Supilo kept confronting the Allies with the idea of Yugoslav freedom. Although it learned immediately of the terms of the Treaty of London of April, 1915, which brought Italy into the War through what was, in effect, a territorial betrayal of the Yugoslavs, its loyalty to the Allied cause suffered little inasmuch as the invasion of Serbia by the enemy occurred soon after. In 1917 the Yugoslav Club, made up of sympathizers in the Austrian Reichsrat, and the exiled Serbian government under Mr. Pashitch gave added support to the Yugoslav Committee. By Mr. Pashitch for the government, and Dr. Trumbitch for the Committee, the Corfu Declaration was signed, July 20, 1917. It set forth the principles of Yugoslav unity under the Karageorgevitch dynasty together with the democratic tenets of universal suffrage and freedom of religion.

In 1918 Yugoslavs and Italians agreed to cooperate in defeating the Dual Monarchy, and the ensuing disaffection from the Austro-Hungarian forces and their final collapse made certain the creation of a Yugoslav kingdom. Despite Italian disapproval and the efforts of Serbia to found a kingdom with itself as nucleus, an act of union was promulgated on Nov. 23, 1918, at Zagreb, capital of the ex-Austrian Slav provinces, and Prince Alexander was invited to take the throne of a united Yugoslavia. At the same time, King Nicholas of Montenegro was deposed and Montenegro joined the union. See MONTENEGRO.

The path of the new state was to be a thorny one in the beginning. Italy consistently refused its recognition of the accomplished fact of the Yugoslav state and at the Peace Conference unalterably insisted not only on the Treaty of London line but, in addition, Fiume. To the Yugoslavs, mediation by President Wilson of the whole Adriatic question was perfectly acceptable; to the Italians, aware of President Wilson's doctrines of self-determination and also understanding that on such a basis not all their claims could be substantiated, there was no way out but the Treaty of London. Wilson's pro-

posals they hotly rejected and Wilson's sensational declaration of Apr. 23, 1919, over the head of the Italian government, infuriated the Italian people. The Adriatic question continued intermittently to trouble the progress of southern European affairs for the next four years. For the D'Annunzio escapade, the succeeding conversations with the Supreme Council, the patched-up Treaty of Rapallo of Nov. 12, 1920, and finally the threatening gesture of Mussolini and the Peace of Rome of January, 1924, see the article FIUME-ADRIATIC CONTROVERSY.

Yugoslavia was, in a sense, the victor, for, excepting the cession of Fiume to Italy, the new line followed substantially Wilson's proposals of 1919. There were other questions that served to distract attention from domestic concerns and to prevent that reconstruction that was so sorely needed. The division of the Banat of Temesvár, which both Yugoslavia and Rumania claimed on ethnographic grounds, was not consummated until 1920, when, by the Treaty of the Trianon, Yugoslavia finally gained the western country (Torontál) as well as the Bačka district containing the large city of Szabadka. To the southwest, the Pan-Serbs agitated for the annexation of the Scutari region (northern Albania). Not until 1921 did Yugoslavia agree to relinquish her claims to this rich district, which included the valleys and outlets of the Drin and Boyana Rivers. Again, the settlement of the Austrian boundary line presented difficulties. By the treaty, a plebiscite had to be held in the Klagenfurt area before its disposition could be finally determined. In October, 1920, one of the two zones voted to remain in Austria, with the result that the whole area was restored. By the Treaty of Neuilly (November, 1919), Bulgaria was forced to give up to Yugoslavia, on the east, the Strumitsa district as well as the Tsaribrod and Bosilegrad districts.

Thus, not until 1921 was Yugoslavia ready to turn to the business of setting her house in order. In November, 1920, elections were held for members of a Constituent Assembly, and the meeting of that body, the first to represent the opinion of the new state, indicated something of the new loyalties. Cleavages were largely on racial and then on economic lines, although religious animosities were also apparent. Decentralization was particularly favored by the Catholic Croats and Slovenes, who feared the supremacy of the Orthodox Serbs. The Communists gathered about them the dissident spirits from the late enemy provinces, especially the Bačka, as well as the Mohammedans of Bosnia. The character of the new groupings may be adduced from the parties represented in the Constituent Assembly. There were 102 Radicals, 94 Democrats, 42 Communists, 51 Croatian-Agrarians, 33 Serb Agrarians, 25 Mohammedans, 21 of the Catholic People's Party.

As a result of these fundamental differences, the establishment of the new state proceeded slowly. Government by bloc was the only way out and could be carried on only as a result of the alliance of the Radicals and the Democrats, strengthened by the adherence of the Bosnian Mohammedans and the Slovene Agrarians. It was only on June 28, 1921, that the constitution, embodying the notion of a centralized Serb state, finally passed through the Assembly. Even then, this result could hardly have been achieved had not the entire Croat delegation of 161 members quit the body. Throughout 1922,

however, the new constitution was not promulgated, the rump Assembly remaining in control and the Government under Mr. Pashitch continuing in office despite well-authenticated charges of disregard for ministerial responsibility.

Communist outbreaks in 1921 added to the general uncertainty and were followed by harsh measures of reprisal in which the Communist members were expelled and the constitutional guarantees annulled. However, the increasing growth of the Peasant Party indicated the true temper of the country.

Jugoslavia is essentially agricultural and its problems centre in the development of its natural resources and the spread of its means of communication. To these, the country increasingly devoted itself and made as rapid headway as the vexatious administrative questions would permit. In the field of foreign affairs, the prevailing policy was conciliatory. By a series of conventions with Czechoslovakia and Rumania in 1920 and 1921, the Little Entente was constituted to check the Hapsburg pretensions; in October, 1923, Yugoslavs gained Greek permission for their use of the port of Saloniki; in 1924, an understanding was effected with Italy for the amicable settlement of the Adriatic problem. The friendliness of France contributed much toward strengthening the financial structure of the new state and the security of its national integrity. Jugoslavia was assured of a respectable place among Central European nations.

The first general election, March, 1923, gave the same groups that had controlled the Constituent Assembly, ascendancy in the national Parliament. Mr. Pashitch remained at the head of affairs, his party and that of the Democrats backing vigorously his resolute attitude toward the separatist Croats. Though in February, 1924, 98 Croats once more appeared to take their seats in the Parliament after an absence of four years, their policy continued hostile, as was shown by their opposition to the Fiume Treaty and their continual demands for Croatian independence. In March, and again in April, 1924, by combining with the other Opposition groups, the Croats succeeded in compelling Premier Pashitch to resign. Thanks to the King's continued confidence in him, the veteran leader returned to power, each time, with a reconstructed cabinet; but the significance of Croatian opposition was larger than mere cabinet juggling would indicate.

The important fact revealed by more than four years of Croatian obstruction was that the Croats, though willing to unite with their kinsmen in a decentralized Yugoslav nation, were irreconcilably opposed to the continued dominance of the Serbs in the new and enlarged nation. Territorial consolidation had proved to be but the first step toward genuine national unification, and the other steps remained to be made. The head of the Croat movement was Stephan Raditch, whose whole-hearted devotion to the cause of the Croat peasant earned him the regard of all the Balkan peoples. By 1924 he was a leader of the first importance in southeastern Europe. His strong leaning toward Russia, strengthened still further by a visit to Moscow in June, brought renewed fears on the part of the Government of a Communist uprising, and in July a number of arrests were made.

The return of Croatian representatives to the Assembly in the spring of 1924 so strengthened

the opposition that on July 18 the Pashitch ministry resigned. The Croats were not included in the succeeding Davidovitch ministry, but supported it for a time. Ever-growing dissension led to its resignation in October and in November the King decided to call general elections, meanwhile putting the government again in the hands of Pashitch. Toward the close of the year, the premier took drastic measures in dissolving the Croatian Peasants' Party. The year 1924 was signalized by an agreement with Bulgaria and an important treaty negotiated in January with Italy. The latter was a five-year treaty of friendship by which Jugoslavia granted to Italy full sovereignty over Fiume and received balancing concessions.

In the elections held in February, 1925, the Radical Party won 140 seats, which with the support of one of the minor factions gave it a slender majority. During the spring, however, a series of negotiations brought the Radical and the Raditch parties together and in July they formed a coalition government. Mr. Raditch with several other Croat leaders had been imprisoned since the first of the year. He was now set free and later received the post of Minister of Education in the cabinet and represented the country at the League of Nations meeting. For a while, political harmony seemed to reign, but the antagonism between the leading factions was too great to be permanently suppressed and in April, 1926, the premier resigned following the resignation of Croat cabinet members, including Raditch. The ministry was reorganized under M. Uzunovitch, with the Raditch Party represented in the cabinet although Raditch himself remained out.

The new Government maintained an uncertain lease of life until December. The storm that broke when the Treaty of Tirana between Italy and Albania was published swept out of office the Foreign Minister, M. Nintchitch, who had consistently followed a policy of accord with Italy, and the whole cabinet followed. In the midst of efforts to form a new government, the aged M. Pashitch died, leaving the already tangled situation still more involved. At the close of the year, M. Uzunovitch succeeded in bringing Radicals and Raditch Party leaders together once more in a new cabinet, but in its short life of four months, it had sufficient strength only to put through the budget.

The excitement over the Albanian situation continued to run high and was in part responsible for the ministry's resignation in April. It was succeeded by a coalition of Radicals and Democrats headed by V. Vukitchevitch. Elections held in September brought no particular changes, the existing government parties obtaining a substantial majority. Aside from the perennial political strife in domestic affairs, the Government at this time was occupied chiefly with strenuous efforts to form an alliance which would at least partially offset the advance of Italy in the Balkans. This was finally accomplished on Nov. 11, 1917, when a treaty of friendship and alliance was signed with France. Relations with Bulgaria became increasingly strained at this time because of the incessant border raids by bands of Macedonian "comitadjis," which Bulgaria seemed quite unable to suppress. The murder of the Yugoslav General Kovachevitch on Oct. 5, 1917, brought the situation to a most serious stage, but an actual clash between the two countries was happily avoided.

In 1928 the issue which had divided the country since its founding, the reiterated demands of the Croats, and to a lesser extent the Slovenes, for full autonomy, became more than ever a source of discord. It found expression particularly in the bitter opposition to the ratification of a pending treaty with Italy negotiated in 1925, which the Croats claimed sacrificed their interests to the Government's desire for support for a loan. In May, rioting and anti-Italian demonstrations became frequent. The climax to all the disorder came on June 20, when a Radical deputy, Punica Ratchitch, shot down five Croat party leaders, killing two outright and wounding Stephan Raditch and two others. Immediately, the land was in an uproar. The Croat deputies withdrew in a body from the Assembly and returned to Zagreb. There they declared a boycott on the Government, refusing even to recognize its envoys as long as any party in any way connected with the murders was in office. The Government did all it could to placate them.

When the crisis brought about the resignation of the ministry on July 4, the King requested the wounded Raditch to form a cabinet, but he refused. Anton Koroshetz, a Slovene clerical, then organized a government. On August 8, Stephan Raditch died and the whole of Croatia was plunged in mourning. In the absence of the Croat representatives, the Government readily put through the ratification of the Italian agreement. During the following months the Serb-Croat hostility grew more and more bitter, with frequent riots and much bloodshed. The Koroshetz ministry made several vain attempts at conciliation, even offering Croatia partial autonomy. In December, steps were taken apparently looking toward placing Croatia under military rule. With the Croatian situation but reflecting the condition of helplessness to which the whole civil government had arrived, it became apparent that the long years of party dissension and parliamentary inaptitude had brought governmental affairs to the breaking point. On December 30, the Koroshetz cabinet resigned, and after a week's futile effort to find in the political welter sufficient strength to form a stable government, the King at one stroke swept the whole parliamentary system into the discard, abolished the constitution, and set up a military dictatorship with General Zivkovitch as premier.

Although the *coup* and the dictatorship that followed it were quite in line with similar overthrows in Italy and other countries, it differed from them in that the King himself took over all power, and also in that he professed with apparent sincerity a devotion to democratic government and an intention ultimately to return to it. In his proclamation of Jan. 5, 1929, he asserted that "parliamentary government, which was always my own ideal as it was that of my unforgettable father, has been so abused by blind party passions that it prevented every useful development in the State." On January 6, decrees were issued making the King sole source of power with a ministry responsible to him alone, prohibiting communism and unduly nationalistic parties, limiting the freedom of the press, and doing away with all local elective bodies.

During the following months, successive measures were taken to safeguard the new regime and make it workable. On February 18, the King by decree created a Legislative Council to succeed the former Parliament, consisting of ex-

ministers, etc., and having practically none but advisory powers. The Government was reorganized in the interests of efficiency. Several newspapers were suppressed. On June 7, Punica Ratchitch was given a twenty-year prison term for the murders of a year before.

By the people of Yugoslavia, the setting-up of the dictatorship was accepted without enthusiasm and without particular protest. In foreign relations, the chief immediate reaction was Italy's declaration that no new treaty could be negotiated to replace the five-year pact of friendship which had expired in January, 1929, until the political situation should become more settled. Although the sponsors of the new regime professed to look forward to a resumption of parliamentary government, they admitted that it might be a long time before such objective could be realized, and in midsummer of 1929 the country faced an indefinite continuation of one-man rule.

**JUGOSLAV LITERATURE.** The unification of the literature written in the various sections of the Kingdom of the Serbs, Croats, and Slovenes has been very difficult to achieve and its progress has depended much upon the political relations between the different provinces. Before the World War, there was a growing tendency for young Serb writers to publish at Zagreb and, vice versa, for the Croats to have some of their works in the Serb journals. With this in mind, we must remember that there was an active literature in both sections of the country.

In Croatia, older writers, such as Anton Tresić Pavičić, a poet and novelist of Dalmatia, had largely withdrawn from the field and turned the literary output over to men of the younger schools which followed rather closely the predominant tendencies in western Europe. Those in Serbia had been more largely under Russian influence, but there was a number of prose writers and poets, among whom were Jovan Dušić, Milan Rakić, and Miličić. Again, the only author who has become known abroad is Bishop Nikolaj of Ochrida, who, as the Rev. Nikolaj Volimirović, won fame as a preacher in St. Paul's Cathedral, London, where he had gone in connection with the education of Serb refugees.

Slovene literature has developed rather apart from the other groups. Ivan Cankar, the leading writer, died in 1918. He had long been moved, as it were, by a religion of beauty and was a genuine meditative lyric poet. Since his death, the leading poet is Oton Zupančič, who continues the tradition of love for his country and a real and serious attitude toward his art. There are at present no outstanding prose authors.

Modern Yugoslav literature, taken as a whole, has not yet reached the heights attained in the Middle Ages; yet we can be sure that the vigor and the energy that are being put forward will in a short time bring forth a national contribution to world literature.

**JUNG, CARL GUSTAV (1875- ).** A Swiss psychologist and psychoanalyst. Jung, who was the earliest convert to the new doctrines of Freud, was at that time assistant to Prof. Paul E. Bleuler the psychiatrist of the Zurich University, who also was favorably disposed to the new departure. All of his works are in English translation: *Psychology of Dementia Praecox* (1909); *Theory of Psychoanalysis* (1912); *Analytical Psychology* (1916); *Psychology of the Uncon-*

scious (1910); *Studies in Word Association* (1918); *Psychological Types* (1923), and *Contributions to Analytical Psychology* (1928). During 1925-26 he studied primitive psychology among the natives of North Kenya, Africa. Jung has divided all mankind into extraverts and introverts with many subdivisions. See **PSYCHOLOGY**, **ABNORMAL**, and **PSYCHOANALYSIS**; **ASSOCIATION TESTS**.

**JUNIOR COLLEGES.** See **UNIVERSITIES AND COLLEGES**.

**JUNIOR HIGH SCHOOLS.** See **EDUCATION IN THE UNITED STATES**.

**JUSSERAND**, zhü's'-rän', JEAN ADRIEN ANTOINE JULES (1855- ). A French diplomat and scholar (see VOL. XIII), Ambassador to the United States (1902-25). He had profound knowledge of English literature and life, and was a member of many American and British, as well as French, learned societies and academies. His later works include: *A Literary History of the English People* (1913); *With Americans of Past and Present Days* (1916); *The School for Ambassadors, and other Essays* (1924); and "The Historian's Work" in *The Writing of History* (1926). Consult *Great Men and Great Days*, by Stéphane Lauzanne (1921).

**JUTLAND, BATTLE OF.** See **WORLD WAR, Naval Operations**.

**JUVENILE COURTS.** Although the first juvenile courts were established about 1900, from 1914 there was great activity in the formulation of principles and the development of methods of administration. In 1914 a report of the special committee of the National Probation Association, appointed to consider juvenile courts and their administration, was published in book form under the title *Juvenile Courts and Probation*, by Bernard Flexner and Roger N. Baldwin. This statement of the aims of the juvenile court and detailed discussion of the means by which its purposes may be realized, together with the educational work of the National Probation Association, of State organizations supervising juvenile court work, and of individual judges and probation officers, brought increased recognition of the importance of the movement and the administrative standards that must be maintained. In 1923, following a series of studies made by the Children's Bureau of the United States Department of Labor and conferences held under the joint auspices of that Bureau and the National Probation Association, a detailed statement of Juvenile Court standards was published by the Children's Bureau and widely distributed.

Since it aims to save, rather than to punish, the delinquent child and to protect the neglected and dependent child, the ideal function of the juvenile court is not to determine whether or not a child has committed a specific offense, but through social investigations and physical and mental examinations, to ascertain the needs of each child and determine the treatment to be given. Children are to be kept in their own homes if possible and, if institutional care is needed, it must be educational and not punitive. To attain these ends, the procedure in children's cases must not be criminal in nature, and the court hearings must be entirely separate from the trials of adult offenders. The hearings must be private and informal, and must be held before a judge or referee who understands problem children and is able to use intelligently the resources which the community

and the State provide; and skilled probation service and facilities for expert study of the child's physical and mental condition must be available. It is desirable to keep children in their own homes, if possible, pending the hearing and determination of their cases and, if detention is required for their own welfare or the public safety, it must not be in jails or police stations, but in family boarding homes or special detention homes adequately equipped for constructive service.

These are the ideals of the juvenile court, but their realization, even in the larger cities, is far from complete and, in many small towns and rural districts throughout the country, children are still subjected to publicity, criminal procedure, jail detention, and treatment that can not be effective because of the absence of facilities for the study of the child and for skilled probation service. Nevertheless, real progress has been made in the extension of juvenile-court principles and practice. In 1910 legislation authorizing probation in children's cases was on the statute books of 38 States and the District of Columbia, but the application of this legislation was mainly confined to the larger cities. Eight years later, juvenile-court laws having been passed in every State except two, and laws authorizing probation in children's cases in every State except one, a survey was made by the Children's Bureau of the United States Department of Labor, covering 2034 juvenile courts and other courts hearing children's cases. This study showed that of an estimated 175,000 children's cases in 1918, 125,000 were heard by courts with some degree of special organization, and that such service existed in all the large cities and in 71 per cent of the cities having populations of from 25,000 to 100,000. The minimum degree of specialization used as a basis of comparison in this survey was separate hearings for children, officially authorized probation service, and the recording of social information. Only 321 courts, or 16 per cent of those reporting, had even this minimum; and almost half these courts were in five States. It was found that many States were not fully carrying out their laws. From at least one court in every State came reports of detaining children in jails, and in 37 courts in 18 States, no effort was made to separate children detained in jails from adult offenders; more than one-fourth of the courts with probation service reported that no provision whatever was made for physical examination and relatively few courts had facilities for mental examinations. Although authorized in every State but one, probation service was known to have been used during the year in only 45 per cent of these courts with jurisdiction over children.

Unfortunately, in many of the States, the juvenile court has been converted into a general catch-all. Here has been assigned the jurisdiction over mothers' pensions, adoptions, cases involving feeble-minded children, even domestic relations. In very few instances has the complete attention been concentrated on the original definition of the juvenile court, i.e., as an agency for preventing and treating delinquency. In one respect, a technique has been developed—that of the probation worker. It has become a regular, paid service whose workers, if necessary, are prepared to reconstruct the child's family, school, and vocational and recreational relationships.

In addition to providing means of investigating the social history of the child and his family, of giving physical examinations and treatment and routine mental tests, there has been made an effort to probe even deeper. It has been found necessary to link up the juvenile court with the psychiatric clinic. The first of these joint efforts was tried in Chicago in 1909. Since 1922, to demonstrate the importance of a psychiatric point of view, the Commonwealth Fund of New York has been financing the assignment of psychiatric clinics to selected communities for limited periods, and also has been supporting training courses for psychiatric social workers and probation officers given by the New York School of Social Work.

One of the most difficult aspects of the work is the creation of measuring sticks for the purpose of evaluating the success of the courts. In 1928 the director of the U. S. Children's Bureau was able to report that only 42 juvenile courts throughout the country were coöperating in the uniform reporting of statistics of delinquency, dependency, and neglect. Another stumbling block is an adequate definition of delinquency. In Boston, for example, children are arrested for the most trivial offences such as fence-climbing, bathing without a suit, etc., and no cases are adjudicated outside the court. In Chicago, children are brought in only for the relatively

serious offenses; the police officers adjudicate most of the cases outside the courts and comparatively few are entered on the dockets. Are statistics from the two cities in any way comparable? Again, there is the matter of treatment. In Chicago, the proportion of commitments to institutions is great; in Boston, delinquents are sent to highly-selected foster homes; in Cincinnati, the whole procedure is more or less informal, there are few psychiatric examinations and, after a talk with the judge, the delinquent boy or girl in the great majority of cases is placed on probation in his own home under the custody of his parents. What has been the result? Boston, with its highly technical procedure has been no more successful than Chicago with its institutional commitments or Cincinnati with its haphazard examinations and its neglect of the careful study usual in the better type of juvenile courts. All this has led W. I. Thomas and D. S. Thomas in *The Child in America* (1928) to come to this conclusion: "It suggests that we have idealized the juvenile court as an institution and that its successes, where it has successes, are not closely correlated with the procedure but due to unknown causes." Thus, an experiment that started out under such great expectations closes at the time of writing (1929) on what must be considered an uncertain note.

**KAHN**, kân, GUSTAVE (1859- ). A French novelist and critic (see VOL. XIII). In 1924 he became editor of *Menorah*, a semi-monthly Zionist publication. His later works include *La Childebert* (1926) and *Fantini-Latour* (1927).

**KAHR**, GUSTAV VON (1862- ). A German public official, born at Weissenburg. He was active in the establishment of the Bavarian Republic, and from March, 1920, to September, 1921, was Minister-President. He came into conflict with the Reich government over questions of authority and resigned his post, largely as a result of the opposition of General Ludendorff and other reactionaries. In 1923 he was appointed general commissioner of state in full charge of the government and held this position during the attempt of Adolf Hitler and General Ludendorff to overthrow the Government. The failure of this attempt resulted in the arrest of Hitler and Ludendorff. See BAVARIA.

**KAISER**, k'zër (F. K.) GEORG (1878- ). A German playwright of the expressionist school. He was born at Magdeburg, attended college and engaged in commerce at Buenos Aires. After 1901 he devoted himself to the drama. He is the author of *Die Bürger von Calais* (1914); *Von Morgen bis Mitternacht* (1916, produced in New York in English translation, 1919); *Die Koralle* (1918); *Gas* (1920); *Gilles und Jeanne* (1923); *Kolportage* (1924); *Zweimal Oliver* (1926); and *Die Sorina* (1927).

**KAISER**, ISABELLE (1866-1925). A Swiss author, who wrote in German and French (see VOL. XIII). Her later works include *Le Vent des Cimes* (1916); *Rahels Liebe* (1921); *Hilda, die Heze* (1921); and *Die Nächte der Königin*, short stories (1924).

**KALEDIN**, ALEXEI (1861-1918). A Russian general born at Usti-Chozher (Dongebiet) of a Cossack father. In 1914 he led the 12th Division of Cavalry, in 1915 he was wounded and imprisoned in Austria, and in 1916, free again, he commanded the 8th Army. His masterly conduct of the campaign of Volhania and the capture of Lutsk gaining for him the title of "Hero of Lutsk." On the outbreak of the Revolution in 1917, the Cossacks elected him commander-in-chief. When he found that his struggle against Bolshevism was useless, he committed suicide in February, 1918.

**KALININ**, MIKHAIL IVANOVICH (1875- ). A Russian Communist chairman of the Central Executive Committee of the Russian Socialist Federation of Soviet Republics since 1919. He went to work in a St. Petersburg cartridge factory at the age of fourteen, joined the Social-Democratic Party in 1898 and for his political activities was exiled to Siberia a number of times, the first in 1899. Released from prison following the revolution of 1917, he took an active part in the Bolshevik movement. In 1919 he was elected a member of the central committee of the Communist Party. He wrote, in German,

*Was tut die Sowjetmacht für die Verwirklichung der Demokratie?* (1926).

**KALLEN**, HORACE MEYER (1882- ). An American philosophical writer. He was born in Silesia, Germany, was taken to the United States at the age of four, educated at Harvard University, the Sorbonne, and Oxford. He was named by William James as editor of his unfinished book, *Some Problems in Philosophy* (1910). After teaching at Harvard (1908-11), he went to the University of Wisconsin (1911-19). When the New School of Social Research was organized in New York City, he was appointed lecturer in philosophy. He is the author of *William James and Henri Bergson* (1909); *Creative Intelligence*, with John Dewey and others (1916); *The Structure of a Lasting Peace* (1918); *Zionism and World Politics* (1921); *The League of Nations, and To-day and Tomorrow* (1921); *Culture and Democracy in the United States* (1924); *Education, the Machine and the Worker* (1925); *Why Religion?* (1927); and *Freedom in the Modern World* (1928).

**KAMENEV**, LEV BORISSOVITSCH (1883- ). A Russian Communist journalist, diplomat, and political leader, born in Moscow. A former coeditor of the *Pravda*, Petrograd, several times banished from Russia for his revolutionary activities, he became a member of the central committee of the Communist Party in 1917 and was one of the negotiators of the Brest-Litovsk Treaty with Germany in 1918. From 1918 to 1925, he was president of the Moscow Soviet and from 1924 to 1926 president of the Council of Labor and Defence. In December, 1925, and again in 1927, he joined with Trotsky and others in opposing Stalin, the Soviet chief executive. He served as Ambassador to Italy (1926-27) and was also president of the All-Russian Central Executive Committee. In 1921 he wrote *The Soviet Republic in the Capitalist World*.

**KAMERUN**, kâ'me-roon'. Formerly a German protectorate on the west coast of Central Africa, but since its capture by British and French troops in 1916, part of the British and French Empires under the names of British Cameroon and French Cameroon. See CAMEROON, BRITISH; and CAMEROON, FRENCH.

**KANAVEL**, ALLEN BUCKNER (1874- ). An American surgeon, born at Sedgwick, Kan., and educated at Northwestern University (Ph.B. 1896; M.D. 1899). After studying in Vienna, he joined the faculty of Northwestern University where he was successively lecturer, assistant professor and, after 1919, full professor of surgery. He became widely known through a classical monograph entitled *Infections of the Hand*, which was passed through several editions. He is also associate editor of *Surgery, Gynecology and Obstetrics*.

**KANDEL**, ISAAC LEON (1881- ). An American educator, born in Rumania. He studied in Manchester, England, and at Columbia and Jena universities. For several years, he taught in universities in Ireland and from 1908

to 1910 was scholar and teaching professor at Columbia University. In 1915-23 he was associate in education at Teachers College, Columbia University, after 1923 professor of education there, and in 1914-23 was specialist of the Carnegie Foundation for the Advancement of Teaching. He is the author of *Elementary Education in England* (1914); *Federal Aid for Vocational Education* (1917); *Education in Germany* (1918); and *Reports on Education in Great Britain, Ireland, Germany and France* (1919). He edited: *Twenty-five Years of American Education* (1924); *Educational Yearbook of the International Institute* (1925); *The Classics in Germany, England, and France* (1925); and *French Elementary Schools* (1926).

**KANSAS.** The thirteenth State in size (82,158 square miles) and the twenty-fourth in population; capital, Topeka. The population increased from 1,690,949 in 1910 to 1,769,257 in 1920, a gain of 4.6 per cent; estimated population, 1928, 1,835,000. The white population rose from 1,634,352 (1910) to 1,708,906 (1920); Negro, from 54,030 to 57,925. Foreign-born whites decreased in number from 135,190 to 110,578. The urban population mounted from 493,790 to 617,964; the rural fell from 1,197,159 to 1,151,293. The growth of the principal cities was as follows: Kansas City (q.v.), 82,331 to 101,177; Wichita, 52,450 to 72,217; Topeka, 43,684 to 50,022.

**Agriculture.** Kansas is one of the most important of agricultural States. Conditions since the War have been greatly affected by the general agricultural situation in regard to wheat and other grains, for accounts of which, see AGRICULTURE, CORN, WHEAT, etc. The number of farms increased very slightly, from 165,286 in 1920 to 165,879 in 1925. The total acreage in farms was 425,179 in 1920, but fell to 43,729,129 in 1925. The improved land in farms embraced 30,600,760 acres in 1920. The acreage of crop land in 1925 was 23,896,507. The total percentage of land in farms decreased from 86.8 in 1920 to 83.6 in 1925. The total value of farm property rose from \$2,039,389,910 in 1910 to \$3,302,806,187 in 1920, but declined to \$2,504,339,779 in 1925; the average value per farm being \$11,467 in 1910, \$19,982 in 1920, and \$15,097 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 95,149 were operated by owners; 729, by managers; and 70,001, by tenants. The comparative figures for 1910 are 111,108; 1835; and 65,398. White farmers in 1920 numbered 104,048, compared with 176,150 in 1910; native-born, 146,859, compared with 150,346; foreign-born, 17,187, compared with 25,804; colored, 1238, compared with 1691. In 1920 the number of dairy cows was 681,207; in 1925, 380,150; "beef" cows, 912,892 in 1920, 923,148 in 1925; mules, 243,332 in 1920, 260,163 in 1925; sheep, 361,102 in 1920 and 314,894 in 1925. The number of swine had decreased greatly during a decade (from 3,037,000 in 1910 to 1,816,000 in 1920); but it rose to 2,196,569 in 1925. The estimated production of the chief farm crops for 1928 was as follows: Corn, 179,118,000 bushels; wheat, 177,833,000; oats, 37,729,000; barley, 17,661,000; potatoes, 7,560,000; and hay, 4,646,000 tons. Comparative figures for 1913 are corn, 23,424,000 bushels; wheat, 86,983,000; oats, 34,320,000; barley, 1,994,000; potatoes, 2,920,000; and hay, 1,350,000 tons.

**Mining.** The principal mineral products of the State are petroleum, zinc, natural gas, and coal. There is considerable production of lead. The progress of the petroleum industry during the period since 1914 is indicated by these figures: production in 1914, 3,103,585 barrels; 1916, 8,738,077; 1917, 36,536,125; 1918, 45,451,017; 1920, 39,005,000; 1922, 31,766,000; 1926, 41,498,000; 1927, 41,069,000; 1928, 38,596,000. The increased production in the later years indicates a remarkable development in the new petroleum fields throughout the State. The coal production in 1914 was 6,860,988 short tons, valued at \$11,238,253; 1917, 7,184,975, \$16,618,277; 1918, 7,561,947, \$22,028,142; 1920, 5,926,408, \$22,923,000; 1921, 3,466,641, \$13,333,300; 1927, 3,442,762, \$9,648,000; 1928, 2,809,724, \$6,861,000. The value of clay products has varied widely from \$1,905,961 in 1914 to \$2,064,520 in 1918; \$4,021,740 in 1920; and \$3,969,040 in 1926; the increased value in years coinciding with the War was due largely to the decreased purchasing power of money and the consequent higher prices. Shipments of cement, exclusive of natural cement, varied from 3,237,906 barrels in 1914 to 4,158,399 in 1920; 3,643,582 in 1921; and 6,141,937 in 1927. In addition to products mentioned above, the State produces a considerable quantity of gypsum, natural gas, and sand and gravel. The total value of the mineral products in 1926 was \$165,000,612, compared with \$198,097,758 in 1920, \$120,759,783 in 1919, \$149,902,001 in 1918, and \$25,866,351 in 1914. In 1927 the mineral production was valued at \$120,368,526. Kansas ranked tenth among the States.

**Manufactures.** While Kansas is chiefly an agricultural State, it is also important industrially. There are 17 cities which have a population of more than 10,000, the combined populations of which form 23.6 per cent of the total for the State. In 1919, 72.1 per cent of the total value of the State's manufactures were reported from these cities. There were in the State in 1914, 3136 manufacturing establishments; 3474 in 1919; 1860 in 1925; 1856 in 1927. Persons engaged in manufactories as wage earners numbered 41,259, 61,049, 46,078, and 45,368, respectively, in those years; and the capital invested amounted to \$163,789,752 (1914) and \$357,534,129 (1919). The value of products in 1914 amounted to \$322,234,194; 1919, \$913,667,094; 1925 \$698,096,115; 1927, \$681,570,334. While the increase in the value of the product in 1914-19 was in great measure due to changes in industrial conditions brought about by the War, the increase in the average number of wage earners clearly indicated growth in manufacturing activities in the State. The most important industry in point of value of products is that connected with slaughtering and meat packing, the value of the product being \$151,647,000 in 1914; \$427,663,000 in 1919; \$249,465,885 in 1927. Flour-mill and gristmill products ranked second; they were valued at \$72,895,000 in 1914; at \$206,881,000 in 1919; at \$133,625,683 in 1927. Petroleum refining, in the third place, amounted to \$8,923,000 in 1914 and to \$73,878,325 in 1927. The chief manufacturing cities in the State are Kansas City, Topeka, and Wichita. In Kansas City, there were 165 establishments in 1909, with a product valued at \$164,081,000; 196, with \$468,686,000 in 1919; products totaled \$296,646,000 in 1925. In Topeka in 1909, there were 202 with \$17,821,000; 161, with \$20,685,000 in 1914; and 169, with \$45,708,000 in 1919; in 1909,

Wichita had 223, with \$10,267,000; 199, with \$11,668,000 in 1914; and 199, with \$57,789,969 in 1927.

**Education.** Educational progress has been sustained in recent years. The Legislature passed at various times many measures designed to improve the educational system. A rural high-school measure of 1915 permitted legal electors residing in territory containing not less than 16 square miles and comprising one or more townships or parts thereof to establish rural high-school districts. Under this law, over 240 rural high schools were soon organized. The Legislature of 1923 passed an act reorganizing the county high-school system, abolishing normal county high schools and creating community high schools and providing for the payment of tuition in connection therewith; and by the end of 1923, 26 such high schools had been established. The same Legislature passed a measure for carrying out the law of 1917 relating to vocational education; and useful legislation relating to the blind and deaf and dumb. The name of the normal schools of the State was changed to teachers' colleges. A Board of Administration was authorized to make a survey of the southwestern part of the State and to determine the advisability of establishing State teachers' colleges. The school population of the State (minors from 5 to 17 years, inclusive) was, in 1925-26, 473,094; the public-school enrollment was 424,907; in 1923 it was 427,310. Kansas has always been among the States with the lowest percentages of illiterates. Its percentage decreased from 2.8 in 1910 to 2 in 1920; among the native-born, from 1.1 to 0.7 per cent; among the foreign-born, from 10.3 to 10.2; among the Negroes, from 15.9 to 11.2.

**Finance.** State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$14,254,973 (of which \$691,604 was aid to local education); for conducting public-service enterprises, \$440,562; for interest on debt, \$1,215,202; for permanent improvements, \$9,105,088; total, \$25,015,825 (of which \$9,773,112 was for highways, \$1,789,743 being for maintenance and \$27,983,369 for construction). Revenues were \$27,086,679. Of this, property and special taxes formed 39.3 per cent; departmental earnings and charges for officials' services, 11.5 per cent; and sales of licenses and the tax on gasoline, 34.8 per cent. Property valuation was \$3,674,105,303; State taxation thereon, \$9,502,190. Net State debt on June 30, 1927, was \$24,836,544.

**Political and Other Events.** In 1914 there were elections for United States Senator and governor and other State officers. Senator Bristow, a candidate for renomination on the Republican ticket, was opposed by Charles Curtis and by Victor Murdock, Progressive leader of the House of Representatives. Mr. Curtis received the Republican nomination and was elected. Arthur Capper, Republican, was elected governor. A constitutional amendment providing for the recall of public officials was adopted. In 1916 Governor Capper was reelected. In spite of this fact, President Wilson carried the State, receiving 314,588 votes, to 277,658 for Charles E. Hughes. In 1918 Governor Capper was elected United States Senator on the Republican ticket, and Henry J. Allen, Republican, was elected governor. In 1919 a general strike in the coal fields of the State resulted in the taking over of the mines by the State authorities under the

direction of Governor Allen and their operation by volunteers. The Legislature in this year created an Industrial Court, before which should be brought all matters in dispute between employers and employees in what the law describes as "basic industries," including food, fuel, clothing, and all public utilities. In 1920 Senator Curtis was reelected to the Senate, and Henry J. Allen was reelected governor. In the presidential voting of this year, Warren G. Harding received 396,195 votes; James M. Cox, 185,447. Constitutional amendments were adopted at this election, relating to promotion of farm home-owning, against the increase of farm tenancy, and for the promotion of good roads. The Kansas Court of Industrial Relations was reorganized and, at the close of the year, 28 industrial cases had been filed, 20 of these by labor organizations, and in 13 cases wage increases had been granted. On Apr. 9, 1920, strikers in the coal mines were arrested and placed in jail for ignoring the summons of the Industrial Court. On April 30, the Industrial Court was declared constitutional by the State Supreme Court. On Feb. 7, 1921, Alexander Howat, the leader in the coal-mining strike, was arrested by the authorities of the Industrial Relations Court for calling a strike in violation of an injunction. He was convicted. In 1922 the Democrats came into power, electing as governor Jonathan M. Davis. In his campaign, he spoke against the Industrial Court and promised a reduction of taxes. Although the Legislature did not act adversely, the functions of the Industrial Court were greatly curtailed by a decision of the United States Supreme Court on June 11 that the court had no power to fix wages. See LABOR ARBITRATION.

The vote for President in 1924 was: Coolidge, 407,671; Davis, 156,319; LaFollette, 98,461. Ben S. Paulen, Republican, was elected governor in 1924 and reelected in 1926. In 1928 the presidential vote was: Hoover, 513,672; Smith 193,003. Clyde M. Reed, Republican, was elected governor.

**Legislation.** Several measures passed in 1915 were designed to strengthen the prohibition laws of the State. The Legislature of 1917 amended the laws relating to the administration of the State government and created a State manager for State institutions; enacted a general prohibition law; and amended the child-labor law. The Legislature of 1921 abolished the Industrial Welfare Commission and conferred its powers on the Court of Industrial Relations; created a State aircraft board; made provision for the establishment and maintenance of city planning commissions in cities of the first class; and imposed a penalty for the failure to employ the English language exclusively in teaching in the elementary schools. A Public Utilities Commission was created and provision was made for the organization of rural high-school districts and for the consolidation of school districts for educational purposes. An election was authorized to be held in 1922 on the question of compensation of veterans of the War. This proposal, carrying \$25,000,000 in bonds, was carried by the people. The Legislature of 1923 accordingly passed a soldiers'-bonus law. It also authorized a board of administration to make contracts for the drilling of oil and gas wells on land under its control belonging to the State, where there is a State institution on such land within two miles of one or more producing oil wells. The Legislature of 1923 submitted to the

people to be voted on at the general election of 1924 a constitutional amendment permitting the Legislature to distinguish among subjects of taxation. A law of 1909 prohibiting cigarettes was repealed in 1927; life imprisonment for persons convicted of a third felony was provided. A special session in 1928 framed a constitutional amendment to give the highway administration adequate control of funds.

**KANSAS, UNIVERSITY OF.** A coeducational State institution of higher learning at Lawrence, Kan., founded in 1864. Between 1914 and 1928, student enrollment increased from 2812 to 4224, with 1683 in the summer of the latter year; faculty membership from 200 to 280; and the library from 100,000 to 200,000 volumes. Chancellor, Ernest Hiram Lindley, LL.D.

**KANSAS CITY.** The largest city in Kansas. The population increased from 82,331 in 1910 to 108,851 in 1920 and to 118,300 in 1928, by estimate of the Bureau of the Census. This includes the suburb of Rosedale, which was annexed in 1922. The area is 22 square miles. In 1924 a city-planning and zoning ordinance was adopted, designed to take care of the growth of the city for the next 40 years. Since 1924 several buildings of unusual architectural interest have been erected in Kansas City. Among these are the Commercial National Bank Building in Italian Renaissance style, the \$500,000 War Memorial Hall in Roman Doric style, and the Wyandotte County Court House erected at a cost of \$1,000,000 in Greek Doric style. The William Rockhill Nelson Gallery of Art, named for the man who was instrumental in beautifying Kansas City, is under construction on the site of his home at Brush Creek. In the main business districts of the city, 22 commercial buildings, including four large office buildings, have been erected since 1924. In 1926, 1703 building permits, valued at \$3,423,076, were issued. Extensive improvements also have been made of the city's water and light facilities, \$2,600,000 of a \$4,000,000 bond issue having been expended for this purpose. A 125-acre airport has been constructed in the Fairfax district, one of five industrial districts distributed throughout the city. In 1925 there were 160 manufacturing establishments in Kansas City, employing 14,336 persons who received \$17,871,613 in wages; the value of products manufactured was \$290,790,130. The assessed valuation of property in Kansas City in 1927 was \$138,991,000; the net debt was \$12,870,000.

**KANSAS CITY.** An important industrial and railroad centre of Missouri. The population increased from 248,381 in 1910 to 324,410 in 1920 and to 391,000 in 1928 by estimate of the Bureau of the Census. The area is 58 square miles. In 1920 home-rule charter-making powers were acquired by the city, and in 1926 the city-manager plan of government was adopted. According to this plan, a council of nine members is elected, one of whom acts as mayor, while the city manager is chosen by the council. Between 1914 and 1924, a viaduct and double-deck bridge, a 14-mile boulevard, a 15-mile sewer system, and a dyke for flood protection were built by the city. Bond issues for municipal improvements since 1924 include \$8,500,000 for the construction of trunk sewers, \$11,000,000 for a new municipal water system, \$1,000,000 for the purchase and improvement of a 688-acre municipal airport, \$500,000 for a municipal river terminal, and \$250,000 for Swope Park, one of the largest

municipal parks in the United States. Kansas City is the home of the Federal Reserve Bank of the tenth district, and one of its finest structures is the Federal Reserve Bank Building. Other edifices which have been recently constructed are the 24-story Southwestern Bell Telephone Building, the R. A. Long Building, the Commerce Building, the First National Bank, the New England National Bank, and the Kansas City Life Insurance Building. In 1927, 470 building permits, valued at \$15,215,875, were issued. The Liberty Memorial, including a shaft with a crucible at the top in which a fire is to burn constantly, a hall of records, and a fraternity house, was dedicated on Armistice Day, 1926. The value of manufactured goods rose from \$189,732,860 in 1923 to \$221,349,000 in 1927. In 1925, 25,576 persons were employed in approximately 500 manufacturing establishments and received \$32,884,000 in wages. Kansas City has 60 national and state banks and trust companies with total resources of \$362,657,674 and 61 building and loan associations with total resources of \$72,084,020. The assessed valuation of property in 1927 was \$500,879,000; the net debt was \$43,430,000. In June, 1928, the Republican National Convention was held in the great Convention Hall.

**KANSAS WESLEYAN UNIVERSITY.** A coeducational institution under the auspices of the Methodist Episcopal Church, founded in 1885 at Salina, Kansas. The number of students increased from 149 in 1910 to 966 in the fall of 1928; in the same period, the faculty increased from 20 to 35, and the number of volumes in the library from 12,000 to 16,000. A physics laboratory was equipped in 1920 and an administration building, with an adjoining auditorium seating 1500 persons, the total cost of which was \$250,000, was completed in 1928. Departments of liberal arts, commercial science, music, and fine arts are maintained leading to the degrees of bachelor of arts, bachelor of science, bachelor of music and bachelor of science in commerce. A special gift of \$25,000 for the retiring of the bonded indebtedness of the University was made in 1928 by Walter P. Chrysler. The General Educational Board pledged \$100,000 toward endowment provided all indebtedness be liquidated by Jan. 1, 1930, and that an additional \$200,000 endowment be secured. President, the Rev. L. B. Bowers, D.D.

**KAPP, káp, WOLFGANG VON (1858-1922).** A German revolutionist, born in New York City, where his father, Friedrich Kapp, a well-known Liberal leader, was in exile. He founded the Agricultural Credit Institute of East Prussia, which was very successful. During the World War, he was one of the leading representatives of the Junkers and bitterly opposed all measures taken to establish a republic. In March, 1920, he headed a conspiracy to obtain control of the Government. This was at first successful, and he was installed as Imperial Chancellor. He endeavored to form a government but was frustrated largely by a universal strike, which rendered him powerless. The movement collapsed on March 17, and he fled from Berlin, escaping by airplane to Sweden.

**KAPP PUTSCH.** See TRADE-UNIONISM, Germany; GERMANY, under History.

**KARAFUTO.** See SAKHALIN.

**KARAKHAN, LEO M. (1889- ).** A Russian Communist journalist, diplomat, and public official. He was a member of the Russian delega-

tion which signed the Brest-Litovsk Treaty, served as Minister to Poland (1921-22) and Ambassador to China (1924-26), and since the latter year has been Assistant People's Commissary for Foreign Affairs.

**KARELIA CONTROVERSY.** See FINLAND, RUSSIA.

**KARL I, EMPEROR OF AUSTRIA AND HUNGARY.** See CHARLES I.

**KAROLYI, kârô-lyé, MICHAEL, COUNT** (1875- ). A Hungarian statesman born in Budapest of a family historically prominent. In 1910 he became a member, and in 1913 chairman, of the Independence Party, and urged universal suffrage. Before and during the World War, he manifested strong pacifism and outspokenly condemned German policies. When defeat was realized, he was called on (Oct. 31, 1918) to form a ministry, his first task being to conclude an armistice with General D'Esperey, commander on the Macedonian frontier. In January, 1919, he became provisional President of the Hungarian Republic. His endeavors to restore order were frustrated by the Bolshevik propaganda under Bela Kun, and he resigned in March, 1919, living in exile thereafter. In 1925 when his wife became ill in the United States, he applied for a visa to join her and was given one on condition that he refrain from political activity while there. The action of the Government was severely criticized by liberals in the United States. In September, 1928, he visited that country again, but was permitted only a limited stay. He wrote *Fighting the World* vol. i, *The Struggle for Peace* (1924). See HUNGARY, under *History*.

**KARPINSKI, LOUIS CHARLES** (1878- ). An American mathematician, born at Rochester, N. Y., and educated at Cornell University, Columbia, and Strassburg. He taught mathematics at Berea (1898-1900) and at the Oswego (N. Y.) Normal School during 1903-04, but in 1904 accepted a call to the University of Michigan where in 1919 he became full professor of mathematics. Dr. Karpinski has devoted his attention chiefly to the history and pedagogy of mathematics. An authority on the history of science, he was collaborator on the *Archivio di Storia della Scienza* and author of *The Hindu-Arabic Numerals*, with D. G. Smith (1911); *Robert of Chester's Latin Translation of the Algebra of Khwarizmi* (1915); and *Unified Mathematics*, with H. Y. Benedict and J. W. Calhoun (1918). Professor Karpinski also wrote *History of Arithmetic* (1925).

**KASPROWICZ, JAN** (1860-1926). A Polish writer, born at Szymbork. His principal works were *Christus* (1891); *Von bauerlicher Scholle* (1891); *Weltuntergang*, a play, (1891); *Liebe* (1894); *Johannisenachtsmärchen* (1900); *Der untergehenden Welt* (1901). He also translated works of Shakespeare, Goethe, Shelley, Byron, Tennyson, Rostand, and Hautmann.

**KATANGA.** See COOPER.

**KATO, kâ'tô, TOMOSABURO, BARON** (1859-1923). A Japanese admiral and statesman (see VOL. XIII). In the World War, he was commander-in-chief of the First Fleet which guarded Allied transportation from German raiding in the Pacific. After the War, as Minister of Marine, he began to build up Japan's navy. He headed the Japanese delegation to the Disarmament Conference at Washington and afterward won his government's consent to the treaty. His appointment as Premier in June, 1922, was

regarded as a check to the military party. See JAPAN, under *History*.

**KAUFFMAN, REGINALD WRIGHT** (1877- ). An American author (see VOL. XIII). He served on the Mexican border in 1916 and enlisted in 1917 for service in France. His later books include *The Latter Day Saints*, with Ruth Wright Kauffman (1917); *The Azure Rose* (1918); *Our Navy at Work* (1918); *Victorious* (1919); *Money to Burn* (1924); *The Ranger of the Manor* (1924); *Spanish Dollars* (1925); *Seventy-Six!* (1926); *Overland Trail* (1927); *Man of Little Faith* (1927).

**KAUFFMAN, RUTH WRIGHT** (Mrs. REGINALD WRIGHT) (?- ). An American writer and war correspondent, born in New York City, and educated at Bryn Mawr and in Paris, at the Collège de France. During 1905 and 1906, she investigated women's work in department stores, offices, and domestic service, and in 1909 she investigated "white slavery" in the United States and Europe. During the World War, she was correspondent for *Leslie's* and for the *Christian Herald* and was the first woman correspondent at the American front in France. In 1918 she was connected with the publicity department of the American Red Cross. Her writings include: *Women War Workers* (1919); *Three Little Kittens* (1922); *The Boundary Line* (1923); *The "I-Don't-Want-To" Series*, for children (1924); *Route Barrée* (1925).

**KAUFMAN, GEORGE S.** (1889- ). An American playwright, born at Pittsburgh, Pa. For several years he conducted humorous daily columns in the *Washington Times* and the *New York Evening Mail* and was subsequently on the dramatic staff of the *New York Tribune* and of the *New York Times*. He was the author, with Marc Connelly, of many successful plays, including *Dulcy* (1921); *To the Ladies* (1922); *Beggar on Horseback* (1924); *The Butter and Egg Man* (1925); and with Edna Ferber, *The Royal Family* (1927).

**KAUTSKY, kout'ski, KARL JOHANN** (1854- ). An Austrian Socialist (see VOL. XIII). He was one of the most important and prolific writers among the Social Democrats of Germany. During the World War, he supported the Government. In 1919 he published four volumes of documents, pertaining to pre-war history, with marginal notes by the ex-Kaiser, which raised a storm in Germany. In 1920 Kautsky appealed to American Socialists to help reestablish the Socialist Internationale. He was strongly anti-Bolshevik. His later works include *Der Politische Massenstreik* (1914); *Die Vereinigten Staaten Mitteleuropas* (1916); *Die Befreiung der Nationen* (1917); *Serbien und Bulgarien in der Geschichte* (1917); *Habsburgs Glück und Ende* (1918); *Demokratie oder Diktatur?* (1918); *Die Sozialisierung der Landwirtschaft* (1919); *Wie der Weltkrieg Entsteht* (1919); *Delbrück und Wilhelm II* (1920); *Georgien* (1921); *Von der Demokratie zur Staatssklaverei* (1921); *Die proletarische Revolution und ihr Programm* (1922); *Die materialistische Geschichtsauffassung* (1927).

**KAWAKAMI, K. K.** (1875- ). A Japanese writer, born in Tokyo, who was educated in the law in Japan. In 1901 he came to the United States and studied at the universities of Iowa and Wisconsin. In 1905, engaged in journalism, he traveled extensively in China, Siberia, and Russia. He was a correspondent for leading newspapers in Tokyo and a frequent contributor

ARISTIDE BRIAND  
MINISTER OF FOREIGN AFFAIRS OF FRANCE

to American magazines and newspapers. In 1921-22 he covered the Washington Disarmament Conference for the New York Herald Syndicate, and in 1927 he went to Europe for Japanese newspapers. In English his writings include: *Political Ideas of the Modern Japan* (1903); *Asia at the Door* (1914); *Japan and World Politics* (1917); *Japan and World Peace* (1919); *The Real Japanese Question* (1921), and *Japan's Pacific Policy* (1922).

**KAYE-SMITH, SHEILA** (?- ). An English novelist, born at St. Leonard's-on-Sea. Her first published novel was *The Tramping Methodist* (1908). This attracted wide attention and was followed by *Star Brace* (1909); *Spell-land* (1910); *Isle of Thorns* (1913); *Three Against the World* (1914); *Sussex Gorse* (1916); *Little England* (1918); *Tamarisk Town* (1919); *Green Apple Harvest* (1920); *Joanna Godden* (1921); *The End of the House of Alard* (1923); *The George and the Crown* (1925); *Joanna Godden Married, and Other Stories* (1926); *Saints in Sussex*; *Poems and Plays* (1927), and *Iron and Smoke* (1928). She was at her best in country novels in which the influence of native traditions and environments on her characters was vividly portrayed.

**KAZAK REPUBLIC.** See **SIBERIA.**

**KEDAH.** See **MALAY STATES, NON-FEDERATED.**

**KEEN, WILLIAM WILLIAMS** (1837- ). An American surgeon (see **VOL. XIII**). His later works include *Treatment of War Wounds* (1917); *Medical Research and Human Welfare* (1917); *I Believe in God and Evolution* (1922); *Selected Papers and Essays* (1923); and *Everlasting Life* (1924). Also *Keen's System of Surgery*, issued in 8 vols. (1906-21). He has delivered numerous lectures defending animal experiments and was very active during the War in behalf of the Allies. He received special honors from England and France. In 1917 he was appointed a member of the National Research Council.

**KEITH, KETH, ARTHUR** (1864- ). An American geologist (see **VOL. XIII**). As a member of the U. S. Geological Survey, he was in charge of the Geologic Atlas of the United States east of the 100th meridian (1913-21). In 1926 he was appointed a professor in the graduate department of the University of Texas. In 1927 he was president of the Geological Society of America and in the following year was elected to the National Academy of Sciences. He wrote *Outlines of Appalachian Structure and Handbook of New England Geography*.

**KEITH, SIR ARTHUR** (1866- ). A British anatomist and anthropologist (see **VOL. XIII**). He was Fullerian professor of physiology at the Royal Institution, 1917-23, and its secretary from 1922 to 1926. Later, he was Conservator of Museum and Hunterian professor of the Royal College of Surgeons. In 1927 his address, "Darwin's Theory of Man's Descent," delivered as president of the British Association for the Advancement of Science, provoked widespread discussion and led to his publishing *Darwinism and What It Implies* (1928). He also edited and wrote numerous works on anatomy and anthropology, including: *Antiquity of Man* (1914, 2nd ed., 1925); *Menders of the Maimed* (1919); *Engines of the Human Body* (1920, 2d ed., 1925); *Nationality and Race* (1920); *Religion of a Darwinist* (1925); and *Concerning Man's Origin* (1927).

**KELANTAN.** See **MALAY STATES, NON-FEDERATED.**

**KELLOGG, FRANK BILLINGS** (1856- ). An American lawyer and diplomat (see **VOL. XIII**). In 1916 he was elected United States Senator from Minnesota for the term 1917-23 but was defeated for reelection in 1922. In 1923 President Harding appointed him American Ambassador to Great Britain to succeed George B. M. Harvey. On Mar. 4, 1925, he became Secretary of State in President Coolidge's cabinet. In 1928 he negotiated the multilateral treaty renouncing war, known as the Kellogg Pact. The honorary degree of LL.D. was conferred on him by Harvard University in 1929.

**KELLOGG, JOHN HARVEY** (1852- ). An American surgeon and hygienist (see **VOL. XIII**). His later works include *Colon Hygiene* (1915); *The Hygiene of Infancy* (1916); *The New Method in Diabetes* (1917); *Plain Facts*, a summary of some of his older writings (1917); *Auto-intoxication* (1918); *Rational Hydrotherapy* (1918); *The Itinerary of a Breakfast* (1919); *The Health Question Box* (1920); *The New Dietetics* (1921); *Tobaccoism* (1922); *The Natural Diet of Man* (1923).

**KELLOGG, OLIVER DIMON** (1878- ). An American mathematician, born at Linwood, Pa., and educated at Princeton and Göttingen. During 1902-05 he was an instructor at the John C. Green School of Science at Princeton, and during 1905-20 he was at the University of Missouri, where he became full professor in 1910. In 1919 he became a lecturer on mathematics at Harvard and in 1920 an associate professor there, attaining a full professorship in 1927. He has been interested in various problems of integral and differential equations, potential functions, and functional theory, on all of which he has published papers in mathematical journals.

**KELLOGG-BRIAND PACT.** This pact, also referred to as the multilateral treaty for the renunciation of war as an instrument of national policy, was ratified by the United States Senate Jan. 15, 1929, and by most of the nations of the world. Described as "potentially the biggest event in modern diplomatic history," the pact was the result of nearly two years of negotiation between the major powers. The American Secretary of State, Frank B. Kellogg, and the French Minister of Foreign Affairs, Aristide Briand, were its principal sponsors. The negotiations were inspired by the fact that the arbitration treaty between France and the United States was due to expire Feb. 27, 1928.

M. Briand took the initial step on Apr. 6, 1927, in a statement to representatives of the press, in which he suggested the abolition of war as between France and the United States. Interest in this proposal led to the exchange of six notes between M. Briand and Mr. Kellogg beginning in December, 1927. Secretary Kellogg desired to enlarge M. Briand's proposal to include a general multilateral treaty, not only between France and the United States, but between all the powers. Mr. Kellogg wished to ban all war, whereas M. Briand desired to limit the ban to wars of aggression. On Apr. 13, 1928, Secretary Kellogg invited the British, the German, the Italian, and the Japanese governments to join France and the United States in an agreement to sign a treaty the spirit and substance of which was that these governments formally condemned war as an instrument of

their national policy and renounced it in favor of the pacific settlement of international disputes.

To this, France made the following reservations: (1) that the proposed treaty should not become effective until all countries had signed it; (2) that the right of "legitimate defence" still remained; (3) that violation of the pledge not to engage in war by one country would automatically release all other countries; (4) that the treaty should not interfere with the previous obligations of France under the League Covenant, the Locarno agreements or any of her neutrality treaties. In the United States, Senator Borah suggested that if a multilateral pact was not to become an instrument of oppression, the failure of any one signatory to observe its engagement should automatically release the other signatories from their engagements toward the defaulter. It was with these qualifications that the French statesman agreed with the United States to the submission of the draft treaty for the consideration of the German, British, Italian and Japanese governments. The French reservations were not, however, referred to in the Kellogg treaty or letter of transmission.

Thus there were wide differences between the American and the French positions. Mr. Kellogg rejected the French reservations and the French opposed Mr. Kellogg's plan without reservations. Mr. Kellogg proposed to renounce war as an instrument of national policy without conditions. The French reserved for themselves the right to make war under the war clauses of the Covenant of the League of Nations, the treaties of Locarno, and their treaties of alliance. Mr. Kellogg was offering a substitute for alliances. The French proposed to adhere to their alliances. On Apr. 21, 1928, M. Briand made public an alternative draft of the Kellogg treaty embodying the French reservations. He then approved the transmission to the Governments of Great Britain, Germany, Italy and Japan by the United States of the original Briand proposal, and the six notes and other correspondence covering the subject subsequently exchanged between France and the United States. Mr. Kellogg's statement that the right of self defence was inalienable and unimpaired by the treaty provided the ground upon which the other governments announced their willingness to sign. Great Britain on May 19, 1928, accepted the treaty without reservations, but pointed out that for the British Empire the right of self-defence included that of protecting "certain regions of the world" vital to its welfare. A revised draft of Mr. Kellogg's original treaty was then sent out from Washington to fourteen other governments, including the signatories of the Locarno agreements and the British Dominions. It carried a new preamble embodying the French proposal that violation of the pact by any one signatory released the others and was accompanied by a covering letter setting forth the various reservations made and stating that the United States found them acceptable. The draft treaty, which was finally agreed upon, follows:

#### ARTICLE I

The High Contracting Parties solemnly declare in the names of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national policy in their relations with one another.

#### ARTICLE II

The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.

#### ARTICLE III

The present treaty shall be ratified by the High Contracting Parties named in the preamble in accordance with their respective constitutional requirements, and shall take effect as between them as soon as all their several instruments of ratification shall have been deposited at Washington.

This treaty shall, when it has come into effect as prescribed in the preceding paragraph, remain open as long as may be necessary for adherence by all the other powers of the world. Every instrument evidencing the adherence of a power shall be deposited at Washington, and the treaty shall immediately upon such deposit become effective as between the power thus adhering and the other parties hereto.

It shall be the duty of the Government of the United States of America to furnish each Government named in the preamble and every Government subsequently adhering to this treaty with a certified copy of the treaty and of every instrument of ratification or adherence. It shall also be the duty of the Government of the United States of America telegraphically to notify such Governments immediately upon the deposit with it of each instrument of ratification or adherence.

In faith whereof the plenipotentiaries have signed this treaty in the French and English languages, both texts having equal force, and hereunto affix their seals.

Fifteen nations signed the treaty in the Salle de l'Horloge in Quai d'Orsay, Paris, on Monday afternoon, Aug. 27, 1928, a year and a quarter after M. Briand sent his message to the American people. The government heads who signed for the various nations were: Dr. Gustav Stresemann for Germany; Frank B. Kellogg for the United States; Paul Hymans for Belgium; Aristide Briand for France; Lord Cushendun for Great Britain; William Lyon Mackenzie-King for Canada; Alexander John McLachlen for Australia; Sir Christopher James Parr for New Zealand; Jacobus Stephanus Smit for South Africa; William Thomas Cosgrave for the Irish Free State; Lord Cushendun for India; Count Gaetano Manzoni for Italy; Count Uchida for Japan; A. Zales for Poland; Dr. Edward Benes for Czechoslovakia. M. Briand, in the only speech delivered at the ceremony, described the treaty as a "general reinsurance" of the work of the League of Nations. He said that henceforth war, branded with illegality, "is by mutual accord truly and regularly outlawed so that a culprit would incur the unconditional condemnation and probably the enmity of all its co-signatories."

On the day following the Paris ceremony, the United States government sent a note to 48 nations, inviting their adherence to the pact. The invitation to Russia was forwarded through France, inasmuch as the United States had no diplomatic relations with the Soviet Government. By Jan. 1, 1929, 21 nations had ratified the pact and on January 15 the United States Senate ratified it by a vote of 85 to 1. In recommending ratification of the treaty, the Senate Committee on Foreign Relations submitted a report explaining (1) that the right of self defence was not impaired, (2) that the Monroe Doctrine points to a possible menace against which this right of self defence might be exercised, and (3) that the treaty does not bind the United States to take forcible measures against a country that may be deemed to have disregarded it. Consult David Hunter Miller, *The Peace Pact of Paris* (New York, 1928).

**KELLY, GEORGE** (1887- ). An American dramatist, born at Philadelphia and trained

in private schools. He went on the stage in juvenile parts in New York in 1912 and later played in touring companies. For five years he appeared in one-act vaudeville features that he composed himself. He then produced a series of plays beginning with *Finders Keepers* and including *The Torch Bearers*; *The Show-Off*; *Craig's Wife* (Pulitzer Prize, 1925); and *Daisy Mayme*.

**KELLY, HOWARD ATWOOD** (1858- ). An American surgeon (see VOL. XIII). Since 1919 Dr. Kelley has been emeritus professor of gynecology at Johns Hopkins University and consulting gynecologist at the Johns Hopkins Hospital, Baltimore. He is the author (with W. L. Burrage) of *Dictionary of American Medical Biography* (1920, 1928) and he also wrote *A Scientific Man and the Bible* (1925); *Gynecology* (1928); and *Some American Medical Botanists* (1929).

**KELSO, JAMES ANDERSON** (1873- ). An American theologian, born at Rawal Pindi, India. He studied at Washington and Jefferson College, the Western Theological Seminary, and in Germany and was ordained to the Presbyterian ministry in 1898. In 1897 he was instructor in Hebrew at the Western Theological Seminary and was successively professor of Hebrew and Old Testament literature, acting president, and president of this institution (1908- ). He was lecturer at the American School of Research in Jerusalem, 1922-23. He wrote many books on theological subjects, including *A History of the Hebrews in Outline* (1921); and *A Hebrew Prophet and His Message* (1922).

**KEMAL PASHA**, kēm'āl pāshā, GHAZI MUSTAFA (1880- ). A Turkish Nationalist leader and President, who was born at Saloniki, and graduated from the military staff colleges in Constantinople with the rank of captain. A liberal, he founded the "Union and Progress Committee" which caused the downfall of Abdul Hamid and the proclamation of the constitution in 1908. At the outbreak of the World War, when he was military attaché in Sofia (1912-14), he opposed Turkish intervention, but fought brilliantly in Gallipoli, the Caucasus, and Syria. In 1920 he organized a rival government at Angora which gained control of Anatolia, and refused to accept the Treaty of Sévres, signed by the Sultan in Constantinople (later replaced by the more advantageous Treaty of Lausanne, 1923). By treaty with the Soviet Republics of the Caucasus, Kemal Pasha added a portion of Armenia to the Angora government, and by treaty with France, he regained Cilicia (1921). In September, 1922, by his signal defeat of the Greek Armies in Asia Minor, he became virtual master of Turkey, and in November the Sultan was dethroned. In August, 1923, Kemal was chosen president of the newly elected National Assembly, and in March, 1924, first president of the Turkish Republic, proclaimed Oct. 29, 1923. Measures of the National Assembly which were inspired by him were: the exchange of Turks from the Balkans for Christians from Turkey; the abolition of the Caliphate, and the resultant separation of church and state (1924); the abolition of the fez, of polygamy and the veil for women (1925 and 1926); the introduction of the new civil and penal law codes, based on those of Switzerland and Italy, respectively (1926); the census of 1927, and the substitution of the Roman alphabet for the Arabic (1928). Frequent attempts to assassinate Kemal were

made, the offenders being severely dealt with. In 1927 the newly elected National Assembly unanimously reelected him to another four-year term as President. See **TURKEY**, under *History*.

**KEMMERER, EDWIN WALTER** (1875- ). An American economist (see VOL. XIII). Retaining his professorship of economics and finance at Princeton, he also served as financial adviser to the Governments of Mexico (1917), Guatemala (1919), Colombia (1923), Union of South Africa (1925), Chile (1925), Poland (1926), Ecuador (1926-27), Bolivia (1927), and China (1929). In 1925 he was a member of the commission which formulated the Dawes Plan. His later works include: *Modern Currency Reforms* (1916); *The United States Postal Savings System* (1917); *Monetary System of Mexico* (1917); *The A B C of the Federal Reserve System* (1918); and *High Prices and Deflation* (1920).

**KEMP, HARRY HIBBARD** (1883- ). An American author, born in Youngstown, Ohio, and educated at the University of Kansas. He traveled all over North America in the guise of a tramp and made special studies of night life in London and New York. He wrote: *Judas*, a play (1910); *The Cry of Youth*, poems (1914); *The Thresher's Wife*, poems (1914); *The Passing God*, poems (1919); *John Gregory*, a novel (1922); *Tramping on Life*, a novel (1922); *The Sea and the Dunes*, poems (1926); *More Miles*, a novel (1927); *The Bronze Treasury* (anthology, 1927).

**KENDALL, EDWARD CALVIN** (1886- ). An American chemist born at South Norwalk, Conn., and educated at Columbia University. He was research chemist for Parke, Davis & Co., of Detroit, Mich., and also at St. Luke's Hospital, New York, 1911-14. In 1914 he became head of the section of chemistry at the Mayo Clinic in Rochester, Minn., and also professor of biochemistry at the University of Minnesota under the Mayo Foundation. His chief studies have been on the secretions of the human body, especially of the pancreas and the thyroid gland; his valuable researches have included the isolation of the active principles of the latter. For his work on thyroxin, he received the John Scott Prize of the city of Philadelphia in 1921 and the Chandler Medal of Columbia University in 1925.

**KENDALL, (WILLIAM) SERGEANT** (1869- ). An American figure painter (see VOL. XIII). Among his awards from 1914 to 1924 was a gold medal for painting, from the Panama-Pacific International Exposition in 1915. He was dean of the School of Fine Arts at Yale University, 1913-22. Among his later works may be mentioned *Crosslights* and *Intermezzo*.

**KENDRICK, JOHN BENJAMIN** (1857- ). A United States Senator, who was born in Cherokee County, Tex., and received a public-school education. Since 1885 he has been a cattle man in northern Wyoming and southern Montana, owning a large range ranch. He was a member of the Wyoming Senate (1910-14), Governor of Wyoming (1915-17), and U. S. Senator (Democrat) for three terms (1917-35).

**KENLY, WILLIAM LACY** (1864-1928). An American soldier, born at Baltimore, Md. He was graduated from the United States Military Academy in 1889, and was commissioned second lieutenant in the 4th Artillery. He served in Cuba in the Spanish-American War, and later in the Philippines. Before the United States

entered the World War, he had studied aviation, and although he landed in France in command of the 7th Field Artillery, he soon became chief of the air service, American Expeditionary Forces. He held the post from August, 1917, to November, 1917, and then, as brigadier general, was in command of the 2d Field Artillery Brigade, until Jan. 4, 1918. Ordered to the United States in March, 1918, he was appointed director of military aeronautics, with the rank of major general in the National Army. He served in this capacity until March, 1919, and in the following October, he was retired from active service. He was prominent in the organization of the Army Air Service Association in 1918 and was its first president. His war services were rewarded by the Distinguished Service Medal of the United States, a Commandership of the French Legion of Honor, the Order of the Bath of Great Britain, and the Italian Order of the Crown (Grand Officer). After his retirement from the Army, he was vice president of the Marland Oil Company.

**KENNEDY, DANIEL JOSEPH** (1862- ). An American clergyman and educator, born in Knox County, Tenn., and educated in schools in the United States and in Europe. He was ordained to the Roman Catholic priesthood in 1884. He filled chairs in the faculty of colleges in Europe and in 1906 became lecturer on sacramental theology at the Catholic University of America. From 1920 to 1923, he was professor of dogmatic theology at this university. His several books on theological subjects include *Saint Thomas and Medieval Philosophy* (1919).

**KENNEDY, MARGARET (MRS. DAVID DAVIES)** (1896- ). A British novelist who was educated at Cheltenham and Somerville College, Oxford. In 1922 shortly after her graduation from Somerville, she published *A Century of Revolution*, which was long used as a school history text. Up to this time, she had been writing fiction and destroying it all because it was not up to her standards. But in 1923 *The Ladies of Lyndon*, the first novel she thought worthy of preservation, was published, and in the next year *The Constant Nymph*. In 1926, with Basil Dean, she dramatized the novel, and it was a success also in this form. Other books were *Red Sky at Morning* (1927), and *Come With Me*, a play with Basil Dean (1928).

**KENOTRON.** This device, in the interval between 1914 and 1924, was developed from a scientific laboratory toy to a practical article of commerce. It will rectify small alternating currents (0.25 amperes) at 100,000 volts. Four of them have been arranged to rectify both half-cycles of 0.25 amperes at 200,000 volts. The kenotron consists of a hot cathode, platinum, tungsten, or impregnated tungsten, and a cold plate or anode in a high vacuum. The heated electrode emits electrons which are carried to the cathode by the correct potential, but as the cold electrode does not emit electrons there can be no current in the opposite direction. It is based on the Fleming valve. Variations and derivations of this type have been constructed to rectify currents as high as 1500 amperes. These tubes, however, have a small amount of gas in them. Consult a paper by Hull in *Trans. A. I. E. E.*, 1928.

**KENT, FRANK RICHARDSON** (1877- ). An American journalist. He was born at Baltimore, Md., was trained in public and private schools, and studied for a short time at Johns Hopkins

University. After an apprenticeship as reporter on the *Baltimore American*, he went to the *Baltimore Sun* in 1898 and was political reporter, Washington correspondent, and managing editor of that newspaper (1898-1921). Since 1921 he has been vice president. He is editor and owner of the *Maryland Almanac* and has written: *The Story of Maryland Politics* (1911); *The Great Game of Politics* (1923); *The Democratic Party: History* (1928); and *Political Behavior* (1928).

**KENT, NORTON ADAMS** (1873- ). An American physicist, born in New York City, and educated at Yale and Johns Hopkins Universities. During 1901-03 he was an assistant at the Yerkes Observatory and then held the chair of physics (1903-06) at Wabash College. In 1906 he was called to Boston University, where in 1910 he became full professor. He had made original investigations of such subjects as electric sparks in liquids and in air at high pressure, the shift of spark lines due to changed conditions, vacuum tube discharge in magnetic field, and magnetic separation of lithium doublets, on all of which he has published the results of his studies.

**KENT, ROCKWELL** (1882- ). An American artist. He was born at Tarrytown Heights, N. Y. His art studies were followed at Columbia University, and under Chase, Henri, Hayes Miller, and Thayer. He first attracted attention in 1907 with his pictures of Maine, such as *Winter and Seiners*, realistic marines notable for their strength of outline and massing of color. In 1913 he visited Newfoundland and brought back works which included the imaginative *House of Dread*, *A Newfoundland Dirge*, and *The Voyage Beyond Life*, pervaded by a dark atmosphere of mystery. Thereafter, during a sojourn in Alaska in 1918, he produced work of a symbolic and spiritual quality which was highly reminiscent of Blake. Among these decorative, clean-lined drawings, the *Mad Hermit* series was particularly noteworthy. His trip to Tierra del Fuego in a lifeboat in 1922 was also productive of mystical impressions. His work is represented in the Metropolitan Museum, New York, the Art Institute of Chicago, and other museums. He was the author of *Wilderness* (1920); and *Voyaging* (1924), and was editor of *Creative Art*.

**KENTUCKY.** The thirty-sixth State in size (40,598 square miles) and the fifteenth in population; capital, Frankfort. The population increased from 2,289,905 in 1910 to 2,416,630 in 1920, a gain of 5.5 per cent; estimated population, 1928, 2,553,000. The white population rose from 2,027,951 (1910) to 2,180,560 (1920); the native-white, from 1,987,898 to 2,149,780. The number of foreign-born whites fell off from 40,053 to 30,780; that of Negroes, from 261,656 to 235,938. The urban population increased from 555,442 to 633,543 and the rural from 1,734,403 to 1,783,087. The growth of the principal cities was as follows: Louisville (q.v.), 1910, 223,928 and 1920, 234,891; Covington, 53,270 to 57,121; Lexington, 35,099 to 41,534. Newport fell from 30,309 to 29,317.

**Agriculture.** The number of farms decreased 4.5 per cent, or from 270,626 in 1920 to 258,524 in 1925; the acreage in farms decreased from 21,612,772 to 19,913,104, or by 7.9 per cent. The improved land in farms embraced 13,975,746 acres in 1920. Crop land acreage was 6,827,313 in 1925. The total value of farm

property showed an increase from \$773,797,880 in 1910 to \$1,511,901,077 in 1920, but declined to \$963,568,916 in 1925; the average value per farm being \$2986 in 1910, \$5587 in 1920, and \$3727 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. The total percentage of land used for agricultural purposes decreased from 86.3 in 1910 to 84 in 1920 and 77.4 in 1925. Of the total number of farms in 1925, 175,442 were operated by owners; 281, by managers; and 82,801, by tenants. The corresponding figures for 1910 are 170,332, by owners; 993, by managers; and 87,860, by tenants. White farmers in 1920 numbered 257,998, compared with 247,455 in 1910; colored farmers, 12,628, compared with 11,730. There was a decrease in the colored population which noticeably affected the farm-labor situation. Farms reported as under mortgage numbered 40,615 in 1920; 34,088 in 1925. The total number of cattle was 1,093,453 in 1920; 904,983 in 1925; dairy cows, 659,794 in 1920, numbered 387,592 in 1925; swine, 1,504,431 in 1920; 919,304 in 1925; sheep, 707,845 in 1920 and 695,962 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 66,638,000 bushels; wheat, 920,000; oats, 7,930,000; potatoes, 5,985,000; sweet potatoes, 1,246,000; tobacco, 306,000,000 pounds; and hay, 1,725,000 tons. Comparative figures for 1913 are corn, 74,825,000 bushels; wheat, 9,860,000; oats, 3,168,000; potatoes, 2,450,000; and tobacco, 281,200,000 pounds.

**Mining.** Kentucky is an important producer of minerals. It ranked eighth in the value of these products in 1927. Its resources are limited almost entirely to nonmetallic minerals, since there is but little metal mining in the State; in the order of their value, they are coal, petroleum, clay products, and natural gas. The progress of the industry during the period from 1914 is indicated by comparative figures. The coal production in 1914 was 20,382,763 net tons, valued at \$20,852,463; 1916, 25,393,997, \$30,193,047; 1917, 27,807,971, \$60,297,653; 1918, 31,612,617, \$80,666,642; 1920, 35,690,762, \$146,576,000; 1921, 31,588,270, \$55,092,600; 1926, 62,924,462, \$109,740,000; 1927, 60,123,998, \$119,249,000. The increased value of production in the War years was largely due to the decreased purchasing power of money and the consequent higher prices received for commodities. The output of petroleum has varied in recent years from 502,441 barrels in 1914 to 3,088,100 barrels in 1917; 4,367,968 in 1918; 8,738,000 in 1920; 9,012,600 in 1921; 8,973,200 in 1922; 6,274,000 in 1926; 6,719,000 in 1927; and 7,359,000 in 1928. In addition to the minerals mentioned, the State produced in 1926, 10,410,000 M feet of natural gas; also gasoline, sand and gravel, and stone. The total value of the mineral products was \$152,614,177 in 1927; \$146,768,273 in 1926; \$195,920,036 in 1920; \$110,305,840 in 1919; \$104,165,945 in 1918; and \$26,668,474 in 1914.

**Manufactures.** The census of 1920 reported eight cities of more than 10,000 inhabitants, the combined populations of which were 17.9 per cent of the total for the State. In 1919 these cities reported 72.7 per cent of the value of the State's manufactured products. In 1909 there were in the State 4776 manufacturing establishments; in 1919, 3057; in 1925, 1860; and in 1927, 1851. Persons engaged in manufactures in those years numbered 79,060, 83,954, 76,562;

and 74,912, respectively. Capital invested amounted to \$172,778,805 in 1909 and \$270,535,395 in 1919. A great increase in the value of products occurred prior to 1920. It was due chiefly to the change in industrial conditions brought about by the War. Yearly values of factory products were: 1914, \$230,249,000; 1919, \$395,660,000; 1925, \$453,731,042; and 1927, \$447,764,961. Flour-mill and gristmill products are important in point of value, with \$22,365,000 in 1909; \$45,774,000 in 1919; and \$29,940,276 in 1925. The lumber and timber industry is extensive, amounting in 1909 to \$21,381,000; 1919, \$34,456,000; 1925, \$12,579,228; 1927, \$12,201,912. The construction and repair industry ranks high, with products in 1909 worth \$6,535,000; 1914, \$13,344,000; 1919, \$30,598,000. In 1926 tobacco manufactures produced 85,172,000 cigars, 459,060,000 cigarettes, and 38,112,000 pounds of tobacco and snuff. The value of tobacco products in 1927 exclusive of cigars and cigarettes which were \$8,886,409 was \$20,047,231. The chief manufacturing cities of the State are Louisville, Covington, and Newport. In Louisville, in 1909, there were 903 establishments with products valued at \$101,284,000; in 1919, 767, with \$204,566,000; in 1925, products valued at \$263,693,000. In Covington in 1909 there were 196, with \$8,712,000; in 1914, 161, with \$8,265,000; and in 1919, 133, with \$17,121,000. In 1909 Newport had 144 manufacturing establishments with products valued at \$6,491,000; 1914, 100, with \$8,306,000; 1919, 81, with \$16,935,000.

**Education.** The educational problems of Kentucky are unusually difficult because of the isolation of many of its communities and the difficulty of administering to their needs through schools. Much progress has been made toward surmounting this difficulty. In 1919 a measure created a survey commission, providing for a State educational survey. The services of experts under the employ of the General Education Board were secured and more than 18 months were spent in making the survey. The General Assembly in 1920 enacted laws increasing the salaries of teachers and county superintendents and providing means by which money could be obtained, a compulsory-education law, and a law providing for health education in schools. The most important of all, was the county school administration law, creating county boards of education to fix the rate of the school levy and to appoint a county superintendent. In 1918 the minimum salary for teachers was made \$45 a month, and in 1920 this was increased to \$75 a month. In 1916 there were 149 high schools with an enrollment of 18,850; in 1925-26, 707 secondary schools, with an enrollment of 45,486. The junior high-school movement made progress. Enrollment in the schools has steadily increased. The total enrollment in the schools in 1914 was 517,290; in 1925-26 it was 575,482. Expenditures for schools were \$13,615,133 in 1921; in 1925-26 they were: current, \$15,641,089; outlays, \$1,958,274. The percentage of illiterates decreased from 14.5 in 1910 to 10.6 in 1920: among the native white population, from 12.8 to 9.2; among the foreign-born whites, from 8.2 to 7.5; among the Negroes, from 34.7 to 26.4.

**Finance.** State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$17,971,261 (of which \$5,421,646 was aid to local

education); for interest on debt, \$618,388; for permanent improvements, \$11,143,001; total, \$29,732,590 (of which \$11,116,658 was for highways, \$2,599,000 being for maintenance and \$9,517,658 for construction). Revenues were \$30,719,702. Of this, property and special taxes formed 36.8 per cent; departmental earnings and charges for officials' services, 7.5 per cent; sales of licenses and the tax on gasoline, 39.5 per cent. Property valuation was \$2,923,088,336; State taxation thereon, \$10,193,642. Net funded State debt on June 30, 1927, was \$2,503,153.

**Political and Other Events.** Republicans made gains in certain recent election years. In 1914 two United States Senators were elected; they were J. N. Camden, elected to fill out the term of Senator Bradley, and J. C. W. Beckham, both Democrats. In 1915, when A. O. Stanley was elected governor, the Democrats retained all the offices except that of Secretary of State. In 1916 the Republicans made a strong effort to carry the State. In the presidential voting of this year, President Wilson received 269,990 votes; Charles E. Hughes, 241,854. On Sept. 4, 1916, the Lincoln Memorial at Hodgenville, built over the log-cabin birthplace of Abraham Lincoln, was formally presented to the nation by the Lincoln Farm Association; the speech of acceptance was delivered by President Wilson. On Nov. 5, 1917, the United States Supreme Court declared unconstitutional a race segregation ordinance passed by the city of Louisville in 1914. In 1918 Gov. A. O. Stanley, Democrat, was elected United States Senator. In 1919 the Republicans elected their candidate for Governor, E. P. Morrow. In 1920 the Republicans were again successful, electing R. P. Ernst, Senator; for President, J. M. Cox received 456,497 votes; W. G. Harding, 452,480. In 1923 the Democrats elected as governor William J. Fields. The presidential vote of 1924 was: Coolidge, 398,966; Davis, 374,855; LaFollette, 38,465. Flem D. Sampson, Republican, ran for governor in 1927, proposing that the State supply free textbooks, and was elected, though other State offices went to Democrats. Movements made progress, in 1927 and after, for the preservation of Mammoth Cave and Cumberland Falls. The vote for President in 1928 was: Hoover, 558,064; Smith, 381,070.

**Legislation.** The Legislature of Kentucky meets biennially, in even years. The Legislature of 1916 created the Workmen's Compensation Board, and passed several important laws relating to the regulation of the liquor traffic. In 1917 a modern tax was enacted. The Legislature in 1918 provided for a State bar examination. In 1919, State-wide prohibition was adopted. In 1920 the child-labor laws were amended, a State department of roads and highways was created, a prohibition-enforcement act was passed, a measure providing for the suppression of mob violence and the prevention of lynching was enacted, the State school system was modernized, a Department of Charities and Correction was created, the election laws were amended, and provisions were made for a State tuberculosis sanatorium. In 1922 a State coöperative marketing act was passed. In 1924 the Legislature passed a law requiring daily readings from the Bible in the public schools, restored the forestry department, and created a State park commission. In 1928 was enacted a law for purchase of school textbooks at State expense. A five-cent gasoline tax was rendered permanent, and a State judicial council was created.

**KENTUCKY, UNIVERSITY OF.** A State institution for the higher education of men and women at Lexington, founded in 1858. The enrollment increased from 1245 in 1914 to 2456 in the autumn of 1928, with an additional 1309 in the summer session of that year. The faculty increased from 75 to 237 members, and the library from 30,000 to 85,757 volumes. During the same period, the income increased from \$400,000 to \$1,364,573. The courses in economics, sociology, botany, zoölogy, music, art, and agriculture, were enlarged; courses in public health and hygiene were established; a college of education was created in 1923; and following upon changes in curriculum and faculty organization in 1925, Prof. Edward Wiest, formerly head of the department of economics and sociology in the arts and science college, became dean of the school of commerce, organized in that year. Art and chemistry buildings were constructed, also a new residence hall for women; additions to the plant in the following year consisted of a stock-judging pavilion, a new theatre, and an engineering shop. A gift of 15,000 acres from the E. O. Mountain Fund in 1923 provided opportunity for experiment in re-forestation, horticulture, farming, and stock-raising in the mountains of eastern Kentucky. The University in 1928 comprised seven colleges: Arts and sciences; agriculture; engineering; law; education; commerce; and the graduate school. Frank Le Round McVey, Ph.D., LL.D., succeeded Henry Stites Barker, LL.D., as president in 1917.

**KENWORTHY, JOSEPH MONTAGUE** (1886- ). A British sailor and member of Parliament, who was trained at the Royal Naval Academy. He entered the British Navy in 1902 and retired in 1920 with the rank of commander, after having served throughout the World War. Elected to Parliament from Central Hull as a Liberal in 1919, he joined the Labor Party in 1926 but retained his seat. He is the author of *Will Civilization Crash?* (1927); and *Freedom of the Seas*, with George Young, (1928).

**KENYA, KĀ'nĕ-a, COLONY AND PROTECTORATE.** A British Crown colony in Africa, formerly known as the East Africa Protectorate, but after July, 1920, as the Kenya Colony. The protectorate is a strip of territory along the coastline 10 miles broad, leased from the Sultan of Zanzibar. The area is about 225,100 square miles; the population, in 1926, was estimated at 2,736,517, of whom 12,529 were Europeans, 30,583 Indians, and 10,557 Arabs. The largest city, Mombasa, had a population of 39,824 in 1926; the capital, Nairobi, 32,464. Most of the highland area suitable for white settlers was preempted by 1921. The land was being sown in maize and coffee in increasing quantities, while livestock breeding, dairying, etc., were coming in for more and more attention. The colony continues to prosper; imports and exports increased steadily from 1914 on, except for a passing setback in 1919-20. In 1913-14, imports were valued at £2,147,937; in 1920-21, they were £6,911,858; in 1927 £7,097,180. In 1913-14 exports were £1,482,876, while in 1920-21 they were £5,000,920, and in 1927 £5,397,216. Shipping increased somewhat, or from 3,565,795 tons entered and cleared in 1913-14 to 3,615,935 tons in 1927. Leading exports were hides and skins, grain, copra, coffee, and fibre. Revenues and expenditures mounted after 1914. In 1913-14 revenues were £1,133,708 and expenditures; £1,115,899; in 1922, £1,049,032 and £1,-

972,212; in 1927, £2,846,110 and £2,515,115. The State railway, by 1928, had been increased to 1109 miles. The annual railway surplus, beginning with 1920, was devoted to the railway construction fund. In connection with the trade figures above, it should be noted that in 1917 Uganda and Kenya were united in a customs union. See UGANDA.

**History.** In 1920 this protectorate, formerly known as the East Africa Protectorate, was changed to a Crown colony with the name Kenya Colony and placed under the British Colonial Office. The year before, in July, 1919, a measure of self-government was granted the territory when Europeans were permitted to elect 11 members to the Legislative Council; Indians were to be represented by two nominated members, and Arabs by one. The Government maintained its ascendancy by reserving the right to nominate enough members of the council to assure its control. Kenya became the storm centre of a famous controversy, reverberations of which soon were to be heard all over the British Empire. From 1896 on, Indians had come to the country in increasing numbers in the rôle of money lenders, traders, and artisans, so that after the World War there were 22,822 of them to 9561 Europeans. The restrictions placed on them by the whites were onerous. In particular, Indians in Kenya objected to the reservation of the Highlands for Europeans; commercial and residential segregation in the towns; the limited franchise; and restrictions on Indian immigration. The Indian position derived strength from the significant resolution passed by the 1921 Imperial Conference, favoring citizenship for Indians in the Empire. The question was whether the Indians were to be recognized as citizens of the Empire or as a subject race. Disagreement, continuing until 1923, became daily more bitter. A programme of 1923 which included a further extension of the franchise for Indians, based on a white majority of seven to four, and the abandonment of segregation and embargo on immigration, pleased neither side. The danger of open violence now spurred the British government to action. A conference was called, and the Colonial Office decided to compromise by establishing the principle of an Imperial trusteeship, based on neither European nor Indian self-government. The settlement, as finally effected, called for a communal franchise with five elected Indians and 11 Europeans, though with the official majority retained; the continuance of immigration regulations then in existence; the reservation of the Highlands for Europeans; the abolition of all segregation.

A new constitution was adopted in December, 1925, under which the executive council consists of eleven members in addition to the governor, while the legislative council consists of eleven elected European members, five elected Indian members, one member nominated to represent African interests, one elected Arab member, and a sufficient number of *ex-officio* and nominated official members to give these a majority. A treaty signed between Great Britain and Italy in July, 1924, resulted in the transfer, in June, 1925, of the Juba River and a strip 50 to 100 miles wide on the British side of the river. During 1926 and 1927 a commission investigated the boundaries of the ceded territory.

**KENYON, SIR FREDERIC GEORGE** (1863- ). An English classical scholar and archæ-

ologist (see Vol. XIII). He was president of the British Academy (1917-21), professor of ancient history in the Royal Academy (1918), and president of the Society for the Promotion of Hellenic Studies (1919-24), the Bibliographical Society (1924-26), and the Union Académique Internationale (1928). In 1925 he was knighted and made warden of Winchester College and in 1927 he was Romanes lecturer at Oxford. During the World War, he served in France as a lieutenant colonel in the Territorial Force. He was the author of *Ancient Books and Modern Discoveries* (1928).

**KENYON, WILLIAM SQUIRE** (1860- ). An American jurist (see Vol. XIII). He was elected United States Senator from Iowa in 1911 and, being successively reelected, served until 1922, when he resigned following his appointment by President Harding as judge of the United States Circuit Court. While in the Senate, he was leader of the so-called "farm bloc" and was an aggressive supporter of progressive legislation. In May, 1920, President Hoover appointed him a member of the National Law Enforcement Commission.

**KENYON COLLEGE.** An institution at Gambier, Ohio, for men, founded by Philander Chase, first bishop of the Protestant Episcopal Church in Ohio, and incorporated in 1824. The corporation maintains two schools, an undergraduate college of letters and arts, and a divinity school. In the college, the student enrollment increased from 136 in 1914 to 253 in the autumn of 1928, the enrollment being limited to 250. The faculty increased from 14 to 24, and the library from 27,000 to 45,000 volumes. The endowment was increased from \$520,000 to \$1,024,000, the income in 1928 being \$208,000. A total of \$600,000 was added to the endowment fund in 1921. In 1923 a dormitory, designed to house 100 students, and to be known as Leonard Hall, in honor of the Bishop of Ohio, was under construction at a cost of \$200,000; a central heating plant was under construction at the same time. In 1926 the Samuel Mather Science Hall, a gift of Henry G. Dalton of Cleveland, Ohio, and costing \$350,000, was dedicated. President, William F. Peirce, L.H.D., D.D.

**KERENSKY, KÉR-én'-kě, ALEXANDER** (1881- ). A Russian Socialist leader, born in Siberia and graduated in law from the University of Petrograd, where he practiced for some years. He entered the Third Duma in 1912, was an impassioned and forceful speaker and became a leader in the Fourth Duma by 1917. After the overthrow of the Czar, Kerensky was Minister of Justice in the Lvov coalition ministry until May, when he became Minister of War. In July, he became premier. He attempted to reorganize the Russian Army and make it a potent factor again in the struggle against the Central Powers, but was hampered on every side by the activities of the Bolsheviks and disgruntled military leaders. In September, 1917, he was able to crush an abortive revolt led by General Kornilov, but by November, he was unable to withstand the Bolsheviks, who drove him from power. After his downfall, he visited many of the capitals of Europe, finally establishing an anti-Bolshevik newspaper in Paris. In 1928 he lectured in the United States on anti-Bolshevik propaganda. See RUSSIA, *History*.

**KERE, ALFRED** (1807- ). A German critic, born at Breslau. He edited the magazine *Pan*, and his published works include;

*Davidsbündler: das Neue Drama* (1904); *Die Harfe* (1918); *Die Welt im Drama* (1918); *Die Welt im Licht* (1920); *Der Krämerspiegel*, a play with music by Richard Strauss, *New York and London* (1923); *O Spanien!* (1924); *Yankee-land* (1925); *Caprichos*, poems (1926); and a book of reminiscences and reflections, *Es sei wie es wolle, es war doch so schön* (1927).

**KERR, JAMES MANFORD** (1851- ). An American legist, born near Tippecanoe City, Ohio, and educated at the National Normal University, Lebanon, Ohio. He began to practice law in Ohio in 1877. He edited several law periodicals, founded the *American Law Journal*, and became editor for the Bender-Moss Company and the Bancroft-Whitney Company, law book publishers of San Francisco, Calif. His numerous writings include: *Before and at Trial* (1889); *Business Corporation* (1890); *Cyclopaedic California Civil Code*, 2 vols. (1905); *Cyclopaedic California Penal Code* (1906; 2d ed., 1921); *Cyclopaedic California Political Code* (1906; 2d ed., 1921); *Cyclopaedic California Code of Civil Procedure*, 2 vols. (1907; 2d ed., 1921-22); *Kerr's Wharton on Criminal Law*, 3 vols. (1912); *California Digest*, 10 vols. (1915-17); *Biennial Supplement* (1917); *Kerr's Wharton's Criminal Procedure, with Forms*, 4 vols. (1918); *Kerr's Pleading and Practice under the Procedural Codes*, 2 vols. (1919); *Biennial Code Supplement* (1923).

**KERR, SOPHIE** (Mrs SOPHIE KERR UNDERWOOD) (1880- ). An American novelist, born at Denton, Md. She was educated at Hood College, Frederick City, Md., and the University of Vermont. She began to write stories at 18 years of age and did newspaper work in Pittsburgh, Pa., for a few years, and then went to New York City, where she was managing editor of the *Woman's Home Companion*. She contributed stories to practically all the major magazines in the United States. Her novels include: *Love at Large* (1916); *The Blue Envelope* (1917); *The Golden Broom* (1918); *The See-Saw* (1919); *Painted Meadows* (1920); *One Thing Is Certain* (1922); *Confetti* (1927).

**KESSEL, JOSEPH** (1898- ). A French writer, of Russian descent, whose best novel was *L'équipage* (1923). His other works include *Les rois aveugles*, with Hélène Iswolsky (1925); *Terre d'Amour* (1927); *Les cœurs purs* (1927); and *Nuits de Sibérie* (1928), short stories.

**KETTERING, CHARLES FRANKLIN** (1876- ). An American electrical engineer and inventor. He was born in Ashland County, Ohio, and after receiving technical training in Ohio State University (B.E. and M.E., 1904), joined the electrical department of the National Cash Register Company at Dayton, Ohio. In 1914 he organized the Dayton Metal Products Company and later became president and general manager of the General Motors Research Corporation and president of the Dayton Engineering Laboratories Company. He invented a starting, lighting, and ignition device for automobiles which came to be known as the "Delco." He also invented and put on the market the Delco light for farm houses. He was elected to the National Academy of Sciences in 1928.

**KEUTGEN, FRIEDRICH WILHELM E.** (1861- ). A German historian and professor of history at the University of Hamburg. He was born at Bremen and studied at Giessen, Göttingen, and Strassburg. He was lecturer at Johns Hopkins University in Baltimore in 1904-05, and

organized and became lecturer at the Kolonial Institut in Hamburg in 1910. He wrote *Die Hansa in England im Vierzehnten Jahrhundert* (1890); *Die Aufgabe der Genealogie* (1899); *Der Grosshandel im Mittelalter* (1902); *Handelsgeschichtliche Probleme* (1904); *Britische Reichsprobleme und der Krieg* (1914); *Entstehung des Britischen Weltreichs* (1915); *Das Britische Kolonialreich* (1915); and *Der Deutsche Staat des Mittelalters* (1918).

**KEY, PIERRE VAN RENSSELAER** (1872- ). An American editor, born at Grand Haven, Mich., and educated privately and at the Chicago Musical College. For several years, he was music critic on the staff of newspapers in Chicago, and from 1907 to 1919, he was music editor of the *New York World*. In the latter year, he founded and became editor of the *Musical Digest*. He contributed many articles on musical subjects to newspapers throughout the country, compiled the *Music Year Book*, 1926-27, and wrote biographies of McCormack and Caruso.

**KEYES, FREDERICK GEORGE** (1885- ). An American physical chemist, born at Kingston in Canada, and educated at Rhode Island College and Brown University. After teaching chemistry at Brown, he went to the Massachusetts Institute of Technology as research associate in physical chemistry in 1909. During 1913-16 he was chief engineer of the Cooper Hewitt Electric Company and then returned to the Institute of Technology, where in 1920 he became director of the research laboratory in physical chemistry and in 1922 head of the department of chemistry. His own researches have included equilibrium measurements, gas and liquid phase, thermodynamic properties of ammonia, and low temperature in connection with the kinetic theory of development, which he has published in technical journals. During the World War, he was director of the research and control laboratory of the Chemical Warfare Service at Puteaux, France. He is the author of *The Thermodynamic Properties of Ammonia* (1916).

**KEYNES, KÄNZ, JOHN MAYNARD** (1883- ). An English economist and publicist. He was educated at Eton and King's College, Cambridge, and then entered the civil service in the India Office (1906-08). He was on the Royal Commission on Indian Finance and Currency (1913-14), and in the Treasury (1915-19), acting as its principal representative at the Paris Peace Conference (1919), besides being the Chancellor of the Exchequer's deputy on the Supreme Economic Council. His work in Paris gave him world-wide distinction. He was among the first to protest against the rigorous provisions of the reparations clauses of the Versailles Treaty. He wrote *Economic Consequences of the Peace* (1919) and *A Revision of the Treaty* (1922). A chapter of the former contained the now famous attack on the visionary character of President Wilson's programme. His other writings include *Indian Currency and Finance* (1913); *A Treatise on Probability* (1921); *Money and Foreign Exchange* (1923); *A Short View of Russia* (1925); and *The End of Laissez-Faire* (1926). He was editor of the *Economic Journal* (1912- ), chairman of *The Nation* (1923- ), and secretary of the Royal Economic Society.

**KEYSER, CASSIUS JACKSON** (1802- ). An American mathematician and philosopher (see Vol. XIII). His works published after

1914 include *The Human Worth of Rigorous Thinking* (1916); *Mathematical Philosophy, a Study of Fate and Freedom* (1922); *Thinking about Thinking* (1926); *Mole Philosophy, and Other Essays* (1927).

**KEYSERLING**, kī'zēr-ling, HERMANN ALEXANDER, COUNT VON (1880- ). A leading German social philosopher, born at Kōnno in Livonia. His family came from the wealthy German-speaking nobility of Baltic Russia. After his education at the universities of Dorpat, Heidelberg, and Vienna, he took a trip around the world. He interested himself in natural science and in philosophy, and before the World War, he was known both as a student of geology and as a popular essayist. The Russian Revolution deprived him of his estate in the Baltic, and with the remains of his fortune, he founded the Gesellschaft für Freie Philosophie (Society for Free Philosophy) at Darmstadt. The mission of this school was to bring about the intellectual reorientation of Germany. Although not a doctrinaire pacifist, Keyserling believed that the old German policy of militarism was dead for all time and that Germany's only hope lay in the adoption of international, democratic principles. His political and social writings include: *Europas Zukunft* (1918); *Deutschlands Wahre Politische Mission* (1919); *Was Uns Not Tut und Was Ich Will* (1919); *Peace or War Everlasting* (1920); and *Politik, Wirtschaft, und Weisheit* (1922). His more speculative writings include: *Das Reisetagebuch einer Philosophen* (1919); *Philosophie als Kunst* (1920); *Weisheit und Sinn* (1922); *Schöpferische Erkenntnis* (1922, published in English in 1928 as *Oreative Understanding*); *Wiedergeburt* (1925); *Die neuentstehende Welt* (1925, in English trans., *The World in the Making* 1927), and *Menschen als Sinnbilder* (1926). He also compiled a symposium called in English, *The Book of Marriage* (1926).

**KIAOCHOW**. See SHANTUNG; JAPAN, under *History*.

**KIDNEY DISEASE**. See NEPHRITIS.

**KILLIAN**, GUSTAV (1860-1921). A German laryngologist, born in Mainz, and educated at the University of Freiburg-im-Breisgau. He made revolutionary advances in the diagnosis and treatment of affections of the infralaryngeal passages, especially in the diagnosis and removal of foreign bodies in the bronchial tubes, by means of his new art of bronchoscopic control. His first college appointment was as assistant to Professor Hack of the chair of otolaryngology in Mainz. The sudden death of Hack led to his succession by Killian. His revolutionary activity in bronchoscopy gained him an appointment as professor of laryngology in the University of Berlin; this was the first professorship of such scope in Germany. Killian introduced another innovation known as suspension laryngoscopy into the technic of his specialty. He wrote no monograph on the bronchoscope, and the omission has been supplied by his pupils. His book, *Die Schwebelaryngoskopie* appeared in 1920; in collaboration with Voss, he wrote a volume on military experience, *Gehörorgan, Obere Luft, und Speisengänge* (1921). A Festschrift volume was published in 1920.

**KILMER**, JOYCE (1886-1918). An American journalist and poet, born in New Brunswick, N. J. Following his graduation from Rutgers College and studies at Columbia Uni-

versity, he taught for a time and then entered newspaper work in New York City. He contributed to many newspapers and magazines on many subjects, but he was chiefly distinguished for his verse and was recognized as one of the most prominent of the younger American poets. At the outbreak of the World War, he enlisted as a private in the 165th Infantry (69th New York), and in August, 1918, was killed in the course of the American advance which drove the Germans from the Marne salient. His books include *Summer and Love* (1911); *Trees and Other Poems* (1915); and *Main Street and Other Poems* (1915).

**KIMBALL**, (SIDNEY) FISKE (1888- ). An American architectural author, born at Newton, Mass., and educated at Harvard University and in Europe. He was assistant in Harvard and instructor at the University of Illinois from 1909 to 1913. In the latter year, he was appointed instructor in architecture at the University of Michigan and was later assistant professor of architecture and assistant professor of fine arts there. In 1919-23 he was professor of art and architecture at the University of Virginia, and since 1925 has been director of the Pennsylvania Museum and School of Industrial Art. He wrote much on architectural subjects and was an editor of *Art and Archaeology* (1916-23). He designed the McIntire Amphitheatre in West Virginia and many other buildings. He was engaged in the restoration of Monticello, the home of Jefferson, and of old mansions in Fairmount Park, Philadelphia. His writings include *Jefferson and the First Monument of the Classical Revival* (1915); *Thomas Jefferson, Architect* (1916); *A History of Architecture*, with G. H. Edgell (1918); *Domestic Architecture of the American Colonies* (1922); and *American Architecture* (1928).

**KINDERGARTEN ASSOCIATION**, NATIONAL. The Association's work of providing kindergarten training for all children has kept approximately even with the increase in population. In 1920, as in 1924, about 4,000,000 children were not provided for. The number of kindergartens, however, increased from 502, located in 322 towns, and training 209,734 children in 1923, to 962 kindergartens, located in 592 towns, and training 357,100 children in 1928. In order to convince the public of the value of early schooling, the association has secured the cooperation of such organizations as the Parent-Teacher Association, and the Federation of Women's Clubs, in advertising through pamphlets and charts. Continuing the practice started in 1917, it sent by request, with the aid of the U. S. Bureau of Education, articles on home education to 1341 periodicals in the United States and 46 other countries. By 1929 laws facilitating the establishment of kindergartens were passed, on the investigation of the association, in 14 States. Headquarters of the National Kindergarten Association are at 8 West 40th Street, New York City.

**KINDERGARTENS**. See EDUCATION IN THE UNITED STATES.

**KING**, (WILLIAM BENJAMIN) BASIL (1850-1928). An American author (see Vol. XIII). His later books are *The Side of the Angels* (1916); *The High Heart* (1917); *The Lifted Veil* (1917); *The City of Comrades* (1919); *The Abolishing of Death* (1919); *The Thread of Flame* (1920); *The Empty Sack* (1921); *The Conquest of Fear* (1921); *The Dust Flower*

(1922); *The Discovery of God* (1923); *The Happy Isles* (1923); *The High Forfeit* (1925); *Faith and Success* (1925); and *The Spreading Dawn* (1927). In his later years, he paid much attention to the hypothesis of the survival of life after bodily death; he embodied his theories in some of his stories in a motion picture, *Earthbound*.

**KING, RT. HON. WILLIAM LYON MACKENZIE** (1874- ). A Canadian public official, who was Prime Minister, President of the Privy Council, and Secretary of State for External Affairs (1921-26, and 1926- ) (see VOL. XIII). During the World War, he was active in adjusting the relations between workers and employers, at the same time investigating these relations for the Rockefeller Foundation (1914-17). In 1919 the National Liberal Convention chose him to succeed Sir Wilfred Laurier as leader of the Liberal Party, and he was reelected to the Canadian Parliament in the same year. On Dec. 29, 1921, he took office with his new Liberal government. He was made a member of the Privy Council in 1922, and received honorary degrees from Queen's, Toronto, Harvard, Edinburgh, Yale, and Oxford. He represented Canada at the Imperial Conference in London in 1923, at the same time receiving the Freedom of that city and Sheffield. He wrote *Industry and Humanity—A Study of the Principles Underlying Industrial Reconstruction* (1918).

**KINKELDEY, OTTO** (1878- ). An American musicologist, born in New York. After studying music at Columbia University under MacDowell (1900-02), he went to Berlin, where he took various courses in musicology at the University, under Kretzschmar, Friedländer, Wolf and Stumpf, at the same time continuing the study of the organ under Egidi and filling the position as organist at the American Church (1902-05). Having received the degree of Ph.D. with his dissertation *Orgel und Klavier in der Musik des 16. Jahrhunderts*, he was appointed, in 1909, teacher of organ and theory and librarian at the Institut für Kirchenmusik in Breslau. In 1910 he became dozent of musicology at the University there, and before the end of the year was advanced to the rank of professor. He resigned in 1914 and returned to New York, where, in 1915, he was appointed Chief of the Music Division of the New York Public Library. During 1923-27 he was professor of music at Cornell University, and then returned to his former post at the New York Public Library. He edited Erlebach's *Harmonische Freude* for the *Denkmäler deutscher Tonkunst* (vols. 46-47).

**KINSMAN, FREDERICK JOSEPH** (1868- ). An American clergyman and writer, educated at St. Paul's School at Concord, N. H., and at Keble College, Oxford. He was Protestant Episcopal Bishop of Delaware from 1908 to 1919, but resigned to become a Roman Catholic and was appointed professor of modern church history in the Catholic University at Washington. He wrote: *Principles of Anglicanism* (1910); *Prayers for the Dead* (1914); *Issues before the Church* (1915); *Outlines of the History of the Church* (1916); *Catholic and Protestant* (1918); *Salve Mater* (1920); *Americanism and Catholicism* (1924).

**KIPLING, (JOSEPH) RUDYARD** (1865- ). An English novelist and poet (see VOL. XIII). He was Rector of the University of St. Andrews (1922-25), Doctor of Philosophy at Athens

(1924), and received the gold medal of the Royal Society of Literature (1926). During the World War, in which his only son was killed, he wrote much on subjects connected with the British Army and nation. His writings include *New Armies in Training* (1914); *Sea Warfare* (1916); *A Diversity of Creatures* (1917); *The Years Between* (1918); *Inclusive Verse* (1919 and 1927); *Letters of Travel* (1920); *The Irish Guards in the Great War* (2 vols., 1923); *Land and Sea Tales for Scouts and Guides* (1923); *Debits and Credits* (1926); and *A Book of Words*, containing the first collection of Kipling's speeches and addresses, his views on modern materialism, art, international relations, dreams, etc. (1928).

**KIRBY, ROLLIN** (1874- ). An American cartoonist. He was born at Galva, Ill., and had a public-school training. He became a magazine illustrator in New York (1901-10) and then contributed cartoons, both social and political, to the *New York Mail* (1911), the *Sun* (1912), and the *World* (1913). Since 1914 he has been political cartoonist of the *New York World*. He was awarded the Pulitzer Prize of \$500 for cartoons in 1921 and 1924. In addition to being a cartoonist, he is a writer of verse, articles, and sketches.

**KIRCHSEISEN, KIRK'Ů-zën, FRIEDRICH MAX** (1877- ). A German historian, born at Chemnitz. He studied history and international law at the Universities of Leipzig and Paris, specialized in the Napoleonic era, and became known also for his geographical and literary researches. His writings include a bibliography on Napoleon which was published in German, English, and French (1902); *Die Schriften von und über Friedrich von Gents* (1906); *Napoleon: Auswahl aus Seinen Aussprüchen* (1907); *Napoleon, Sein Leben und Seine Zeit* (1914); *Der Völkerring* (1915-17); *Die Schlacht an der Marne* (1915); *Lord Nelson* (1926); *Die Bastille* (1927); *Moments Napoleons* (1927); *Die grosse französische Revolution* (1928).

**KIRCHWEY, GEORGE W.** (ASHINGTON) (1855- ). An American legal scholar (see VOL. XIII). In 1915-16 he served as warden of Sing Sing Prison and after 1917 was head of the Department of Criminology of the New York School of Social Work. He resigned as Kent professor of law at Columbia in 1916. He served on various committees investigating prisons and in 1918-19 was director of the United States Employment Service.

**KIRGHIZ AUTONOMOUS SOCIALIST SOVIET REPUBLIC.** See SIBERIA.

**KISTEMAECKERS, HENRY (HUBERT ALEX-ANDRE)** (1872- ). A Franco-Belgian writer born at Floreffe and educated at the Athénée Royal and the University of Brussels. He was best known for his plays, which include *Pierrot amoureux* (1890); *Accroche-Cœurs* (1893); *Le premier client* (1903); *L'Instinct* (1905); *Le Marchand de bonheur*, taken from his novel of the same name (1910); *La Plambée* (1912); *L'Emboscade* (1913); *L'Épilée* (1913); *Un Noir, au front . . .* (1918); *Le Roi des palais* (1920); *La Passante* (1921); *En Bombel ou Un mari s'est échappé* (1923); and *L'Amour* (1924). His novels include *L'évolution sentimentale*, a trilogy (1892-98); *Confidences de femmes* (1894); *Les Heures suprêmes* (1897); *Le Frisson du passé* (1900); *L'apprentissage de Lord Will* (1904); *Will, Trim et Cie* (1906); and *Lord Will, aviateur* (1909).

**KITCHENER**, kich'en-ēr, HORATIO HERBERT, first EARL OF (KITCHENER OF KHARTUM) (1850-1916). A British soldier and administrator (see VOL. XIII). When England entered the World War, Kitchener was at home on leave from Egypt and was appointed Secretary of State for War. He built up an army of over 2,000,000 men. Having undertaken to help in the reorganization of the Russian forces, he sailed from Scapa Flow, on the British warship *Hampshire*, on June 5, 1916, to consult with the Czar. His ship struck a German mine off the Orkneys, and he and most of his staff were drowned. Consult: *Kitchener in his own Words*, by J. B. Rye and Horace J. Grosser (1917); *The Life of Lord Kitchener*, by Sir George Arthur, Kitchener's private secretary 1914-16 (1920); *The Tragedy of Lord Kitchener*, by Reginald, Viscount Escher (1921); and *The Truth about Kitchener*, by Victor Wallace Germaines (1925).

**KITTREDGE**, GEORGE LYMAN (1860- ). An American philologist (see VOL. XIII). He has been professor at Harvard for many years and is a very prolific author. In 1924 he received an honorary Litt.D. from Yale University. His later works include: *Chaucer and His Poetry* (1915); *Gawain and the Green Knight* (1916); *Shakespeare* (1916); *Concise English Grammar*, with F. E. Farley (1918); *Dr. Robert Child, the Remonstrant* (1919); *Sir Thomas Malory* (1925); *Witchcraft in Old New England* (1928).

**KLAGENFURT**, klä'g'en-fört', **BASIN**. This region on the southern boundary of the Austrian Republic in the basin of the Drave, with an area about 1200 square miles, was one of the districts most stubbornly contested in the making of the peace after the World War. Although the whole region is a political and economic unit, since the Valley of the Drave, enclosed by highlands, here widens out into a long corridor, its disposition nevertheless presented a peculiar problem, for the northern side of the valley was peopled by German Austrians and the southern, by Slovenes. Its total population was about 150,000, the majority Slovenes but of no pronounced Slavophil sympathies; Klagenfurt, the town, had 28,958 inhabitants (1910), 25,582 of whom were Germans. The failure of the Austrian armistice terms to fix an occupation line for the province of Carinthia, and the desire of the Yugoslavs to push their boundaries as far north as possible, made this region the scene of turmoil and bloodshed for more than six months after the actual close of war. This turn of affairs compelled the Peace Conference to take action. Articles 50 of the Treaty of St. Germain of Sept. 10, 1919, therefore made provision for the dividing of the basin into two zones, A and B. In the southern and larger zone (A), a plebiscite was to be held first, and the disposition of the whole region was then to be thus determined by the vote in this zone: in the event of a favorable Yugoslav vote, A was to go to Yugoslavia and a plebiscite was to be held in B; in the event of a favorable Austrian vote the whole was to go to Austria without further action. An inter-Allied commission took charge of Zone A on July 21, 1920, and on Oct. 10, 1920, the voting took place. In spite of the fears entertained by Austrians for the loss of the district because of the predominantly Slovene population, about 70 per cent, and the fact that Yugoslavs had administered the zone from September, 1919, the vote was in favor of Austria; 22,025

ballots were cast for the Republic and 15,279 for Yugoslavia. The Basin, therefore, reverted to Austria.

**KLEIBER**, ERICH (1890- ). An Austrian conductor, born in Vienna. After graduation from the Prague Conservatory, he began his career as assistant conductor at the Deutsches Landestheater there. In 1912-18 he was conductor at the Hoftheater in Darnstadt, and for the next two years in Barmen-Elberfeld, where his reputation as an operatic and concert conductor was such that he was called to Düsseldorf and then to Mannheim. In 1923 he became the general musical director of the Berlin Staatsoper.

**KLEIN**, JULIUS (1886- ). An American public official. He was born at San José, Calif., and graduated at the University of California. Later, he studied at the University of Berlin, the Sorbonne (Paris), and Harvard (Ph.D., 1915). He was an instructor and assistant professor at Harvard (1915-23), chief of the Latin-American Division of the U. S. Department of Commerce (1917-19), U. S. commercial attaché in Argentina (1919-20), and director of the U. S. Bureau of Foreign and Domestic Commerce (1921-29). He has been Assistant Secretary of Commerce since March, 1929. He is the author of *Mesta: a Study in Spanish Economic History* (1920).

**KLEMPERER**, OTTO (1885- ). A German conductor, born in Breslau. In 1901 he entered the Hoch Conservatory in Frankfurt, but completed his studies under Kwast and Pfitzner in Berlin. Upon Mahler's recommendation, he was appointed conductor at the Deutsches Landestheater in Prague, in 1907, and two years later became first conductor in Hamburg, whence he was called to Strassburg, and in 1917 to Cologne, where he was made general musical director in 1923. The next year he went in a similar capacity to Wiesbaden. In 1926 he was guest-conductor of the New York Symphony Orchestra, and after his return to Germany he accepted the post of conductor and general director of the Preussische Staatsoper in Berlin (there are three great opera houses in Berlin, the Städtische Oper [Charlottenburg], director Bruno Walter; the Staatsoper, Erich Kleiber; the Preussische Staatsoper, Klemperer).

**KLENAU**, PAUL AUGUST (1883- ). A distinguished Danish composer and conductor, born in Copenhagen. He began his musical studies there under Hilmer (violin) and Malling (composition), then continued in Berlin under Halir (violin) and Max Bruch (composition), and in 1904 went to Munich for further study of composition under Ludwig Thuille. In 1907 he became conductor in Freiburg, but the next year resigned and studied conducting with Max Schillings in Stuttgart. In 1914 he returned to Freiburg as first conductor. In 1920 he became conductor of the Philharmonic Society in Copenhagen and at the same time one of the conductors of the Vienna Konzertverein. His compositions comprise three symphonies; a symphonic poem, *Paolo und Francesca*, later expanded into three movements under the title, *Inferno-Pantasia*; a symphonic fantasy, *Jahrmarkt bei London*; a ballad for baritone and orchestra, *Hbbe Skammelsen*; a choral work, *Die Weise von Liebe und Tod des Kornets Rilke*; *Oespräche mit dem Tod*, for contralto and orchestra; the operas *Sulamith* (Munich, 1913), *Klein Idas Blumen* (Stuttgart, 1916), *Kjartan und Gud-*

run (Mannheim, 1918; rewritten as *Gudrun auf Island*, Hagen, 1924); and *Die Lästerschule* (Frankfort, 1927).

**KLIMKE, FRIEDRICH A.** (1878-1924). An Austrian Jesuit. He was born at Golleow and studied classical philology at the university of Cracow. He became professor of philosophy and of the history of philosophy at the Universities of Cracow and Innsbruck and in 1920 was called to the Gregorian University in Rome. His writings include: *Der Deutsche Materialismusstreit im Neunzehnten Jahrhundert* (1907); *Der Mensch* (1908); *Hauptprobleme der Weltanschauung* (1910); *Der Monismus und Seine Philosophischen Grundlagen* (1911); *Monistische Einheitsbestrebungen in der Katholischen Weltanschauung* (1912); *Monismus und Pädagogik* (1918); *Unsere Sehnsucht* (1922).

**KLIMSCH, FRITZ** (1870- ). A German sculptor who was born in Frankfort, and studied at the academies of Frankfort and Berlin. Among his best works are *Salome*, in a private gallery in Berlin; the *Niobid* in Leipsic; a *Dancer* and the *Virchow* monument in Berlin, and a bust of Max Liebermann.

**KLOTZ, OTTO JULIUS** (1852-1924). A Canadian civil engineer and astronomer (see Vol. XIII). He was director of the Dominion Observatory at Ottawa (1916-24), chairman of the National Committee of Canada of the International Astronomical Union in 1920, and president of the American Seismological Society during 1920-21.

**KLUCK, KLUK, ALEXANDER VON** (1846- ). A German general (see Vol. XIII). He led the campaign of the Marne in 1914, was wounded in 1915, and retired in the following year. General von Kluck wrote of his participation in the World War in the volume entitled *Führung und Taten der Erste Armee* (1920).

**KNAPP, BRADFORD** (1870- ). An American agricultural educator, born at Vinton, Iowa, and educated at Vanderbilt University and in law at the University of Michigan. For several years he practiced law in Iowa and until 1911 was engaged in coöperative demonstration work for the Bureau of Plant Industry. In 1911 he was appointed special agent in this bureau and from 1915 to 1920 was chief of extension work in the South for the States Relations Service of the United States Department of Agriculture. In 1920-23 he was dean of the College of Agriculture of the University of Arkansas and director of the State Experiment Station. Since 1923 he has been president of the Oklahoma Agricultural and Mechanical College. Professor Knapp wrote *Safe Farming; How the Whole Country Demonstrated*; and publications for the United States Department of Agriculture.

**KNEISEL QUARTET.** See Music, under *Chamber Music*.

**KNIGHTS OF COLUMBUS.** A Roman Catholic fraternal and benevolent society founded in 1882. In addition to the Supreme Council and the board of directors, there were, on June 30, 1929, 61 State councils and two territorial jurisdictions; and in the 2544 subordinate councils, the insurance members numbered 247,040, and the associate members 390,083.

Carrying out its notable World War relief, the Knights of Columbus opened, in 1919, free evening courses to ex-service men in academic, commercial, trade, and technical subjects. As the number of schools increased, correspondence and home study courses were instituted in 1921,

and in 1923 this opportunity was extended to all members of the Order. In accordance with a plan evolved in 1922, the Knights of Columbus devoted much of their resources to work among boys, and in June, 1926, the first class was graduated from the two-year Boy Guidance course at Notre Dame University. A programme and ritual for a junior order, the Columbian Squires, was accepted in 1925, and further development the following year; the Circles of Squires increased steadily through 1929.

The Supreme Council, in August, 1926, authorized the directors of the Knights of Columbus to assess its members to the extent of \$1,000,000 to finance an educational campaign against the policies of Soviet Russia, particularly against such Bolshevistic activities as were exhibited by the Mexican régime. To this end, approximately 4,000,000 pamphlets on the Mexican situation were distributed through 1928, and numerous lectures delivered throughout the United States.

Benevolence outside the United States included the gift of \$25,000 to aid those suffering from the earthquake in Japan in 1925. In the same year, managers of the society's \$1,000,000 endowment fund for welfare work in Italy completed the fifth large playground erected by the Order in that country. The Knights of Columbus publishes the *Columbia*, a monthly magazine of general character, which had a circulation exceeding 700,000 in 1928. The headquarters of the Supreme Council are located at New Haven, Conn., and in 1928 Martin H. Carmody was the supreme knight; William J. McGinley, the secretary; and D. J. Callahan, the treasurer.

**KNIT GOODS.** See TEXTILE MANUFACTURING.

**KNOX, PHILANDER CHASE** (1853-1921). An American lawyer and statesman (see Vol. XIII). He was reelected to the Senate in 1916 for the term ending 1923. He took a prominent part in debates on the Versailles Treaty and the Covenant of the League of Nations and was the author of the Knox Resolutions, which proposed the repeal of the joint resolution of Apr. 6, 1917, declaring the existence of a state of war with Germany, and in its place the declaration that the state of war was at an end, on the condition that the United States should have possession of the property of the German government in the United States, and of its subjects, until a treaty should be ratified. This resolution was defeated. Senator Knox was one of the chief opponents of the Versailles peace treaty in the Senate.

**KNOX COLLEGE.** A coeducational institution at Galesburg, Ill., founded in 1837. The student enrollment increased from 340 in 1913-14 to 664 in 1927-28, the faculty was increased from 26 to 42 members, and the library from 10,000 to 50,000 volumes. The productive funds were increased in the same period from \$402,601 to \$1,750,000, and the yearly income from \$53,851 to \$210,000. Lyman Kay Seymour Hall, a men's dormitory, union, and commons, costing \$150,000, was erected in 1921; the Henry M. Seymour Library was finished in 1928, completely equipped in every detail. The college had adopted a policy of owning all fraternity houses, which are leased for a long term to the fraternities; two new fraternity houses were built; and three large residences were made over for fraternity purposes. President, Albert Britt, A.B., Litt.D.

**KODÁLY, ZOLTÁN** (1882– ). A prominent Hungarian composer, born in Kecskemét. He received his musical education at the Hochschule in Budapest, where he has been a teacher of theory and composition since 1907. From the beginning, he was fascinated by the Hungarian folk-songs, of which he has collected up to date (1929) nearly 4000. The intense study of these exerted a profound influence upon the formation of his own style as a composer, which is an intimate blending of the characteristics of this folk-music with elements of impressionism, which latter he absorbed from his contact with Debussy during a stay in Paris in the winter of 1906–07. This enthusiasm for folk-song he shares with his compatriot Béla Bartók in collaboration with whom he has published two volumes of these songs, followed by three more volumes edited by himself alone. Besides a treatise, *The Pentatonic Scale in Hungarian Folk-music* (1917; in Hungarian), he also wrote numerous articles on the subject for Hungarian, Italian, and French journals. His original compositions are mainly in the field of chamber music (sonatas, string quartets). His most ambitious work is *Psalmus Hungaricus* (Psalm LV) for tenor, chorus, and orchestra; his best-known work, an orchestral suite arranged from incidental music to Garay's *Háry János*.

**KOEHLER, KÄRLER, WOLFGANG** (1887– ). A German psychologist, born at Reval in Estonia, and educated at the universities of Tübingen, Bonn, and Berlin. After teaching in German schools, he found himself during the World War at an anthropoid research station in German South Africa. There, he conducted investigations on the perceptive capacities of chimpanzees and apes. After the War, he was professor at the University of Berlin. On leave of absence in 1924, he lectured at Clark University, in the United States. His researches in animal psychology led Koehler to become one of the leaders of the new school of German psychology known at the *Gestaltpsychologie* or psychology of forms. His published work comprises, in addition to a number of monographs, the volume, *Die Physischen Gestalten in Ruhe und im stationären Zustand* (1920), and *Intelligenzprüfungen an Menschenaffen* (1921).

**KOESTER, FRANK** (1876–1927). A German-American engineer, born at Sterkrade, Germany. Trained in his profession in Germany, he came to the United States in 1902. His first engagement was with the New York Subway Construction Company, after which he served as engineer with the Guggenheim Exploration Company, the American Smelting and Refining Company, and similar corporations. In 1911 he entered consulting practice in New York City and was lighting expert for Allentown, Scranton, and other cities in Pennsylvania. Besides patenting numerous improvements in plant engineering, he wrote *Steam Electric Power Plants* (1908); *Hydroelectric Developments and Engineering* (1909); *Electricity for the Farm and Home* (1913); *The Price of Inefficiency* (1913); *Modern City Planning and Maintenance* (1914); *Secrets of German Progress* (1915); *Under the Desert Stars*; and *The Gods of the North* (1923).

**KOFFKA, KURT** (1886– ). A German psychologist, born at Berlin and educated at the University of Berlin and at Edinburgh. He became professor of psychology at the University of Gießen and founded the periodical, *Psychologische Forschung*, with a new orientation for

experimental psychology. His published writings include: *Experimentaluntersuchungen zur Lehre vom Rhythmus* (1908); *Ueber Vorstellungen* (1911); *Zur Analyse der Vorstellungen und Ihrer Gesetze* (1912); *Beiträge zur Psychologie der Gestalt* (1919); *Die Grundlagen der Psychischen Entwicklung* (1921); and *Growth of the Mind* (tr., 1924).

**KOKOSCHKA, OSKAR** (1886– ). An Austrian poet, painter, and dramatist, conspicuous among the modernist artists. He became a professor in Berlin. Since the publication of *Die träumenden Knaben*, a poem in free verse illustrated by himself (1908), he has written the plays *Mörder, Hoffnung der Frauen* (1907); *Der brennende Dornbusch* (1911); *Hiob* (1917); *Orpheus und Eurydike* (1919).

**KOLAR, VICTOR** (1888– ). A well-known violinist and composer, born in Budapest, of Bohemian parents. After graduating from the Prague Conservatory, where he studied violin under Kubelik and composition under Dvořák, he came to the United States in 1904. In 1905–07 he was one of the first violinists of the Pittsburgh Symphony Orchestra, then joined the New York Symphony Orchestra, becoming assistant conductor in 1915, and from there went to Detroit, in 1919, as concert master and assistant conductor of the Detroit Symphony Orchestra. He wrote *Symphony in D*; two symphonic poems, *Hiawatha* and *A Fairy Tale*; two orchestral suites, *Americana* and *Lyric*; a string quartet in E minor; pieces for violin; and songs.

**KOLCHAK, KOL'CHUK, VLADIMIR VASILIEVITCH** (1874–1920). A Russian admiral and soldier. During the Russo-Japanese War, he distinguished himself in the defense of Port Arthur, and from 1906 to 1916 he was on the general staff of the navy. During the World War, he showed military ability and became rear admiral in 1916, later being given an independent command in the Baltic and a promotion to vice admiral and commander of the Black Sea Fleet. Following the Revolution in 1917, he became an anti-Bolshevik leader, and his brilliant successes at first gained him virtual leadership. In 1919, however, he gradually lost ground, and at the end of that year, following brief successes, he was obliged to retire to Vladivostok, where, in January, 1920, an anti-Kolchak revolution broke out. On June 24, he surrendered to the revolutionary forces at Irkutsk and was executed. See sections on *HISTORY* in the articles *RUSSIA* and *SIBERIA*.

**KONTI, ISIDORE** (1862– ). An American sculptor (see VOL. XIII). Among his later works, in his refined and decorative manner, were a fountain in Audubon Park in New Orleans, the memorial to Bishop Potter in St. John's Cathedral, New York City, and an ideal work in bronze, *The Genius of Immortality*, in the Metropolitan Museum, New York City.

**KOO, VI KUYUIN WELLINGTON** (1887– ). A Chinese statesman and diplomat who studied at Columbia University and received the degree of doctor of philosophy. He was successively English secretary to President Yuan Shi-kai, councillor in the Foreign Office, Minister to Washington (1915), China's plenipotentiary and then head of her delegation to the Paris Peace Conference, Chinese representative in the Assembly of the League of Nations, Minister to Great Britain (1921), a delegate to the Washington Disarmament Conference (1921–22), Minister of Foreign Affairs at Peking (August, 1922–24),

Finance Minister (1926), and Premier and Minister for Foreign Affairs (1926-27). In 1927 he was appointed China's representative on the International Court of Arbitration at the Hague.

**KOREA, OR CHOSŌN.** A dependency of Japan, occupying the peninsula on the mainland of Asia opposite the main island of Honshū. Area, 85,241 square miles, 82,930 being on the mainland and 2302 in neighboring islands. According to the census figures of Oct. 1, 1925, the population was 19,519,927, as compared with 17,288,989 in 1920. The foreigners numbered slightly more than 45,000, the vast majority of whom are Chinese. The largest cities with their populations at the end of 1926 were: Seoul, 306,363 (81,559 Japanese); Pusan, 106,323 (40,803 Japanese); and Pyong-Yang, 114,371 (23,545 Japanese).

**Production and Industry.** Korea is almost entirely an agricultural country; the cultivated area at the end of 1926 was 11,276,115 acres. The chief crops are rice, barley, wheat, beans, grain of all kinds, tobacco, and cotton. In 1927 the rice crop amounted to 84,998,445 bushels; in the previous year, the barley production was 35,410,630 bushels; agricultural products also included 21,757,687 bushels of soya beans, 157,489,981 pounds of upland American cotton, and 57,149,756 pounds of native cotton. The native industries include textile fabrics, paper, pottery, metal ware, manufactured tobacco, brewed drinks, and leather. All the industries are of the cottage variety. The chief mineral products are gold, silver, zinc, copper, lead, iron, tungsten ore, graphite, coal, quartz, and kaolin. The total value of mineral products in 1926 was 24,130,350 yen.

**Foreign Trade.** 1927 imports amounted to \$181,778,000, consisting principally of cotton gray sheeting, coal, lumber, machinery, cotton fabrics, Chinese hemp fabrics, petroleum, sugar, and cotton yarn. 1914 imports were \$31,615,000. Similarly, 1927 exports amounted to \$170,160,000, consisting principally of rice, beans, raw silk, including tussah silk, iron and steel, fish, ginseng, fertilizer, cotton, gold, cowhides, cattle, paper, and pulp. In 1914 exports were \$17,194,000, consisting of rice, beans, peas, cowhides, ginseng, cotton, and leather manufactures.

**Communications.** The total mileage of government railways open for traffic on Mar. 31, 1928, was 1456.5 miles, and the total mileage of private railways at the same date was 513.8 miles. On Oct. 1, 1928, there was celebrated the completion of the Tanko Railway line between Genzan and Kwainai, a distance of 388.4 miles. Work was also being pushed on the Hei-Gen line between Heijo and Genzan, a route that when completed would cross the north of Korea. Provision was made for the construction of further new lines and the addition by purchase of 210 miles of private railways to the government system. The lines under construction and projected were designed to transport forest products from the upper districts of the Yolu River, minerals from northern Korea, marine products from the eastern coast of the peninsula, and agricultural products from southern Korea. It was estimated that within 10 years the total mileage of all railways in Korea would amount to 3500 miles. All of the lines were well equipped with modern rolling stock.

**Mining.** The principal mineral products of Korea are gold, silver, copper, zinc, lead, iron, tungsten ore, graphite, coal, quartz sand, and

kaolin. Gold mining on a large scale has been carried on by Europeans and Americans, but more recently, mine owners in Japan have begun mining various metals and other minerals in various parts of the peninsula, so that there is a tendency to expand the mining industry more and more each year. The total annual yield of all the mines in Korea in 1916 was 14,078,188 yen. It increased in 1918 to 30,838,074 yen and after the War declined to 14,503,781 yen in 1922, increasing by 1927 to 24,169,229 yen.

**Forestry.** The total area of forests and plains has been estimated at 15,867,762 hectares of which 5,454,545 hectares is occupied by State forests, while the remainder is hilly districts with young trees or bare of trees. The government has encouraged afforestation and the annual cutting of forests amounts to about 1,255,000 cubic meters. In the fiscal year 1927, the receipts from State forests were 6,627,004 yen, the expenses, 4,271,274 yen, leaving a balance of 2,355,730 yen.

**Government Enterprises.** Among the monopolies maintained by the Government is the culture of ginseng, the annual production of which is estimated at 21,000 kilograms and the value at 2,200,000 yen. The manufacture of salt, another government monopoly, has an annual production capacity of 120,000 metric tons. Tobacco also is cultivated as a government monopoly with profit to the Government in 1927-28 of 13,589,150 yen.

**Budget and Finance.** Total expenditures and revenues for 1927-28 were \$157,852,000 (1913-14: \$31,546,744); total debt Mar. 31, 1927, was 298,619,147 yen (\$148,852,000) 1916: \$36,801,000.

**History.** Under Japanese administration, the province progressed materially. Bare hill-sides were afforested, agriculture received the benefit of scientific supervision, and railways were built. Advances were startling in every line of economic activity; but the absolute character of the Japanese authority, the dominance by the military, the refusal to heed the demands for a larger measure of popular government, all contributed to a feeling of resentment which the democratic doctrines of the War finally fanned into open hostility. Throughout 1919 there were everywhere marked evidences of unrest; means of communication were cut; cities were the scenes of mob violence; public officials were attacked and some even killed. The Japanese, on the other hand, retaliated by increasing their garrisons and by employing repressive measures. By April, the riots had taken on so much of the character of actual rebellion that the Japanese Privy Council was spurred into action. A programme of reform introduced during the year included the extension of civil government at the expense of the military and responsibility of the governor to the Japanese Ministry. Korea was made an integral part of the Japanese Empire, and Koreans were put on the same footing as Japanese, nominally at least. Members of the former Korean dynasty and cabinet received Japanese patents of nobility. In 1920, the Korean tariff was assimilated to that of Japan. Meanwhile a revolutionary party, through a committee at Shanghai, promulgated a republican constitution for the "Provisional Government of the Korean Republic." An attempt was made to interest Soviet Russia in the struggle of the Koreans for independence, while natives and friends of Korea in other countries, espe-

cially in the United States, endeavored to show sympathy for Korean aspirations by giving publicity to acts of oppression, violations of the right of pro-Korean missionaries, summary executions of Korean patriots, etc., alleged to have been committed by the Japanese in Korea.

Disorders were suppressed with severity by the military. On Apr. 25, 1926, Prince Yi Wang, the deposed Emperor, died and the Japanese government took extraordinary precautions to prevent an ensuing outbreak. On April 29, Alderman Takayama was assassinated and Alderman Kato stabbed by a Korean. The Japanese tried to placate Korean national feeling by giving the ex-Emperor a most elaborate funeral and decreeing June 10 as a day of mourning throughout the Japanese Empire; but the move did not prevent threats of rioting in Seoul, and some hundreds of arrests were made. In spite of the marked improvement in almost every department of the country's life under Japanese rule, the restless suppressed agitation for independence continued. Lacking other outlet, it appeared to link itself with communist movements, at least in the eyes of the Japanese government. In April, 1927, the courts decided that 99 Koreans arrested in the previous summer must stand trial on the charge of communism. The case dragged on and was not finally decided until February, 1928, when most of the defendants were sentenced to prison. In the same month 33 other communists were arrested in Seoul and in June an attempt was made on the life of the Governor General. These evidences of continued dissatisfaction, however, brought no concessions from the Government and the outlook continued to be apparently most unpromising for the hopes of Korean Nationalists.

**KORNGOLD, ERICH WOLFGANG** (1897- ). An Austrian composer (see VOL XIII). In 1919-26 he was conductor at the Stadttheater in Hamburg. He then returned to Vienna, where he was appointed, in 1927, professor of theory and conducting at the Staatsakademie für Musik. He added to his works the operas *Der Ring des Polykrates* and *Violanta* (both in Munich, 1916; the former in Philadelphia, the latter in New York, 1927); *Die tote Stadt* (Hamburg, 1920; New York, 1921); *Das Wunder der Heliane* (Hamburg, 1927); incidental music to *Much Ado about Nothing*; a symphonic overture, *Sursum Corda*; a piano concerto in C# minor for left hand alone (for the one-armed pianist Paul Wittgenstein); a string sextet in D; a string quartet in A; and a piano quintet in E.

**KORNILOV, LAVR GEORGEVITCH** (1870-1918). A Russian general who entered the army in 1888 and served in the Russo-Japanese War, as Russian military agent in China (1907-11), and as commander in Siberia. On the outbreak of the World War, he commanded a division in Galicia. Captured by the Austrians, he escaped and in 1916 assumed command of the 25th Army Corps. At the outbreak of the Revolution in March, 1917, he was made commander-in-chief of the troops in Petrograd, but resigned on account of lack of discipline and was assigned to the command of the 8th Army Corps. In September, 1917, he attempted to establish himself as dictator by marching on Petrograd, but the movement collapsed and he surrendered. Escaping to the Caucasus, he gathered a force of Cossacks and was killed in action against the Soviet forces in March, 1918. See RUSSIA, under *History*.

**KOROSEĆ, ANTON** (1872- ). A Yugoslav public official, leader of the Slovenian People's Party. He was head of the Slovene delegation to the Croatian-Slovene National Council which voted for union with Serbia in 1918. From July until November, 1924, he was a member of the Yugoslav cabinet headed by Davidović. His party advocates an autonomistic regrouping of the kingdom.

**KOSSAK, WOJCIECH, ADALBERT VON** (1857- ). A Polish painter, born in Paris, who studied under his father and at the Munich Academy. He became widely known for his battle pictures which won the highest awards at Munich, Vienna, Berlin, and Paris. His works are in the National Museum at Cracow, the Royal Gallery in Budapest and in the galleries of Vienna and Berlin. He has lived in Paris since 1902.

**KÖSTER, KÄSTÖR, ADOLF** (1883- ). A German writer and public official, born at Verden and educated at the universities of Halle, Marburg, Heidelberg, and Zurich. He was lecturer at the University of Munich, traveled in England, America, Asia, and Africa, and during the World War was correspondent for Social-Democratic papers. He was Minister of the Interior from October, 1921, to August, 1923. He has written *Die Ethik Pascals* (1906); *Der Junge Kant* (1913); *Die Zehn Schornsteine* (1909); *Die Bange Nacht* (1913); *Der Tod in Flandern* (1915); *Brennendes Blut* (1916); *Der Kampf um Schleswig* (1920); *Können wir weiterkämpfen?* (1921); *Fort mit der Dolchstichlegende* (1922); and *Unser Recht* (1923).

**KOSTROWIECKI, A. VON.** See APOLLINAIRE, GUILLAUME.

**KOUSSEVITZKY, SERGEI (ALEXANDROVITCH)** (1874- ). A Russian conductor and virtuoso on the double-bass (see VOL XIII). In 1910 he founded a publishing house devoted almost exclusively to the publication of modernistic works (Skriabin, Stravinsky, Prokofiev, Medtner, etc.). The revolution of 1917 ended all his activities in Russia. The orchestra was disbanded and the publishing firm confiscated by the provisional government. In 1920 he left Russia and settled in Paris, where he immediately established a series of concerts for the production of modernistic works, and also conducted Russian operas at the Opéra, at the same time undertaking extensive tours as guest-conductor of Germany, England, Italy, and Spain. In 1924 he became conductor of the Boston Symphony Orchestra, which under his direction fully regained its former prestige. He was decorated with the cross of the Legion of Honor (1924), in 1926 was made Mus.Doc. by Brown University. In 1929 he received an honorary LL.D. degree from Harvard University.

**KOWEIT.** See ARABIA.

**KRAEMER, HENRY** (1868-1924). An American pharmacist, born at Philadelphia, Pa., educated at the Philadelphia College of Pharmacy and Columbia and Marburg universities. He was instructor of the New York College of Pharmacy and during 1895-97, professor of botany at Northwestern University. In 1897 he accepted the chair of botany and pharmacognosy at the Philadelphia College of Pharmacy and became also director of the microscopical laboratory. These places he held until 1917, when he accepted a similar chair at Michigan, where he served also as dean. In 1920 he became direc-

tor of the Kraemer Scientific Laboratory. He was editor of the *American Journal of Pharmacology*, 1898-1917, and in 1900 became a member of the committee of revision of the United States Pharmacopoeia. He is the author of *A Textbook of Botany and Pharmacognosy* (1902); *Applied and Economic Botany* (1914); and *Scientific and Applied Pharmacognosy* (1915).

**KRAEPELIN, EMIL** (1856-1926). A German psychiatrist who revolutionized some of the conceptions of insanity. After receiving his degree in medicine, he studied in the psychological laboratory of Wundt and was assistant under Flechsig. He was professor of psychiatry successively at the Universities of Dorpat, Heidelberg, and Munich, and then retired to devote himself to his Research Institute. Kraepelin made trips to the tropics of both hemispheres to study insanity in primitive peoples. His first work on psychiatry was issued in 1883 and he published numerous volumes which were translated into English and French. All of his work, revised to date, was published in four volumes between 1909 and 1915. Kraepelin brought most of the endogenous insanities under two heads, dementia præcox or early mental failure and manic-depressive insanity.

**KRAFT, KRIFT, ZDENKO VON** (1886- ). An Austrian writer, born at Gitschin, and privately educated with special attention to drama and music. His works include: *Adagio Consolante* (1910); *Maria Theresa* (1918); *Missa Solemnis* (1920); and a trilogy of novels on the life of Wagner, *Barrikaden* (1920); *Liebestod* (1921); and *Wahnfried* (1922). Later works are *Alljeder*, stories (1922); *Lord Byron's Pilgerfahrt*, a novel (1924); *Michael Unbekannt*, novel (1925); *Bruder Silverius*, novel (1925); and *Der Sohn der Mutter* (1927).

**KRALIK VON MEYERSWALDEN, RICHARD** (1852- ). An Austrian writer, born at Eleonorenheim in Bohemia and educated at the universities of Vienna, Bonn, and Berlin. His works include: *Maximilian*, a drama (1885); *Deutsche Puppenspiele* (1885); *Kaiser Marcus Aurelius in Wien*, a drama (1897); *Veronica*, a drama (1898); *Rolands Tod* (1898); *Die Revolution* (1908); *Die Katholische Literaturbewegung der Gegenwart* (1909); *Geschichte von Wien* (1911); *Geschichte der Neuesten Zeit* (1914-20); *Die Neue Staatenordnung* (1918); *Grundriss und Kern der Weltgeschichte* (1920); *Abraham a Santa Clara* (1922); *Weltliteratur der Gegenwart* (1923); *Heinrich von Ofterdingen*, a novel (1923); and the plays *Kaiser Julianus* (1923); *Belsazzar* (1923); *Theophrastus Parazelsus* (1925); *Der letzte Nibelung* (1925); *Der wahre Samaritaner* (1927).

**KRAMER, A. WALTER** (1890- ). An American composer, born in New York City. He studied violin with C. Hauser and R. Arnold, but in composition he is practically self-taught. In 1910 he joined the staff of *Musical America*, leaving in 1922 to go abroad. He has contributed to other periodicals. His compositions include a symphonic poem, *The Tragedy of Nan*; four *Sketches* for orchestra; a *Rhapsody* for violin and orchestra; a suite for string orchestras; *The Hour of Prayer* for baritone, chorus, and orchestra; a string quartet; compositions for organ and for piano; and songs.

**KRAPF, GEORGE PHILIP** (1872- ). An American teacher of English, born at Cincinnati, Ohio, and educated at Wittenberg College and at Johns Hopkins University. He served for sev-

eral years as an instructor of English at the Horace Mann School and in Teachers College. In 1907 he was adjunct professor of English at Columbia and, from 1908 to 1910, was a professor at the University of Cincinnati. In the latter year, he was appointed professor of English at Columbia. He was a member of many learned societies and author of *The Elements of English Grammar* (1908); *In Oldest England* (1912); *Pronunciation of Standard English in America* (1919); *Tales of True Knights* (1920); *First Lessons in Speech Improvement* (1922); *The English Language in America* (1925); *Comprehensive Guide to Good English* (1927); *The Knowledge of English* (1927).

**KRAUS, CHARLES AUGUST** (1875- ). An American physical chemist, born at Knightsville, Ind., and educated at the University of Kansas, Johns Hopkins University, and the Massachusetts Institute of Technology, where he was a research associate in physical chemistry during 1908-12 and assistant professor during 1912-14. In 1914-24 he was professor of chemistry and director of the chemical laboratory at Clark University. Since 1924 he has had a like position at Brown University. The subjects of solutions, organic radicals, and vapor electric apparatus have received his attention. He was Nichols Medalist in 1923. He is the author of *Electrically Conducting Systems*.

**KRAUS, EDWARD HENRY** (1875- ). An American mineralogist, born at Syracuse, N. Y., and educated at the Universities of Syracuse and Munich. During 1896-99 he was instructor in German and mineralogy at Syracuse, where he became associate professor of mineralogy in 1902, and in 1902-04 he was in charge of the department of science at the Syracuse High School. In 1904 he was called to the University of Michigan, where in 1919 he was appointed to the chair of crystallography and mineralogy. He was also director of the mineralogical laboratory (1908-19), dean of the summer session (1915- ), and dean of the College of Pharmacy (1923- ). Besides many papers on chemical and physical crystallography and the optical constants of crystal at varying temperatures, he has written *Essentials of Crystallography* (1906); *Descriptive Mineralogy* (1911); *Tables for the Determination of Minerals*, with W. F. Hunt (1911); *Elementary Mineralogy*, also with Hunt (1920); and *Gems and Gem Materials*, with E. F. Holden (1925).

**KRAUSKOPF, JOSEPH** (1858-1923). An American rabbi, born in Germany. In 1872 he emigrated to the United States and received his degrees from the University of Cincinnati and the Hebrew Union College, both in 1883. He was rabbi in Kansas City from 1883 to 1887 and went to Philadelphia in the latter year. He was the founder of the Jewish Publication Society of America and of the National Farm School. In 1898 he was appointed special relief commissioner to Cuba and was special commissioner and agricultural commissioner in Europe for several years following. In 1904-05 he was president of the Conference of American Rabbis and was an official of other societies. He wrote *The Jews and Moors in Spain*; *My Visit to Tolstoy*; *The Seven Ages of Man*; *The Service Manual*; *The Service Ritual*; and many volumes of lectures. From 1917 to 1920, he was representative of Jewish organizations in the Food Conservation Department in Washington.

**KRAUSS, CLEMENS** (1893- ). A distinguished Austrian conductor, born in Vienna. He came of a very musical family, for the famous star of the Paris Opéra, Gabriele Krauss, was his grand-aunt, and his own mother, Clementine, was one of the principal dramatic sopranos of the Vienna Volksoper. At the age of nine, he was a singer in the Imperial Court Chapel, and later studied under Reinhold (piano) and Grädener and Heuberger (composition) at the Vienna Conservatory. After graduation, 1912, he became chorus master at the Stadttheater in Brunn, then second conductor at the Deutsches Theater in Riga (1913-14), in Nuremberg (1915-16), first conductor in Stettin (1916-21), and then conductor at the Opera and of the symphony concerts in Graz (1921-22). In 1922 he went to Vienna as conductor at the Staatsoper and director of the Kirchenmusikschule connected with the Staatsakademie für Musik, and the following year also succeeded Furtwängler as conductor of the Tonkünstlerverein. In 1924-28 he was intendant of the Opera and conductor of the Museumskonzerte in Frankfurt, while retaining at the same time his connection with the Staatsakademie and the Tonkünstlerverein in Vienna. In 1929 he appeared in the United States as guest-conductor of the Philadelphia Symphony Orchestra and the New York Philharmonic-Symphony Orchestra. Returning to Vienna in the fall of 1929, he became director of the Staatsoper there.

**KREGER, EDWARD ALBERT** (1868- ). An American army officer, born at Keota, Iowa, and graduated from the Iowa State College in 1890. He enlisted for the Spanish-American War with the Iowa troops, was commissioned first lieutenant of the Regular Army (1901) and then served in the Philippines and in Cuba. From 1914 to 1917 he was professor of law at the United States Military Academy and in 1917-18 was assistant to the Provost Marshal. He was acting judge advocate general with the Army in France in 1918-19, and was acting judge advocate general of the United States Army in 1919-21, holding the temporary rank of brigadier general in 1918-20. He was judge advocate of the 3d Corps Area, 1924-25; legal adviser in the Tacna-Arica Arbitration, 1925-27; and judge advocate of the 2d Corps Area after 1927. He received the Distinguished Service Cross for heroism in action in the Philippines and the Distinguished Service Medal for distinguished service as acting judge advocate general.

**KREHBIEL, HENRY EDWARD** (1854-1923). An American music critic (see Vol. XIII). In 1917 he published *A Second Book of Operas* and in 1919 *More Chapters of Opera and Parsifal, an English Version for Performance*, which was used by the Metropolitan Opera Company. In 1921 he published *The Life of Beethoven*, in 3 volumes, being a condensation of the 5 volumes of Thayer's German original.

**KRENEK, ERNST** (1900- ). An Austrian composer, born in Vienna. A pupil of the extreme modernist, Schreker, he succeeded from the very outset of his career in surpassing his master and most of the other extremists in sheer extravagance. Being able to feel the pulse of the times, and alert to seize the psychological moment, he capitalized the craze for jazz, which swept all Germany after the tour of Paul Whiteman in 1926, and wrote the farcical jazz opera, *Johnny spielt auf*, which scored an enormous success in Leipzig (1927), quickly made the

rounds of the principal German opera houses and even found its way to Paris (1928) and the Metropolitan Opera House (1929). His other stage works are *Der Sprung über den Schatten* (Frankfurt, 1924), *Orpheus und Euridice* (Kassel, 1926), and the three one-act operas *Der Diktator*, *Das geheime Königreich*, and *Die Ehre der Nation* (Kassel, 1928). All these works confirm in many minds the impression that his only object in writing is caricature or buffoonery. Nor are his numerous instrumental works worthy of serious consideration.

**KRETSCHMER, ERNST** (1888- ). A German physician, anthropologist, and professor of psychiatry at the University of Tübingen. He became distinguished through his writings, the best known being *Körperbau und Charakter* (1921), which had an English translation, and *Medizinische Psychologie* (1922), which was translated into French. Two of his earlier works have recently been reissued, *Der Sensitive Beziehungswahn* (1918 and 1927) and *Ueber Hysterie* (1918 and 1926).

**KROEBER, ALFRED L(OUIS)** (1876- ). An American anthropologist (see Vol. XIII). In 1917 he founded and was president of the American Anthropological Association. He became professor of anthropology at the University of California in 1919 and director of its Anthropological Museum in 1925. He also made anthropological expeditions to Mexico (1924) and Peru (1925-26). In 1928 he was elected a member of the National Academy of Sciences. His later publications include: *Zuni Potsherds and Hohan* (1915); *Floral Relations among the Galapagos Islands* (1916); *Zuni Kin and Clan* (1917); *Tribes of the Pacific Coast* (1917); *The History of Philippine Civilization as Reflected in Religious Nomenclature* (1918); *Kinship in the Philippines* (1919); *Peoples of the Philippines* (1919); *Yuman Tribes of the Lower Colorado* (1920); *Basketry Designs of the Mission Indians* (1922); *Anthropology* (1923); *Archaic Culture Horizons in the Valley of Mexico* (1925); *Archaeological Explorations in Peru, Part I* (1926).

**KROEGER, ERNEST RICHARD** (1862- ). An American organist and composer, born at St. Louis. After completing his entire musical education under local teachers, he served as organist in various churches in St. Louis and as conductor of several choral societies. He traveled extensively as a concert organist. His principal compositions are the overtures, *Thanatopsis*, *Pittoresque*, *Endymion*, *Sardanapalus*, *Hiawatha*, *Atala*, and *Festival*; a symphonic poem, *Mississippi*; four string quartets, a piano quintet, a piano quartet, a piano trio; many pieces for organ and for piano, especially in the larger forms; and over 100 songs.

**KROGH, KRÖK, AUGUST** (1874- ). A Danish physiologist, born in Grenaa and educated at the University of Copenhagen. He devoted himself to the study of anatomy and physiology with special reference to comparative biology and in 1916 was appointed professor of zoophysiology at the University of Copenhagen, in the same year becoming a member of the Danish Royal Society of Science. He published two well-known works which were translated into English and German: *The Respiratory Exchange of Animals and Man* (1916) and *Anatomy and Physiology of Capillaries* (1922). In the same year, he published the *Silliman Lectures* given at Yale University (2d ed., 1928).

In 1903 he received the Seegen Prize from the Academy of Science of Vienna, and in 1920 he was awarded the Nobel Prize for medicine and physiology.

**KRUEGER**, kru'gër, FELIX (1874- ). A German philosopher and psychologist. He succeeded to the chair of Wundt at the University of Leipzig on the latter's death in 1920. Best known for his *Untersuchungen über Entwicklungspsychologie* (1915), in which he studied social psychology from a historical point of view, he was also the author of several philosophical works. These include *Ist Philosophie ohne Psychologie Möglich?* (1896); *Der Begriff des Absolut Wertvollen* (1898); and *Der Strukturbegriff in der Psychologie* (1924). From Leipzig, Krueger directed a group of researches and studies under the general title of *Entwicklungspsychologie* (Development Psychology).

**KÜCHLER**, K. F. WALTHER (1877- ). A German writer and professor, born at Essen and educated at the University of Leipzig. He was instructor in German at the University of Nancy and at Cornell, lecturer at the University of Gießen, and professor of Romance languages at Würzburg, and, after 1922, at the University of Vienna. He is the author of *Marie Joseph Chéniers Lyrische und Dramatische Dichtungen* (1900); *Die Cent Nouvelles* (1906); *Französische Romantik* (1908); *Libussa* (1919); *Romain Rolland, Henri Barbusse, Fritz von Unruh* (1920); and *Ernest Renan* (1921).

**KÜHLMANN**, RICHARD VON (1873- ). A German diplomatist. He entered the diplomatic service in 1889 and after serving in various capacities, became councilor of the German Embassy in London in 1908. He was sent as German Ambassador to the Hague in April, 1915, and served at Constantinople in 1916-17. He was then appointed foreign secretary to succeed Zimmermann and held this position until his resignation in July, 1918. He was largely responsible for the treaties of Brest-Litovsk and Bucharest.

**KU KLUX KLAN**. An organization founded in 1915 by William Joseph Simmons, of Atlanta, Ga. While in a measure it is a revival of the society of the same name which flourished in the South during the reconstruction period, its aims and purposes are, in a larger sense, distinctly different. The organization of the modern society is claimed by Simmons to have been undertaken by him as the result of a vision. He preserved the regalia and some of the nomenclature of the original Klan, but to these he added other designations, all of which begin with the letters *kl*; e.g., Klokard, lecturer; Kladd, conductor; Kleagle, organizer; Klavern, meeting. The activities of the original Ku Klux Klan were directed almost entirely against the Negroes in the South, for the purpose of preventing their participation in social and political affairs. The modern Ku Klux Klan, although it theoretically avoids stating such as its purpose, is hostile chiefly to Jews and Roman Catholics. The fundamental doctrine of the Klan is "100 per cent Americanism." This, with its corollary principles of "no foreign allegiance" and "white supremacy," means in practice a campaign against Catholics, Jews, and Negroes, particularly the first. The growth of the movement was slow, until after the end of the Great War, when Edward Young Clarke, a former newspaper man, conceived the possibility of organization on a large scale. He was made Imperial Kleagle

and was appointed head of the propaganda department. Numerous agents were put in the field to organize in 40 States. They were called Kleagles. Each member enrolled paid \$10, of which the Kleagle received \$4 and the King Kleagle \$1; the remaining \$5 was sent to the Imperial Treasurer. As a result of these efforts, the Klan spread with marvelous rapidity, and its effects were soon apparent. The organization soon began to function as a censor of personal conduct in many localities and imposed punishment as it saw fit. The result was an outbreak of lawlessness in many States under the name of discipline. This lawlessness reached a climax during the summer of 1922, when murders were charged to its members in Inglewood, Calif., and Mer Rouge, La. There were also outbreaks of violence in various towns in Texas, Oklahoma, Pennsylvania, and other States. Governor Parker of Louisiana made a strong effort to bring about Federal Action to suppress the Klan in that State, but was not successful.

The entrance of the Klan into politics was a further step in its development. It was especially strong in the South and Middle West. In Texas, it was charged, Earle B. Mayfield was elected United States Senator in 1922 through the Klan's support. In Oregon, the Klan was sufficiently powerful to put through legislation banning parochial schools. In Oklahoma, its activities and the attempt of the governor to control them led to the latter's impeachment and removal. (See OKLAHOMA.)

At the height of its power in 1924, the Klan membership was put at between two and one-half and three millions. The following estimated memberships were to be found in the States where the order has its greatest strength: Indiana, 500,000; Ohio, 450,000; Texas, 415,000; California, 200,000; Oregon, 200,000; New York, 200,000; Oklahoma, 200,000; from 50,000 to 100,000 each in the following States: Arkansas, Washington, Kansas, Missouri, Michigan, Illinois, Kentucky, West Virginia, Maryland, New Jersey, Louisiana, Mississippi, Alabama, Florida, Georgia, and Tennessee. Internal dissension and scandals involving prominent Klansmen began to sap the order's strength, so that Senator Carter (Mass of Virginia in 1927 could report that already the Klan was losing its hold in the South. By 1928 it was estimated that the Klan had dwindled to one-third its size in 1924 and that its power had been lost in such former strongholds as Georgia, Mississippi, Louisiana, Indiana, and Colorado. There were positive evidences that the Klan was on the decline as the period under survey closed (spring, 1929). The following were among the more important reasons for the waning influence of the order: internal troubles, scandals, a falling treasury, municipal and State action in compelling the Klan to unmask, and general ridicule. In the summer of 1929, the Klan definitely quit the North when it announced the return of its headquarters from Washington to Atlanta.

During the period under discussion, the Klan played an important part in national elections. At the Democratic Convention of 1924, the attempt of the enemies of the Klan to name it in the party platform as an agent of bigotry almost disrupted the convention. The final vote against naming the Klan, after a hysterical night of balloting, was 546.15 to 541.85. In the 1928 election, the Ku Klux Klan undoubtedly played

an important rôle in the defeat of Governor Smith. As a Catholic, a New Yorker, the friend of immigrants and Jews, he stood for everything repugnant to the Klan spirit and it was generally conceded that in the South and Middle West, the Klan did yeoman service in spreading the gospel of intolerance.

During 1926, 1927, and 1928, the order figured in a number of unsavory scandals that did much to hasten its decline. In Indiana, where it had been a power in politics, it received practically its death blow as a result of the conviction for murder of D. C. Stephenson, the State's Grand Dragon. In Alabama and Pennsylvania, the Klan gained a good deal of unwelcome public attention as a result of internal feuds. In the latter State, in 1928, a Federal judge threw two law suits involving disputing factions out of court because all concerned had come before him with "filthy hands." The court denounced the order as having "stirred up racial and religious prejudices, fomented disorders and unlawful assemblies . . . and that such unlawful assemblies and riots have in many instances been brought about for the avowed purpose on the part of the officers in control of increasing the membership of the organization."

Following the lead of New York State in 1923, many States passed laws to strip the order of its secrecy. These laws, as a rule, were so phrased as to require all organizations, except trade unions and fraternal orders, to give publicity to their regulations, oaths, and memberships. The Klan fought these laws in the courts and took the New York act up to the Supreme Court which, however, found the order for unmasking not unreasonable (Nov. 19, 1928). This decision was a serious blow to the order.

In 1923 dissension broke out between W. J. Simmons, the so-called "Emperor" and H. W. Evans, the Imperial Wizard. Their dispute was taken to court and resulted in the triumph of Dr. Evans who, through 1928, continued the active genius of the order. A woman's organization affiliated with the Klan is called the Kamelia.

**KÜLPE**, kul'pe, OSWALD (1862-1916). A German philosopher (see Vol. XIII). He died in 1915 before completing a treatise on psychological theory embodying the contentions of the imageless thought school. His unfinished work was published posthumously by his pupil Karl Bühler under the title, *Vorlesungen über Psychologie* (1922).

**KUMMER**, FREDERIC ARNOLD (1873- ). An American author and playwright, born in Catonsville, Md. His best-known works include: *Plaster Saints* (1921); *When the Earth was Young* (1922-23); *The Voice*, in which William Courtenay starred (1923). He often wrote under the pseudonym of Arnold Fredericks. Besides his work for the legitimate stage, he wrote many motion-picture scenarios, including *The Slave Market*, *The Yellow Pawn*, *Motherhood*, *The Ivory Snuff Box*, and *The Belgian*.

**KUN**, BÉLA (1886- ). A Hungarian Communist leader, born in Cöhen. He was in Russia during the World War and led a corps in the Red Army. Returning to Hungary early in 1919, he was arrested as a Communist agitator. He organized a revolution at Budapest, in February, 1919, which brought about the resignation of the Karolyi cabinet, and was appointed commissary for foreign affairs in the Hungarian

Soviet government in March. As recognition of this government was refused by the Allies, he made a military alliance with the Russian Soviet government. The Communist government was overthrown in August, 1919, and he fled to Austria, whose government refused to give him up. In July, 1920, he went to Russia where he was a government commissary in Crimea until 1921, when he became a member of the executive committee of the Communist International. On Apr. 26, 1928, he was arrested in Vienna, where he had established headquarters in a drug store two weeks previously. On June 26, he was sentenced to three months imprisonment (two of which he had already served) on a charge of belonging to a secret society and entering Austria on a false passport. At the close of his term, he was deported to Russia. His trial nearly caused a cabinet crisis. Consult *Die Sowjetführer Ungarns* by Zempléni (1924). See HUNGARY, under *History*.

**KUNZ**, GEORGE FREDERICK (1856- ). An American mineralogist (see Vol. XIII). Among his later writings are *B. Roly and His Work* (1914); *Magic of Jewels* (1915); *Ivory and the Elephant* (1915); *Shakespeare and Precious Stones* (1916); and *The Ring* (1917).

**KUPPIN**, ALEXANDER IVANOVITCH (1870- ). A Russian writer, belonging to the realistic school. He was an officer from 1890 to 1897, and his most famous novel was *The Duel* (1905), a story of barracks life. He also wrote delightful tales for children, and many sketches. His writings include *Short Stories* (1893-1918); *Sulamith* (1908); *The Pit* (1909-1913); *A Bracelet of Garnets* (1911); *Leagstrygonians* (1912); *The Black Sea Coast*; *Moloch*; *At Rest*; *A Slav Soul*, stories (1916); *Reminiscences of Anton Chekhov*, with Gorky and Bunin (1921); and *Gambrinus* (1925). After the Bolshevik Revolution, he lived in Paris.

**KURDISTAN**, kūr'dā-stān. A region in eastern Asia Minor comprising for the most part the Turkish vilayets of Mamuret-ul-Aziz, Diarbekr, Bitlis, Van, but also the northern section of the vilayet of Mosul in the now independent State of Iraq or Mesopotamia, and part of western Persia. It is inhabited by the Kurds, a seminomadic people related to the Persians in race and language, but belonging to the Sunni sect. The total population was estimated at 2,500,000. It had been the consistent policy of the old Turkish government to settle the Kurds among the Armenian populations, and thus, by singling them out for special favors, to create strong Mohammedan centres in these unruly vilayets. The independent spirit thus fostered naturally rendered the Kurds indifferent to the War, with the result that their participation was negligible. The Russian policy, once the Russians were in control of Erzerum and Bitlis after 1916, was designed along the same lines, and the Kurds were played off against the Armenians. The entry of the British into Mesopotamia, and the promises held out by British political officers of a Kurdish independent State, naturally made Kurdish leaders gravitate toward Great Britain. By the Treaty of Sévres (1920) provisions were made for the satisfaction of Kurdish national aspirations. An inter-Allied commission was to erect an autonomous government within the area east of the Euphrates, south of the future boundary of Armenia, and north of Syria and Mesopotamia; a commission of Allied representatives acting with Kurds and

Persians was to rectify the frontier between Kurdistan and Persia. If within one year from the coming into force of the treaty, the Kurds gave evidence to the League Council of their desire for complete independence, and if the council approved, Kurdistan was then to be raised to the dignity of a separate sovereign state, and, in that event, Great Britain must permit the voluntary adhesion of the Kurds in Mosul, part of the Mesopotamia mandate, to the new State. The failure of the Sèvres treaty and the realignments effected in subsequent years caused the hopes of the Kurds for independence to be forgotten; the final treaty of Lausanne in 1923 made no mention of a free Kurdistan; and the Kurds remained subject to alien rule. Like pre-war Poland, Kurdistan was divided among three alien nations, namely, Turkey, Persia, and Mesopotamia.

In February, 1925, a Kurdish revolt under the leadership of Sheik Said, a former revolutionary, broke out and gained support among those who felt that the Turkish government had tampered with the Sacred Law of Islam as well as among adherents of the deposed Sultan (See TURKEY) and the Caliphate. This movement which began in the region adjoining the Mosul vilayet on the north and northwest, affected all the Kurdish vilayets and martial law was proclaimed by the Ministry of Fethi Bey. Still more energetic measures were demanded and a new ministry undertook severe military action together with a summary tribunal possessing powers of life and death so that by April the uprising was put down after the insurgents had been defeated and their leaders captured near the town of Mush. The more important were tried at Diarbekr and Sheik Said and 47 of his followers after conviction were hanged on June 29. This suppression of the revolt did not entirely stop the guerilla warfare of the Kurds, but the situation after a year or so gradually calmed down.

**KURZ, kurtz, ISOLDE CLARA M.** (1853- ). A German writer, born at Stuttgart, the daughter of Hermann Kurz, novelist, translator, and librarian at the University of Tübingen. She lived for many years in Florence. She wrote *Gedichte* (1888); *Die Stadt des Lebens* (1902); *Neue Gedichte* (1905); *Hermann Kurz*, a biography (1906); *Lebensfluten* (1907); *Die Kinder der Lilith* (1909); *Cora und Andere Novellen* (1915); *Schwert aus der Scheide*, a volume of verse (1917); *Aus Meinen Jugendland*, an autobiographical work (1919); *Traumland* (1920); *Nächte von Fond* (1924); *Der Despot* (1925); *Vom Strande* (1925); *Der Caliban* (1926); and the autobiographical volume *Meiner Mutter* (1927). She also translated much from the French, English, Italian, and Russian, and received the degree of doctor *honoris causa* from the University of Tübingen.

**KURZ, SELMA** (1877- ). An Austrian coloratura soprano, born in Biala, Galicia. She made her début at the Opera in Frankfurt, where, after a short time she attracted the attention of Mahler, who, in 1899, engaged her for the Vienna Hofoper. Extensive leave of absence enabled her to appear as guest at the leading European opera houses. In 1921 she made a coast-to-coast tour of the United States, arousing great enthusiasm everywhere through the natural beauty of her voice and the perfection of her art, but she confined herself exclusively to the concert stage. She is married to Professor Halban, a Vienna physician.

**KUT-EL-AMARA.** See WORLD WAR, under *Turkish Front*.

**KUTSCHER, ARTUR** (1878- ). A German critic and historian, born in Hanover, and educated at the University of Munich. After 1915 he was professor in the University of München. He wrote *Natürgefühl in Goethes Lyrik* (1906); *Hebbel als Kritiker des Dramas* (1907); *Die Kunst und Unser Leben: Grundsätze zu einer Kritik* (1909); *Schiller und Wir* (1909); *Die Ausdrucksmittel der Bühne* (1910); *Hebbel und Grabbe* (1913); *Kriegstagebuch* (1915); *Frank Wedekind, Sein Leben und Sein Werk* (1921); and other works. He compiled an anthology of soldier songs, *Das Richtige Soldatenlied* (1917), edited the works of Frank Wedekind (1921), and made many stage adaptations.

**KUYBYSHEV, VALERIAN V.** (1888- ). A Russian Communist and Soviet public official, chairman of the Supreme Economic Council since 1927. Joining the Social Democratic Party in 1904, he was arrested in 1906 and banished to Siberia, but escaped. Under the Soviet régime, he served as Commissar for Workers' and Peasants' Inspection, president of the political bureau of the Communist Party, Soviet Plenipotentiary to Bokhara, and head of the State Electrification Committee.

**KWANGCHOW WAN.** See FRENCH INDO-CHINA.

**KYNE, PETER BERNARD** (1880- ). An American novelist, born in San Francisco, Calif., and educated in the public schools and in a business college of that city. For several years, he was engaged in the lumber business. He served in the Philippines during the Spanish-American War and was captain of the 144th Field Artillery during the World War. His books, which are widely popular, include *Three Grandfathers* (1913); *The Long Chance* (1914); *Cuppy Ricks* (1916); *The Valley of the Giants* (1918); *Kindred of the Dust* (1919); *The Green Pea Pirates* (1920); *Pride of Palomar* (1921); *The Go-Gutter* (1922); *Never the Twain Shall Meet* (1923); *The Enchanted Hill* (1924); *The Understanding Heart* (1925); *They Also Served* (1927); *Tide of Empire* (1928). He was a frequent contributor of short stories to magazines.

# L

## **ABOR, AMERICAN FEDERATION OF.**

A non-secret confederation of self-governing trade unions in the United States, Canada, Porto Rico, and Panama, comprising five industrial departments: the building trades, metal trade, union label trade, railway employees, and mining. Its paid-up membership increased nearly 300 per cent between 1910 and 1920, from 1,562,112 to 4,078,740; but after 1920 it began to fall and reached 2,926,468 in 1923. It was 2,933,545 in 1929, a gain of 37,482 over the previous year. The number of local unions in 1914 was 21,460; in 1921, 36,247; in 1928, 29,128. Samuel Gompers long held the presidency, being elected to that position at the 44th annual conference, in 1924, for the 43rd time. Following his death in December, 1924, William Green became president. During the World War, the organization made every effort to work with the Government of the United States; every single act of the president and executive council in connection with the War was unanimously approved without discussion. Its loyalty was strengthened by government recognition of trade-union standards and by such appointments as that of Samuel Gompers as an important member of the Committee of Council of National Defense and that of the first vice president as member of the Commission to the Russian People. This recognition on the part of the Government, and to some extent a rise in the cost of living, strengthened the leadership of the Federation during the war period. On the other hand, its influence was somewhat weakened in that the Labor Board frequently dealt directly with disaffected groups, instead of through the central organization of the Federation. Later, industrial instability, together with the prevalence of high wages, drew many workers away from the unions. In 1923 efforts were redoubled for the organization of nonunion labor, with much propaganda directed against the open shop.

In general, the American Federation of Labor has held firmly to its policy of nonpartisan political activity. Despite a serious movement beginning in 1918 to form a national labor party, and the election of two United States Senators in one State by the newly organized Farmer-Labor Party, the Federation maintained its political activity on the nonpartisan basis of "reward your friends; punish your enemies." In 1924 the Federation leaders wholeheartedly endorsed the candidacy of LaFollette.

The organization did not abate its hostility toward socialism, syndicalism, the I. W. W., and other radical labor movements. Although in 1920 the more radical element within the Federation triumphed over the conservative in favor of government ownership and operation of railways, carried on distinct opposition to the conservative administration through 1921, and demonstrated in 1922 over the question of recognition of the Russian Soviet government, the policy of the Federation is wholly directed by the conserva-

tives, the Federation taking the position that "those who seek to destroy the legitimate labor movement must do it from without." In its attitude toward social development through intervention by the State, the Federation likewise has maintained its traditional policy. This may be briefly outlined, in the Federation's own words, as favoring laws to protect the helpless, to abolish special privilege and to free industry for the working out of its purely industrial problems, to make government more responsive to the needs of the people and to deprive courts of the power to rule as well as to adjudicate.

Thus, the Federation has worked for protective laws for women and children, for seamen, and for government employees. It supported safety and health measures and adequate workmen's accident insurance legislation. It urged the advance planning of public works as an aid to combatting unemployment and the development of a permanent, effective public employment service, though it was hesitant about joining in the movement for unemployment insurance. It applauded the decision in 1920 against the Kansas Court of Industrial Arbitration and in many ways opposed the principle of compulsory arbitration strenuously. A constructive feature of the Federation's policy was its aid to coöperative schemes and its promotion of friendliness with farmers' organizations. A disappointing legal achievement was the clause that Congress put in the Clayton Anti-trust Law in 1914, a recognition of the principle that the labor of a human being is not a commodity or article of commerce, and thus a guarantee of certain rights in connection with labor organization and the use of the boycott. It proved to be an empty victory.

Among the measures of broad social import advocated by the Federation were the restriction of immigration; gradual reduction of Army and Navy; regulation of large industries; extension of popular control of government; limitation of the power of the Supreme Court; and an amendment to the Volstead Act permitting the manufacture and sale of beer. It protested against the ship subsidy bill and military education in the schools. It expressed an unfavorable opinion of the Ku Klux Klan as an unconstitutional organization and a detriment to labor. In connection with Negro labor, an effort was made to prevent the drawing of a color line, and a special organizer was sent to work among the Negroes in the South. The Federation officially declared its sympathy with India and Ireland; it favored the entrance of the United States into the League of Nations and the World Court.

Although the Federation sent no representative to the Inter-Allied Labor Conference at London in 1918 or to the conference in Berne after the Armistice, although its proposition for an inter-Allied labor conference at Paris was not accepted, and although it could not be officially represented at the meeting of the Labor

Department of the League of Nations at Washington in 1919, its international relations widened appreciably during these years. In 1916 steps were taken to cultivate friendly relations with organized labor in Mexico, South America, and Japan. A Pan-American Federation of Labor Conference Committee was created in that year. In 1918 small groups were sent to Europe to confer unofficially with organized labor in Allied countries, and in 1919 the Federation was represented at the International Trade Conference in Amsterdam. While the peace terms were under discussion, the Federation formulated its official attitude on the matter; this was based largely on the declaration of President Wilson, which included in its suggestions that the treaty bar from shipment in international commerce all products involving the labor of children under 16 and that it declare for the basic standard of an 8-hour day. In 1923 affiliation with the International Federation of Trade Unions was strongly recommended, but year after year action was delayed. The Federation's fear of radical thought is shown in its consistent fight against recognition of Soviet Russia, and in its withdrawal of support in 1928 from Brookwood Labor College.

A significant development is the Federation's Union Labor Life Insurance Company which, since its incorporation in 1925, has written a vast amount of life, accident, and health insurance for its trade-union members. See **TRADE-UNIONISM**.

**LABOR ARBITRATION.** The period after 1914 witnessed an increased recognition of the imperative necessity of applying methods of arbitration and conciliation to industrial disputes. Concentrated efforts were made during that period to prevent by the wider use of arbitration the harmful effects of strikes, lockouts, and other violent means of settling industrial controversies, and, although many attempts were unsuccessful, there were marked advances toward industrial peace. Public opinion at least had been awakened to the undeniable desirability of the substitution of peaceful action for violence. The more complex nature of industrial problems in the later years, the importance of unobstructed production during the World War, the stronger organization and the increased sense of power of the trade unions, the unsettled industrial conditions after the War and the resulting unrest, the growing demands on the part of the workers, the steadily increasing specialization and interconnection of industries, all combined to bring about a realization of the imperativeness of labor arbitration. This realization found expression not only in governmental action, but also in numerous attempts on the part of employers and employees to find a *modus vivendi* in industry. Thus, the period was characterized by a constantly increasing number of trade-union agreements making provision for various methods of conciliation.

**The United States.** During 1914 a number of serious strikes and labor disputes were successfully settled by arbitration. The most important event of that year in arbitration legislation was the enactment by Alaska of an elaborate law relating to the adjustment of trade disputes. In 1915, a year of many strikes, the Department of Labor offered its services as mediator in 32 labor controversies, of which 24 were amicably settled, the most important being the Western Railroad case. In the same year, Colo-

rado passed a law setting up an industrial commission with wide powers to arbitrate. John D. Rockefeller, Jr., advanced his Industrial Representation Plan, a comprehensive scheme for the handling of all relations between employers and employees. Of far-reaching importance was the effective trade agreement made in the New York clothing industry, whereby a two years' peace was established.

The year 1916 brought an increase in sentiment for the amicable settlement of labor disputes, which was manifested in the various attempts to terminate by arbitration the troublesome strikes and conflicts of that year, and in the arbitration machinery agreed upon between the Boston Elevated Railroad Company and its employees, and in another case between the Hart, Schaffner & Marx Co. in Chicago and the Amalgamated Clothing Workers; but the most notable event of the year was the passage by Congress of the Adamson Eight-hour Law. After unsuccessful attempts at arbitrating the disputes which threatened to bring about a strike of the four railroad brotherhoods, a law was passed providing that after Jan. 1, 1917, "eight hours shall, in contracts for labor and service, be deemed as a day's work," and empowering the President to appoint a commission of three to investigate for a period of six years the workings of the law. Opponents of the Adamson Law criticized it as being a result of intimidation by the brotherhoods and as imperiling the principle of arbitration. On Dec. 5, 1916, President Wilson made a plea for full public investigation of industrial disputes as an effective means for the prevention of strikes.

With the entrance of the United States into the War, prevention of labor disputes became especially urgent and a labor policy toward that end was entered upon by the Government. As a consequence, the Committee on Labor of the Advisory Commission of the Council of National Defense began in June, 1917, the establishment of local committees of mediation and conciliation, composed of representatives of the employers, the workers, and the general public. In August of the same year, an important agreement was reached between the Government and the international unions engaged in American shipyards. Under this compact, the National Board of Adjustment was created as the final arbiter as to wages, hours, and conditions of work, and the unions agreed not to strike as long as the agreement was in force. The final step of the Government in the prevention of strikes was the creation of the National War Labor Board in April, 1918. The functions of this board were to be: to bring about the settlement of labor disputes by mediation and conciliation in all industries essential to the effective conduct of the War, to establish the necessary machinery for this purpose, and in case of failure of local mediation to carry on the arbitration themselves. The board was to be composed of five representatives of the employers' organizations, five of the A. F. of L., and two impartial chairmen, one for the employers and the other for the workers. The board served successfully as a means of settling disturbing labor troubles during the War. The year 1918 saw also the Altschuler award in the Chicago packing industry, which provided machinery for the settlement of grievances and under which the workers bound themselves not to strike pending the attempts at peaceful settlement of their disputes.

The very serious industrial troubles which broke out after the Armistice led to the calling by President Wilson of the First Industrial Conference on Oct. 6, 1919, for the purpose of considering the fundamental means of bettering the whole relationship between capital and labor. After its failure, the Second Industrial Conference was called, which presented on Dec. 28, 1919, a plan proposing the establishment of the National Industrial Tribunal and of Regional Boards of Inquiry and Adjustment. On Mar. 1, 1919, the conference issued its final report, in which it recommended as the best means for the prevention of industrial conflicts such agencies as had already been established in various trades; namely, shop committees and councils, work councils, etc., and, in case these failed, adjustment by the above-mentioned boards. The programme of the conference did not, however, find practical application, although mediation through the Government had proved rather successful during the War. Arbitration was resorted to with satisfactory results in a number of important disputes during 1921. A case in the packing industry was adjusted by a conference in Washington of the representatives of the employers and employees and the Secretary of Labor. The executive council of the International Typographical Union decided to maintain arbitration in the printing industry in New York and to submit its wage disputes to arbitration. On Jan. 1, 1921, the Pennsylvania Railroad system set up a joint reviewing committee "for the amicable settlement, by joint conference, of all controversial questions affecting the engine and train-service men."

A Court of Industrial Relations on the principle of compulsory arbitration was created in Kansas in 1920. The court affected a number of industries and was composed of three judges appointed by the governor. It was given wide powers, such as to make reasonable awards, investigate industrial conditions, bring suit in the Supreme Court of the State to enforce obedience to its orders, and to take over and run industries in case of emergency and limitation or actual suspension of production. Organized labor was strongly opposed to the court and serious difficulties arose from the conflict between the court and the trade unions in the State. In 1923 the United States Supreme Court unanimously held wage fixing by the Kansas court to be unconstitutional. (See KANSAS.) Machinery for the adjustment of labor disputes on the railroads was set up under the Transportation Act which was passed by Congress in February, 1920. The act provided for the settlement of controversies and grievances between the railroad workers and the managements by the establishment of the United States Railroad Labor Board, which was composed of nine members, appointed by the President. The board attempted unsuccessfully to arbitrate in the great strike of the railway shopmen in 1922.

The Railway Labor Act was passed by Congress and signed by the President, May 20, 1926. The new law abolished the Railroad Labor Board set up by the Transportation Act of 1920 and repealed the mediation, arbitration, and conciliation provisions of the Newlands Act of 1913. The machinery that is created is, briefly, this: Adjustment boards to deal with grievances or disputes over the application or interpretation of existing agreements are to be established by joint agreement. A Federal Board of Mediation is created, to be appointed by the President, with

the duty of intervening at the request of either party or on its own motion, in any unsettled labor dispute, including disputes that the adjustment boards have failed to settle, as well as disputes over changes in wages, rules, or working conditions which are not within the jurisdiction of the adjustment boards. If the Board of Mediation is unable to bring about an amicable adjustment between the parties, it is required to make an effort to induce them to consent to arbitration. Boards of arbitration are provided for when both parties consent to arbitration. Resort to a board of arbitration is voluntary, but its decisions are compulsory and enforceable. If a dispute is not settled by any of these methods, and if in the judgment of the Board of Mediation the dispute threatens substantially to interrupt interstate commerce, the board shall notify the President, who is thereupon authorized in his discretion to create an emergency board to investigate and report to him. After the creation of the emergency board and for 30 days after it has made its report to the President, no change, except by agreement, shall be made by the contending parties in the conditions out of which the dispute arose. Unlike the defunct Railroad Labor Board, the new Board of Mediation was to hand down no "decisions," but only to serve as an aid in bringing about voluntary agreements. The last-resort function of the emergency board is to enable the President to inform the public on which side to lay the blame for failure to reach an agreement.

Perhaps the most comprehensive means so far for the peaceful settlement of industrial disputes is found in the agreements between the Amalgamated Clothing Workers and the clothing manufacturers. Especially notable here is the Trade Board established in Chicago, consisting of two representatives of the union, two of the employers, and an impartial chairman. Practically all the decisions rest virtually with the chairman.

**Great Britain.** Due to the powerful organization of British labor, methods of arbitration have progressed further in Great Britain than in the United States. A great advance was made in the former country by the establishment of the Industrial Council, which was composed of 13 representatives of the employers, an equal number of representatives of the workmen, and Sir George Askwith as impartial chairman. The latter arbitrated in 1914 the strike of the unskilled workers near Birmingham. At the Treasury Conference of 1915, the trade-union officials and the Government concluded an agreement for the purpose of regulating the relations between employers and workers for the duration of the War. The compact stipulated that all disputes should be settled by conferences between the parties or, in case they failed to agree, by three other possible means of arbitration. The miners were the only ones who remained outside of this pact. The Treasury Agreement, however, did not prevent serious unofficial strikes during the remainder of the War. The establishment of the Joint Industrial Councils during the latter part of the War and immediately after the Armistice served effectively to preserve industrial peace in a great number of trades. Probably the most important measure, however, regarding the relations between capital and labor was the Industrial Courts Act of 1918. It created a standing Industrial Court, composed of independent persons and representatives of the employer and employees, all of them appointed by the Government. The court

is a permanent industrial tribunal and as such has settled a great number of disputes by making awards, the most important of which was the Dockers' Court of Inquiry early in 1920. Although the court has no power to compel compliance with its decisions, the number of awards repudiated by the losing side has been negligible. The most momentous single arbitration case in Great Britain was the Coal Commission of March, 1919, which was set up on the demand of the miners for the six-hour day, higher wages, etc. It consisted of six representatives of the miners, six of the mine owners, and an impartial chairman, and dealt with wages, hours, and nationalization of mines. The interim report on wages and hours was published in three parts. The part that called for the seven-hour day, and which was signed by the chairman and three representatives of the employers, was adopted by the Government. None of the reports on nationalization was put into effect. It was thought by many that with the trade boards, the Industrial Court, and the joint industrial councils, Great Britain had three effective agencies for the prevention of industrial disputes by arbitration; but on May 4, 1926, there came the calamitous General Strike, lasting eight days, and the continuance of the coal strike additional months, with disastrous effects upon the labor movement of England as well as upon her major industries. See STRIKES AND LOCKOUTS.

**LABOR BANKS, UNITED STATES.** That extension of the principle of coöperation, as dis-

cussed under that title, which led to the establishment by labor of cooperative banks did not take definite hold in the United States until 1920. The first bank in this country to be owned and controlled by a labor organization was the Mt. Vernon Savings Bank, Washington, D. C. (1920). In that year, also, the Brotherhood of Locomotive Engineers founded at Cleveland, Ohio, what was then said to be the only National bank in which depositors shared earnings. The success of this considerable venture (in 1928 it still had the largest total resources of any single labor bank in the United States) stimulated the establishment of similar institutions. The expansion of the movement in the succeeding years is shown by the accompanying table, from the *Monthly Labor Review* of the U. S. Department of Labor, October, 1928.

The labor bank is distinguished from the ordinary commercial bank chiefly in that (1) it is owned and controlled by labor; (2) it limits the dividend payable to stockholders to 10 per cent; (3) it pays a higher rate of interest on deposits (generally 4 per cent on savings, and 2 per cent on checking accounts above \$500), and computes interest from the first day; and (4) it pays to the depositor, over and above interest, dividends from its net earnings. The labor bank is chartered in the regular way, under State or Federal laws, and is subject to the usual strict examination. Control rests with the labor union (or unions) and its membership: (a) through possession of the majority

## CONDITION OF LABOR BANKS AS OF JUNE 30, 1928

Name of bank and location	Capital	Surplus and undivided profits	Deposits	Total resources
Federation Bank & Trust Co., New York	\$ 750,000	\$ { 750,000 <sup>a</sup> 297,278 <sup>b</sup> }	\$19,036,393	\$21,168,585
Engineers National Bank of Cleveland	1,000,000	{ 858,856 <sup>a</sup> 380,000 <sup>a</sup> }	16,780,115	20,154,680

of the voting stock of the bank; and (b) through union officials and other men in sympathy with labor, who constitute the majority of the officers and board of directors. The labor union itself, as an organization, operates the bank, assuming the usual financial liability to depositors. Business and administrative affairs are in the hands of experienced bankers, acting with the trade-union officials. The fact that labor leaders in the banks were not only legally responsible as bank officials but were also responsible to the labor organizations made for unusual care in choosing competent bankers to administer affairs, and so for conservative policies. The temptation to take risks was further lessened by the limitation on the number of shares to be owned by an individual, usually to three. Without any known exception, labor banks up to 1928 were having considerable financial success. Notwithstanding the limitation on dividends, the market value of labor-bank stocks was above par.

In addition to offering unusual advantages to the depositors and stockholders, the labor bank was a source of strength to the trade union. For one thing, it earned for the union, on its defense and insurance funds, a profit in excess of the interest that these funds ordinarily drew from commercial banks; and not only was it able to supply funds for the sound enterprises of other unions or coöperatives which might otherwise be left unaided, it was in a position to discriminate in granting its loans between employers who were favorable and those who were unfriendly to labor. Moreover, the existence of the labor bank weakened the pressure that commercial banks might exert on individual employers during strikes, by withholding credit. A number of the labor banks were depositories of State and city governments and members of the Federal Reserve system.

Toward the end of the period being surveyed, there were evidences to indicate that the labor banks were not increasing as rapidly as the sanguine originally believed they would. For one, organized American labor had become more and more conservative and was giving up a large part of its activities as entrepreneur; again, private bankers were not as hostile as they had formerly been. During 1926 and 1927, for example, the following labor banks were either sold to private interests or discontinued: Brotherhood of Locomotive Engineers' Coöperative Trust Company (N. Y.), Brotherhood Savings & Trust Co. (Pittsburgh), Brotherhood of Locomotive Engineers' Title & Trust Co. (Philadelphia), Brotherhood of Locomotive Engineers' Bank & Trust Co. (Birmingham, Ala.), and the Brotherhood State Bank (Kansas City). In this period, only two banks made their appearance, viz., Gary Labor Bank and the Brotherhood National Bank (San Francisco).

**LABOR LEGISLATION.** Although America's first labor law was enacted in 1813, when Connecticut set up an educational requirement for working children, and although the development has continued steadily since that time, by far the greater part of effective labor legislation is the fruit of the period since 1910.

A significant recent effort is the constitutional amendment passed by Congress in 1924, which, if it is accepted by three-fourths of the States (five States, Arizona, Arkansas, California, Montana, and Wisconsin, had done so by Jan. 1, 1929), will make it possible for that body to

enact laws regulating child labor throughout the country. This came after two attempts of the Federal Congress to restrict the labor of children, both of which were declared unconstitutional by the Supreme Court. See CHILD LABOR.

Beginning with 1912, fifteen minimum-wage laws were enacted and passed through a period of economic trial and judicial test until, in 1923, the United States Supreme Court found the District of Columbia law unconstitutional for women (see MINIMUM WAGE). There has been progress in the regulation of the form and method of wage payments and establishment of wage preferences and mechanics' liens.

There were at the beginning of 1929 only four States in the country—Alabama, Florida, Iowa, and West Virginia—that had no law whatever to regulate the hours of work for women (see HOURS OF LABOR and WOMEN IN INDUSTRY). Legal regulation of men's working hours has by no means been confined to public works and public utilities—although during the past twenty years many laws have been passed regarding hours in public employments. Legislation limiting the hours of men in dangerous private employments has made a considerable advance. Oregon recently moved on to the eight-hour day in the lumbering industry, but with a reciprocal provision that the new law goes into effect only after adjoining States have adopted the same restrictions. See HOURS OF LABOR.

The first accident-reporting law dates from 1886, but most of the scientific gathering of accident statistics is the work of the past twenty years. The first law requiring safety devices in factories was adopted in 1887, but it is only since about 1910 that universal progress has come in accident prevention. Mining codes also have been enacted or improved, while during the year 1924, the Industrial Commission of Utah, after a mine explosion at Castle Gate which took 172 lives, adopted a set of mine-safety regulations unique in its comprehensiveness and in its application of the best thoughts on the subject. Much public interest in industrial hygiene was manifested in the year immediately following 1910, and since then most of the States have adopted new regulations of factory sanitation and ventilation or improved their former laws.

The United States witnessed the successful operation of the Federal Employment Service for about a year and a half during the World War, and a subsequent decline in its effectiveness through enormously reduced appropriations. It has witnessed as well the establishment of many State public employment services and a considerable development in the regulation of private fee-charging bureaus. Three States, by specific law, have officially recognized the importance of long-range planning of public works to provide employment in periods of business depression. See UNEMPLOYMENT.

Another important development during the period since 1910 is the legislation providing accident compensation for those injured in the course of employment. By Apr. 1, 1929, fifty-one United States compensation laws had been passed, including the three Federal statutes. The legislation was in effect in all but four States (Arkansas, Florida, Mississippi, and South Carolina), since North Carolina adopted it early in 1929. Most of the older laws of the country have been liberalized in one way or another since

they were originally passed. See **WORKMEN'S COMPENSATION**. In addition, 41 States, between 1920 and 1929, voted to cooperate with the Federal government in the vocational retraining of industrial cripples.

As an outgrowth of the same social spirit, pioneer legislation in more than half-a-dozen States has established old-age pensions. See **OLD-AGE PENSIONS**. Mothers'-pension systems were in operation in 43 States, while 45 States had accepted the Federal appropriation for maternity protection offered by the Sheppard-Towner Act of 1921 by 1929. See **MOTHERS' PENSIONS** and **MATERNITY PROTECTION**.

The legislation affecting collective bargaining has not been of great importance. The power of the Kansas Court of Industrial Relations compulsorily to arbitrate conflicts between employers and employees was practically annulled by a United States Supreme Court decision. See **LABOR ARBITRATION**. A number of States during the World War and shortly after enacted laws defining and penalizing criminal syndicalism and sabotage; but several States also officially recognized trade unions and declared human labor is "not a commodity." See **TRUSTS**.

One of the outstanding developments has been in the field of labor-law enforcement and administration. All States now have some provision for the special administration of labor legislation, while most of them have some central body for the purpose. In numerous States, industrial commissions modeled after that of Wisconsin not only enforce the labor law but issue orders which have the compulsion of law, after the Legislature has laid down the general principles which the regulations are to follow. An industrial commission, which also makes constant investigations, is in a far better position to determine the detailed application of a statute than is a body of miscellaneous legislators meeting but once in two years.

The principle hindrances to labor legislation in the past have been (1) the opposition of business interests; (2) the after-war reaction; and (3) adverse court decisions. Fourteen times during the period 1914-1924, the United States Supreme Court decided cases affecting labor by four-to-five or by four-to-four decisions.

Helpful influences in labor legislation include (1) the more general spread of knowledge of the need and practicability of legal protection; (2) the development of effective scientific propaganda organizations such as the Consumers' League, the Child Labor Committee, and the American Association for Labor Legislation; (3) the more active participation of women in public activities; and (4) the application of Federal-State financial cooperation which had within three years after the Federal provision led to the adoption of vocational rehabilitation of industrial cripples by three-fourths of the States and the rapid extension of maternity protection in an even greater number of jurisdictions. By Jan. 1, 1929, only three States (Connecticut, Illinois, and Massachusetts) and the territory of Alaska, had failed to enter into the Federal-State cooperation in maternity protection; only seven States (Connecticut, Delaware, Kansas, Maryland, Texas, Vermont, and Washington) were not cooperating in rehabilitation of cripples. Only five States (Alabama, Georgia, Mississippi, New Mexico, and South Carolina) were without mothers'-pension laws.

A brief survey is sufficient to show how modern indeed is most of our labor legislation. Probably all of it is in need of improvement today, but considering the rapidity with which fundamental changes in legislation have spread over the country since 1910, the prospect seems favorable for future advances wherever the need is clear and the opportunities for public enlightenment are available. See **IMMIGRATION**.

**Supreme Court Decisions.** Decisions by the United States Supreme Court have shown an increasing tendency to overrule legislation for the protection of labor and to curtail labor's organized activities. In the later years, many important decisions were handed down by a closely divided court. A survey made by the United States Bureau of Labor Statistics of the decisions by the Supreme Court, in which cases affecting labor were involved, disclosed the fact that within 40 years there had been 21 cases decided by a vote of four to five or four to four; 13 of these, or nearly two-thirds of the total, falling within the ten years beginning with 1914. It appeared that members of the court were with increasing frequency unable to agree as to whether or not an act of legislation is "plainly and palpably, beyond all question, in violation of the fundamental law of the Constitution."

Many of the court's decisions in the early years of the decade 1914-24 were favorable to labor, particularly in the field of protective legislation, but in the later few years, measures of far-reaching importance to the welfare of wage-earning men and women were nullified by the opinions of a bare majority of the court.

Perhaps the most important favorable decisions of the Supreme Court during this period were those in favor of the constitutionality of workmen's-compensation laws. In giving its final assent to this form of protective legislation, the court took the advanced ground of upholding laws providing for compulsory and exclusive State funds for workmen's-accident insurance. In its decision sustaining the 10-hour day for factory employees in Oregon, the court for the first time recognized the power of a State to enact laws limiting the hours of work of men in private employment, as well as of women and children. In the Adamson eight-hour-law decision of 1917, the court held that Congress had the power to limit the number of hours to eight for trainmen engaged in interstate commerce. A New York law prohibiting night work for women in restaurants was upheld, as was also a law of Oregon establishing a minimum wage for women and minors. See **MINIMUM WAGE**.

On the other hand, the Supreme Court in a third divided decision finally blocked the efforts of Congress to provide accident compensation for longshoremen and other local harbor workers under State laws. In two decisions, it nullified attempts by Congress to abolish child labor (see **CHILD LABOR**) and in another later decision which aroused widespread interest, it declared unconstitutional a Federal law providing a minimum wage for women and children in the District of Columbia.

Among the important decisions of the Supreme Court which tended to weaken organized labor in the field of collective bargaining were those in the so-called Danbury hatters' and Arkansas coal-miners' cases which established the principle that labor unions and their individ-

ual members are responsible, without limit, for the unlawful actions of the union officers and agents which they have in any manner authorized or sanctioned; the *Coppage v. Kansas* decision which declared unconstitutional a State statute aimed to prevent an employer from forcing his employee to agree not to join a trade union during his term of service; the *Hitchman Coal and Coke Company v. Mitchell* decision which held that where an employer has compelled all of his employees to sign a contract that they will not join any labor union, it is illegal to make any effort to organize them; the *Duplex Printing Company* decision in which the court clearly distinguished for the first time between "primary" and "secondary" boycotts, and declared that the Clayton amendment to the Sherman Anti-trust Law had not legalized the secondary form; the *United Mine Workers of America v. Coronado Coal Company* decision in 1922 which held that trade unions are suable in their own names—the first case of importance in America permitting a suit against an incorporated union.

The fact that an increasing number of far-reaching decisions of the Supreme Court in cases affecting labor had checked protective legislation and trade-union activities—and had been handed down by a closely divided court—made a political issue of the contention that the court is the chief obstacle to social progress in America and that action should be taken by Congress to limit the power of the court to pass upon the constitutionality of laws. See **LAW, PROGRESS OF THE.**

**LABOR LEGISLATION, AMERICAN ASSOCIATION FOR.** Founded in 1906, this national scientific membership society approaches social problems from the general welfare viewpoint. Its membership includes representatives of employers and employees, public officials, economists, social workers, and other public-spirited men and women. Its programme includes workmen's compensation, old-age pensions, weekly rest day, promotion of mine safety including rock-dusting, stabilization of employment and effective administration of labor laws. The Association, which is supported by voluntary contributions of members and friends, maintains an information service for its members, publishes special reports and the quarterly, *American Labor Legislation Review*, and holds conferences. Headquarters are at 131 East 23rd St., New York City.

**LABOR OFFICE, INTERNATIONAL.** See **LABOR ORGANIZATION, INTERNATIONAL.**

**LABOR ORGANIZATION, INTERNATIONAL.** One of the most significant and novel features of the Paris peace settlement of 1919 was the incorporation as Part XIII of the Treaty of Versailles of a special Labor Convention setting forth a chapter of principles for labor legislation and providing for the establishment of the permanent International Labor Organization. This labor section of the treaty represented a signal triumph for the cause both of internationalism and of labor. A commission on international labor legislation with 15 members, including such prominent leaders as Samuel Gompers, the president of the American Federation of Labor, and Vandervelde, the patriotic Belgian Socialist, was appointed by the Peace Conference in January, 1919, to formulate suitable treaty provisions for labor welfare and unemployment. The Commission made its report

on March 24. Following detailed consideration and revision by the Council of Four, this report was adopted on April 11. It consisted of two parts, one creating a permanent organization for international labor legislation and the second enunciating a veritable bill of rights for labor. Recognizing that the existence in the various countries of special circumstances arising from differences of climate, habits, and customs of economic opportunity and industrial tradition made strict uniformity in the conditions of labor difficult of immediate attainment, the essential methods and principles were affirmed to be: (1) Consideration of labor not as a commodity; (2) right of association for lawful purposes for both employers and employees; (3) payment of a wage adequate to maintain a reasonable standard of life; (4) adoption of an 8-hour day or 48-hour week; (5) adoption of a weekly rest of at least 24 hours, including Sunday whenever practicable; (6) abolition of child labor and continuation of the education and proper physical development of children; (7) equal remuneration for men and women for work of equal value; (8) equitable treatment in every country of all workers lawfully resident therein; and (9) adequate systems of inspection in which women should participate, to insure enforcement of protective regulations. These aims and purposes were sanctioned in the League of Nations Covenant (Article XXIII, Section A).

The machinery of the International Labor Organization as created by the Convention embraced two major organs, a periodic International Labor Conference and a permanent International Labor Office. The Conference, composed of four delegates from each member state, two appointed by the Government and one each by the most representative organizations of employees and workmen, respectively, was to meet at least once a year, to consider labor problems, to discuss standards of labor welfare, to debate feasible measures for the attainment and maintenance of these standards, and to formulate decisions either as conventions for ratification or rejection by the national parliaments of the world, or as recommendations to be submitted to and considered by these national parliaments or local legislatures. These conventions might then be executed by means of appropriate domestic legislation.

Up to July, 1929, the Labor Conference had met eleven times. The first meeting was held at Washington, D. C., Oct. 29–Nov. 29, 1919. Though the United States was not officially represented, 121 delegates from 39 other countries were in attendance. Germany and Austria were admitted to membership by a vote of 71 to 1. Six draft conventions and six recommendations were adopted; the most noteworthy achievement was an 8-hour-day convention. The other conventions dealt with unemployment, care of female workers in industry before and after childbirth, prohibition of nocturnal employment of women in industry, prescription of a minimum age of admission of children to employment, and the prohibition of night employment for children under 18. The second session was held at Genoa, Italy, in June, 1920, when 27 nations were represented by specialists competent to deal with conditions of maritime labor. Three conventions were adopted, dealing with seamen's employment agencies, payment of unemployment insurance in cases of shipwreck, and prescription

of a minimum age of 14 years for employment of boys at sea; recommendations also were made on employment insurance, enactment of national seamen's codes, and regulation of hours of work in the piscatorial industry and inland navigation. The Permanent Joint Maritime Commission was constituted to further the work of improving maritime labor conditions.

The third session of the Labor Conference held at Geneva, Switzerland, during October, 1921, dealt mainly with problems of agricultural labor. Strenuous French objections to any consideration of these problems as alien to the jurisdiction of the Labor Organization were overruled and subsequently the Permanent Court of International Justice at its first session in July, 1922, definitely established the competence of the conference. A whole series of conventions and recommendations were adopted dealing with labor in general and specifically extending to agriculture. Legislation had hitherto been restricted rather narrowly to urban industrial labor. These 1922 measures included limitation of hours of labor, unemployment insurance, improvement of working conditions, and protection of women and children.

The fourth annual meeting, at Geneva in October, 1922, adopted a recommendation calling for more adequate and accessible information regarding transit and migration of persons from one country to another. Also adopted for submission to the League of Nations was an amendment to Article 393 of the Treaty of Versailles; it elaborated and liberalized somewhat the governing body thereby set up to control the International Labor Office. The fifth session, held in October, 1923, was principally concerned with the general principles of the organization of factory inspection. At the sixth session, in June, 1924, great satisfaction was expressed at the steadily improving industrial conditions of Europe; but decision was made to extend the study of unemployment.

The seventh session, in 1925, dealt with international standards for workmen's compensation; the eighth in 1926, with inspection of immigrants aboard ships, and the ninth, the same year, with seamen; the tenth, in 1927, with health insurance and the minimum wage; the eleventh, in 1928, with minimum-wage-fixing machinery and the prevention of occupational accidents. Twenty-four draft conventions and 26 as commendations have been adopted.

The International Labor Office was subjected to the control of a governing body of 24 members appointed annually by the International Labor Conference; the 1922 amendment had proposed a body of 32 triennially selected members at least 12 of whom should be non-European. This body had the functions, first, of preparing the agenda of the conference; secondly, of conducting the correspondence and negotiations involved in the execution of its decisions; and thirdly, of making technical investigations and collecting and disseminating general information about labor conditions in all parts of the world. Organized first at London in January, 1920, the Labor Office, in July, 1920, was transferred to the seat of the League of Nations at Geneva; for the Labor Organization, although autonomous, was placed under the aegis of the League and is supported financially by grants of money made by the League Assembly. The first director of the Labor Office, who in 1929 was still in charge, was Albert Thomas, the

French Socialist and labor leader, who had been an exceedingly capable Minister of Munitions during the War. Under his able supervision, an administrative staff of experts, men and women from different countries, was recruited and trained and continues to function.

**LABOR ORGANIZATIONS.** See **TRADE-UNIONISM**.

**LABOR PARTY, AUSTRALIAN.** See **AUSTRALIA**.

**LABOR PARTY, BRITISH.** See **GREAT BRITAIN**; **SOCIALISM**, under *Great Britain*.

**LABRADOR.** A dependency of Newfoundland, and the most easterly part of the British North American mainland; area, 120,000 square miles; population, 4054 in 1927, as compared with 3965 in 1913. The leading activities of the population, mostly Eskimos and Indians with some whites, continues to be the fisheries and fur trapping. The Grenfell Mission among the whites, and the Moravian Brethren among the Eskimos to the north, continue to make life supportable for the population. The settlement of the long-outstanding boundary dispute between Canada and Newfoundland in this region resulted from the decision on the part of both governments in 1920 to submit the matter to the British Privy Council. A survey commission in December, 1920, revealed the importance of the contested region by the discovery of rich forest lands and mineral areas. The decision of the Privy Council was not rendered until March, 1927, when the boundary between Quebec and Newfoundland was definitely delimited. The line as finally determined was the watershed of the rivers flowing into the Atlantic Ocean, the coastal boundaries being from Blanc Sablon, on the south, to Cape Chidley, on the north. As a result of this decision, an estimated area of some 110,000 square miles was confirmed as under the jurisdiction of Newfoundland.

**LACQUERS.** See **CHEMISTRY, APPLIED**.

**LACRETELLE**, lá'kr-tél', JACQUES DE (1888- ). A French psychological novelist who was born at Cormatin (Saône-et-Loire) and educated at the Lycée Janson-de-Sailly. In 1922 his *Silbermann*, the story of the persecutions of a Jewish boy in France, received the Prix Femina-Vie Heureuse. His other works include *La vie inquiète de Jean Hermelin*, memories of his childhood (1920); *La mort d'Hippolyte* and *La belle journée*, both short stories; *La Bonifas* (1925); *Lettres espagnoles* (1927); *L'âme cachée* (1928); and *Vie politique de Victor Hugo* (1928), *Silbermann* and *La Bonifas* were translated into English.

**LACROSSE.** Although lacrosse originated in Europe, it is in the Americas that the game is now making its greatest headway. Canada and the United States turn out the strongest teams, recruiting from various clubs and colleges. The growing popularity of lacrosse in the United States college world is evinced by the constantly increasing numbers of spectators attracted to these contests. The high schools of the larger cities also are showing much enthusiasm for this sport. Johns Hopkins University of Maryland has almost invariably presented the most powerful lacrosse teams. The lacrosse competitions at the Olympic Games (q.v.) of 1928 aroused considerable interest.

**LADD, ANNA COLEMAN** (MRS. MAYNARD LADD) (1878- ). An American sculptor, born in Philadelphia, Pa., who studied in Paris

and Rome and in 1915 was elected an associate member of the National Society of Sculptors. One of her masters was Charles Grafly, an able technician. In most of her figures, Mrs. Ladd is concerned with the proper disposition of light by means of the modeling. Her work has strength and originality, and her preference is for imaginative subjects. She has, however, executed many successful portrait busts (Duse, Pavlova, Ethel Barrymore) and bas-reliefs. Among her sculptures are the "Spirit of Serbia," exhibited at the Rhode Island School of Design, "Bronze Lady," at the Gardner Collection, Boston, "Wind and Spray," in the Borghese Collection at Rome, and the fountains in the Boston Public Gardens. During 1918, Mrs. Ladd conducted a studio in France for portrait masks for mutilated soldiers.

**LADRONE ISLANDS.** See PACIFIC OCEAN ISLANDS.

**LAESSLE, ALBERT** (1877- ). An American sculptor, born in Philadelphia, Pa., who studied at the Spring Garden Institute, Drexel Institute, and the Pennsylvania Academy of Fine Arts. He was a pupil of Charles Grafly and studied in Paris with Michel Béquine. He is best known for his studies of animal life, of which good examples are exhibited in the Pennsylvania Academy of Fine Arts, where three of his sculptures, "Turtle and Lizards," "Blue-Eyed Lizard," and "Chanticleer" are to be found, and from which he received the Fellowship Prize (1915), the Widener Memorial Gold Medal (1918), and the Fellowship Gold Medal (1923). He was awarded the gold medal of the Philadelphia Sesquicentennial in 1926. At the Carnegie Institute, Pittsburgh, his study, "Heron and Fish," is on exhibition. Other examples of his work are "Victory" and "Turning Turtle," at the Metropolitan Museum, New York, "Penguins," at the Philadelphia Zoological Gardens, "The Bronze Turkey" and "Billy," at the Philadelphia Art Club, and three small bronzes, "An Outcast," "Locust and Pine Cone," and "Frog and Katydid," at the Peabody Institute, Baltimore.

**LA FARGE, CHRISTOPHER GRANT** (1862- ). An American architect (see VOL. XIII). From 1910 to 1915, he was a member of the firm of La Farge & Morris, and in 1918 became investigator and assistant general manager of the United States Housing Corporation in Washington. Since Jan. 1, 1926, he has been a member of the firm of La Farge, Warren & Clark, New York City. He was an associate of the National Academy and was formerly president of the Architectural League of New York. He was also a member of the Advisory Board of the School of Architecture of Princeton University and of the Advisory Council of the School of Architecture of the Massachusetts Institute of Technology. He was made honorary M. F. A. by Princeton in 1921.

**LAFAYETTE COLLEGE.** A college and school of engineering for men at Easton, Pa., founded in 1826. The enrollment grew from 580 in 1914 to approximately 1000 in the autumn of 1928; the faculty from 50 to 95; and the library from 30,000 to 71,000 volumes. The productive funds were increased from \$770,960 in 1917 to \$2,800,000 in 1928. An endowment campaign in 1920 netted \$1,000,000. The Helen R. P. Manson chair of Biblical literature, \$200,000 from Fred M. Kirby and the Fred Morgan Kirby professorship of civil rights, the Simon

Cameron Long professorship in chemistry, \$500,000 from John Markle for a mining engineering building with its endowment, and Easton Hall, a dormitory for freshmen, a gift of the citizens of Easton, were added during the period. Nine acres were acquired as an addition to the campus in 1922, and a new gymnasium was completed in 1924 as a memorial to Lafayette men in the War. William Mather Lewis, LL.D., succeeded John Henry MacCracken, Ph.D., LL.D., as president in 1927.

**LA FOLLETTE, ROBERT MARION** (1855-1925). A United States Senator from Wisconsin (see VOL. XIII). He was reelected successively from 1910 to 1923, and during that entire period dominated the Republican Party in Wisconsin. He actively opposed, in 1916-17, all war preparations, and an attempt was made by the Legislature of Wisconsin to deprive him of his office as Senator (see WISCONSIN). In spite of these efforts, he was reelected. Although he was absent from the Senate on account of illness for a large portion of the time in the latter part of the decade, his influence in the Senate continued to be great. In 1922, 1923, and 1924 he was able, by his control of so-called blocs in both the Senate and the House, to decisively affect the functioning of those bodies. In the Senate, he led a group of members from the Western States who, in 1923-24, on account of the small margin between the Republican and Democratic membership, held the balance of power, and were able to affect legislation to a large extent. This was true also in the House, where the Republican Representatives, from Wisconsin and other States, who were controlled by him were able, by combining with the Democratic Party, to overthrow attempts of the Republican majority to pass important measures and to modify others. In 1924 he announced his candidacy for the Presidency on an independent ticket. He had previously organized the so-called Conference for Progressive Political Action, composed chiefly of insurgent Republicans and Democrats and some members of the Farmer-Labor Party. At a convention in Cleveland, in July, 1924, he was nominated for President. He also received the nomination of the Socialist Party, although he had never been identified with Socialism. In the election, he received the electoral vote of Wisconsin. See UNITED STATES, *History*.

**LA FOLLETTE, ROBERT MARION, JR.** (1895- ). A United States Senator, born at Madison, Wis. From an early age, he was closely associated with his father, U. S. Senator Robert M. La Follette (see above), in political matters, becoming his secretary at Washington and serving as secretary of the Senate Committee on Manufactures, of which the elder La Follette was chairman. After his father's death in 1925, he was elected to the Senate, being the first son of a U. S. Senator to take his father's seat by direct succession. In 1928 he was reelected for the term ending in 1935. He succeeded his father as chairman of the Senate Committee on Manufactures, and is a member of the committees on commerce, foreign relations, Indian affairs, and mines. He is editor of *La Follette's Magazine*.

**LAGERLÖF, Ill'gér-läf (OTTLIA LOVISA) SELMA** (1858- ). A Swedish novelist (see VOL. XIII). She took an active interest in communal affairs and served as a member of the municipal council in her native county, Wärm-

land, where with the aid of the Nobel Prize, she restored the ancestral estate. Her later publications include: *Astrid* (1914); *Dunnungen*, a comedy (1914); *En Emigrant* (1915); *Silvergrievan* (1915); *Drimman* (1916); *The Outcast* (1918); *Ingmarssönerna* (1919); *Zachris Topelius* (1920); *Marbacka, the Tale of a Manor* (1922); *The General's Ring* (1925); *Charlotte Lovensköld* (1925); and *Anna Svård* (1928). Consult *Selma Lagerlöf*, by M. Kristensen (1918).

**LA GORCE**, PIERRE-FRANÇOIS-GUSTAVE DE (1846- ). A French historian, born at Vannes and educated at the Institution Saint Jean (Douai) and the University of Paris. He began his career in 1872, at Rocroi, as *juge suppléant*, and held positions subsequently at various places, but resigned in 1880, finding that he could not follow his conscience in judging cases. He then practiced law for several years, but finally gave that up, too, and devoted himself thereafter to historical studies. In 1895 he was awarded the *Prix Alfred Née* by the French Academy, and in 1900 the Academy's *Grand Prix Gobert*. In 1907 he was admitted to the Académie des Sciences Morales et Politiques, and in 1914 was elected to the French Academy, being received in 1917. He belonged to the "classic" school of historians. His works include, besides contributions to periodicals: *Histoire de la seconde République française*, 2 vols. (1887); *Histoire du second Empire*, 7 vols. (1894-1906); *Histoire religieuse de la Révolution française* 5 vols. (1909-23); *Paul Guirard* (1911); *À travers la France chrétienne* (1920); *Saint Vincent Ferrier* (1924); and *Louis XVIII* (1926).

**LAHM**, FRANK PURDY (1877- ). An American airman, born at Mansfield, Ohio, and educated in France and at the United States Military Academy. He won the first Gordon Bennett Balloon Race at Paris in 1906 and the National Balloon Race in 1911. Also, he organized the Army Air Service in the Philippine Islands. He was on active duty in France, 1917-19, being in charge of the Air Service of the 2d Army, A. E. F. (1918-19). In 1922 he was air-service representative of the War Department. He was 9th Corps Area Air Officer, 1924-26, and in September, 1926, was appointed brigadier general for a period of four years, and at the same time assistant to the chief of Air Corps, to organize and command the Air Corps Training Centre.

**LAIRD**, IARD, JOHN (1887- ). A British philosophical scholar, Regius professor of moral philosophy at the University of Aberdeen. He was educated at Edinburgh, Heidelberg, and Cambridge universities, and then became professor of Dalhousie University, Nova Scotia (1912), and later held the chair of logic and metaphysics at Queens's College in the University of Belfast (1913-24). He was Mills lecturer for 1923-24 at the University of California. His writings include *Problems of the Self* (1917); *A Study in Realism* (1920); *The Idea of the Soul* (1924); *Our Minds and Their Bodies* (1925); and *A Study in Moral Theology* (1926).

**LAKE ERIE COLLEGE**. An institution for the higher education of women at Painesville, Ohio, founded in 1898. Student enrollment in the fall of 1928 was 190; in the same year there were 33 members of the faculty, 20,000 volumes in the library, and productive funds amounting to \$793,890.45. The college received a number

of gifts since 1924, including the Helen Rockwell Morley Memorial Music Building costing \$271,000, an organ for the same costing \$47,000, a central heating plant and laundry costing \$111,000, and \$312,000 for increasing the endowment. President, Vivian Blanche Small, Litt.D., LL.D.

**LAKE FOREST COLLEGE**. A coeducational institution, with Presbyterian affiliations, founded at Lake Forest, Ill., in 1857, as Lind University, and known since 1876 as Lake Forest College. The student body increased from 230 in 1923 to 385 in 1927-28 and the faculty from 21 to 33 members in the autumn of 1928. Reid Memorial Library in 1928 contained 38,500 volumes; the productive endowment of the college was \$1,521,847; and the income from endowment for 1927-28 was \$89,429. Between 1914 and 1928, the curriculum was adapted to modern demands, including the development of courses in business administration leading to the degree of bachelor of business administration. In 1928 there were 26 buildings in use on the campus, including 11 houses for professors, four of which were constructed in 1927. President since 1920, Herbert McComb Moore, D.D., a graduate of the Class of 1896.

**LAMARCK THEORY**, MODERN VIEWS OF. See HEREDITY.

**LAMB**, ARTHUR BECKET (1880- ). An American chemist, born at Attleboro, Mass. He was graduated from Tufts College in 1900, and studied chemistry at Harvard, Leipzig, and Heidelberg. He was instructor in electrochemistry at Harvard (1905-06), assistant professor and professor of chemistry at New York University (1906-12) and at Harvard (since 1912). During the World War, he was the chief of the chemical defense division of the Chemical Warfare Service with the rank of lieutenant colonel and later was also director of the Nitrogen Research Laboratory (1919-20). His original studies have been varied and include researches on such topics as the dehydration of periodic acid, isomensin in comoric acid derivatives, the potential of iron, equilibria among cobaltamines, removal of carbon monoxide from air, and active charcoal, on all of which he has published the results of his investigations. In 1917 he became editor of the *Journal of the American Chemical Society*. He is a member of the National Academy of Science and various chemists' societies.

**LAMB**, HORACE (1849- ). A British mathematician (see Vol. XIII). He retired from his Owens College and University of Manchester professorship in 1920. He was Copley Medalist in 1924 and president of the British Association in 1925. He is the author of *Higher Mechanics* (1920).

**LAMKIN**, VEL WALTER (1877- ). An American public-school official. He was born at California, Mo., graduated at Clinton (Mo.) Academy, and studied at the University of Missouri. He taught in the public schools of Clinton (1897-1906); was chief clerk and high-school inspector of the Missouri State Department of Education (1907-09), and served as county superintendent of schools for Henry County, Mo. (1909-15). He was State Superintendent of Public Schools in 1916-18, and in 1919 transferred his activities to the Federal Board of Vocational Education, first as chief of the division of rehabilitation and later as director. Since 1921 he has been president of the North-

west Missouri State Teachers College at Maryville. In 1928 he was president of the National Education Association.

**LAMME, BENJAMIN G.** (1864-1924). An American electrical engineer, born on a farm near Springfield, Ohio, and educated at the Ohio State University. He was one of the four greatest electricians of his time, ranking with Edison, Steinmetz, and Tesla. Beginning with the Westinghouse Company in 1889 at \$30 a month, he became its chief engineer in 1903. He had been but six months in the employ of the company when he had designed the double-reduction-gear railway electric motor. Later, he devised the great "umbrella" generators which made possible the use of the power of Niagara Falls, the high-tension system of power transmission, the alternating-current system, and many other outstanding inventions. He was also a great teacher, and inspired many investigators throughout the world. In 1923 the Ohio State University awarded him the Joseph Sullivan Medal. During the World War, he represented the American Institute of Electrical Engineers on the Naval Consulting Board and was chairman of the board's inventions committee. He was the author of *Electrical Engineering Papers* (1919). His autobiography, edited by Mansfield Dudley, appeared in 1926.

**LAMONT, ROBERT PATTERSON** (1867- ). An American manufacturer and Secretary of Commerce. He was born at Detroit, Mich., was graduated in civil engineering from the University of Michigan, and worked as an engineer on the World's Fair grounds at Chicago (1891-92). For five years, he was secretary and engineer for a firm of contractors. He then engaged in manufacturing, becoming president of American Steel Foundries in 1912, and later chairman of the board of the Griffin Wheel Company. In the World War, he was commissioned major in the National Army and later became chief of the Procurement Division, Ordnance Department, at Washington with the rank of colonel. In March, 1929, he was appointed Secretary of Commerce in President Hoover's cabinet.

**LAMONT, THOMAS WILLIAM** (1870- ). An American banker, born in Claverack, N. Y. He was graduated from Harvard in 1892, and for a time was engaged in newspaper work. From 1903 to 1909, he was secretary and treasurer and vice president of the Bankers' Trust Company. He joined the firm of J. P. Morgan & Co. in 1911 and was also a director and official in many important financial corporations. During the Peace Conference in Paris, he was one of the chief financial advisers of the American delegation. He also took a prominent part in the discussions on reparations held in London in July and August, 1924, and in Paris in the spring of 1929. During 1912-25 he served as an overseer at Harvard University.

**LANCHESTER, HENRY VAUGHAN** (1863- ). A British architect. Privately educated, he commenced practice in 1889 and in the course of his career drew plans for the Cardiff City Hall and Courts; the Wesleyan Central Hall, Westminster; the Council Hall, Lucknow, India; and Leeds University. He also made the town-planning schemes for Delhi, Madras, Rangoon, and Zanzibar. He was editor of *The Builder* (1910-12), vice president of the Royal Institute of British Architects (1913 and 1927), and president of the Town Planning Institute (1922-23). He published a number of works on town planning.

**LAND BANKS.** See AGRICULTURAL CREDIT. **LAND GRANT COLLEGES.** See AGRICULTURAL EDUCATION; AGRICULTURAL EXTENSION.

**LANDIS, KENESAW MOUNTAIN** (1866- ). An American jurist (see VOL. XIII). He served as judge of the Northern District of Illinois from 1905 to 1922, resigning in the latter year to accept the position of commissioner for the American and National Leagues of Professional Baseball Clubs, and National Association of Professional Baseball Leagues. In 1927 he investigated charges of betting on games brought against two leading players, Cobb and Speaker, and exonerated both of those veterans. In 1921 he acted as arbiter of building-trade disputes, fixing the wage of all classes of building trades in Chicago.

**LAND RECLAMATION.** See RECLAMATION. **LAND.**

**LANDSBERGER, IANTS'BËRK-ËR, ARTHUR H.** (1876- ). A German writer, born at Berlin and educated at the universities of Berlin, Greifswald, Munich, Heidelberg, and Paris. He spent some years in traveling and in 1907 joined Georg Brandes, Hugo von Hofmannsthal, Prof. Werner Sombart, Prof. Richard Muthé, and Richard Strauss in the establishment of the magazine *Morgen*, which during its comparatively brief existence was at the head of German periodical literature. He is the author of *Das Kind mit den vier Müttern* (1911); *Iliss* (1916); *Lache, Bajazzo* (1916); *Die neue Gesellschaft* (1917); *Frau Dirne* (1918); *Wie Satan starb* (1919); *Miss Rockefeller filmt* (1920); *Was die Nacht mir zuträgt* (1920); *Gott Satan, das Ende des Christentums* (1923); *Lachendes Asien, Fahrt nach dem Osten* (1924); *Asiaten* (1926); and some novels of varying merit.

**LANE, FRANKLIN KNIGHT** (1864-1921). An American cabinet officer (see VOL. XIII). He was appointed Secretary of the Interior by President Wilson, in 1913, and during his tenure took an active part in many important measures, and was considered one of the most efficient members of the cabinet. He gave especial attention to the conservation of public resources. He retired from office on Mar. 1, 1920, on account of ill health. Shortly after, he became vice president of the Pan-American Petroleum and Transport Company. His letters were published in 1922.

**LANE, RALPH NORMAN ANGELL.** See ANGELL, NORMAN.

**LANE, SIR (WILLIAM) ARBUTHNOT** (1856- ). A British surgeon, born at Fort George, New Brunswick. He received his medical degree from Guy's Hospital Medical School, London, later becoming a surgeon to the hospital. He became widely known for his operative treatment of fractures, his cleft palate operation, and for his researches into intestinal obstruction, constipation of mechanical nature, and autointoxication and his operative treatment of these conditions. He advocated with great persistence and originality his theory of the uselessness of the colon and its general harmfulness. He has published monographs on the treatment of fractures, cleft palate, and intestinal obstruction.

**LANG, COSMO GORDON** (1864- ). Archbishop of Canterbury and Prelate of the Order of St. John of Jerusalem. He was educated at Glasgow University and Balliol College, Oxford. After studying at the Inner Temple in London (1883-89), he entered the church and was curate

at Leeds (1890-93). He was fellow and dean of divinity at Magdalen College, Oxford (1893-96), served as vicar of St. Mary's, the Oxford University Church (1894-96), and as vicar of Portsea (1896-1901). He was created Bishop of Stepney in 1900, was canon of St. Paul's Cathedral (1901-08), and in the latter year became Archbishop of York. He was particularly noted for his work and preaching in industrial centres. He visited the United States in 1918, received degrees from many universities, and in 1923 the Royal Victorian Chain. On the resignation of Archbishop Davidson of Canterbury, he was elected in his place and installed on Dec. 4, 1928. His publications include *The Miracles of Jesus as Marks of the Way of Life* (1900); *The Parables of Jesus* (1906); *The Opportunity of the Church of England* (1906).

**LANGDON, STEPHEN HERBERT** (1876- ). An American Assyriologist. He was born in Michigan and studied at the Michigan State University, at Union Theological Seminary in New York, at Columbia University, the Sorbonne and Collège de France in Paris, in Leipzig, and in Oxford. He was deacon of the Church of England in Paris, 1905, and after 1908 was Shillito professor of Assyriology at Oxford. In 1923-27 he was director of the Oxford and Field Museum Expedition in Mesopotamia. He is the author of *Annals of Assurbanipal* (1905); *Les Inscriptions du Wadi Brisa* (1905); *Babylonia and Palestine* (1906); *La Syntaxe du Verbe Sumérien* (1907); *Sumerian and Babylonian Psalms* (1909); *A Sumerian Grammar and Chrestomathy* (1911); *Neu-Babylonische Königsinschriften* (1912); *Babylonian Liturgies* (1912); *Tammuz and Ishtar* (1914); *Sumerian Epical and Liturgical Texts* (1915-17); *Le Poème Sumérien du Paradis* (1919); *Sumerian Liturgies and Psalms* (1919); *Babylonian Wisdom* (1922); *Excavations at Kish* (1925); *Babylonian Penitential Psalms* (1927); and was editor of *Babyloniaca* (Paris, 1908-14); *Oxford Editions of Cuneiform Texts* (1923- ); *Babylonian Epic of Creation* (1924).

**LANGE, lǎng'ě, CHRISTIAN LOUIS** (1869- ). A Norwegian peace advocate, born at Stavanger. He has been general secretary of the Interparliamentary Union since 1909, and was Norwegian delegate to the second Hague Peace Conference (1907), and to the League of Nations (since 1920). In 1921 he won the Nobel Peace Prize. He wrote *Histoire de l'Internationalisme*, 1 to 1648.

**LANGFELD, HERBERT SIDNEY** (1879- ). An American experimental psychologist. He was born at Philadelphia, Pa., and was educated at Haverford College and the University of Berlin. In 1902-03 he served as Second Naval Attaché at the American Embassy in Berlin. He returned to academic work and in 1910 became associated with the department of psychology at Harvard University. In 1919-22 he was director of the experimental laboratory there. Since 1924 he has been professor and director of the psychological laboratory at Princeton. His publications include, in addition to experimental monographs, a manual, *Experimental Psychology* (1916), and an empirical study of aesthetics, *The Aesthetic Attitude* (1920).

**LANGLEY AERODROME.** See **AERONAUTICS**.

**LANGLOIS, lǎng'glwǎ, CHARLES VICTOR** (1863- ). A French historian, born at Rou-

en, and educated at the Lycée St. Louis in Paris and the École des Chartes, where he was graduated with honors. In 1901 he was appointed professor at the Faculty of Letters of the University of Paris, and in 1912 director of the national archives. He was admitted to the Institute of France in 1917 as a member of the Academy of Inscriptions and Belles Lettres, and was also a member of the Commission for the Literary History of France. He wrote *Le Règne de Philippe III* (1887); *Les Archives de l'histoire de France*, with H. Stein (1891); *Introduction aux études historiques*, with C. Seignobos (1897, trans. 1912); *Manuel de bibliographie historique* (2 vols., 1896, 1904); *Histoire du moyen âge* (1901); *L'Inquisition* (1902); *Questions d'histoire et d'enseignement* (1902); *La société française au XIII<sup>e</sup> siècle* (1903); *Histoire de l'écriture en France* (1905); *La connaissance de la nature et du monde au moyen âge* (1911); *Un mémorialiste parisien: Laurent Boucher* (1912); *Les hôtels de Clisson, de Guise et de Rohan-Soubise au Marais* (1922); and *La vie en France au moyen âge de la fin du XII<sup>e</sup> au milieu du XIV<sup>e</sup> siècle* (3 vols., 1925-27).

**LANGMUIR, IRVING** (1881- ). An American chemist, born at Brooklyn, N. Y. He was graduated from Columbia University and later studied in Göttingen, where he received his Ph.D. in 1906. He was instructor in chemistry at Stevens Institute of Technology, but in 1909 became research chemist to the General Electric Company in Schenectady, N. Y., where he devoted much attention to the development of gas-filled tungsten lamps and electron discharge apparatus, and devised a high-vacuum pump. These won for him the Nichols Medal of the New York Section of the American Chemical Society in 1915 and in 1920, the Hughes Medal of the Royal Society of London in 1918, the Rumford Medals of the American Academy of Arts and Sciences in 1920, and the Perkin Medal in 1928. During the World War, he made special experiments on devices for the detection of submarines at the Naval Experiment Station at Nahant, Mass. See **CHEMISTRY**.

**LANGUAGE.** See **ETHNOLOGY**; **PHILOLOGY** **MODERN**.

**LANKESTER, lǎn'kes-tēr, SIR EDWIN RAY** (1847-1929). An English naturalist and zoologist (see Vol. XIII). He was Linnean Medalist in 1920. His later works included *The Diversions of a Naturalist* (1915); *Science and Education* (1919); *Secrets of Earth and Sea* (1920); and *Great and Small Things* (1923). He continued his work as editor of the *Quarterly Journal of Microscopical Science* until his death Aug. 15, 1929, in London.

**LANS'DOWNE, HENRY CHARLES KEITH PETTY-FITZMAURICE, FIFTH MARQUIS** (1845-1927). An English public official. He served as minister without portfolio in the coalition cabinet in 1915-16. At the end of the World War, he took a moderate attitude in regard to peace, and published several proposed plans, parts of which were incorporated in the Treaty of Versailles.

**LANSING, ROBERT** (1864-1928). An American lawyer and public official (see Vol. XIII). Shortly after assuming the office of counselor for the State Department, he succeeded William Jennings Bryan as Secretary of State, holding that office until 1920, when he was dismissed by President Wilson for alleged usurpation of the latter's authority by calling cabinet meet-

ings during the latter's illness. He was a member of the American Commission to Negotiate Peace at Paris in 1919 and published *The Big Four and Others at the Peace Conference* (1921); *The Peace Negotiations* (1921); and *Notes On Sovereignty* (1921). Following his retirement from the cabinet, he practiced law in Washington.

**LANSING-ISHII AGREEMENT.** See JAPAN, under *History*.

**LANSON, LÂN'SON', GUSTAVE** (1857- ). A French literary critic (see VOL. XIII), formerly a professor at the Sorbonne. He was director of the École Normale Supérieure from 1919 to 1927, when he became honorary director. In November, 1917, he was one of the founders of the Ligue Civique, an organization politically of the Right. His later writings include *Culture allemande, humanité russe* (1915); *Trois mois d'enseignement aux États Unis* (1917); *La démocratie américaine* (1918); *Esquisse d'une histoire de la tragédie en France* (1920); and *Méthodes de l'histoire littéraire* (1925). He edited, with an introduction, variations, and notes, *Premières méditations poétiques* of Lamartine (1917), and the second series of *Les grands écrivains de la France* (6 vols., 1922-25). Consult *Mélanges offerts par ses amis et ses élèves à M. Gustave Lanson*, which has a bibliography (1922), and *Le victorieux XX<sup>e</sup> siècle*, by Pierre Moreau (1925).

**LAOS.** See FRENCH INDO-CHINA.

**LAPARRA, RAOUL** (1876- ). A French composer, born at Bordeaux. He studied at the Paris Conservatoire under Fauré and Massenet, and won the Prix de Rome in 1903 with a cantata, *Ulysse*. He gained international reputation with his opera *La Habañera* (Paris, 1908; Boston, 1910; Metropolitan Opera Company, 1924). His other operas are *Peau d'âne* (Bordeaux, 1899), *La Jota* (Paris, 1911); *Le Joueur de Violon* (Paris, 1925); and two not yet produced (1929), *Amphitryon* and *L'Aventure pittoresque*. His also wrote incidental music to *El Conquistador*, an orchestral suite, *Un Dimanche Basque*; a violin sonata, and interesting pieces for piano.

**LAPLACE, ERNEST** (1861-1924). An American surgeon, one of the pioneers of the new antiseptic surgery. He was born in New Orleans and received his degree in arts at Georgetown University, Washington, D. C., in 1880, and his degree in medicine at Tulane University, New Orleans, in 1884. Going abroad for postgraduate work, he studied under the direct supervision of Pasteur, Lister, and Koch. He was appointed professor of surgery at the Medico-Chirurgical College, Philadelphia, in 1892 and later held the same chair in the graduate school of medicine of the University of Pennsylvania. He became well known through his forceps for intestinal anastomosis, his extensive writings on antiseptics and intestinal surgery, and his work in brain surgery.

**LARBAUD, VALÉRY** (1881- ). A French novelist, one of the leaders of the modern psychological school. He was a cosmopolitan, writing from a world, rather than a national point of view. *A. O. Barnabooth*, his diary, begun in 1902, finished 10 years later, and published in 1913, presented perhaps his most famous character. Larbaud's other works include *Enfantines*, stories (1918); *Samuel Butler*, a lecture (1920); *Fermina Marquez*, for children (1920); *Amants, heureux amants*, three stories

(1923); and *Jaune, bleu, blanc*, essays (1927). In 1924 *A. O. Barnabooth* was translated into English.

**LARDNER, RING W.** (1886- ). An American writer, born at Niles, Mich. He served as a sports writer for many different newspapers, including the *Chicago Tribune* and *Boston American*. His books include *Bib Bal-lads* (1915); *You Know Me, Al* (1915); *Gullible's Travels* (1917); *Own Your Own Home* (1917); *Treat 'Em Rough* (1918); *The Real Dope* (1918); *The Young Immigrants* (1919); *The Big Town* (1921); *How to Write Short Stories* (1924); *What of It?* (1925); *The Love Nest* (1926); *The Story of a Wonder Man* (1927); *Roundup* (1928). As a fictionist, he was first known for his humorous and slangy genre sketches of the sporting world, his baseball players and Broadway hangers-on being depicted with fidelity and kindliness. His *How to Write Short Stories* and *Roundup* seemed to be approached in the same light spirit, but the stories which composed the volumes indicated a matured artistic attitude and a seriousness of purpose, in the handling of his typical American lower middle-class characters, that at once prompted critics to group the works with Master's *Spoon River Anthology* and Anderson's *Winesburg, Ohio*.

**LARMOR, LÄR'mor, SIR JOSEPH** (1857- ). A British physicist (see VOL. XIII). Continuing his work as Lucasian professor of mathematics at Cambridge, he was awarded the Royal Society's Royal Medal in 1915 and the Copley Medal in 1921. He served as Unionist member of Parliament from Cambridge University (1911-22), as president of the London Mathematical Society (1914-15), and was made an associate of numerous foreign learned societies, including the National Academy of Sciences of the United States. He wrote *Mathematical and Physical Papers* (1929).

**LARSEN, JOHANNES ANKER.** See ANKER-LARSEN, JOHANNES.

**LARSEN-TODSEN, NANNY I.** (1884- ). A celebrated Swedish dramatic soprano, born in Hagby. She received her musical education at the Conservatory of Stockholm (1900-06), and, after her most successful début at the Royal Opera there, she was engaged permanently in 1907. She won a great reputation as one of the foremost living interpreters of Wagner. When the Bayreuth Festival was resumed in 1924, she sang Brünnhilde in the *Ring* cycle. She made her American début at the Metropolitan Opera House as Brünnhilde in *Götterdämmerung* (Jan. 31, 1925) and has sung there since.

**LASKI, LÄSK'ë, HAROLD J.** (1893- ). An English political philosopher, born at Manchester and educated at New College, Oxford. He was lecturer in history at McGill University (1914-16), and at Harvard University (1916-20). In 1920 he returned to England to join the London School of Economics, in 1923 he became political science reader at the University of London, and in 1926 professor of political science there. He was vice chairman of the British Institute for Adult Education, on the council of the Institute of Public Administration, and political science lecturer at Magdalene College, Cambridge (1922-25). His works on the problem of sovereignty in the modern state, with their insistence on political and economic decentralization—*The Problem of Sovereignty* (1917); *Authority in the Modern State* (1919); and *Found-*

*dations of Sovereignty* (1921)—were considered most important contributions to the political thought of the period. He showed his familiarity with the history of political thinking in his masterly summary, *Political Thought from Locke to Bentham* (1920). He edited a volume of *Burke's Letters* (1922); *Morley's Essay on Burke* (1924); the *Autobiography of J. S. Mill* (1924); and the *Library of European Political Thought* (1926-28). Besides writing for various periodicals, he wrote *A Grammar of Politics* (1925) and *Communism* (1927).

**LASKY, JESSE L.** (1880- ). An American moving-picture producer, born at San Francisco, Calif. He was educated in the schools of San Francisco and was for a time reporter on newspapers in that city. After experiences in Alaska and Hawaii, he entered the theatrical business with Henry B. Harris in New York City. In 1914 he organized and became president of the Jesse L. Lasky Feature Play Company, which afterward merged as the Paramount Famous Lasky Corporation, having large studios at Hollywood, Calif. He was one of the most important figures in the development of moving pictures.

**LASSITER, WILLIAM** (1867- ). An American soldier, born in Petersburg, Va. He was graduated from the United States Military Academy in 1889, and was commissioned in the artillery, in which he served during his military career. He saw service in the Spanish-American War and was on duty with the General Staff in 1911 and 1913. He was commissioned brigadier general in the National Army in 1917, and major general in the following year. In 1922 he became major general in the Regular Army. He was chief of artillery for the 1st Corps in 1918 and served in the same capacity with the 2d Army later in the same year. He was commander of the 32d Division in 1918-19, and was chief of artillery of the 3d Army in April, 1919. In August of that year, he returned to the United States. From 1921 to 1923, he was assistant chief of staff in charge of operations and training. He was appointed commander of the Panama Division in 1923 and succeeded General Pershing as head of the Tacna-Arica Plebiscite Commission in 1926. Since 1927 he has commanded the 6th Corps Area, with headquarters at Chicago.

**LATANE, JOHN HOLLADAY** (1869- ). An American educator, born at Staunton, Va. He graduated from Johns Hopkins University in 1892 and after serving as acting professor of history and economics in the Baltimore City College, he became master of history and English at the Military College at San Rafael, Calif. From 1898 to 1902, he was professor of history and economics at Randolph-Macon Woman's College, and from 1902 to 1913, professor of history at Washington and Lee University. In 1913, he became professor of American history and head of the Department of History at Johns Hopkins, and in 1919, dean of the college faculty. He was a member of many learned societies and wrote *From Isolation to Leadership* (1918); *The United States and Latin America* (1920); and *History of American Foreign Policy* (1927).

**LATERAN TREATY, THE.** With the advent of 1929 came rumors that quiet negotiations had been going on for some time looking to a settlement of the Roman question and to a treaty of reconciliation between the Holy See and Italy

in which there could be recognition of the sovereignty and independence of the Pope and a concordat between the Holy See and Italy. This was confirmed by Cardinal Gasparri, the Papal Secretary of State, in an address on February 7, to the members of the diplomatic corps accredited to the Holy See. The treaty of conciliation settling the 60-year-old controversy between the Church and the Italian state was signed in the Lateran Palace, on Feb. 11, 1929, by Cardinal Gasparri, acting for Pope Pius XI, and Premier Mussolini, on behalf of King Victor Emmanuel, thus marking one of the most momentous events in the history of the Papacy.

According to the official communiqué issued for publication on February 12, the settlement consisted of three documents: (1) a treaty eliminating the Roman question, (2) a concordat regulating the conditions of religion and the church in Italy, and (3) a convention systematizing the financial relations between the Vatican and Italy arising out of the 1870 events.

The preamble of the treaty reaffirms the principle in the first article of the "Italian kingdom's constitution" by which Catholicism is the only state religion in Italy. The treaty creates a new state called the "City of the Vatican" in which territory the Holy See is the sole authority. The piazza in front of St. Peter's is in Vatican territory, but will continue open to the public and be subject to the Italian police. Italy will provide the Vatican City with a railway station, and direct communication to the other states by telegraphic, telephonic, wireless, and postal services. Persons with permanent residence in the Vatican City will be Papal subjects. Immunities will be granted to church dignitaries, persons attached to the Papal Court, and Vatican officials. Territorial immunities will be provided for patriarchal basilicas and other ecclesiastical edifices outside the Vatican City. Italy recognizes the Vatican's right to send to foreign countries and to receive diplomatic representatives according to international law. Italy will accredit an ambassador to the Vatican, and the Vatican a nuncio to Italy. The Italian government will (at the Vatican's request) see to punishment in Italy of crimes committed within the Vatican City. The Vatican will deliver to Italy refugees accused of acts considered criminal by the laws of both state and city.

A clause declares that the Vatican will remain extraneous to temporal competitions with other states unless the conflicting parties appeal to its mission of peace. The Vatican territory will always be considered neutral and inviolable. The Vatican recognizes the Italian Kingdom under the dynasty of the House of Savoy, and Italy recognizes the state of the Vatican City under the Supreme Pontiff's sovereignty. Italy recognizes marriage as a sacrament regulated by canon law in its relation to civil law. Cases concerning nullity and dissolution of marriages celebrated but not consummated are reserved to ecclesiastical courts. The Vatican consents to civil authorities' judgment on separations. Religious instruction in elementary and secondary schools is made compulsory. Italy recognizes organizations forming part of Italian "Catholic action," which must be nonpolitical.

The Vatican accepts in the financial convention 750,000,000 lire in cash and 1,000,000,000 lire in Italian state bonds bearing 5 per cent interest as indemnity for loss of temporal power in 1870 and for its consequences.

The new Vatican state is about 160 acres in extent. On March 13, the Italian Council of Ministers approved a bill for the fulfillment of the treaty, and, on May 27, King Victor Emmanuel signed the bills giving effect to its stipulations. On July 25, Pope Pius XI passed through the bronze doors of St. Peter's to take part in an elaborate Eucharistic procession, and thus ended the voluntary imprisonment within the Vatican confines that had extended from 1870, through the pontificates of his four predecessors, Pius IX, Leo XIII, Pius X, and Benedict XV. It is estimated that 100,000 spectators filled St. Peter's Piazza to witness this ceremony. See ITALY, under *History*; ROMAN CATHOLIC CHURCH.

**LATEUR, FRANK.** See STREUVELS, STIJN.

**LATOURETTE, KENNETH SCOTT** (1884- ). An American clergyman and professor, born at Oregon City, Oreg. He was graduated from Yale in 1906 and was a member of the faculty of that university until 1909. For a time, he served as traveling secretary of the Student Volunteer Movement of Foreign Missions, and from 1910 to 1917 was a member of the faculty of the College of Yale in China. In 1914 he became a member of the faculty at Reed College, Portland, Oreg., afterward going to Denison University. In 1921, he became professor of missions at Yale and since 1927 his professorship has included Oriental history. He was ordained to the Baptist ministry in 1918. Among his works are *History of Early Relations Between the United States and China, 1784-1844* (1917); *Development of Japan* (1918); *The Christian Basis of World Democracy* (1919); *A History of Christian Missions in China* (1928).

**LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF.** A religious body commonly known as the Mormon Church, existing chiefly in the United States. It was organized Apr. 6, 1830, at Fayette, N. Y., by Joseph Smith, whom his followers credit with having discovered, through a divine revelation, a set of plates, buried in a hill, from which by a special power received from God, he translated the text of the Book of Mormon, the special sacred book of the church. The Mormon articles of faith include belief in God, Jesus Christ, and the Holy Ghost, the punishment of men for their own sins, the atonement, divine authority, baptism, laying on of hands, prophecy, salvation for the dead, the Bible "as far as it is translated correctly," the common virtues, and obedience to constituted authorities. The membership of the church is chiefly in the Mountain States, owing to the early migrations of Mormons and their final settlement in Utah.

The administrative divisions of the church are known as the stake, ward, branch, and mission. A stake comprises wards and branches, and is directed by a presidency of three. A ward is frequently a part of a city, and is directed by a bishop and two counselors. The branch, similar to the ward, is directed by an elder. In 1928 the church consisted of 101 stakes, 939 wards, and 72 independent branches. Membership increased from 403,388 in 1916 to about 640,000 in 1928. The work of the church is directed by the Melchizedek priesthood, which numbered 73,382 members in 1928; there is also an Aaronic, or junior priesthood, which totaled 72,899 in 1928. Missionary work also has generally increased. In 1928 there were 11 missions in the United States, with 1267 missionaries,

and about 87,500 members, and approximately 28,000 members in Europe, and 14,000 in the Pacific Islands. In the United States, there are seven temples, while the church maintains Brigham Young University (q.v.) at Provo, Utah, six junior colleges, two collegiate institutes, one high school, and 72 seminaries, small schools adjoining high schools and providing special religious instruction. The auxiliary bodies include a women's relief society numbering about 61,820, which cares for the poor and sick, Sunday schools with 257,967 pupils, including 26,250 officers and teachers. The two Mutual Improvement Associations, composed of young persons, had an enrollment of 101,444. The primary association had 106,993 children under 14. Religious classes had an enrollment of 59,574. The church holds general conferences in the first week of April and of October of each year, at Salt Lake City, Utah.

**LATTER-DAY SAINTS, REORGANIZED CHURCH OF JESUS CHRIST OF.** This is the smaller of the two bodies known as Latter-day Saints, bearing the distinctive term "Reorganized" as part of its church title. Founded in Wisconsin in 1852, it represents a reorganization of some of the scattered congregations which developed among the Latter-day Saints after the death of Joseph Smith in 1844. The Reorganized Church is identical in faith and religious practice with the original church, but rejects polygamy as inconsistent with Joseph Smith's revelation. Its membership increased from 73,899 in 1915 to 103,174 in 1928; the number of ministers from 6136 in 1923 to 6732 in 1928; the number of Sunday schools from 637 in 1915 to 714 in 1928; and pupils from 33,062 to 37,841. The denomination maintains Graceland College at Lamoni, Iowa, the Institute of Arts and Sciences at Independence, Mo., homes for the aged, a sanitarium, a powerful radio broadcasting station at Independence, Mo., and publishes the *Saints' Herald*, a weekly periodical. Its headquarters are at Independence, Mo., and the president is Frederick M. Smith, a grandson of the founder, who succeeded his father, Joseph Smith, in 1914.

**LATVIA.** One of the Baltic Succession States arising out of the War, formerly part of the Russian Empire. It is made up of the former Russian province of Courland, the southern half of the former province of Livonia, and the western part, amounting to about one-third, of the former province of Vitebsk. It covers 25,402 square miles of territory, with a coast line of 338 miles and a total frontier line of 1040 miles, bounded by Estonia on the north, Russia on the east and Lithuania on the south. Total population, 2,552,000 in 1914; 1,883,180 at the census of 1928. Capital, Riga. For administrative purposes, it is divided into four districts. The census of Jan. 1, 1925, divided the population in to the following ethnic groups: 75.6 per cent Letts, 12.3 Russians, 4.5 Jews, 2.5 Germans, and 0.9 Poles. Of the total population, 76 per cent was rural. Density per square mile was 74.5. By occupations: 56 per cent agricultural, 18 per cent in industry, and 6 per cent in trade. About 60 per cent of the population was Protestant. Catholic majorities were to be found in Latgale and parts of Courland. Population of chief towns, 1925: Riga, 337,700 (517,552 in 1913 and 330,997 in 1928); Libau, 60,702; Dvinsk, 40,640; Mitau, 28,321; Windau, 16,384.

**Production.** Latvia is primarily an agricultural country, although in recent years there has been a strong trend toward industrialization. The area and production of the principal crops in 1927 were as follows: Wheat, 145,000 acres, 2,636,000 bushels; rye, 633,000 acres, 10,189,000 bushels; barley, 458,000 acres, 5,975,000 bushels; oats, 754,000 acres, 12,205,000 bushels; potatoes, 211,000 acres, 26,358,000 bushels; flax and linseed combined, 156,000 acres, 46,965 pounds of flax and 655,000 bushels of linseed. In the same year, there were 967,000 cattle, 535,000 swine, 1,128,000 sheep, and 369,000 horses. At the end of 1926, there were 2732 industrial enterprises employing 49,672 workers. The total value of industrial production in 1926 was \$59,226,000. Among the chief industries are food, drink, and tobacco, wood-working, chemical, textile, metal working, and paper and printing. Latvia has virtually no mineral resources.

**Trade.** The volume of trade is growing year by year, as shown by the following comparison:

Year	Imports (In lats; 1 lat = \$0.193)	Exports
1921 .....	70,697,355	29,264,991
1922 .....	107,370,110	101,992,006
1923 .....	211,872,025	161,929,052
1927 .....	221,245,682	249,987,549

The chief articles of import in 1927 consisted of: semi-manufactured goods, i.e., wool and woolen yarn, iron and steel products, hides and leather, petroleum; manufactured goods, i.e., cotton and woolen goods, machinery, implements; foodstuffs, i.e., grain and flour, sugar, herrings, tobacco. Chief among commodities exported were: lumber, other wood materials, flax and flax tow, precious metals, butter. By countries of origin, 1927 imports were distributed as follows: Germany, \$19,044,000; United Kingdom, \$5,086,000; Lithuania, \$1,406,000; Netherlands, \$1,444,000; Poland, \$2,793,000; Russia, \$3,542,000. Main countries of destination of exports: United Kingdom, \$14,437,000; Belgium, \$4,587,000; Germany, \$11,252,000; France, \$945,000; Russia, \$724,000. The United States bought \$1,317,000 worth of Latvian products and supplied goods valued at \$1,054,000.

**Transportation.** Length of railroads, 1850 miles (1927). Number of locomotives, 326; freight cars, 5682; passenger cars, 671. On June 30, 1927, Latvia's shipping included 88 vessels of 100 tons or more with a total gross tonnage of 88,782. This represented quite a long stride toward restoration of the country's pre-war merchant fleet, which on Jan. 1, 1914, comprised 59 steamers of 77,626 registered tons, and 274 sailing and motor vessels of 49,093 tons, but which by the end of 1921 had decreased 75 per cent, or to 34,021 tons. Vessels entering Latvian ports in 1927: 4041 of 1,761,000 net tons capacity; cleared, 4047 of 1,760,000 tons.

**Finance.** For the year 1928-29, the budget balanced at 164,110,000 lats. The state debt at the beginning of 1928, was 84,110,000 lats, of which 28,404,000 lats were due the United States. There were in circulation, Dec. 31, 1927, 70,963,000 lats. On Nov. 1, 1922, the Bank of Latvia, in which the Government was the chief stockholder, was opened. In June, 1922, the lat (\$0.193) became the unit of currency, and has remained continuously at par since that time.

**Education.** In 1927-28 there were 1904 elementary schools with 157,206 pupils and

7542 teachers. There were 122 secondary schools with 22,066 pupils. By the census of 1920, it was established that 70 per cent of the population could read. National minorities are taught their native languages in government schools. In 1919 the Riga Polytechnic was raised to be the Latvian University. In 1927-28 there were 7561 students and 320 instructors.

**History.** Early in 1918, as a result of the uncertainty engendered by the Russian Revolution and the threatening gestures of the peasants, German forces were invited by the Baltic barons to occupy Latvia. The Bolshevik troops were compelled to retire, and German troops invaded the country. A German Army of Occupation was allowed to remain even after the Armistice, for the Allies were not yet prepared to guard the country against Russia. (See BALTIC PROVINCES.) On Nov. 18, 1918, however, independence was declared, and a government, controlled by the moderate, or peasant, elements set up. Bolshevik troops at once invaded the new state, captured Riga early in January, 1919, expelled the Latvian government, and set up a Soviet government. War was waged intermittently throughout the year, the chief Latvian force being a Baltic *Landwehr*, officered by Germans. In May, the Bolsheviks were driven from Riga, but the fear of German preponderance made the native Letts seek aid from the Allies. The Ulmanis government (the peasant parties) was recognized and an Englishman was placed in charge of the *Landwehr*, which thus became the official Lettish force.

Latvia became a battleground as a result of the Allied determination to attack Russia by way of the Baltic provinces, and not until 1920 did the Letts succeed in clearing their territory of foreign troops. On Aug. 11, 1920, then, the Russo-Latvian Treaty was signed at Riga. Its main provisions were: an ethnographic frontier for Latvia; a large timber concession to Latvia; nonliability for Russian state debts; disarming of anti-Bolshevik troops in Latvia; free transit for Russian goods across Latvian territory; payment to Latvia of 4,000,000 gold rubles. Then, after recognition by the Supreme Council, Latvia was admitted to the League of Nations on Sept. 22, 1921.

The Constituent Assembly, called in 1920, completed a national constitution on Feb. 15, 1922. The Parliament (*Sacima*) elected by universal suffrage and based on proportional representation, which chooses the state President, was provided for. The Prime Minister, in turn, was to be designated by the state President. The first Parliament, elected on Oct. 7, 1922, was controlled by a Social Democrat bloc, with the peasant and minority parties in the opposition. Of the last, there were no less than 17 distinct groups having a total of 41 members. A new government formed June 10, 1923, was supported by a coalition of the Peasants' League, Democrats of the Centre, and Right Socialists, with the Premiership held by the head of the Peasants' League.

The second Parliament was elected in October, 1925, and at its meeting in November it reflected Jan Chakste for his second three-year term as President. Chakste died on Mar. 14, 1927, whereupon Parliament, on April 8, elected Gustave Zemgals to be Latvia's second President. The Conservative, Peter Junaszewski, became Prime Minister on Jan. 14, 1928, after the fall of a Socialist-Populist coalition. The elections of

Oct. 7, 1928, however, in which there were 44 political parties in the field, went against the Government, and Junaszewski therefore resigned, to be succeeded, on November 30, by Hugo Celmins, an Agrarian.

The Latvian government adopted a paternalistic attitude, especially toward the farmers, and the country prospered. Nevertheless, there was considerable discontent. Communist activities were rife, particularly in 1927 and 1928. In the first half of November, 1927, the police arrested several members of the Comintern of Latvia, who possessed written instructions from Moscow. On July 24, 1928, a number of Communists were court-martialed for treason and given long sentences at hard labor. An offer made by Russia to exchange these prisoners for Latvian political prisoners in Russia was refused. Then, a general strike was called for Aug. 22, 1928, in protest against the closing of the offices of extremist unions because of their plots against the Latvian constitution and government. A vigilant police and a drenching downpour cooled the ardor of the strikers and made the attempt look farcical. Again, on Nov. 13, 1928, an attempt was made by extreme radicals to assassinate President Zemgals, but the police frustrated the scheme.

Despite such happenings, the influence of Russia in Latvia was quite strong, and in September, 1927, a commercial treaty was signed by the two countries, whereby, among other things, they set up a dual control of the international flax market. This and other manifestations of an *approchement* with the Bolsheviks have served to act as a check upon the organization of a contemplated Baltic Confederation among Russia's succession states. There were almost a score of Baltic conferences between 1920 and 1929, and the movement for confederation was led by M. Meirovics, a Latvian Foreign Minister; but the latter's death in September, 1925, postponed, if it did not prevent, the fruition of the project. Meanwhile, ties have been strengthened between Latvia, Finland, Estonia, Poland, and Lithuania by a series of commercial and trade treaties. Moreover, on Jan. 16, 1927, Latvia and Estonia signed a draft convention for a customs union and general coordination of their economic and social legislation.

**LAUDER, SIR HARRY MACLENNAN** (1870- ). A Scottish singer and comedian (see Vol. XIII), who was knighted in 1919. He is the author of *Harry Lauder's Logic* (1917); *A Minister in France* (1918); *Roamin' in the Gloamin'*, an autobiography (1928).

**LAUSANNE CONFERENCE AND TREATY.** See **PEACE CONFERENCE AND TREATIES**; **TURKEY**, etc.

**LA VALLÉE POUSSIN, CHARLES DE.** See **VALLÉE POUSSIN, CHARLES DE LA.**

**LAVEDAN, la've-dān', HENRI LÉON ÉMILE** (1859- ). A French author, best known for his plays (see Vol. XIII). His later works include *Les grandes heures* (6 vols., 1915-21); *Dialogues de guerre* (1916); *La famille française*, a survey (1917); *La belle histoire de Geneviève*, a play (1919); a series entitled "Le chemin du salut" which includes *Irène Olotte* (1920), *Gaudias* (1921), *Panteau* (1923), and *Madame Leclair* (1925), all excepting the first being in two volumes; *Lydie* (1921); *Catherine* (1922); *Monsieur Gastère* (1926), and *Monsieur Vincent* (1928), the last three being plays. He sometimes wrote under the pseudonym of Manchecourt.

**LAVIS, FRED** (1871- ). An American railroad engineer, born in England. After attending St. Luke's Middle Class School at Torquay, Eng., he went to the United States at the age of sixteen. He held minor positions as an engineer in New England and Cuba and then engaged for 15 years in railroad location and construction in the United States, Mexico, Central America, and South America. In the building of the Pennsylvania Railroad tunnels into the City of New York, he was resident engineer and after their completion in 1909, he practiced as a consulting engineer (1909-28), specializing in the economics of transportation, finance, and location and construction of railroads. He was chief engineer of the Argentine Railway Company, consulting engineer to the Bolivian government, and consulting engineer to the American International Corporation during that period. In the years 1924-28, he devoted most of his time to the design and construction of New Jersey's super-highway through the congested areas in Jersey City and Newark, to connect with the Holland Tunnel under the Hudson River to New York. In 1911 Mr. Lavis examined the properties now forming a part of the International Railways of Central America for the National City Bank of New York and became consulting engineer for the directors of that organization in 1926. In 1928 he was made president of the International Railways. He wrote the following books: *Railroad Location, Surveys and Estimates* (1906); *Subway Construction in New York* (1915); *Railway Estimates* (1917); and *Instructions to Locating Engineers* (1919).

**LAW, THE RT. HON. ANDREW BONAR** (1858-1923). A British statesman (see Vol. XIII). On the formation of the first Coalition Cabinet in 1915, he was appointed Secretary of State for the Colonies and in the first Lloyd George ministry in December, 1916, he became Chancellor of the Exchequer. Owing to the constant absence of the Prime Minister during 1916-19, he acted as leader of the House during that period, and was also a member of the War Cabinet. In 1919 he was the plenipotentiary to the Peace Conference. In the same year, he became Lord Privy Seal and leader of the House, positions which he resigned in 1921, along with the leadership of the Unionist Party. In 1922 he headed the Conservative revolt from the Coalition Cabinet, contributed largely to the victory of the Conservative Party in October of that year, and was chosen Prime Minister. He resigned on account of ill health in May, 1923, and died on October 30 of the same year.

**LAW, INTERNATIONAL.** See **BLOCKADE**.

**LAW, PROGRESS OF TIME.** Law may be said to be the totality of rules prescribed by the proper authority for the regulation of society. One of the inherent qualities of law is its stability. There is a practical reason for the rigidity of positive law. The common law is a barrier against arbitrary decisions of the judiciary. Safety demands certainty in the administration of law, but the doctrine of *stare decisis* and the form of precedent are not alone based upon the assumption that individualization is unwise; society postulates a body of legal rights and duties which are predictable, vested interests which are determinable and fixed.

It does not follow, however, that the law is a static and unchangeable picture. Law must possess a considerable degree of rigidity, but it also possesses elasticity and adaptability in or-

individual activities by law are found in the interpretation of the recent statutes passed by New York and New Jersey.

New York, by statute, forbade the resale of theatre tickets at an advance of more than fifty cents above the box-office price. This statute was passed to protect the public against extortionate prices and was premised upon the assumption that a theatre was a place of public amusement, was affected with a public interest, and, therefore, could be controlled in the matter of the resale price of tickets.

This statute was declared unconstitutional by the United States Supreme Court in 1927, the majority judges denying the assertion that a theatre was a public business and arguing that the statute regulating the resale of tickets in an enterprise fundamentally private could not be constitutionally enacted. A strong dissent by four justices emphasized the contrary view that public opinion, crystalized into a statute, should not be dismissed upon the shadowy ground of liberty of contract.

Again in 1928, a New Jersey statute, regulating the fees charged by employment agencies in obtaining employment for applicants, was declared unconstitutional. Here, also, the divergent views of the constitutionality of legislation among the members of the Supreme Court may be clearly noted. Mr. Justice Sutherland, writing the opinion of the court, rejected the contention that employment agencies are "affected with a public interest." That abuses exist in the operation of these agencies was conceded, but these evils, while sufficient to justify regulation of employment agencies, would not permit regulation of the fees to be charged by these agencies.

Against this view, the minority of judges stressed the necessities of the persons seeking employment, their inability to bargain on equal terms with the employment agencies, and the prevalence of legislation seeking to correct these evils.

This survey indicates that the predominant view of the Supreme Court at the present time (1929) is to distinguish sharply between public and private business, to resist the entry of excessive regulations in the border-line enterprises, and to enunciate as a controlling principle of constitutional law the paramount right of individuals to contract without meddlesome interference by State or Federal governments.

**Property Rights.** The conservation of the right of property is clearly within the purview of the due-process clause of the Constitution. This right, however, is not absolute, but may be partially or even completely extinguished when the public interest requires it. The most striking example of the relativity of property rights, excluding the right of eminent domain, may be noted in the operation of the Eighteenth Amendment prohibiting the manufacture and sale of intoxicating liquors. This amendment automatically prevented the use of property and instrumentalities for the forbidden purposes and thereby materially lessened the value of these properties without compensation. Similar laws and statutes restricting or prohibiting the sale of food products have been held to be constitutional since they were passed to safeguard the public health. A familiar restriction is the "blue sky" law which conditions the sale of securities without a State license. Laws regulating the height of buildings, "zoning" laws, and ordinances prohibiting or taxing the use of land for billboards,

all of which have been declared to be constitutional, are modern illustrations of the lawful invasion of the individual's property rights.

An interesting illustration of the constitutionality of a statute which seriously qualifies the property rights of the individual is found in the so-called cedar-rust statute of Virginia. This statute was passed authorizing the State to order the owners of red cedar trees to cut the same down, when infected with cedar-rust. Cedar-rust is an infectious plant disease in the form of a fungoid organism and originated in cedar trees, without, however, injuring them. The cedar-rust was transmitted to apple trees and worked great damage. No provision was made in the Virginia statute for compensating the owner of the cedar trees for the full value of the trees cut down.

The question considered by the United States Supreme Court in construing the constitutionality of the Virginia cedar-rust statute was whether the State could destroy one class of property without adequate compensation therefor, when the destruction was necessary to protect another class of property. It appeared that the apple trees of Virginia, in the judgment of the Legislature, were of greater value to the public than the cedar trees. The Supreme Court decided that the preponderance of public interest in the preservation of the apple trees carried with it the necessary right to order the destruction of the cedar trees.

Another recent illustration of the power of the legislature to qualify the property rights of an individual is found in the zoning laws generally passed by municipal and town legislatures. A recent ordinance of the village of Euclid, Ohio, excluded all industries from a certain area of this village, without reference to their harmless or harmful character. The Supreme Court of the United States, reviewing this zoning law, held that it was constitutional even though industries were totally excluded from a given area in the village. If the validity of the legislative classification for zoning purposes is fairly debatable, the legislative judgment will not be disturbed by the courts. In the Euclid case, it is admittedly a difficult matter for the Supreme Court to determine definitely that the exclusion of all industry from a given area is *per se* unreasonable. This typical decision is in accord with the general policy of the courts to uphold zoning laws fixing the heights of buildings, the materials to be used, and the user of the buildings after erection. Problems of health and fire risk are inevitably involved in the erection of these structures and are proper subjects for legislative action provided only that the legislative action is not arbitrary or unreasonable.

**Equal Protection of the Laws.** The Fourteenth Amendment, in addition to its provision establishing and guaranteeing due process of law, provides that all persons within the jurisdiction of the State shall be accorded "equal protection of the laws." This important phrase secures equal treatment to all persons in the enjoyment of their rights and privileges. Equal protection does not prevent the State from classifying portions of the people according to their particular relations, but this classification must be based upon some real difference which separates the class affected from the other groups in the social order. This constitutional guarantee was originally incorporated to secure to the colored race, then recently emancipated,

the complete enjoyment of their freedom, but the Amendment is not confined to racial inequalities. Within its original purpose may be noted the cases that consider the constitutionality of legislation which establishes separate schools for white and colored children, separate coaches and stations in railroad service. These statutes have been validated on the ground that equality of laws does not necessitate intermixture of the races socially, provided that both races are given similar accommodations; but when a State passed a law prohibiting a colored person from buying property in a white district, and imposed the same restrictions upon a white person purchasing property in a colored section, the Supreme Court held that this provision, although aimed to lessen racial strife, exceeded the power of the State and violated the guarantee of equal protection of the laws.

Laws that classify distinct groups in the community are valid provided that the distinction is not arbitrary or unreasonable. For instance, the State may pass special regulatory statutes controlling insurance companies, banks, grain elevators, and mines. Such legislation may impose various forms of licenses, different rates of taxation, and varied modes of control without offending the equal protection clause. The employer-employee relation has been especially subject to particular legislation. Laws control hours of labor, working conditions, and safety appliances; but arbitrary discrimination will be inhibited in industrial legislation. In a recent case, the Supreme Court held a statute of Arizona to be unconstitutional which prohibited the use of injunctions in labor disputes, although a vigorous dissent to this decision was registered by four justices.

**Police Power of Government.** The police power inherent in government balances and limits the liberty of the citizen for the common good. The boundary of the police power is shadowy and uncertain. It sometimes includes a consideration of the limits of legislative power, sometimes a discussion of the conflict of State and Federal authority, and frequently the vague definition of the public welfare and individual right. Police power lies at the base of all those laws which curtail the freedom of contract, regulate the conduct of business, impose restrictions upon the use of property, and protect the health and safeguard the morals of the citizenry.

This necessary power of government is broad and flexible. It was recently invoked to curb the property rights of landlords during the housing shortage by the passage of emergency rent legislation. Congress was exercising the police power when it passed the temporary wage scale for railroad employees in connection with the Adamson Eight-Hour Law. The States also are possessed of a similar power which the Federal government must respect within its proper limits. The dividing line between the State and Federal police power is sometimes rather uncertain. The Congress may not, under the guise of taxation or regulation of interstate commerce, usurp the police power of the State. An important application of this principle of the separateness of the police power may be seen in the child-labor cases. In these cases, Congress attempted to bar from interstate commerce in the first case, and to tax in the second case, the products of child labor in the States. Obviously, the primary purpose was not to reg-

ulate commerce or to tax, but simply to reach out and to control interstate affairs. Both statutes were declared to be unconstitutional as an invasion of State sovereignty.

The strong stand of the Federal judiciary against the covert entry and domination of State business by Congressional acts is wise and necessary. The palpable need of child-labor laws is generally conceded; but the duality of our scheme of government negatives the right of Congress to infringe upon the reserved police power of the States to accomplish a worthy end. If this pronounced trend toward centralization were to continue, local government would become a mere name. The Federal government could through the extension of the power to regulate commerce virtually dominate the remote activities of the State. These excursions into States' rights have reached the peak, and the attitude of the Supreme Court gives support to the belief that further encroachments will not be successful.

The police power of the State, however, is not without limits even in its local environment. The exercise of the police power must bear a tangible relation to the governmental power and a due recognition of individual rights. Thus, a State may lay a tax upon or forbid the manufacture and sale of obnoxious and harmful foods such as oleomargarine, or the use of benzoate of soda in nonfermented beverages. A wide latitude even to the point of caprice has seemingly been allowed in State legislation; but the line against excessive and arbitrary prohibition is still drawn, although the separation is often difficult to define. The German language cases, decided in 1923, illustrate the possible misuse of police power by the State. Several States passed laws forbidding the instruction in any foreign language of any children under a certain age or school grade. Without questioning the power of the State to compel attendance and to make reasonable regulations for all schools, the Supreme Court held that the restriction was beyond the power of the State and violative of individual rights. A more extreme form of the same radical exercise of State control is the Oregon Compulsory Public School Law, which prohibits the instruction of children between the ages of 8 and 16 in private schools and compels attendance in public schools. Supported by the attitude of the Supreme Court in the German language cases, the United States Supreme Court declared that the Oregon Compulsory School Law infringed upon the liberties of the parents, invaded the property rights of the private institutions affected, and usurped the natural and inherent rights of parochial and private schools to each. These laws indicate in the field of State legislation a present tendency to strain the powers of sovereignty to the breaking-point, and to transgress unduly the reserved rights of the people in accordance with the Bill of Rights, most of which are found in the first 10 amendments to the Federal Constitution.

**The Eighteenth Amendment.** The advent of prohibition as a national policy has presented many important and original legal questions. The Supreme Court upheld the validity of the Eighteenth Amendment and the constitutionality of the National Prohibition Act which was passed to enforce the Amendment.

The Eighteenth Amendment provides that Congress and the several States shall have con-

current power to enforce this Amendment by appropriate legislation. Pursuant to this concurrent jurisdiction, many States passed local enforcement laws. This dual administration of prohibition raised the question whether an individual could be punished twice for the same violation, once by the Federal and again by State authorities. The question was answered by the Supreme Court to the effect that the Eighteenth Amendment was a limitation and not a grant of power to the States, and that the same act may be an offense against both the State and Federal governments without offending the "double jeopardy" provision of the Fifth Amendment.

Under section 21 of the National Prohibition Act, any house, building, or place where intoxicating liquor is manufactured, sold, kept or bartered, is declared to be a common nuisance, and by section 22, the said nuisance may be abated through the exercise of the "padlocking" power of the courts. Interesting questions have arisen with reference to the extent of this padlocking power against the landlord of a tenant who has been convicted of violation of the National Prohibition Act. Generally stated, the courts have not hesitated to exercise the power of padlocking against a landlord when he actually knew, or ought to have known, that the leased premises were being operated by his tenant in violation of law. The tenor of the decisions indicates that the landlord is under a duty to exercise reasonable diligence in preventing the leased premises from being used contrary to the provisions of the National Prohibition Act.

Again, under section 26 of the National Prohibition Act, any vehicle used in the transportation of intoxicating liquor may be seized. Obviously, no difficulty arises in the lawful seizure and sale of any vehicle owned by the person violating the National Prohibition Act. Questions have arisen, however, with reference to the right of the Government to seize and sell vehicles owned by third persons. The trend of judicial decisions indicates that established innocence on the part of the owner of the vehicle will be followed by a return of the vehicle to him. On the other hand, if he colluded directly or indirectly with the operator of the vehicle, no protection will be offered to him simply because he did not actively operate the vehicle at the time. Frequently, it appears that third persons, not the owners of the vehicle, have liens against it. While the courts have not allowed these liens to interfere with the sale of the vehicle being used in violation of the National Prohibition Act, the lienors, acting in good faith, have been allowed to obtain the amount of their liens out of the sale price which was obtained for the vehicle by the Government.

**Property.** The initiative and enterprise of man are dependent upon the recognition of his right to the fruits of his labor, the privilege of acquiring property from his accumulations and the guarantee that the State will protect his goods from unlawful aggression. Hence, property law has its proper place in the legal order. In the development of the law of property, changes are less frequent than in other branches. There is manifest an emphasis upon certainty and rigidity in the rules governing the acquisition, enjoyment, and transfer of property. This stability is necessary in order that the legal consequences of action concerning property may be definitely determinable.

Even the law of property, however, is not wholly free from force of external changes in the march of events. No longer can we say with Blackstone that the rights of private property cannot be invaded even for the general good of the whole community. Property is losing its individualistic coloring and is gradually becoming socialized. This does not portend the overthrow of private property, but it indicates rather the realization that the ownership of property is a trusteeship in which society has a latent interest. The owner of property is subject to the control by the State in its acquisition, use, and disposition. Charitable corporations are frequently restricted as to the quantity of land which they may acquire; the use of land is dependent upon the effects of such user upon the public; and the disposition of property is subject to stringent rules against entangling provisions which tend to suspend its transferability. The "dead-hand" influence is reprobated by statutes which prohibit stipulations preventing alienation. These limitations are of ancient lineage, but their principle is visible in more recent extensions of the same fundamental principle.

The shortage of homes, incident to the War, resulted in the passage of emergency rent legislation which took from the owners the right to fix the rental value of their properties and transferred this property right to administrative boards with power to adjust controversies between landlords and tenants. This power, operating to diminish materially the rights of ownership, was upheld as necessary in view of the public need; but it was plainly limited to the present emergency and the Supreme Court of the United States refused to continue its provisions in the absence of proof that the emergency still existed in the District of Columbia.

An event which is not without considerable interest in the development of the law of property in America is the comprehensive and fundamental codification of the English property law. This law aims at simplification and clarification of property rights, reduces materially the number and complexities of common-law estates, and renders obsolete a great part of the classic rules of property. It is symptomatic of the general recognition that the law has lagged behind the progress of society and requires a thorough overhauling to bring it down to date. The success of the English experiment will be followed with interest in the United States and will probably arouse American jurists to initiate similar reforms.

America is beginning to recognize the imperative need for a readjustment of the property law governing the descent and distribution of property. A typical illustration of the tendency to reform property laws is found in the report of a commission appointed in New York in 1927, delegated with the duty of proposing changes and drafting a law in the matter of the descent and distribution of real and personal property. This commission filed a report in 1928 outlining the following changes in the law of property: (1) The removal of distinction between real and personal property, and the assimilation of a uniform plan for the inheritance and distribution of real and personal property. (2) The substantial increase of the present dower right of the widow and the elimination of the existing inchoate right of dower as a burdensome restraint on the conveyance of real property.

In support of this general movement of reform, to the end that the present distinctions between real property and personal property may be eliminated, it may be said that the present distinctions between real and personal property are mainly based upon historical reasons no longer important. Sound policy dictates that the property of an individual after death should pass to definite beneficiaries without reference to the character or kind of property so transferred. Again, personal property has become more common with the expansion of credit and the purchase of stocks, bonds, and other securities by the public. Land no longer constitutes the major portion of inherited wealth. Hence, the wisdom of treating all property, whether real or personal, in accordance with similar rules of descent is generally conceded and will make for simplification and equality in the inheritance of property in general.

**Contracts.** Social, economic, and commercial changes cause corresponding changes in the branches of the law immediately affected. In an era of expanding commerce and industrial growth based upon credit and confidence, it is inevitable that contracts should enter into a majority of mercantile transactions. The preliminary agreement, the sale of goods, the conveyance of land, the issuance of instruments of credit, the guarantee of payments, the formation of partnerships and corporations, all these business relations necessitate the passing of promises which form the central field of contract law. Due to the fluctuating problems of commerce, the law of contracts discloses renewed signs of activity.

The fundamental questions of offer and acceptance, consideration, and the like are being reopened and debated in the light of modern business requirements. One of the litigated enigmas of contracts is the definition of the real elements of a promise which will render the promisor legally liable to the promisee. Is it necessary for the promisee to give or to promise to give an equivalent value to the promisor? Or is it sufficient that the parties make a business bargain independent of the relative value of the respective promises or acts? Or does it suffice that a promise is made which is relied on by the promisee without the promisor's assumption of any affirmative obligation?

These queries outline the conflicting theories of the nature of consideration. Dean Roscoe Pound has styled them respectively as (1) the equivalent theory, (2) the bargain theory, and (3) the injurious-reliance theory. The leading theory today is the bargain theory, which validates all promises which arise out of a give-and-take bargain. Under this view, it is not fatal that the more exacting requirements of the equivalent theory are missing; but there is a perceptible effort being made by the courts to enlarge the scope of contractual liability according to the mandates of the so-called injurious-reliance theory. This latter theory may seem to be too idealistic in that it seeks to impose a liability for a promise which is not balanced by a corresponding promise from the other party to the agreement; but it is predicated upon the sound ethical doctrine that it is not right for a man to violate his promises even when they are gratuitous. Certainly, it is unfair to do so when the promisee acts upon the assumption that the promise will be fulfilled and suffers damage by reason of his reliance.

Despite the undercurrent of support for the reliance theory, the prevalent definition of consideration includes the element of mutual undertakings by both parties.

Standardization of the law of contracts has made appreciable progress in certain branches. Insurance contracts have been made uniform by legislation. Negotiable instruments, sales, bills of lading, warehouse receipts, stock certificates, and partnerships have been subjects which are governed by uniform acts in many States. Ambitious attempts have been made in a few States to reduce the whole field of contract law to a code; but the attempts have been premature and generally unsuccessful. Codification must involve a restatement of the law; and the difficulty is that one cannot restate that which has not yet been definitely stated. The conflicting theories must first be evaluated and weighed before a complete code can be successful.

**Torts.** A tort has been defined as "a wrong independent of contract." It may be said that the law of torts embraces the liability of individuals for the invasion of the rights of others when this liability is not based upon a contract. It includes the invasion of noncontractual rights of person and property, whether the transgression is willful or negligent. One of the marks identifying a common-law tort has heretofore been the proof of some fault on the part of the defendant. A tortious wrong connoted a wrongdoer. Assuming no personal culpability, no willful or negligent action or inaction, the common-law rule was that there could be no liability without fault. If the damage was purely accidental, the maxim, *damnum absque injuria*, applied.

Exceptions are being engrafted upon the cardinal principle of no liability without fault. It is no longer true that liability presupposes a wrongdoer. Laws frequently impose absolute duties which eliminate the necessity of proving fault as an ingredient. A typical example is workmen's-compensation legislation, now generally operative in the United States, which fixes liability on the employer for injuries to his employees incurred in the course of their employment. The absence of due care of the employee or the absence of negligence on the part of the employer are of no consequence. The employer is an insurer and must reimburse the injured employee. Apart from statutes, many American courts have broken down the common-law rule by holding that a person may be liable for damages due to his keeping instrumentalities which are inherently dangerous if they escape. If these agencies actually cause damage, liability follows without any proof of concurrent fault on the owner's part. Other courts stubbornly resist the expansion of the principle of liability without fault and assert that it is hostile to the course of the common law.

The pragmatic school of jurisprudence, arguing for a sociological interpretation of law, disputes the contention that liability should be premised on fault. It is said that the correct approach to the question of legal liability should be the balancing of the whole circle of conflicting social interests and the recognition of the predominant claims of society. If social progress and economic interests will be advanced by the enlargement of individual responsibility, there is no barrier against the consequent liability. The elevation of social

interests, prominent in the tenets of modern legal philosophy, is a reaction against the rigid individualism of the nineteenth century. It has a proper place in the formulation of rules of legal liability, but it is possible that, in our zeal to promote the general welfare, we may unduly submerge the individual welfare. Excessive paternalism is just as dangerous as excessive individualism. In the judgment of many, we are rapidly approaching the danger point of unwise and futile attempts to correct human failings by the compulsion of law. So also it may be suggested that the complete abandonment of the common-law principle of no liability without fault is fraught with potential harm.

It is generally stated that there is liability when there is fault accompanied by actual damage; but this proposition is sometimes debatable. A lively controversy exists regarding the right to recover damages for mental fright due to the negligent conduct of another when no direct physical impact is present. Some courts contest the existence of any right to recover damages owing to the difficulty of tracing the damage and the dangers of malingering and falsification. If this practical objection can be removed, it is arguable that the form of the damage should not be an obstacle to legal redress. Medical science is progressing to the point where it is possible to distinguish between real and feigned nervous disorders. The result is noticeable in the gradual enlargement of cases allowing recovery for fright negligently or willfully caused by the defendant's conduct. A somewhat similar question arises when an unborn child is alleged to have been injured by the negligence of the defendant before birth. Has the unborn child a right to sue for damages? The almost unanimous view of the courts is that no recovery will be allowed. The practical objection is that it is impossible to prove the source of the injuries. It is also said that the unborn child is not a legal entity at the time of the injury; but this treatment of the child yet unborn as beyond the pale of legal rights has been subject to established exceptions in the criminal law and the law of property. If the cause of the damage is certain and can be traced to the willful or negligent acts of another, it is somewhat artificial to find the law protecting the property rights of an unborn child, punishing criminally pre-natal killing of the child, and denying a civil remedy to the child after birth.

**Law Reform.** The progress of the law is indicated not only by the course of decisions and legislation, but also by movements to reform the law which are visible in society. A study of law reform serves two purposes: it portrays shortcomings in the administration of the law, and it discloses the tangible form of the proposed remedies. Six major tendencies or agencies which are destined to shape juristic development are prominent at the present time: (1) Reform of criminal law; (2) investigation of the bar; (3) the American Law Institute; (4) uniform State legislation; (5) reformation in legal education; and (6) law enforcement.

**Reform of Criminal Law.** There are two notable trends visible in the reform of criminal law: (1) The increased protection of society from crime through the enactment of more stringent laws and increased severity in matters of punishment, and (2) the study of the criminal

as a victim of environmental and hereditary traits for the purpose of correcting criminal tendencies in the individual by means of observation and treatment. These two trends to some extent overlap and contradict one another. Under the first, protection of society is deemed more important than the correction of the criminal; under the second, the primary object is to save the criminal from himself by study of criminal tendencies and the removal of the causes which make for violation of the criminal laws.

At the present time, the tendency seems to be to enact laws which increase the degree of punishment under the theory that severity of punishment stays the hand of the criminal. A typical illustration of this development is found in statutes which have been recently passed in New York, Vermont, North Dakota, California, and New Jersey eliminating all judicial discretion in the matter of sentences to be imposed on criminals who have been guilty of four or more major violations of criminal law. Recidivism, or the lapse by the criminal into prior criminal habits, is now recognized as a material factor to be taken into consideration in fixing the punishment for the particular crime committed by the criminal. Under the modern application of recidivism, it is frequently provided that fourth offenders must be sentenced for life on the theory that it is dangerous to society to permit these individuals to be at large.

A vigorous dissent is to be noted against the policy of stringent criminal laws. This dissent emanates from those criminologists who argue that prevention of crime cannot be accomplished by enhancing the severity of punishment; that the true remedy lies in the reformation of the criminal and the removal of the temptation of criminal violation by education, religious training, and home influence.

**Investigations of the Bar.** The truism that the practice of the law is a profession, not a business, calls for the elimination of practices recognized as permissible in the business world, but highly unethical in the confidential relation of attorney and client. Of late, the legal profession has faced the realization that members of the bar have been pursuing methods smacking of the market-place in an effort to obtain clients. Ambulance chasing, the hiring of runners with the inevitable sequence of fee-splitting, the manufacture and prosecution of fake claims in negligence litigation, perjured testimony—all these evils have become more evident in recent years.

While these practices have been strongly condemned by representatives groups of the legal profession, no appreciable steps have been taken to remove these shortcomings. A movement was instituted in New York in 1928, originating in the Bar Association of the metropolitan district, which culminated in a sweeping investigation of so-called ambulance chasing and attendant evils. The investigation was conducted by the judiciary on the theory that attorneys, as officers of the court, were subject to the court in matters concerning their professional conduct. A searching inquiry followed and disclosed that the above-mentioned evils were prevalent among a restricted number of attorneys. Disbarment proceedings have followed the discovery of unprofessional practices, and it is confidently expected that the result of the investigation will bring about an increased sense of the responsibility of the bar to the public as agents for the administration of justice.

*The American Law Institute.* One of the most widely held criticisms of the law is its present uncertainty and confusion of principles which impede the orderly and exact application of law. It is often difficult for lawyers to predict the outcome of lawsuits owing to the multiplication of diverse and overlapping rules and the inconsistent principles in different States, and sometimes even in the same State. Useless litigation is frequently the result of this confusion, or the compromise of valid claims. The remedy is to simplify and to clear away the accumulated mass of contradictory precedents; to make a new start by building up a body of legal formulas that will restore the power of predictability. The proposal is theoretically sound, but its practical accomplishment offers many difficulties.

The American Law Institute was formed to face these problems and to attempt their solution. The object of the Institute is: "To promote the clarification and simplification of the law and its better adaptation to social needs, to secure the better administration of justice, and to encourage and carry on scholarly and scientific legal work." Its members include the leading judges, lawyers, and law teachers of America, and in addition an active corps of specialists who are assigned particular topics of the law for intensive study. The perplexities of the task of restating the law in clearer form are frankly admitted by the members of the institute, but the need of the restatement has inspired the organization to make every effort to insure the success of the work. The institute was formally organized at a meeting held in Washington, Feb. 23, 1923. Many years must elapse before the concrete results of this important reform can be definitely determined.

*Uniform State Legislation.* The work of the National Conference on Uniform State Law deserves special mention in the consideration of legal reforms. This conference, comprising delegates from all the States, meets annually for the purpose of promoting uniformity in State laws. This is accomplished by the drafting, after careful study and analysis, of uniform statutes covering particular parts of the law. The acceptance of the drafts and their enactment by the State legislatures are purely voluntary, but the response, particularly in the field of commercial law, has been gratifying. Since these uniform acts contain many simplifications in the common-law and statutory principles, they have exercised considerable influence in ameliorating and unifying American law.

*Reformation in Legal Education.* Law schools, as the training centres of future lawyers, wield a potent influence upon the moral and intellectual calibre of the bench and bar. To appreciable degree, the standards of the lawyer and judge are formulated during their law-school course. Agitation for the elevation of the scholastic requirements in the law schools is a result of this close relation between legal education and legal practice. The American Bar Association has recommended that the study of law should be preceded by at least two years of college work. The proposal aroused some opposition on the ground that it would result in closing the doors of the law school to ambitious students; but the majority of the profession accepted the validity of the recommendation and the law schools, with few exceptions, are requiring this additional period of study.

*Law Enforcement.* It cannot be doubted that disregard of law and disobedience to law have greatly increased in recent times. This unfortunate situation is still increasing, if we may judge by statistical proof and careful surveys of the times. In an attempt to determine the causes and to find a remedy, the American Bar Association appointed the Special Committee on Law Enforcement. This committee sent out a country-wide questionnaire to prominent members of the bar and bench. The collated answers point to many causes for this breakdown of law enforcement: the demoralizing influence of war, the passage of legislation which the State cannot enforce, the spread of irreligion, the disintegration of family life, political influence in the administration of justice, and the tardiness and technicalities of legal processes.

These multiple and varied influences complicate the task of law enforcement. Indeed, it may be safely stated that one of the primary difficulties is that the law has gradually been burdened with duties which properly should be, and in the past have been, borne by other agencies of social control. There are limitations on the efficacy of law as a means of rectifying and leveling the inequalities and hardships of societal existence. The home, school, and church have their respective parts to perform in upholding the respect for authority and obedience to law. If the home is invaded with the evils of divorce, if the school fails to implant moral principles in the youth, if the influence of the church is weakened by internal dissension, it is futile to transfer to the State the obligation of social reformation.

There are, however, regions where the law has failed to do its part. In the province of criminal law, we are in need of a general simplification of procedure and substantive law. The law's delay is a potent factor in bringing about the present distrust of law. Time is of the essence in criminal and civil actions. A delay in the establishment of rights or the punishment of crimes is often as fatal as their nullification or destruction. The English practice combines speed and certainty in the detection and trial of criminal offenses. Its adoption in America would result in considerable improvement in the direction of law enforcement.

The future development of law is problematical and doubtful. There is abroad the settled conviction that the law is approaching a critical stage which necessitates a thorough reorganization. It is a hopeful augury that the legal profession recognizes the current shortcomings in the legal order and is offering concrete proposals to simplify and to clarify juridical principles, but the coöperation and support of the people are needed to restore and sustain the orderly progress of law. The sanctity and primacy of law rest upon the willing acquiescence and submission of the people, their spirit of obedience to lawful authority, no less than upon the successful installation of the stated devices of law reform. The problem for the future is not merely one of legal reformation; it also includes the preliminary and important task of social, domestic, industrial, and political purification. In these larger spheres, the law can assist, but it alone cannot cure the failings of humankind.

LAWN TENNIS. See TENNIS.

LAWRENCE, DAVID HERBERT (1835- ). An English novelist, born at Eastwood, Notting-

ham. He attended the Nottingham High School, and when 16 years old became a teacher. He later matriculated at the Nottingham Day Training College, and taught in London. Mr. Lawrence's works are profound studies of the reactions of human nature. His numerous publications, include: *Love Poems and Others* (1913); *Tortoises* (a creative animal study, 1921); *Birds, Beasts, and Flowers* (poems, 1923); *Amores* (poems, 1925); the plays *The Widowing of Mrs. Holroyd* (1914); *Touch and Go* (1920); and *David* (1926); the essays *Twilight in Italy* (1916), *Psychoanalysis and the Unconscious* (1921); *Fantasia of the Unconscious* (1922); *Studies in Classical American Literature* (1923); and *Mornings in Mexico* (1927); and the novels *The White Peacock* (1911); *Sons and Lovers* (1913); *Women in Love* (1921); *Aaron's Rod* (1922); *Kangaroo* (1923); *St. Mawr* (1925); *The Plumed Serpent* (1926); *Glad Ghosts* (1926); *The Woman Who Rode Away* (1928); *Collected Poems* (1929); and *Pansies*, poems (1929).

**LAWRENCE, THOMAS EDWARD** (1888- ). A British soldier, archaeologist and author, and, since 1919, a research fellow of All Souls College, Oxford. He was born in Wales, educated at Jesus and Magdalen College, Oxford, and went to Arabia, where he lived with the tribesmen, to write an archaeological thesis. After four years at the British Museum's excavation on the Euphrates, he joined the Secret Service in Cairo (1914). When the Arabs revolted against Turkey (1915), he determined to unite their forces with the British Army fighting the Turks. He obtained permission to enter the Hedjaz, where only Mohammedans were allowed, and became the director of the Arab revolt, although nominally only a friend of the native chief, Emir Feisal. Winning the confidence of the Arabs, he was able to unite the tribes into an effective army, which contributed greatly to the British successes against Turkey. He was known as "The Uncrowned King of Arabia" and was permitted to wear the curved dagger of a native Mohammedan ruler. He was the chief Arab representative at the Peace Conference (1919), and was adviser on Arabian affairs at the Colonial Office (1921-22), where he had a great deal to do with making Feisal King of Iraq. He refused all honors, including a peerage, and in his effort to shun publicity he served, under assumed names, in the air force and in the tank corps, remaining in both until his real name was discovered. With C. Leonard Wooley, he wrote *The Wilderness of Zin* (1915), and *Egyptian and Assyrian Antiquities, Department of Carchemish* (2 vols., 1914-21), two archaeological reports. He alone wrote *The Seven Pillars of Wisdom*, for private circulation (1926), and *Revolt in the Desert*, an account of his Arabian adventure (1927). Consult *With Lawrence in Arabia*, by Lowell Thomas (1924), and *Lawrence and the Arabs*, by Robert Rankin Graves, the poet (1927).

**LAWRENCE COLLEGE.** A coeducational institution comprising a college of liberal arts and a conservatory of music, at Appleton, Wis., founded in 1846. The student enrollment increased during the years 1914-28 from 439 to 800 in the college, and from 175 to 525 in the conservatory of music. The faculty during the same period was increased from 47 to 85 members. The endowment increased from \$905,423 to \$1,849,902; the value of the plant from \$490,-

110 to \$1,381,642; and the total income from \$134,527 to \$496,328. Whereas the library in 1923-24 contained 42,892 volumes, it had attained 46,000 volumes in 1927-28. During the period under review, a chapel with a seating capacity of 1600, a dormitory for women, a new athletic field, and a gymnasium, under construction in 1928, were added to the equipment of the college; the campus was enlarged; the department of business administration was merged with the department of economics, with four full-time teachers; a chair of Spanish was added to the faculty; and a general museum and a historical museum were established. The scholarship funds were doubled during the years 1924-28 and by 1928 totaled approximately \$100,000. President, Henry Merritt Wriston, Ph.D., LL.D.

**LAWRIE, LEE** (1877- ). An American sculptor, born in Rixdorf, Germany. He was brought to America in infancy and was educated at the public schools and Yale University and studied sculpture under St. Gaudens and Martiny. He is a member of the National Society of Sculptors and in 1921 and 1927 was awarded gold medals by the American Institute of Architects. His work includes the sculptural decorations in the United States Military Academy at West Point, reliefs and statues for many churches throughout the country, including the Church of Saint Vincent Ferrer, for the large reredos of St. Thomas' Church, New York, and the Harkness Memorial Tower and Archway, Yale University.

**LAZZARI, lad'zá-ré, SILVIO** (1858- ). A French composer, born at Bozen, Switzerland. He studied at the Paris Conservatoire under Franck and Guiraud. During 1885-94 he wrote for various French journals advocating the cause of Wagner. He later lived in Paris, devoting his entire time to composition. On the occasion of the world première of his *Le Sauteriot* (Chicago, 1918), he visited the United States. His other works include: the operas *Armor* (Prague, 1898), *La Lépreuse* (Paris, 1912), and *La Tour de Feu* (Paris, 1927); a pantomime, *Lulu*; a ballet, *Melanis* (Paris, 1923); a symphonic poem, *Effet de nuit*; an orchestral suite, *Impressions*; *Konzertstück*, for piano and orchestra; a string quartet, an octet for woodwind, and a violin sonata; piano pieces; choruses and songs.

**LEA, FANNIE HEASLIP.** See AGEE, FANNIE HEASLIP LEA.

**LEACOCK, STEPHEN BUTLER** (1869- ). A Canadian writer and educator (see VOL. XIII). He continued as head of the department of political economy at McGill University. His later works include: *Arcadian Adventures with the Idle Rich* (1914); *Moonbeams from the Larger Lunacy* (1915); *Essays and Literary Studies* (1916); *Further Foolishness* (1916); *Frenzied Fiction* (1917); *The Hohenzollerns in America* (1919); *The Unsolved Riddle of Social Justice* (1920); *Winsome Winnie* (1920); *My Discovery of England* (1922); *Over the Footlights* (1923); *College Days* (1923); *The Garden of Folly* (1924); *Winnowed Wisdom* (1926); *Short Circuits* (1928). Leacock's life in *Mahers of Canadian Literature* (1923), was written by Peter McArthur.

**LEAD.** Many changes and developments in the lead industry have taken place since 1914. The industry was called upon during the World War to supply lead for munitions, but the uses of this metal in times of peace were far more important and are constantly growing with the

development of industry. In the order of their importance in 1927, the industrial uses of lead may be ranked as storage batteries, pigments, cable covering, building, solder, ammunition, bearing-metal, and foil.

Lead is produced in many countries of the world (see table), but the principal sources of supply are the United States, Mexico, Australia, Spain, and Germany; and of these, the United States easily leads. In the United States, Missouri, Utah, Idaho, and Oklahoma were the leading sources of production in 1927. Utah increased its output considerably between 1924 and 1928, as a result of the new improvements in selective flotation and ore-dressing practice, and consequently displaced Idaho in second position as a lead producer. The production estimates of the U. S. Bureau of Mines for 1928, however, indicated that Idaho had regained its former position

as the second producing State. Missouri and Oklahoma supply the soft lead ores that are comparatively free from silver, whereas the so-called complex silver-lead-zinc ores come from Idaho, Utah, and the inter-mountain region of western United States.

In 1913 the United States produced 462,460 short tons of primary lead from domestic and foreign ores; in 1923, 628,517 short tons of primary lead were refined; in 1927 the output was 812,545 short tons, of which Missouri produced 210,366 tons; Utah, 155,199; and Idaho, 150,618. The higher prices for lead recently prevailing have stimulated production, and research work has developed the selective flotation process to its present high state of perfection and widespread application. As a result of this new development, much lead is now recovered from ores that in the past could not be treated profitably.

The production of red lead in the United States reached a maximum of 42,550 short tons, valued at \$9,181,072 in 1926. The maximum for white lead was 194,991 short tons in 1922, valued at \$35,513,395. The maximum output of litharge came in 1925, when a production of 86,546 tons, valued at \$18,587,399, was recorded. The year 1927 witnessed the maximum imports of lead into the United States, when the total content of lead in ore, base bullion, pigs, bars, and sheets, reached 324,646,263 pounds.

**LEAGUE OF NATIONS.** The organization and establishment of a definite agency of international coöperation designed to further concerted action both in the preservation of the future peace of the world and in the promotion of general human welfare—the League of Nations—was the greatest constructive achievement of the Peace Conference at Paris. For the origins of this significant institution, one is obliged to seek far beyond the council chamber of the Peace Conference. However, for the present consideration, it is desirable without further introduction to recall the First and Second Hague Peace Conferences (1899, 1907) which to optimistically minded pacifists seemed extremely auspicious—"the real beginning of an organized international state, with its capital in The Hague, with its regular congresses, with its statutes and codes, with its permanent court of arbitration." They failed to perceive the essential anarchy and increasing tension of international relations, the ominous forces of nationalism, imperialism, militarism, secret diplomacy, and systems of alliances potentially operating to disrupt the state system and to produce the most stupendous catastrophe in all history—the great World War of 1914–18. The precipitation of this vast conflict was a shock and a disillusionment, but to hundreds of thousands in the Allied countries, the protracted struggle gradually took on the aspects of a great and disinterested crusade for eternal peace and righteousness. It became "the war to end war."

Statesmen in all the Allied countries from time to time gave voice to idealistic pronouncements regarding war aims. Premier Asquith spoke of a "real European partnership" and the passing years witnessed ever-increasing coöperation on the part of the Entente governments. It is safe to say that Anglo-American advocacy was the most important factor in promoting the definite formulation of the League concept. Colonel House's (see HOUSE, EDWARD M.) famous pre-war mission in 1914 for the furtherance of a general agreement between the United States, Great Britain, France, and Germany had in it the germ of a world concert of Powers and House subsequently evolved into a zealous and indefatigable champion of the League of Nations ideal.

With the lessons of the Serajevo crisis fresh in mind, Sir Edward Grey, British Foreign Minister, in numerous letters to House, emphasized ceaselessly his belief that the future peace of the world was contingent upon the substitution of regular and permanent international conferences and concerted organization for the existing nationalistic anarchy. Most significant of all, however, was the progressive espousal of the project by President Woodrow Wilson. In December, 1914, he planned the negotiation of a general Pan-American pact for the preservation of peace in the Western Hemisphere, the basic formula of which should be "mutual guarantees

of political independence under republican form of government and mutual guarantees of territorial integrity."

These negotiations continued through 1915 and 1916, but never reached fruition, largely because the diplomatic crises with European belligerents distracted Wilson's attention from American affairs; but these very crises, so destructive of any mythical concept of national isolation, impressed upon him the rôle which the United States might play in an association of nations not merely American but world-wide in character. Utilizing the substance of the Grey-House discussions, the President, in a stirring address before the American League to Enforce Peace on May 27, 1916, laid down three general principles which prefigured his international aims during subsequent years: (1) Every people has a right to choose the sovereignty under which it shall live. (2) The small states of the world have a right to enjoy the same respect for their sovereignty and for their territorial integrity that great and powerful nations expect and insist upon. (3) The world has a right to be free from every disturbance of its peace that has its origin in aggression and disregard of the rights of peoples and nations.

Here was Wilson's fundamental creed enunciated a year before America intervened in the great World War; his subsequent addresses represented merely the elaboration and refinement of details. In his note of Dec. 18, 1916, suggesting that the belligerents state their peace conditions, he intimated that "a concert of nations immediately practicable" should be the chief purpose of a settlement. Speaking before the United States Senate on Jan. 22, 1918, he advocated "a covenant of coöperative peace" and demanded the replacement of the old system of alliances by a general concert of Powers. His War Message of Apr. 2, 1917, emphasized American determination to fight for a "universal dominion of right by such a concert of free peoples" as should bring peace and safety to all nations.

The project for a league was incorporated in his address of Jan. 8, 1918, as the Fourteenth Point, viz., "a general association of nations must be formed under specific covenants for the purpose of affording guarantees of political independence and territorial integrity to great and small states alike." Reiterated in an address of July 4, 1918, President Wilson's advocacy of the project reached its war-time culmination in his address of Sept. 27, 1918, when he insisted that a league of nations would be an "indispensable instrumentality" of a secure and lasting peace and must constitute "the most essential part of the peace settlement itself." At the time of the Armistice, this stipulation, among others, was accepted by Germany and by the Entente Powers as a legal basis for subsequent negotiations. The President's momentous resolution to attend the Peace Conference in person expressed his unswerving determination that a league should be created.

President Wilson waited long before proceeding to anything like a draft of the frame work of the proposed league. Nevertheless, organizations such as the American League to Enforce Peace and the British League of Nations Association had long been engaged in drawing up plans for keeping the peace. Men like ex-President Taft, Elihu Root, Lord Robert Cecil,

and Lord Bryce had given the matter careful consideration, examining with a fresh interest the famous schemes propounded in previous centuries by Pierre du Bois, St. Thomas Aquinas, Marsiglio of Padua, King Henry IV, the Quaker, William Penn, the Abbé St. Pierre, the philosopher, Immanuel Kant, Czar Alexander I, and others. In September, 1917, Lord Robert Cecil wrote to Colonel House suggesting that the time had come to appoint a commission to study feasible plans; but Wilson discountenanced the proposition and during the winter of 1917-1918 no official steps were taken to institute public discussion that might crystallize opinion upon the character of the proposed league; but after his famous Fourteen Points pronouncement, Wilson, though asserting his personal conviction "that the administrative constitution of the League must grow and not be made," finally commissioned House to discuss the elements of a league with the most eminent of its American proponents—Taft, Root, and the distinguished university executives, Butler and Lowell.

In the meantime, the British government, largely under the stimulus of Lord Robert Cecil, had taken the definite step of appointing a committee, headed by Sir Walter Phillimore, to inquire, from a judicial and historical point of view, into the various schemes for establishing, by means of a league of nations or other device, some alternative to war as a method of settling international disputes. The Phillimore Committee submitted a draft convention on Mar. 20, 1918, outlining a plan pledging each of the Allied states not to go to war with another Allied state without previously submitting the matter in dispute to arbitration or to a conference. Any covenant-breaking state would *ipso facto* be at war with the other Allied states, which should be bound to take jointly and severally all such measures—military, naval, financial, and economic—as might best avail to punish the breach of covenant. Provision was likewise made for handling disputes with or between outside states, which also might apply for admission to the League. The Convention of the League was automatically to abrogate all treaty obligations *inter se* inconsistent with its terms. Thus, the Phillimore plan, despite its limitations, foreshadowed much of the substance of the final covenant.

A short time later, on June 8, 1918, a French government committee under the chairmanship of Léon Bourgeois reported a draft essentially similar to that which was subsequently introduced by the French at the Peace Conference. It provided for an annual International Council, and a permanent committee or secretariat. Juridical disputes were to go to the International Tribunal, other disputes to the Council. Diplomatic, juridical, and economic sanctions were provided and the decisions of both the Tribunal and the Council were to be enforced, if need be, by joint economic, military, and naval measures. The forces of the League were to consist of contingents supplied by member states, and were to be under a permanent international military staff. This report was sent to both the British and American governments.

When President Wilson received a copy of the Phillimore plan, he was absorbed in other problems and therefore requested Colonel House to consider and rewrite the proposed constitution. With some assistance from David Hunter Miller and Sir William Wiseman, Colonel House drafted

a covenant along his own lines, though incorporating several of the salient provisions of the Phillimore plan, and dispatched it to the President on July 16. Colonel House's plan provided for a more elaborate organization of League machinery, including not merely a conference of delegates, but a secretariat and an international court. The sanction of physical force was omitted in favor of recourse to blockade or economic coercion. A definite though flexible mutual guarantee of territorial integrity and political independence was incorporated, and the League was also to have the function of assuring peace through limitation of armament. Wilson approved the House draft almost in its entirety, but when rearranging and revising it in his own first draft, he conspicuously omitted the international court and restored the sanction of physical force. After discussing the revision with House in August, 1918, the President, though continuing his public advocacy of the League principle, seems to have let the matter of drafting a definite constitution rest until after the Armistice. In fact, he systematically and successfully opposed all efforts (e.g., those of the British government) to transfer discussion of the specific details of a covenant to the forum of general public opinion.

Once on board the *George Washington* en route to Europe, Wilson resumed consideration of the problem, announcing himself (Dec. 10, 1918) in favor of League control of territories conquered from the enemy. After his arrival in Paris, the President received, but was wholly uninfluenced by, certain suggestions from his Secretary of State, Robert Lansing, who championed the theoretical equality of all states and favored legalistic methods of settling international disputes. More important were two new projects, both British and based in large degree upon the Phillimore report, but each with characteristic features of its own—one by General Smuts of South Africa and the other by Lord Robert Cecil. Profoundly impressed by Smuts's plan, which was expounded in a brilliant pamphlet, Wilson utilized it in revising his own, taking over a whole new scheme of organization establishing a smaller executive council in addition to the general conference and secretariat embodied in previous plans, more definite ideas concerning limitation of armament, arbitration and its guarantees, and also a definite mandatory system for the supervision and control of conquered territory.

The Inter-Allied Labor and Socialist programme of February, 1918, had looked forward to the international administration of all colonial empires, but Smuts, to whose mind the mandatory concept had thus been suggested, limited its scope to territories dismembered from the Russian, Hapsburg, and Ottoman empires. Wilson, attracted to the central idea which had such deep roots in historic American policy (e.g., Cuba), advocated its application to the former German colonies.

Cecil's plan, which proposed domination of League activities by an executive council composed exclusively of the Great Powers, did not so much influence the President, but powerful currents of world opinion represented by the labor movement and Jewish propaganda caused Wilson to insert in his second draft provisions according more recognition to the interests of labor in the determination of world affairs and requiring all new states to grant equal rights to

their "racial or national minorities." In compliance with Wilson's request, this second draft, when printed and circulated on Jan. 10, 1919, brought forth a number of comments and criticisms, some of which (e.g., those submitted by General Bliss and David Hunter Miller) impelled him to prepare a new revised draft completed on January 20. Certain vital differences between this third Wilsonian draft and an official plan transmitted to him from the British delegation, led to a collation of the two into a compact plan by D. H. Miller and Lord Cecil (January 27) which was then subsequently revised by the legal advisers of the two delegations. This so-called Hurst-Miller draft, though wholly satisfactory to neither side, provided a broad basis of agreement between them. Wilson, it is true, prepared (February 2) a fourth draft of his own, but owing to opposition from Lord Cecil, this draft failed to supersede the compromise.

"Practically nothing—not a single idea—in the Covenant of the League was original with the President. His relation to it was mainly that of editor or compiler, selecting or rejecting, recasting or combining the projects that came in to him from other sources. He had two great basic convictions, that a League of Nations was necessary; that it must be brought into immediate existence." Thus wrote R. S. Baker in *Woodrow Wilson and World Settlement* (vol. i, 1922, p. 214).

In December, 1918, Premier Clémenceau of France had openly expressed his desire to retain the old system of alliances; at the same time, Winston Churchill, of the British cabinet, mouthpiece of reactionary militarism had declared that the League was no substitute for British sea power. At Paris, most of the Allied Powers, including Japan, wanted the territorial, military, and economic settlements made first and in accordance with the provisions of the old secret treaties, before any attempt should be made to set up the League. The French, in listing the subjects to be considered by the conference, placed the League last. Wilson, warmly supported by Cecil and Smuts of the British delegation, placed it first and insisted that a League of Nations should be made "an integral part of the general treaty of peace." A resolution to that effect, passed by the Council of Ten on January 22, was accepted by the second plenary session three days later, and a commission was appointed, composed of two representatives from each of the five great Powers (United States, Great Britain, France, Italy, and Japan) and one from each of the five, later nine, small powers (Serbia, China, Brazil, Portugal, Belgium, Czechoslovakia, Poland, Greece, and Rumania). President Wilson became chairman of this commission, the membership of which, as ultimately constituted, embraced such leaders as Premier Orlando of Italy, Baron Makino of Japan, Cecil and Smuts of the British Empire, House of the United States, Bourgeois and Larnaudi of France, Venizelos of Greece, Hymans of Belgium, and Wellington Koo of China. Using the Hurst-Miller compromise plan as a basis of discussion in preference to drafts submitted by the French and Italians, respectively, the commission held ten meetings, February 3-10.

The French desperately endeavored to convert the projected league into a buttress of French security by advocating an international army directed by an international general staff which

should execute the decisions of the League and supervise all military affairs including reduction of armaments. The Italians opposed any attempt to incorporate a provision for the abolition of conscription. The Japanese, supported in this sole instance by the Chinese, insisted upon explicit recognition of the principle of racial equality. Both the French and the Japanese suggestions were rejected as was likewise a religious toleration clause sponsored by Wilson, the most important single alteration being the reinsertion of an article calling for the establishment of a Permanent Court of International Justice. A complete tentative draft of the covenant was submitted to the third plenary session of the conference on February 14 and adopted unanimously.

Meanwhile, a keen struggle in the Council of Ten (January 23-30) had resulted in the reluctant acceptance of a resolution providing for the application of League mandates to the administration of former German colonies rather than sessions in absolute sovereignty as demanded by the British, French, Italians, and Japanese.

The battle over the League was by no means at an end. During Wilson's absence from Paris in late February and early March, the project was necessarily in abeyance, though by no means side-tracked as has been alleged. While in America, the President became acquainted at first hand with Senatorial opposition to the Covenant, and after consulting with his Democratic advisers and certain leading pro-League Republicans including Taft, Root, and Lowell, he returned to Paris determined to secure three amendments designed to cover American criticism. They embraced: (1) Specific recognition of the Monroe Doctrine. (2) Provision for voluntary withdrawal of any state (e.g., America) from the League upon stipulated notice. (3) Specific exclusion of domestic questions from the purview of League activity.

Arriving at Paris, March 14, Wilson quickly repudiated a project which had gained ground during his absence, to impose preliminary general peace terms upon the enemy without immediately establishing the League. On March 18, in conference with Lord Cecil, he agreed upon certain changes in the covenant. On March 20 and 21, a sub-committee of the League of Nations Commission held meetings with the representatives of 13 neutral Powers to discuss the Covenant, the result being a number of proposed textual amendments. The full commission resumed its deliberations from March 22 to April 11, holding five night sessions during the most critical period of the Peace Conference. See *PEACE CONFERENCE AND TREATIES*.

Wilson's desire to have the Covenant altered in accordance with American interests reopened the former struggle with French and Japanese over the respective plans for an international military organization and recognition of racial equality. Even the British (with certain exceptions) opposed specific mention of the Monroe Doctrine, but they were eventually won over and, through a personal understanding with Clémenceau over other French claims before the conference, Wilson secured sufficient backing to have his amendments adopted and the French and Japanese proposals rejected. Revision of the Covenant being thus finally completed by the commission on April 28, it was accepted by the fourth plenary session for subsequent incorpora-

tion as the first section in each of the major treaties of peace.

When the tentative terms of peace were submitted to the Germans at Versailles (May 7), they proceeded among other things to formulate (May 9) an alternative project for a league of nations with an elaborate machinery for mediation, arbitration, and adjudication of disputes. Its membership, they contended, should embrace all the recent belligerent Powers, as well as eligible neutral states. After careful consideration by a committee, this counter plan was rejected by the Allies (May 22). Again on May 29, the German delegation protested vigorously against the proposed non-admission of Germany, but without avail. On June 28, 1919, was signed the epoch-making Treaty of Versailles formally embodying the Covenant of the League of Nations.

The Covenant of the League of Nations as thus framed was a comparatively brief document setting forth in 26 articles the rights, obligations, and privileges of the member states. The 32 Allied and Associated Powers convened at Paris (see *PEACE CONFERENCE AND TREATIES*), of which the United States, Ecuador, and Hedjaz alone subsequently refused to join, were designated as original members, and 13 neutral states, viz., Argentina, Chile, Colombia, Denmark, the Netherlands, Norway, Paraguay, Persia, Salvador, Spain, Sweden, Switzerland, and Venezuela, were invited immediately to accede to the Covenant. The desire of the British and Americans forthwith to admit the enemy Powers was frustrated by the opposition of France and Belgium. Certain other states—notably Russia and Mexico—whose governments had not been formally recognized by the Powers generally, were also temporarily excluded. Provision was made for the admission of any fully self-governing state, dominion, or colony as a new member by a two-thirds vote of the General Assembly of the League, and for the withdrawal from the League of any member on two years' notice, "provided that all its international obligations and all its obligations under this Covenant shall have been fulfilled." In accordance with the former provisions, Austria and Bulgaria, as well as Finland, Luxemburg, Costa Rica, and Albania were admitted to membership in December, 1920; Estonia, Latvia, and Lithuania in September, 1921; Hungary in September, 1922; Abyssinia and the Irish Free State in 1923; the Dominican Republic in 1924; and Germany in 1926.

In accordance with the latter provision, Costa Rica on Dec. 24, 1924, announced an intention to withdraw, effective Dec. 31, 1926. During 1928 steps were taken to induce her to reverse this decision. Brazil, likewise, gave notice effective June 13, 1928, of her withdrawal though still professing devoted collaboration with the League. Spain gave notice on Sept. 11, 1926, but before it became effective was induced (March, 1928) to rescind her decision. The other principal sovereign states still outside the League in July, 1929, were Afghanistan, Ecuador, Egypt, Mexico, Sultanate of Nejd, Turkey, Union of Socialist Soviet Republics, and the United States. All of these states, however, participated in specific conferences or committees of the League and frequently responded to invitations to accede to its international conventions.

Three organs of administration and control and one judicial organ were to be established;

namely, an Assembly, a Council, a Permanent Secretariat, and a Permanent Court of International Justice. The Assembly was to meet at stated intervals at the seat of the League and was empowered to deal with any matter within the purview of the Covenant, each member state, including the British Dominions, being entitled to only one vote in its meetings though privileged to send at most three representatives. The Council, as originally provided, was to consist of representatives of nine states comprising, first, five permanent members—the United States, the British Empire, France, Italy, and Japan—and secondly, four others to be selected or superseded by the Assembly "from time to time at its discretion," the first non-permanent members being provisionally designated by the Covenant as Belgium, Brazil, Spain, and Greece. Each state represented on the Council was to have one delegate and only one vote. Additions to either of the two classes of members—permanent and non-permanent—might be made by the Council if such action secured the approval of the Assembly, and it was also stipulated that any member of the League might be represented at meetings of the Council whenever any matter specifically affecting its interest should come up for consideration. Parties to disputes were to have no vote, however, and decisions by the Council normally had to be unanimous. The Permanent Secretariat, comprising a secretary general and such secretaries and staff as might be required, was to be established at Geneva, the first seat of the League.

The purposes of the League as set forth in the preamble to the Covenant were "to promote international coöperation, and to achieve international peace and security." The Covenant embodied pointed endeavors to mitigate or eliminate the general forces alluded to above as operating to cause wars in the state system, namely, nationalism, militarism, imperialism, secret diplomacy, and systems of alliances, and also to provide agencies for the settlement of specific disputes between nations. To this end, the signatory Powers pledged themselves (Art. 10) "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." The members of the League recognized that the maintenance of peace required the "reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations." To the Council was intrusted the important function of formulating decennial plans for the reduction of armaments, which having once been accepted by the particular governments concerned were not to be changed without the consent of the Council. The Council also was empowered to suggest means for preventing the evils attendant upon the manufacture by private enterprise of munitions and implements of war. Members of the League undertook to interchange full and frank information as to the scale of their armaments and their military, naval, and aeronautical programmes.

Any war or threat of war, whether directly affecting any member or not, was declared to be a matter of concern to the whole League; and at the request of any member, a meeting of the Council should be summoned forthwith. Each member possessed the friendly right of calling

the attention of the Assembly or of the Council to any circumstance threatening international peace or good understanding. Members of the League were pledged to submit all potentially dangerous disputes, which could not be satisfactorily settled by diplomacy, either to arbitration or to inquiry by the Council and in no case to resort to war until three months after the award of the arbitrator or the report of the Council. The Permanent Court of International Justice, for whose establishment provision was made, was to be endowed with power to determine any international dispute submitted to it by the contestants and also give an advisory opinion on any matter referred to it by the Council or by the Assembly. Dangerous disputes not settled by diplomacy, or submitted to arbitration, were to be referred to the Council or through it to the Assembly, and if all efforts at conciliation failed, the facts and recommendations were to be published. Members obligated themselves not to go to war with the party to the dispute which accepted the suggestion of the conciliating agency, but any member resorting to war in violation of its covenants was *ipso facto* to be deemed to have committed an act of war against all other members, who bound themselves immediately to sever all commercial, financial, and personal relations with the nationals of the covenant-breaking state and to prevent any intercourse between that state and any other state whether a member of the League or not. The Council was invested with the duty of recommending what effective contribution each member of the League should contribute to the armed forces to be used to protect the covenants of the League. In the event of a dispute between a member of the League and an outside state, or between two or more nonmember states, the League was to offer its services; and if the invitation should be rejected and a member of the League attacked, all other members were to come to its aid.

The Covenant expressly affirmed the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace, but all other obligations or understandings inconsistent with the terms of the Covenant were to be abrogated, the Assembly being empowered to advise the reconsideration of treaties which had become inapplicable. A blow was dealt to secret diplomacy by the requirement that henceforth every new treaty or international engagement should be forthwith registered with the Secretariat and published by it; and no such pact was to be considered binding until so registered.

As territorial greed and colonial rivalries had been prolific causes of war in the past, the Covenant provided a new system for controlling the German colonies and dismembered portions of the Turkish Empire, which were not to be divided among the victor's as spoils but administered as sacred trusts of civilization for the benefit of the peoples concerned. The various areas were to be intrusted to various members of the League under mandates prescribing the degree and kind of authority that they might exercise, guaranteeing certain rights to the natives and requiring annual reports from the mandatories. In other ways, the League was inextricably interwoven with the general peace settlement. To it were intrusted the adminis-

tration of international areas, such as the Saar Basin and the Free City of Danzig and the conduct of certain plebiscites, such as those in North Schleswig, Allenstein and Marienwerder, and Upper Silesia, which are discussed under their respective heads.

Members of the League pledged themselves to cooperate in the reciprocal establishment of freedom of transit and equitable treatment for commerce, in the improvement of labor conditions, the international prevention of disease and mitigation of suffering, the suppression of the arms traffic, the traffic in women and children, and in opium and other dangerous drugs. To the League were to be transferred all international bureaus and commissions. Provision was made for the amendment of the Covenant at any time by a unanimous vote of the Council and by a majority of the Assembly, though the somewhat faulty drafting of the Covenant was manifested by omission of any reference to ratifications.

The League of Nations formally came into existence on Jan. 10, 1920, with the exchange of ratifications of the Treaty of Versailles. During its early years, League activities developed along three main lines: (1) Establishment, operation, and development of its organs of administration and control. (2) The promotion of general international welfare. (3) The partial elimination of general causes of war and the attempted solution of certain specific disputes arising between nations.

**Development of Organs of Control.** First convened on Jan. 16, 1920, the Council up to June, 1929, held 55 sessions in various places though customarily at Geneva. Official rules of procedure were early adopted and the Council rapidly demonstrated itself to be a flexible organ of action well adapted to the requirements of a constantly changing situation. Starting with three items in the first session, the Council handled some 2400 items up to 1928. In 1922, with the subsequent approval of the Assembly, the Council increased its nonpermanent membership from four to six states, and in 1926 from six to nine. Germany was accorded a permanent seat upon its admission to the League in 1926, so that in 1929 there were five permanent members (a permanent place is reserved for the United States under the Covenant and another is probably available for the Soviet Union) and nine nonpermanent members.

At first, it was the practice of the Assembly to elect its representatives to the Council annually though the same states might be re-elected indefinitely. After an amendment to Art. 4, par. 2 of the Covenant, which became effective July 29, 1926, the Seventh Assembly proceeded in September of that year to adopt a new set of rules whereby three of the (now) nine nonpermanent members were to be elected each year to serve normally for three years and then to be ineligible for an equivalent period unless the disability be removed by a two-thirds majority of the Assembly—which in any case reserved full power to make a sweeping change of all nine in any one election. The states which have served are as follows, the asterisk indicating the nine members in August, 1929: Belgium (1926-28); Brazil (1920-26); \* Canada (1926-29); \* Chile (1926-29); China (1921-23, 1926-28); Colombia (1926-28); \* Cuba (1927-30); Czechoslovakia (1924-27); \* Finland (1927-30); Greece (1920); Netherlands (1926-

28): \* Persia (1928-31); \* Poland (1926-29, and reëligible); \* Rumania (1926-29); Salvador (1926-27); Spain (1920-26, 1928-31, and reëligible); Sweden (1923-26); Uruguay (1923-26); \* Venezuela (1928-31). In August, 1923, the Council decided that henceforth regular meetings would be held quarterly in December, March, June, and just prior to the annual meeting of the Assembly. Since 1926 the August-September meeting has split into two sessions, the Council reorganizing after the election of nonpermanent members by the Assembly.

The First Assembly, summoned by Woodrow Wilson as authorized in the Covenant, met at Geneva on Nov. 15, 1920, its session lasting until December 18, with 41 states represented. Henceforth, regular meetings were held annually in September and one special session was held in March, 1926, to consider Germany's admission to the League (see below). Though not possessing the flexibility and initiative of the Council, the Assembly came to occupy a place of considerable importance in the League. Its membership embraced men of experience in public affairs, often endowed with keen powers of criticism and in some cases real constructive ability—premiers, foreign ministers, members of parliaments and diplomatic corps. By prescription in the Covenant and by practice, the Assembly came to perform three duties exclusive to it, i.e., passing the annual budget, admitting new members, and electing nonpermanent members of the Council. By an amendment to the Covenant, Art. 6, par. 5, effective Aug. 13, 1924, the Assembly was to decide upon the proportion of the expenses of the League to be born by each member. The League budget for 1929 totaled 27,026,280 gold francs. Annual reports of the work of the Council and Secretariat, submitted to the Assembly for review, criticism, and approval, elicited discussions constituting an extremely useful appraisal of international progress and a challenging symposium of world opinion upon important questions. Indeed, the centre of gravity in the League slowly shifted from the Council to the Assembly with broadening democratic consequences.

By an annex to the original Covenant, Sir James Eric Drummond of Great Britain was named first Secretary General and during the next decade an elaborate but highly efficient and flexible Secretariat was developed under his direction. The Secretariat was charged with the task not only of preparing the work and executing the decisions of the Council and Assembly, but also of placing at their disposal extensive, detailed, specific, and up-to-date information upon the various topics and problems confronting one or the other. An admirable organization was developed to direct the multifarious and intricate activities falling under its supervision, the Secretariat being divided into various technical sections and administrative services with a technical staff of about 475 men and women experts drawn from some 40 nationalities. These members of the Secretariat acted in an international capacity and were not in any sense representatives of their own country.

Commencing with a treaty filed by Denmark, Norway, and Sweden on July 5, 1920, the secretariat had registered 2000 treaties by May, 1929. The League's Treaty Series, to which the United States government likewise in the course of time, decided to send its international engagements, thus became a vast compendium of the new in-

ternational law and organization of the world. About 500 public and private international agencies and commissions also had been placed under the ægis of the League.

In February, 1920, an advisory commission of 12 eminent international jurists was appointed by the Council to draft a statute organizing the Permanent Court of International Justice authorized by the Covenant (Art. 14). With the exception of the provision for obligatory jurisdiction and certain minor details, their report was approved by the Council during the summer of 1920 and adopted by the Assembly at its first meeting. Thirty-six nations made a futile effort to secure compulsory jurisdiction for the new court, but the Great Powers refused to engage themselves to submit all justiciable disputes thereto, although subsequently numerous smaller states signed an additional optional clause for compulsory jurisdiction, or entered into mutual agreements to that effect. "The jurisdiction of the Court," ran Art. 36 of the statute creating it, "comprises all cases which the parties refer to it and all matters specially provided for in the Treaties and Conventions in force." The new court was designed to be an impartial, permanent judicial organ, capable of settling international disputes of a purely legal character without the intrusion of political considerations. It was not intended to duplicate or supersede the Court of Arbitration created by the First Hague Peace Conference (1899). The two courts continued to exist side by side, the old court having the function of arbitrating a difficulty, the new one, the function of deciding what law applied in any given case. It was not intended, as were the Council and Assembly, to devise arrangements, adjustments, and compromises as a method of harmonizing conflicts between states, but simply to interpret, explain, and apply international laws and conventions. Following a suggestion made by Mr. Root of the United States, the statute provided for the election of judges for a term of nine years by an absolute majority in the Council and Assembly voting separately, thereby appeasing the demands of both large and small states for commensurate powers of choice. In September, 1921, 11 judges, including Prof. John Bassett Moore of the United States, and four deputy judges were chosen in this way. The first regular session of the Court was opened at its permanent seat (The Hague) on June 15, 1922.

**Promotion of International Welfare.** Up to 1929, perhaps the chief service performed by the League of Nations had been the promotion of international welfare. Its humanitarian work proved varied and efficient and by extensive technical investigations it threw much light upon unsolved social and economic problems. The Assembly and Council were assisted in specific phases of League business by what are known as "technical organizations." The fully developed technical organization devoted itself to a single field of international relations and consisted of three parts: (1) a section of the Secretariat serving as an exploring, recording, and secretarial body; (2) an advisory or technical committee composed of experts serving to give definite form to the material placed before it by member states or the Secretariat; and (3) conferences of representatives of member and other states convened on the advice of the committee and on invitation from the Council, result-

ing in international conventions submitted by signatory states to their appropriate internal organs for ratification.

In addition to the work of the International Labor Organization, discussed under LABOR ORGANIZATION, International, the following activities of the League of Nations may be noted:

**Economic and Financial Organization.** This included the creation of economic and financial committees of various types; the sponsoring of the Conference on International Coöperation in Statistics at London Aug. 14-15, 1919, before the League was formally in being, and the continuation of the *Monthly Bulletin of Statistics* hitherto published by the Supreme Economic Council; the convocation of the International Financial Conference at Brussels, Sept. 24-Oct. 8, 1920, attended by representatives of 39 states, which helped to clarify financial problems of reconstruction. Of unusual significance was the summoning by the Sixth Assembly of an International Economic Conference which sat at Geneva, May 4-23, 1927, attended by delegates and experts from 50 countries, the personnel including industrialists, merchants, bankers, economists, agriculturists, experienced officials and representatives of workers' and consumers' organizations and coöperative societies. This conference, after a general exchange of views on existing economic conditions and difficulties, adopted a final report embodying recommendations subsequently accepted in whole or in part by some 30 governments as a practicable international programme for economic peace and progress. Two annual sessions of an economic consultative committee were held at Geneva, May, 1928, and May, 1929, to survey the international economic situation as it developed subsequent to the conference. Numerous other conferences adopted conventions or protocols dealing with import and export, prohibition and restriction, simplification of customs formalities, arbitration of commercial disputes, unfair competition, and other aspects of international commercial intercourse.

The financial committee proved to be a medium through which the League of Nations contributed in a vital way to the financial reconstruction of Europe. By common consent, the aid of the League saved Austria and Hungary from bankruptcy, disaster, and anarchy, and restored them to their place in the world with their autonomy intact. Assistance, through loans floated under League auspices, was likewise rendered to the Free City of Danzig; to Estonia; to Bulgaria; and to Greece, as is discussed in the articles on these countries. Elaborate investigations into the vexatious problems of counterfeit currency, central bank statistics, and double taxation were launched.

**Organization for Communication and Transit.** Under this head are to be noted sessions of the General Conference on Freedom of Communications and Transit at Barcelona in 1921, at Geneva in 1923 and 1927, and the creation of an advisory and technical committee; the Conference of Press Experts at Geneva, 1927, the adoption of conventions and recommendations dealing with freedom of transit, passport and identity certificates, use of maritime ports and navigable waterways, vessel measurement, an international régime of railways, transmission of electric power, the development of hydraulic power, and the international circulation of motor vehicles. The calendar reform problem received

exhaustive attention. A convention signed at Lausanne, July 24, 1923, practically neutralized the Dardanelles, Sea of Marmora, and Bosphorus, and the commission created to administer this régime was placed under the supervision of the League.

**The Health Organization.** Acting through the General Health Advisory Commission, a standing committee and a section of the secretariat, the League incalculably furthered the work of promoting sanitation, fighting epidemics, collecting and disseminating epidemiological intelligence, arranging international interchanges of public health offices, standardizing sera and investigating the problems of infant mortality, cancer, and health insurance.

**Intellectual Coöperation.** In compliance with a resolution of the Second Assembly, the council decided, Jan. 14, 1922, to appoint a committee on intellectual coöperation with 12 members (increased to 15 in 1928). Henri Bergson, the French philosopher, H. A. Lorentz, the Dutch physicist, and Gilbert Murray, the Oxford Greek scholar, served successively as chairman of the committee, whose membership embraced such eminent scientists as Robert A. Millikan, the American physicist, Albert Einstein, the German physicist, and Mme. Curie, codiscoverer of radium. After affording assistance to intellectual workers, in numerous central European states, who confronted hard conditions as a result of the post-war derangement, the committee developed a programme for permanent work touching such important subjects as university relations, science and bibliography, arts and letters, intellectual rights, and instruction of youth. Upon the invitation and with the support of the French government, the International Institute of Intellectual Coöperation was established at Paris in 1926.

**Suppression of Opium Traffic.** Continuing pre-war efforts to abate the opium-traffic evil, the League appointed an advisory committee in 1921 and held two opium conferences in 1924-25, the convention of which became in 1926 and 1928 the starting point of its work in this field.

**Traffic in Women and Children.** The League held an International Conference at Geneva, June 30-July 5, 1921, with 35 states participating, which reaffirmed and supplemented pre-war engagements for suppressing this evil. An advisory committee on the traffic in women and children appointed in 1922 was reorganized in 1924 as the Advisory Commission for the Protection and Welfare of Children and Young People, with two sections, one dealing with the traffic in women and children and the other with child welfare. Energetic measures were set on foot to investigate the methods of traffickers. A special convention for suppressing the circulation of obscene publications signed at Geneva, Sept. 12, 1923, by 43 states, entered into force on Aug. 7, 1924.

**Refugees and Relief of Distress.** The first great humanitarian accomplishment was the repatriation of 430,000 prisoners of war belonging to 26 different nations at the phenomenally low average cost of \$5 per person. The Greek Refugee Settlement scheme dealt with 1,500,000 people, the Bulgarian with 200,000. Over 1,500,000 Russian refugees scattered throughout Europe and Asia required much attention. The same problem existed for 300,000 Armenians and other lesser groups. All of these situations were handled with humane effi-

ciency by League commissioners. Moreover, an International Relief Union was established (by convention and statute of July 12, 1927) for immediate action in case of disaster anywhere in the world regardless of race, nationality, or political or religious considerations.

**Mandates and Backward Peoples.** See **MANDATES**.

**Administration of Territory.** See **SAAR BASIN, DANZIG**.

**Progressive Codification of International Law.** The Committee of Justice appointed by the Council in 1920 to draft a statute for the Permanent Court of International Justice, also reported a resolution of its own dealing with the codification of international law. After some delay, the Council in response to a resolution of the Fifth Assembly (Sept. 22, 1924) appointed a committee of experts for the Progressive Codification of International Law (Dec. 12, 1924), which held annual sessions beginning in 1925 and made systematic preparations for a future codification conference to be held at The Hague. Of interest also was the establishment at Rome on May 30, 1928, of the International Institute for the Unification of Private Law, endowed by the Italian government and operating under the control of the League.

**Achievement of Arbitration, Security, and Disarmament.** Praiseworthy as had been the activity of the League of Nations in the promotion of international coöperation and general human welfare during the first decade of its existence, it nevertheless did not fulfill altogether satisfactorily its basic function of eliminating the general causes of war and settling specific disputes between states. During the peace negotiations, the Allied plenipotentiaries in response to the German delegation's protest against unilateral disarmament had made the following categorical reply: "The Allied and Associated Powers wish to make it clear that their requirements in regard to German armaments were not made solely with the object of rendering it impossible to resume her policy of military aggression. They are also the first step toward the general reduction and limitation of armaments which they seek to bring about as one of the most fruitful preventives of war, and which it will be one of the first duties of the League of Nations to promote." Efforts to make the covenant-prescribed (Art. 8) agreement upon the subject were continuous after 1920, but up to 1920 had led to no general result.

When the League went into operation, nearly all states felt that the control of national armament was one of the most sacred attributes and efficacious guarantees of their independence. On May 9, 1920, the council set up the Permanent Advisory Commission on Armaments (consult Art. 9 of Covenant) consisting of military, naval, and air officers appointed by the governments represented in the council. The First Assembly, however, resolved to entrust the problem to the Temporary Mixed Commission, so as to take it out of the hands of strictly professional military experts. The Second Assembly (1921) urged this commission to make proposals in the shape of a draft treaty, but the commission found that a general feeling of insecurity was the chief obstacle to action. The Third Assembly (1922) emphasized this view in resolutions stating that "moral disarmament is an essential preliminary condition of material disarmament, and that this moral disarmament can only be achieved in

an atmosphere of mutual confidence and security." The existence in the Covenant of Art. 10 did not seem to inspire "mutual confidence and security." Indeed, strangely enough, attempts were made (1920-23) to interpret away the significance of (and even to cut out by amendment) "the heart of the covenant," as Wilson had described it. In 1923 the Temporary Mixed Commission reported a draft treaty of mutual assistance (written largely by Lord Robert Cecil) to the Fourth Assembly which perfected the text for submission to the governments. Eighteen states approved it in principle, but various criticisms were leveled against it, one of which was that it did not take into sufficient account existing machinery for the pacific settlement of international disputes.

The deliberations of the brilliant Fifth Assembly (1924) were dramatized and vitalized by the brief attendance of Premiers Édouard Herriot of France and J. Ramsay MacDonald of Great Britain. These men had already given a more friendly complexion to European diplomacy. Fresh from the achievements of the London Conference on Reparations (see **REPARATIONS**), which launched the so-called Dawes Plan, they were imbued with the true League spirit. The result was the adoption of the famous Geneva Protocol for the Pacific Settlement of International Disputes opened for signature on Oct. 2, 1924. By a series of solemn pledges, the signatory states were committed to arbitration, they were to sanction the principle that aggressive war was no longer a recognized method of settling disputes, and they were to agree that a state was an aggressor when it refused to submit its case to arbitration. These principles were tantamount to acceptance of compulsory arbitration. When a certain number of states should have ratified the Protocol, the International Conference for Limitation of Armament was to meet at Geneva and, as soon as any plan for reduction adopted by that conference went into operation, the protocol was to become effective; but the downfall of the MacDonald ministry in Great Britain (see **GREAT BRITAIN, under History**) brought into power a new Conservative government which deemed it necessary to reserve the right to use force in remote parts of the world to which British rule and trade extended (witness the drastic ultimatum to Egypt—December, 1924), and which was reluctant to promise coöperation in any economic punitive measure, the chief reliance for enforcing the Protocol, while the United States remained outside the League. On Mar. 12, 1925, Sir Austen Chamberlain, the new British Foreign Secretary, announced to the Council his Government's decision not to ratify. The Geneva Protocol was dead.

Already a new project was in the offing, this time one initiated by Germany. For some years after the War, most Germans looked upon the League of Nations as a tool in the hands of their enemies, pointing in confirmation of this view to the Eupen-Malmédy plebiscite, the influence of France in the Saar Governing Commission, and the advantages given to Poland in the Upper Silesian award. After the adoption of the Dawes Plan, however, and under the realistic leadership of the brilliant Foreign Minister, Gustav Stresemann, the German attitude slowly altered. Obtaining the endorsement of his cabinet, Stresemann began to lay plans for taking Germany into the League. Encouraged by pri-

vate inquiries, he made formal application for admission on Dec. 11, 1924, stipulating four prerequisite conditions: (1) Germany would expect a permanent seat in the Council and general equality of treatment; (2) as a temporarily disarmed state, she could not be expected to contribute armed support to League measures against a defiant state; (3) in pledging herself to keep her obligations, she should not be understood as renewing her acceptance of the war-guilt affirmation (Art. 231) of the Treaty of Versailles; and (4) she would expect in due time to be given an active share in the working of the mandate system. On Mar. 14, 1925, the Council made a generally favorable reply; though asserting the impossibility of allowing special privileges to a nation coming into the League, it pointed out that there were provisions in the Covenant by which Germany's unarmed condition would be taken into account. The note concluded by expressing the desire of the Council to see Germany in the League and "thus play, in the organization of peace, a part corresponding to her position in the world."

Meanwhile (Feb. 9, 1925), Stresemann proposed to the French government the negotiation of a general pact guaranteeing the security of the existing frontiers in western Europe. Germany, moreover, would undertake not to go to war to change any of her eastern boundaries as fixed at Versailles, but she reserved the right to submit their modification to courts of arbitration or to the League of Nations. Briand, the French Foreign Minister, after securing a promise of British coöperation, replied to Berlin (June 18, 1925) suggesting that success depended upon Germany's assuming the obligations and enjoying the rights laid down in the Covenant of the League. A further exchange of views followed definitely preparing the way for a conference. A preliminary meeting of jurists at London (August 31) threshed out technical legal points.

The Sixth Assembly of the League (September, 1925), while reaffirming the cardinal principles of the defunct Geneva Protocol, gave its support to the proposed security pact. On Oct. 16, 1925, a treaty was tentatively signed at Locarno, Switzerland, by high-ranking representatives of Belgium, France, Germany, Great Britain, and Italy, pledging the maintenance of the existing boundaries in western Europe. Four arbitration conventions were concluded between Germany and Belgium, Germany and France, Germany and Czechoslovakia, and Germany and Poland, respectively. As one of the essential conditions of the pact, it was agreed that Germany should join the League of Nations. The conference at Locarno then adjourned, while parliamentary sanction for its engagements was sought in the various countries concerned. In France (see FRANCE, under *History*), where irreconcilable "Poincarism" was still strong, there were many who mistrusted any acceptance of Germany's word, but the prestige of Briand and the intense longing for peace supervened. In Great Britain (see GREAT BRITAIN, under *History*), the Locarno settlement received the support of the Conservative majority and of most of the Opposition. In the small nations on the continent, it was popular as offering a possible basis for enduring peace. The bitterest struggle occurred in Germany, but Stresemann finally (November 27) secured a decisive victory in the Reichstag. Four days later, on Dec. 1, 1925, the

conferees reconvened at London for the formal ceremony of acceptance. The Locarno pact was a reality.

The stage now seemed set for Germany's entrance into the League of Nations. In February, 1926, the German government made formal application for admission. A special meeting of the Council summoned a special meeting of the Assembly for March 8. Then developed an amazing situation. Spain and Brazil, both non-permanent members of the Council, determined to block Germany's admission to a permanent seat until they received similar recognition: Poland, supported by France, advanced the same claim. The climax of absurdity was reached when Czechoslovakia, China, and Persia evinced similar ambitions. Stresemann, profoundly chagrined at these unforeseen complications and overwhelmed by the reproaches of fire-eating Nationalists at home, let it be known that Germany would not join the League at all unless she obtained a permanent seat in the Council with its significance undiminished by the accordance of such a position to any other state at the same time.

As March 8 approached and none of the contestants relaxed her pretensions, the situation became tense and strenuous. At Geneva, Chamberlain and Briand, whose secret manipulation had in some measure caused the deadlock, endeavored unsuccessfully to arrange a compromise through private negotiations. The prestige of the League was being sadly impaired by "the lamentable spectacle of intrigue and indecision," as one journalist described it. Finally, a face-saving arrangement was agreed upon, which cleared up the difficulty in part. Sweden magnanimously relinquished her nonpermanent seat in the Council in favor of Poland upon condition that a pro-French state retire in favor of Holland. (Czechoslovakia made the sacrifice.) Spain and Brazil remained adamant, however, and Briand, Chamberlain, and other leaders were obliged to confess defeat. To prevent irreparable injury to German feelings, the Locarno Powers issued a statement declaring that morally speaking, they considered Germany a member of the League. The Special Assembly convened, but consideration of Germany's application for membership was deferred until the regular September meeting. A committee on the composition of the Council was appointed to study the problem. Assisted by belated French and Spanish ratification of an amendment to the Covenant (proposed in 1922) giving the Assembly power to determine the method of election and to prescribe conditions of reëligibility for nonpermanent members of the Council, the committee conceived a plan whereby Germany alone was to be admitted to a permanent seat, the number of nonpermanent members was to be increased to nine (see above) elected for three-year terms, one-third retiring each year and then being ineligible for three years unless specifically declared reëligible by a two-thirds majority of the Assembly: Brazil gave formal notice (June 10, 1926) of intended withdrawal from the League (in accordance with Art. 1 of the Covenant).

The Committee's report was approved by the Council and submitted to the Seventh Assembly, which met Sept. 6, 1926. Two days later, Germany's application for membership was passed by a unanimous vote. The award of a permanent seat to Germany coupled with the increase of nonpermanent Council seats was approved.

On September 10, the German delegation was welcomed to membership. Stresemann mounted the tribune and delivered an address lauding the aims of the League and pledging the loyalty of Germany. Briand followed with a felicitous speech extolling the prospect of durable peace between France and her age-old enemy. On September 11 came Spain's formal notice of withdrawal from the League, but this was destined to be reconsidered (March, 1928) before it became effective. The Assembly then proceeded to adopt the plan for remodeling the Council as outlined by the committee, adding to it, however, a provision that the Assembly might, if it saw fit, change the entire complement of non-permanent members. Not only was the League now a more democratic organization, but it likewise embraced all of the ex-enemy powers except Turkey. In 1927 Germany was allotted a representative on the Permanent Mandate Commission. Surely much water had flowed under the bridge since 1919.

Resuming the story of the long struggle for disarmament and security, it may be noted that, at a conference of 45 states held at Geneva, a convention was signed (June 17, 1925) providing (when duly ratified) for the establishment of a general system of supervision and publicity for the international trade in arms, munitions, and implements of war, and a special system for areas where measures of this kind were generally recognized as particularly necessary. A protocol signed the same day, prohibiting the use of asphyxiating, poisonous, or other gases and of bacteriological methods of warfare, came into force for certain states (e. g., France) on Apr. 2, 1927, with others acceding subsequently. Preliminary investigations were set on foot to facilitate the ultimate suppression of private manufacture of arms and munitions. On Sept. 26, 1925, the Council established the preparatory commission for the Disarmament Conference which, during the ensuing years, continued the study of the armaments problem.

The negotiation of the Locarno Pact and the admission of Germany to the League gave a new impetus to the Assembly's continuous attempt to realize the formula "arbitration, security, and reduction of armament." The Seventh Assembly stated that the principles of conciliation and arbitration and "security by the mutual guaranteeing of states against any unprovoked aggression," should "govern the policy of every civilized nation."

The Eighth Assembly (1927) declared in a resolution: (1) That all wars of aggression are and shall always be prohibited; (2) that every pacific means must be employed to settle disputes of every description, which may arise between states; and (3) . . . that the states members of the League are under an obligation to conform to these principles. A new Committee on Arbitration and Security was appointed whose essential duty should be "to consider . . . the measures capable of giving all states the guarantees of arbitration and security necessary to enable them to fix the level of their armaments at the lowest possible figure in an international disarmament agreement." This Committee submitted to the Ninth Assembly (1928) a series of reports and draft conventions which were perfected by it. The result was a multilateral general act; and three model bilateral conventions for conciliation, arbitration, and judicial

settlement, a model collective treaty of mutual assistance, a collective and bilateral treaty of nonaggression, and a model treaty to strengthen the means of preventing war. Meantime, the multilateral Briand-Kellogg Pact for the renunciation of war had been signed at Paris (Aug. 27, 1928) further altering the political conditions in which the armament problem was envisaged. The drafting of the Young plan for definitive solution of the Reparation problem (June 7, 1929) prefigured further progress toward European amity. Moreover, the long-drawn-out and tortuous Anglo-American negotiations on limitation of naval armaments took a definite turn for the better in July, 1929.

During the years 1920-29, while wrestling with the thorny problem of achieving security and reducing armament, the League of Nations was simultaneously experimenting with its machinery and developing a technique for the adjustment of specific disputes between nations in accordance with Articles 11 to 17 of the Covenant. This system did not contemplate handling any dispute until the resources of direct negotiation between the parties should be exhausted. Moreover, as it proved, not all wars or threats of war were referred to the League for action—e.g., the Russo-Polish War and the Greco-Turkish War. The explanation for the undoubted impotence of the League in these and other instances is to be sought in the fact that the Allied Powers strove, somewhat unsuccessfully on the whole, to deal through the Council of Premiers or Conference of Ambassadors with questions arising from the peace settlement. Civil wars, such as the momentous revolutionary upheaval in China, were outside of the jurisdiction of the League.

Nevertheless, despite some discouraging setbacks, the League of Nations had a few not inconspicuous achievements to its credit. A controversy between Finland and Sweden over the Åland Islands (see FINLAND and SWEDEN, under *History*) was successfully adjusted (1920-22); the intervention of the League in the Albanian question (see ALBANIA) was marked by at least temporarily beneficial results (1921-23); and the compromise solutions of the question of partitioning Upper Silesia between Germany and Poland (1921-22) and of the possession of Mosul at issue between Turkey and Great Britain as mandatory for Iraq (1924-26) were both fairly statesmanlike. A bitter controversy between Poland and Lithuania over Vilna (q.v.) was less satisfactorily handled (1920-24), though a dispute between the same two nations over the port of Memel (q.v.) was settled (1924). A Greco-Bulgarian border clash which developed to the verge of belligerency was expeditiously and firmly settled (1925). Most of the foregoing topics are discussed elsewhere in these volumes either separately or in the articles on the individual countries.

Undoubtedly, the most thorough-going and disheartening rebuff which the League experienced resulted from the bellicose and defiant attitude of Italy during the Corfu incident (August-September, 1923). It is important to note that, throughout its career in settling controversies, the council never used or threatened to use military or economic warfare, but rather placed reliance upon persuasion, conciliation, tactful guidance of direct negotiation, and at most the mobilization of public opinion. It was not the super-state of perfervid 1919 imagination.

As the League of Nations was thus beginning to develop the prestige and integrity of an enduring institution, the policy of the United States government toward it was undergoing substantial modification. The attitude of "fearsome aloofness," of the early Harding-Hughes régime was impossible of continuance. American collaboration with the League, its secretariat, its committees, commissions, and conferences, proved neither contaminating nor entangling and what originated as a grudging experiment subsequently elicited approval and even encouragement. If the evolution of the League did not correspond in all respects with the prediction of Woodrow Wilson, it certainly had not fulfilled the dire prophecies of his opponents. Moreover, it should be pointed out that Wilson himself had "particularly emphasized the importance of relying on experience to guide subsequent action." The future had yet to reveal whether or not the League of Nations would draw the remaining non-member states (the United States, Russia, Turkey, Mexico, etc.) into its fold, but if no millennium had dawned, at least the lesson of Armageddon had not been wholly lost.

**Bibliography.** In the following list are given the more significant and general works dealing with the League of Nations: R. S. Baker, *Woodrow Wilson and World Settlement*, 3 vols. (Garden City, N. Y., 1922); J. S. Bassett, *The League of Nations* (New York, 1928); C. Howard-Ellis, *The Origin, Structure, and Working of the League of Nations* (Boston, 1928), to be followed by two cognate volumes by the same author; C. P. Howland, *Survey of American Foreign Relations-1928* (New Haven, 1928), a valuable and comprehensive study of the period, 1917-27; D. P. Myers, "Nine Years of the League of Nations 1920-28," *World Peace Foundation Pamphlets*, vol. xii, no. 1 (Boston, 1929); D. H. Miller, *The Drafting of the Covenant*, 2 vols. (New York, 1928); E. M. House and C. Seymour, *What Really Happened at Paris* (New York, 1921); C. Seymour (ed.), *The Intimate Papers of Colonel House*, 4 vols. (Boston, 1926-28); H. W. Temperley (ed.), *A History of the Peace Conference of Paris*, 6 vols. (1920-24).

**LEATHER.** The leather industry in the United States in the period from 1914 underwent many vicissitudes in which the production of live stock, the demands due to the World War, and the general changes in business and industrial conditions figured. In 1919 and 1920, as a result of the War, which developed a huge production and accumulation of hides, skins, and leathers, there was a drastic deflation and hides were forced upon the market. Furthermore, with the increased use of the automobile and changes of style in footwear, new kinds of leather were required, while there was a decline in the output of harness leather. At the same time, technical improvements have been made in tanning and leather-making technology and processes.

The United States ranks first among the nations of the world in the production of leather, tanning as it does at least 50 per cent of the world's output. Its total production of finished leather is estimated to be equal to that of all the rest of the world combined, but nearly half of the cattle hides and calfskins are imported, and almost all the sheep, lamb, goat, and kid skins. The production of cattle hides, cattle skins, and sheepskins in the United States has not increased proportionately with the demand for

leather, and American tanneries are forced to import a considerable amount of material. For example, in 1928, while there was a large production of hides and skins (the number reached 135,895,000), yet about 45 per cent of the raw material entering into the manufacture of leather was imported, with the exception of goatskins, of which 98 per cent was imported. Normally, in the United States, there is a greater production of leather than the domestic markets can consume and this production must be taken care of by substantial exports, which in 1919 reached a peak value of \$218,783,300, declining to \$31,787,275 in 1921, and rising to \$55,165,000 in 1928. The United States easily leads the nations of the world in leather exports, Germany being second. It is quite apparent that the condition of the leather industry is more or less connected with world conditions, and in few American industries are there such serious fluctuations as in those connected with the production of leather.

In the United States, the finished product of the tanning industry consists of whole hides, sides, backs, bends, butts, and offal skins, and the four main groups of finished leather products divided into: (1) sole, belting, side upper, patent, harness, bag, and upholstery; (2) calf and kip upper leather; (3) goat and kid upper and fancy leather; (4) sheep and lamb upper, lining, glove, and fancy leather. The leather industry, according to the Bureau of the Census, 1925, ranked eleventh among the 16 leading industries of the United States when considered from the viewpoint of the total value of the product. As already stated, it is necessary for the United States to import approximately 50 per cent of the calfskins, 30 per cent of the calf hides, 99 per cent of the goatskins, and 63 per cent of the sheepskins used in its tanning industry; or, in other words, fully 50 per cent of the hides and skins entering into international trade are taken by the United States, exclusive of those originating in the country.

In 1927 the American tanning industry consumed 132,217,000 hides and skins, of which 77 per cent was used in the production of shoe leather; 5 per cent, in fancy bookbinding and kindred leathers; 10 per cent, in glove leather; 3 per cent, in belting, bag, harness, and upholstery leather; and the remaining 5 per cent in miscellaneous leathers. The consumption of the various hides and skins in 1923 was as follows: cattle hides, 21,820,000; calf and kid skins, 16,987,000; goat and kid skins, 50,736,000; sheep, lamb, and cabretta, 30,062,000; and other hides and skins, 7,556,000.

The American leather production in the period from 1914 to 1928, as summarized by the Bureau of the Census, is given in the table on page 922.

The imports of raw hides and skins into the United States in 1927 amounted to 447,142,000 pounds, valued at \$112,846,000, the imports coming from widely scattered sources with South America and particularly Argentina ranking as the chief source of imported cattle hides; and Asia, especially British India and China, of goatskins; New Zealand, United Kingdom, and Argentina being the principal sources of sheepskins and lamb skins.

The exports of leather in 1927 totaled \$54,004,000, which was the largest amount since 1919 when the extraordinary figure of \$218,783,300 was attained. In 1914 the exports from the United States totaled \$44,975,996. It will be apparent from the outline summary of the imports

## LEATHER PRODUCTION, BY PRINCIPAL CLASSES

[All figures in thousands of units specified]

Class	1914	1921	1922	1923	1924	1925	1926	1927	1928

† Not called for in schedule for 1921.

for 1925 gave for leather and leather manufactures a total production of goods valued at \$1,768,000,000, though it was stated that this figure involved considerable duplication. The output of the tanning industry for 1925 was valued at \$462,000,000, which was a decline in value of 5.8 per cent from 1923. The figures of the Census for leather and leather manufactures are given in the accompanying table.

In the total value of products for the leather

industry and harness, 2.3 per cent; and leather goods not otherwise specified, about 3 per cent. Among the States, Massachusetts ranked first in 1925, while New York and Missouri were second and third, respectively. The accompanying table gives a comparative view of the United States leather manufacturing industry for specific years with comparative totals. See **BOOTS AND SHOES; LIVE STOCK.**

**LEBANON, GREATER.** A State proclaimed in Sept. 1, 1920. See SYRIA.

**LE BARON, WILLIAM** (1883- ). An American editor and playwright, born at Elgin, Ill. He studied at the University of Chicago and at New York University, and served as managing editor of *Collier's Weekly*, director general of Cosmopolitan Productions (1919-24), and associate producer of the Famous Players-Lasky Corporation (1924-27). Since 1927 he has been vice president of the Film Booking Office Studio. He was the author of several successful plays, including *The Very Idea*; *Her Regiment*; *Back to Earth*; *Apple Blossoms*; *Nobody's Money*; *The Scarlet Man*; and *The Love Letter*.

**LEBLOND, MARIUS** (1877- ) and **ARY** (1880- ). French brothers who formed a literary partnership, signing their works Marius-Ary Leblond. Their novel, *En France*, won the Prix Goncourt for 1909. After the World War, their books were often full of a lofty idealism. They also wrote the sociological studies: *La grande île de Madagascar* (1907); *La Pologne vivante* (1910); and *La France devant l'Europe* (1913). Their novels include *La Sarabande* (1904); *Le miracle de la race* (1918); *Ulysse, café, ou l'histoire dorée d'un noir* (1924); *L'amour sur la montagne* (1925); and *Les martyrs de la république*, a contemporary novel (3 vols., 1926-27). Other works include *La société française la troisième république d'après les romanciers contemporains* (1905); *Peintres de races*, a history of painting (1909); *Gallieni parle* (2 vols., 1920), and *Fétiches*, short stories (4th ed., 1923).

**LE BON, le bôn', GUSTAVE** (1841- ). A French ethnologist and psychologist (see Vol. XIII). His most important later works were: *La vie des vérités* (1914); *Enseignements psychologiques de la guerre européenne* (1915); *Premières conséquences de la guerre: transformation mentale des peuples* (1st series, 1916; 2d series, 1917); *Hier et demain: pensées brèves* (1918); *Les opinions et les croyances* (1918); *Psychologie des temps nouveaux* (1920); *Le déséquilibre du monde* (translated as *The World Unbalanced*, 1923); and *L'évolution actuelle du monde: illusions et réalités* (1927).

**LE BRAZ, le brâs, ANATOLE** (1859-1926). A French poet and novelist (see Vol. XIII). His later works included *La Bretagne*, an anthology (1925), and *Poèmes votifs* (1926).

**LEE, JAMES MELVIN** (1878- ). An American editor, born at Port Crane, N. Y. He was graduated from Wesleyan University in 1900 and in 1901-02 taught at the Western Reserve Seminary in Ohio. He then entered the newspaper business and was editor of many periodicals, including *Outing*, *Leslie's Weekly*, and *Judge*. He was lecturer on journalism at the New York University in 1910-11, and in the latter year became director of the department of journalism in that university. He wrote *How to Be Self-supporting at College* (1903); *History of American Journalism* (1917); *Opportunities in the Newspaper Business* (1919); *Business Ethics* (1925).

**LEEDS.** An important manufacturing city of England and centre of the British woolen and wholesale clothing trade. The population at the census of 1921 was 458,232; in 1927 it was estimated to be 482,600. The municipal area is 30,137 acres (more than 47 square miles). In addition to factories for the manufacture of rope,

thread, linen, glass and earthenware, machinery and machine tools, steam engines, and railway wagons, the city has the largest share of the leather trade of Great Britain. The city government is in the front rank among progressive local governing authorities. It has provided extensive hospital accommodations, for the treatment of infectious diseases and tuberculosis, and the treatment of children up to five years of age. In addition, there is an institution for the employment of tubercular persons. The water supply is obtained from reservoirs in the Washburn Valley, with a storage capacity of 3,276,000,000 gallons, and the daily consumption is 18,266,000 gallons. A new reservoir has been constructed at Leighton with a capacity of 1,050,000,000 gallons. In 1922 the corporation purchased the Temple Newsam estate, comprising 935 acres, together with the historic mansion of Temple Newsam, birthplace of Lord Darnley, the ill-fated husband of Mary, Queen of Scots. The mansion is on the site of a preceptory of the Knights Templars and was the original of Templestowe in Scott's *Ivanhoe*. It contains a fine collection of books and paintings, among which are portraits of Darnley and Mary.

**LEE OF FAREHAM, ARTHUR HAMILTON, FIRST VISCOUNT** (1868- ). A British soldier and public official, who was born at Bridport and educated at Cheltenham and Woolwich. He entered the Royal Artillery in 1888 and remained in the army until 1900, when he had reached the rank of brevet major. He served in various stations, and was in Canada from 1893 to 1898 as professor of strategy and tactics at the Royal Military Academy, during the period also organizing a military survey of the Canadian frontier and acting as special correspondent for the *Daily Chronicle* during the Klondyke gold rush. He then was military attaché with the U. S. Army during the Spanish-American War (1898), and at Washington (1899). On retiring from the army, he entered Parliament as a Conservative (1900-18), serving as Civil Lord of the Admiralty (1903-05), chairman of the parliamentary Aerial Defence Committee (1910-14), parliamentary military secretary to the Ministry of Munitions (1915-16), personal military secretary to Lloyd George, who was then Secretary of State for War (1916), and director-general of food production (1917-18). In 1918 he was made a baron, and he entered the cabinet in the following year as Minister of Agriculture and Fisheries (1919-21), later becoming First Lord of the Admiralty (1921-22). He was a member of the Imperial Cabinet (1921), a delegate to the Washington Conference (1921-22), and served as chairman of the Royal Commissions on the Public Services in India (1923-24) and on Thames Bridges (1926). In 1914 he re-entered the army for a time as a colonel. He received many honors, including that of Knight of the Grand Cross, Order of the Bath (1929), was prominent in the world of art as a member of museum boards, and in 1921 gave the Chequers estate, used as the country seat of the Premier, to the nation.

**LEEWARD ISLANDS.** A group of islands in the British West Indies, constituting a colony. They comprise Antigua, Montserrat, St. Christopher, and Nevis (usually called St. Kitts), a part of the Virgin group, Dominica, and their dependencies. Total area, 715 square miles; population, 122,242 in 1921 (127,193 in 1911). The leading products are sugar, mo-

lasses, lime-juice, coconuts, and fruits. Imports for 1913-14 and 1927 were £588,362 and £842,464. Exports for the same years totaled £563,963 and £662,492. Revenues and expenditures of government follow for 1926-27 (1913-14 figure in parentheses): revenue, £289,393 (£174,331); expenditure, £259,037 (£171,128); public debt, on Mar. 31, 1927, £278,850 (£244,689).

**LE GALLIENNE, EVA** (1899- ). An actress born in London, England, the daughter of Richard Le Gallienne. She was educated in France at the Collège Sevigné and started her stage career in London at the Prince of Wales Theatre in 1915 in *The Laughter of Fools*. The next year, she went to New York and gave her first American performance in *The Melody of Youth*. Other successes included: *McLazarus* (1916-17); *Off Chance* (with Ethel Barrymore 1917-18); *Not So Long Ago* (1920-21); *Lilium* (1921-22); *The Swan* (1923); *The Assumption of Hannele* (1923); *Jeanne d'Arc*, by Mercedes de Acosta (1925); *The Call of Life*, by Schnitzler (1925); *The Master Builder*, by Ibsen (1925-26). Miss Le Gallienne was the founder and director of the Civic Repertory Theatre, which was opened in New York in 1926. She edited *Civic Repertory Plays* (1926).

**LEGGE, ALEXANDER** (1866- ). An American manufacturer and public official, born in Dane County, Wisconsin. His family moved to a Nebraska farm while he was a youth and he worked there for ten years before entering the employ of the McCormick Harvester Company at Omaha in 1891. He rose rapidly in the company and its successor, the International Harvester Company, becoming general manager in 1913 and president in 1922. During the World War, he served as chairman of the War Industries Board and also as manager of the Allied Purchasing Commission. In 1929 he resigned as president of the International Harvester Company to become chairman of the Federal Farm Board by appointment of President Hoover.

**LEGINSKA, ETHEL** (real name LEGGINS) (1890- ). An English pianist, born at Hull. After studying four years at the Hoch Conservatory in Frankfurt, she continued her studies with Leschetizky in Vienna for three years more. Her successful début in London was followed by extended tours of Europe. She made her American début in New York (January, 1913), but did not establish herself as a really great pianist until the next year, when she began to play colossal programmes, well calculated to show her transcendent technique and masculine power. Overwork brought on a nervous breakdown in 1917, obliging her to retire temporarily from the concert stage. During her convalescence, she became fired with the ambition to win laurels as a composer, and for this purpose studied composition with Ernest Bloch in New York. She returned to the concert stage in 1921, but her appearances as a pianist after that time were rather infrequent. In 1924 she made her début as an orchestral conductor in Munich, with the Konzertverein, appeared as guest-conductor with the Conservatory Orchestra in Paris and the London Symphony Orchestra. The following year, she returned to the United States, making her American début as conductor with the New York Symphony Orchestra (January 9), and won success as a conductor also in Boston and at the Hollywood Bowl. In 1926 she became the regular conductor of the Boston Philharmonic Orchestra and the Boston Women's Symphony

Orchestra, and since 1927 has also made regular appearances as guest-conductor of the Women's Symphony Orchestra of Chicago. Her compositions, which are decidedly futuristic, consist of songs, pieces for piano, *Four Poems* (after Tagore) for string quartet, a symphonic poem, *Beyond the Fields We Know*, and *Four Barbaric Subjects* for orchestra.

**LEGION, AMERICAN.** A society of veterans of the World War, organized Mar. 17, 1919, in Paris, France, by members of the Army and Marine Corps serving with the American Expeditionary Forces. On Sept. 16, 1919, it was incorporated by Act of Congress, declaring itself to be "patriotic, nonpartisan, nonpolitical, non-military, and permitting no distinctions due to rank or place of service." Membership was open to any soldier, sailor, or marine who served honorably between Apr. 6, 1917, and Nov. 11, 1918, and women enlisted or commissioned in any branch of service during that period. The Legion held its first national convention at Minneapolis, Minn., Nov. 10-12, 1919. It adopted a constitution, elected Franklin D'Olier, of Philadelphia, national commander, and began its career as an established body.

The Legion has conducted a campaign against political radicalism, and at the seventh annual convention, in Omaha, Nebr., in 1925, repeated its conviction that the United States should maintain forces adequate for defense, and that a Federal law should provide for a universal draft in war time. The Legion pronounced itself in favor of the United States, adhering to a permanent court of international justice, co-operating with the League of Nations, and taking part in other international conferences. It recommended expansion of aviation, the establishment of an aerial mail service between the United States and Panama, and the creation of a medical corps within the Veterans' Bureau. John M. McQuigg was elected to succeed James A. Drain as commander.

The Legion completed, in 1926, the \$5,000,000 fund which it had originated the previous year, to endow work for veterans and orphans of ex-service men. At the convention in Philadelphia, Pa., it again endorsed the principles of the National Defense Act of 1920, but declined to restate its approval of a court of international justice. General John J. Pershing was elected honorary commander of the Legion for life, and Howard Paul Savage was made national commander.

The convention of 1927 was held in Paris, France, September 19-24, where the 20,000 members and their families, including the 1077 delegates who attended, were entertained by the French government and by veterans' organizations. At the close of the convention, 250 members made a good-will trip, and were received in Rome by King Victor Emmanuel III, in Brussels by King Albert I, and in London by King George V. During the year, the Legion had carried out a programme of community service, and it again expressed itself in favor of a universal draft bill. Edward E. Spafford was elected commander.

In 1928 the convention met at San Antonio, Texas, and a review of the year's work showed that \$2,788,301.15 had been recovered for the disabled; and that the Legion had been influential in advancing child-welfare legislation; and in the enactments of a Federal allotment of \$15,000,000 for new hospitals, a bill pro-

viding for the retirement of disabled emergency officers, and liberal improvements in the Veterans' Bureau Act. The Legion also worked for the passage of a universal draft bill, and continued its community service. Paul V. McNutt was made commander. Following the convention, a committee of Legionnaires visited Mexico, where they were received by President Calles.

The membership of the Legion increased from 450,000 in 1919 to 751,721 in 1928. The American Legion Auxiliary, formed in 1921 by the mothers, wives, sisters, and daughters of Legion members numbered 297,957 in 1928. Other organizations connected with the American Legion are La Société des 40 Hommes et 8 Cheveaux, and La Boutique des Huit Chapeaux et Quarante Femmes. The official publication is the *American Legion Monthly*. Permanent headquarters are at the War Memorial Building in Indianapolis, Ind.

**LEGUIA**, Iá-gō'yá, AUGUSTO B. (1863- ). A Peruvian President (see Vol. XIII). On May 18, 1919, a disputed election led to the arrest of Dr. José Pardo, former President, and the assumption of that office by Leguia, whose election was later confirmed and legalized by the Peruvian Congress. The constitution was twice changed so that he might remain in office: in 1923 to permit a President two consecutive terms, and in 1927 to allow unrestricted reelection. He was reelected in 1924 and again in 1929, his term to expire in 1935. See PERU, under *History*.

**LEHÁR**, Iá'hár, FRANZ (1870- ). An Austrian composer (see Vol. XIII). He added to the list of his works: *Der Sterngucker* (Vienna, 1916); *Wo die Lerche singt* (Budapest, 1918); *Die blaue Mazur* (Vienna, 1920); *Die Tangokönnigin* (Vienna, 1921); *Frühling* (Vienna, 1922); *Frasquita* (Vienna, 1922); *La danza delle libellule* (Milan, 1922); *Die gelbe Jacke* (Vienna, 1923); *Olo-Olo* (Vienna, 1924); *Paganini* (Vienna, 1925); *Friederike* (Berlin, 1928). Consult E. Decsey, *Franz Lehár* (Vienna, 1924).

**LEHIGH UNIVERSITY**. A nonsectarian institution for the higher education of men at Bethlehem, Pa., founded in 1866. The student enrollment increased from 672 in 1914 to 1477 in the autumn of 1928, and for the summer session of the latter year, there were 466 registered; the faculty increased from 75 to 155 members; and the library from 133,200 to 127,902 bound volumes and 51,307 pamphlets. The productive endowment in 1914 was \$1,314,000, and the income \$240,000, as compared with an endowment of \$5,123,112, and an income of \$1,125,158, in 1928. Coppée Hall, named in memory of the first president of the University, Dr. Henry Coppée, and Taylor Gymnasium were built in 1914; an extension to the chemistry laboratory was completed in 1920; and the Alumni Memorial Administration Building, a memorial to the men of the University who died in the War, was completed in 1924. During 1926 a building for the college of business administration was erected, linking Christmas and Saucon halls; a building was renovated for the Armory; and an additional large athletic field was acquired. In 1927 announcement was made of a gift of \$1,000,000 from James Ward Packard, founder of the Packard Motor Car Company, to be used for the erection of an electrical and mechanical engineering laboratory, the corner stone of which was laid June 9, 1928. Construction was begun

in September of the latter year on a new library structure designed to increase the library facilities approximately fourfold. Evening schools in business administration and naval architecture were established in 1920; a university health service, providing dispensary service and annual physical examination for all students, was opened in 1923; and an endowment campaign for \$4,000,000 was started. In September, 1925, a new curriculum was inaugurated, leading to the degree of bachelor of science in industrial engineering. This course was offered to meet the needs of those students who intend to enter industries essentially technical in character, but who do not intend to go into the mechanical or technical departments. Charles Russ Richards, M.M.E., Eng.D., LL.D., succeeded Henry Sturgis Drinker, LL.D., E.M., as president in 1922.

**LEHMANN**, Iá'mán, LILLI (1848-1929). A German dramatic soprano (see Vol. XII). She died in Berlin, May 17, 1929. In the full possession of her glorious powers, she continued her dramatic career until 1914, when she bade farewell to the stage as Donna Anna in Mozart's *Don Giovanni* at the Salzburg festival, but continued her recitals till 1921. After that, she still taught almost to the day of her death. During her career, she actually sang on the stage 170 rôles in 114 operas, in German, Italian, and French, while her concert repertory included all the standard oratorios and over 600 songs. From all available records, it appears that no singer ever rivaled her in extent or variety of repertory. As a coloratura soprano, she equaled Patti or Melba, as an interpreter of Wagner, Materna, Sucher, or Klafsky. She combined all the supreme qualities of singer and actress: a glorious natural voice, faultless technique, fiery temperament, penetrating intelligence, queenly stage-presence, plasticity of pose, and grace of movement. Not only was she a high-priestess of art, but she also possessed, in an eminent degree, the gift of imparting the technique of her art to others, as is proven by such pupils as Olive Fremstad, Geraldine Farrar, Melanie Kurt, Marion Weed, and Florence Wickham.

**LEITH**, CHARLES KENNETH (1875- ). An American geologist, born at Trempealeau, Wis. He studied at the University of Wisconsin, and in 1900 became assistant geologist with the United States Geological Survey, which position he held until 1905. Meanwhile, he was called to the University of Wisconsin, where in 1903 he became full professor of geology. In 1905 he became lecturer on pre-Cambrian geology at the University of Chicago. Dr. Leith specialized on pre-Cambrian, structural, metamorphic, and economic geology, and is an accepted authority on the iron districts of the United States and on the origin of iron ores. During the World War, he was an adviser on minerals to the United States Shipping, War Trade, and War Industries boards (1918) and later (1919) to the American Commission to Negotiate Peace in Paris.

**LEJEUNE**, JOHN ARCHER (1867- ). An officer of the U. S. Marine Corps, who was born in Pointe Coupée Parish, La., studied at the Louisiana State University, and was graduated from the U. S. Naval Academy (1888). For two years, he was at sea as a naval cadet, being shipwrecked on the U. S. S. *Vandalia* in the hurricane at Apia, Samoa, in March, 1889. He was commissioned second lieutenant of the U. S. Marine Corps in 1890 and promoted through the

grades to brigadier general (1916). He commanded marines on board the *Cincinnati* in the Spanish-American War, on the Isthmus of Panama (1903-04), in the Philippines (1908-09), and during the capture of Vera Cruz, Mex., in 1914. In the next two years, he served as assistant to the commandant of the Marine Corps at Washington and in September, 1917, was appointed commander of the Marine Barracks at Quantico, Va. In the World War, he was on duty with the 35th Division in the Alsace sector in June, 1918; commanded the 64th Brigade, 32d Division, on the Swiss border, and the 4th Brigade (marines), and the 2d Division, A. E. F., from July 28, 1918, to Aug. 8, 1919. He took part in the battles of St. Mihiel, Blanc Mont Ridge (Champagne offensive), and Meuse-Argonne, and after the Armistice, in the march to the Rhine and the occupation of Coblenz bridgehead. He returned to the United States in command of the 2d Division in August, 1919. In 1920 he was placed in command of the Marine Corps as a major general. He was retired at his own request in July, 1929, effective November 12, and immediately took up new duties as superintendent of the Virginia Military Institute.

**LELAND STANFORD JR. UNIVERSITY.** See STANFORD UNIVERSITY.

**LEMANN, MONTE M.** (1884- ). An American lawyer, who was born at Donaldsonville, La., and graduated at Tulane University, New Orleans, and the Harvard Law School (1906). He was admitted to the bar in 1907 and practiced at New Orleans until 1918, when he was called to Washington to aid in settling legal problems that arose in connection with the World War. After six months of such service, he returned to New Orleans, where he continued practice, held a professorship of law in Tulane University, and became president of the Louisiana Bar Association. He has long advocated the simplification of our legal system. In May, 1929, he was appointed a member of the National Law Enforcement Commission by President Hoover. He has contributed articles to the *Cyclopaedia of Law*.

**LEMBERG.** See GALICIA and UKRAINE.

**LENGLEN, SUZANNE** (1899- ). A French tennis player, born near Paris and educated at the Institut Massena, Nice. She won the Women's Olympic singles championship in 1920 and was recognized as the greatest woman tennis player. Because of ill health, she was unable to defend her laurels in 1924 either at the English championships at Wimbledon or the Olympic Games at Paris, but with the exception of that year, she was champion of France and England from 1921 to 1925, and of France in 1926. In the following year, she became a professional player. She wrote *Lawn Tennis, the Game of Nations* (1925), and *The Love-Game*, a novel (1926). Consult *Suzanne Lenglen*, by Claude Anet (1927).

**LENIN. NIKOLAI (VLADIMIR ILYITCH ULYANOV)** (1870-1924). A Premier of Russia and leader of the Bolsheviks in the establishment of the Soviet government. He was born at Simbirsk on the Volga, the son of a counselor of state of the Government of Simbirsk. He was Greek Orthodox by religion and was educated at the Simbirsk Gymnasium and the University of Kasan. After 1890 he was a leader of the radical Social Democrats and, in 1903, when the Russian Social Democratic Congress, held in

London, split into Mensheviks (minority) and Bolsheviks (majority), Lenin became the leader of the latter faction. He agitated in various European countries, occasionally going back to Russia, and he attempted to turn the World War into a war against the bourgeois. He returned to Russia shortly after the March, 1917, revolution, and worked for the advent of the Bolsheviks, which he successfully engineered in November of that year. He was chairman of the Council of the People's Commissaries, head of the Communist Party, and managed to become the embodiment of the principles of the Soviet Republics. At the close of 1921, he became too ill to take a very active part in the government, so that others ruled in his name. On his death in January, 1924, his body was preserved and placed behind glass in the Kremlin at Moscow, his tomb becoming a Communist shrine. He wrote a great deal about his theories for newspapers and reviews, and made many speeches about them, which were published in 1928 as *Lenin Speaks*. A collected edition of his works was begun in 1927. Consult *Lenin*, by Leon Trotsky (1925); *Mars, Lenin, and the Science of Revolution*, by Max Eastman (1926); *Lenin and Gandhi*, by René Fülöp-Miller (1927), and *Lenin*, by Valeriu Marcu (1928). See RUSSIA, under *History*.

**LENINGRAD** (formerly Petrograd, Saint Petersburg). The most important commercial centre of Soviet Russia and former capital of the Russian Empire. The population at the census of 1926 was 1,614,008; in 1928 it was estimated at 1,676,800. After the October (1917) revolution, Leningrad was redivided into six districts: Central, Moscow-Narva, Volodarsky, Petrograd, Vasilevsky Ostrov, and Viborg. Leningrad was probably more greatly affected by the revolution and the consequent blockade than any other large Russian city. The shutting off of foreign trade, the shortage of fuel and provisions which caused thousands to leave the city, the heavy loss of life in the World War and the revolution, and the moving of the capital to Moscow resulted in reducing the population of the city from about 2,415,000 at the beginning of 1917 to 722,229 in 1920. With the advent of a new economic policy and the beginning of the reconstruction process in 1921, the population began gradually to increase, reaching 1,067,328 in 1923.

**Commerce and Industry.** The port of Leningrad has played an important part in the city's economic revival. Before the World War, it handled about 16 per cent of Russia's total foreign trade. In 1928 this figure had increased to 19.4 per cent, owing to the fact that part of the trade formerly going by way of other Baltic ports had been acquired by Leningrad. In 1927 the amount of freight handled by the port amounted to 1,850,000 tons, as compared with 429,000 tons in 1921. The number of vessels using the port increased from 308 in 1921 to 1804 in 1927. There are two channels for the entry of ships into the harbor: an artificial sea canal 19.8 miles long and 350 feet wide for vessels of deep draught and a smaller canal for vessels of a draught of only 11 feet. The grain and timber harbor has 10 quays, allowing for the simultaneous berthing of 40 steamers. There are also a coal harbor with an area of 4,900,000 square feet and a sea quay for oil cargoes and large timber logs. The total length of the Leningrad quays is 21,000 feet. The warehouses ac-

commodate about 100,000 tons. Port improvements since 1923 have included dredging the larger sea canal to a depth of about 9.5 meters (31 feet), so that vessels with a draught up to 28 feet may enter the harbor, the development of railway lines, the building of six reinforced concrete warehouses, and the construction of additional piers and a new large harbor on Gladky Island for the handling of timber exports.

The rebuilding of the economic life of Leningrad, has been largely the result of an extensive electrification programme. The value of products manufactured increased from 700,000,000 rubles in 1924-25 to 1,500,000,000 rubles in 1927-28. The textile industry accounted for 17.4 per cent, the clothing industry, 9.2 per cent, and the shoe industry, 4.7 per cent of the total output. The manufacture of electrical apparatus, such as high-powered generators and turbines, etc., which in 1913 accounted for only 2.5 per cent of the total production, made up 8.6 per cent in 1927. In 1926-27, 232,502 workers were employed in 485 manufacturing establishments in Leningrad. Their average monthly wage amounted to 80.74 rubles which, reduced to pre-war value, indicated that wages were 25 per cent higher than those prevailing in 1913.

**Educational Institutions and Museums.** Leningrad has 50 higher educational institutions, 151 scientific institutes, and 102 scientific societies serving the entire country. Among these institutions, the more important are the All-Union Academy of Science, the Pulkova and the Physical observatories, the Physico-Technical Institute, the Institute of Decorative Arts, the Leningrad Institute for the Science of Books, the Institute for the Observation of Childhood, and the Leningrad Communist University founded in 1921 and housed in the Uritsky (formerly the Taurida) Palace. The Leningrad Government Law Courts have been erected on the site of the building of the famous Third Division of Secret Police which, after its organization in 1838, led the fight against the revolutionary movement.

The museums which have been founded by the Soviet government are playing an important part in the life of the people. The Museum of Art Culture, founded in 1918, is a centre of modern art. The Museum of the Red Army, founded in 1920, illustrates the development of the army. The Permanent Exhibition of the Supreme Economic Council spreads industrial and technical information among the workers. The Central Theatrical Museum, established in 1918, is a means of preserving the chief memorials of the Russian theatre. The Museum of Comparative Religious Thought, opened in 1922, contains originals and reproductions of various objects of worship from Egypt, Assyria, Babylon, India, and some of the Siberian tribes. The Central Geographical Museum, founded in 1919, depicts Russia's physical characteristics. The Museum of Ways of Communication, founded in connection with the Institute of Engineers, illustrates the historical development of transportation. The Museum and State Institute of Ceramics, in connection with the State Porcelain Factory, is playing an important part in the development of a new type of Russian ceramic art. The Winter Palace has been transformed into a Museum of the Revolution, the chief part of the collection consisting of objects connected with the Russian Revolution and various insur-

rections of the nineteenth century; considerable space has been allotted also to the revolutions of western Europe. In this palace, the apartments of Nicholas I, Alexander II, and Nicholas II are shown as historical memorials. The Tusupov Palace, in the basement of which the monk Gregory Rasputin was murdered in December, 1916, was made into a museum in 1919.

**History.** At the outbreak of the World War, the German-sounding name of the city, Saint Petersburg, was changed to Petrograd, which is the Russian expression meaning the City of Peter. In consequence of the expanded war industry, the number of industrial workers grew from 233,000 in 1914 to 378,000 in 1917. Leningrad was the fountain head of the social revolution. The Soviet of Workingmen's and Soldiers' Delegates, formed immediately after the outbreak of the revolution in February, 1917, was the model for the formation of councils throughout Russia. After the return of Lenin and Trotsky from exile, the Bolsheviks gained in power and used the Red Guards to execute a *coup d'état* against the Kerensky provisional government. On Nov. 8, 1917, the second All-Russian Congress of Soviets recognized the Soviet government. A Council of People's Commissars was established, with Lenin as Premier and Trotsky as Commissar for Foreign Affairs. The attacks of Kerensky and Krasno which followed shortly after the establishment of the Soviet power were defeated, as well as the attacks of General Yudenitch in the summer and autumn of 1919. The advance of the Germans into the Baltic provinces on the reopening of hostilities in February, 1918, brought about the removal of the Soviet government to Moscow. The death of Lenin, whose life had been so closely connected with the revolutionary history of the city, was the occasion for changing its name to Leningrad in March, 1924. See RUSSIA.

**LENORMAND, HENRI RENÉ (1882- )**. A French dramatist who was born in Paris and educated at the Lycée Janson-de-Sailly. He was successful in his introduction of psychoanalysis and Freudianism to the Paris stage, where Pitoëff was his most understanding interpreter. His plays include *Les Possédés* (1909); *Pous-sière* (1914); *Les Ratés*; *Le Temps est un songe*; *Le Simoun* (1921); *Le mangeur de rêves* (1922); *La Dent rouge* (1923); *Une Vie secrète*; *À l'ombre du mal* (1924); *L'Homme et ses fantômes* (1925); *L'Armée secrète, suivi de Fidélité et du Juge intérieur* (1925); *Le Lâche* (1926); *Miaure* (1927). Consult *Sur le Théâtre de H.-R. Lenormand*, by Daniel Rops (1926).

**LENTELLI, LEO (1879- )**. An American sculptor born in Bologna, Italy, who was formerly instructor of drawing at the Art Students' League, New York and of sculpture at the California School of Fine Arts. He is best known for his figure of the Savior and 16 figures for the reredos of the Cathedral of St. John the Divine, New York. He also designed groups for the Panama-Pacific International Exposition in San Francisco in 1915. Among his awards was the gold medal for sculpture offered by the New York Architectural League in 1922. He became a member of the National Society of Sculptors in 1907.

**LEONARD, ADNA WRIGHT (1874- )**. A Methodist Episcopal bishop, born at Cincinnati, Ohio. He was graduated from New York University in 1899 and from the Drew Theological Seminary in 1901. In 1889 he was ordained to

the Methodist Episcopal ministry and held pastorates in Porto Rico, Rome, and several cities in Ohio. From 1910 to 1916, he was pastor in Seattle, Wash. In the latter year, he was elected bishop. He is the author of *The Shepherd King* (1911); *Evangelism in the Remaking of the World* (1919); and *Hearthstone League: a Book of Remembrance* (1925).

**LEONARD, WILLIAM ELLERY** (1876- ). An American teacher of English, born at Plainfield, N. J. He was graduated from Boston University in 1898 and took post-graduate courses at Harvard, at Boston University, and in Germany. He served as instructor and principal in several high schools in New York and in Massachusetts, and in 1906 was appointed instructor of English at the University of Wisconsin. He was successively assistant and associate professor of English in that university. Since 1926 he has been full professor. He was a member of many learned societies and is the author of *Sonnets and Poems* (1906); *The Poet of Galilee* (1909); *The Lynching Bee and Other Poems* (1920); *The Locomotive God* (autobiography, 1927); *A Son of Earth* (1928). He also translated many important plays and works from foreign languages.

**LEONCAVALLO, L'ON-KA-VÄL'LO**, RUGGIERO (1858-1919). An Italian dramatic composer (see VOL. XIII). He added to the list of his operas: *La Candidata* (Rome, 1915); *Goffredo Mameli* (Genoa, 1916); *Prestami tua moglie* (Montecatini, 1916); *A chi la Giarrettiera?* (Rome, 1919); and the posthumous *Edipo Rè* (Chicago, 1920), and *Il primo Bacio* (Montecatini, 1923). An opera, *Tormenta*, remained unfinished. From posthumous material, Salvatore Allegra arranged an operetta, *La Maschera nuda* (Naples, 1925). He was one of the few composers who became famous through a single work. This was his earliest, *Paqliacci*, which is the only one that has maintained itself in the standard repertory.

**LEONI, LÄ-Ö'NÉ, FRANCO** (1864- ). An Italian composer, born at Milan. He studied at the Milan Conservatory under Dominetti and Ponchielli. In 1892 he moved to London. He owes his reputation mainly to his very successful opera *L'Oracolo* (London, 1905; New York, 1915). His other operas are *Raggio di Luna* (Milan, 1888); *Rip Van Winkle* (London, 1897); *Ib and Little Christina* (London, 1901); *Franческа da Rimini* (Paris, 1914); *Massemarello*, *Le Baruffe chiozzotte*, *Falene* and *La Terra del Sogno* (all in Milan, 1920). He also wrote the cantatas *Sardanapalus*, *The Gate of Life*, and *Golgotha*, and composed many songs.

**LEPROSY.** With the advance of knowledge and experience, this affection is slowly passing from a hopeless to a relatively curable one. A system of parole prevails among the cured lepers in some localities, and the number that return for treatment gives an inkling as to the success of the latter; thus, of the paroled lepers in the Hawaiian Islands under charge of the United States government, only 8 per cent return for further treatment.

The most impressive news under this head for some years past is the project to raise a fund of \$2,000,000 to combat leprosy in the Philippines, where all lepers have been segregated in the Island of Culion to the number of 6000. This colony serves both to prevent and cure, and at the same time furnishes the greatest opportunity for scientific study of the disease. The fact

that more than 1000 of the colony have been discharged with the disease brought to arrest is a testimonial of the wisdom of segregation. The Philippines Health Department is unable to appropriate the large amount of money necessary for the upkeep of this colony, so that the matter has been taken over by private benevolence, the movement being known as the Leonard Wood Memorial for the Eradication of Leprosy, the late General Wood having taken great interest in the colony during and after his administration of the Philippines.

Although the Wood Memorial has no illusions concerning the leper population of the world, which is placed as at least 3,000,000, it has recently been shown that nearly all countries understate their leper population. Thus, India is supposed in some quarters to have only 100,000 lepers in place of the million which should be credited to her and the same shrinkage is found in numerous other countries. Whatever may be said of good results in small select material, it is staggering to think of curing millions of lepers.

**LE ROY, le-rwä', EDOUARD** (1870- ). A French philosopher, born at Paris. He was admitted to the École Normale Supérieure in 1892, and devoted himself first to mathematics and then to philosophy, receiving his doctorate in the mathematical sciences in 1898. After serving as professor of mathematics in various lycées, he was called to take Bergson's place in the Collège de France in 1914. In 1919 he was elected to the Academy of Moral and Political Sciences, and in 1921 was appointed to the chair of philosophy at the Collège de France. In 1923 he was visiting professor at Columbia University, New York. In his general philosophy, Le Roy, like Bergson, opposed the stereotyped formal intellectualism, which was fashionable at the end of the nineteenth century. He held that there was no essential distinction between scientific rationalism and the religious aspiration for salvation and perfection.

In addition to studies published in the *Revue de Métaphysique* and in the *Annales de Philosophie Chrétienne*, Le Roy published in 1911 an exposition of the Bergsonian method in philosophy, *Une Philosophie Nouvelle: Henri Bergson* (translated into English in 1913).

**LEUSCHNER, ARMIN OTTO** (1868- ). An American astronomer, born at Detroit, Mich. He was graduated at the gymnasium at Cassel, Germany, and in 1888 from the University of Michigan, receiving his Ph.D. degree from the University of Berlin (1907). He was an instructor of mathematics at the University of California, where in 1907 he became professor of astronomy and in 1913-18 and 1920-23 dean of the graduate school. During the World War, he was connected with the Chemical Warfare Service with the rank of major and was also associated with the division of physical sciences of the National Research Council. Dr. Leuschner gave much attention to the perturbations of the Watson asteroids and for his studies on this subject he received in 1915 the Watson Medal of the National Academy of Sciences. He also made valuable improvements in the methods of determining preliminary orbits of comets and planets, and published various papers on theoretical astronomy. He wrote *Celestial Mechanics* (1922).

**LEVERETT, FRANK** (1850- ). An American geologist, who was born at Denmark, Iowa, and passed the first 20 years of his life on a

farm. He taught one year in the public schools and four years (natural sciences) in Denmark Academy. He was graduated from Iowa Agricultural College in 1885, and in the following year entered the U. S. Geological Survey, becoming assistant geologist (1890-1900), and geologist in 1901. He has specialized in glacial geology and in water resources. He was elected to the National Academy of Sciences in 1929. His contributions include: *Water Resources of Illinois* (1896); *Water Resources of Indiana and Ohio* (1897); *The Illinois Glacial Lobe* (1899); *Glacial Deposits of the Erie and Ohio Basins* (1901); *Flowing Wells and Municipal Water Supplies of the Southern Peninsula of Michigan* (1906); *Comparison of North American and European Glacial Formations* (1910); *Surface Geology of Michigan* (1911, 1912); *The Pleistocene of Indiana and Michigan and the History of the Great Lakes* (1915); and *Surface Formations and Agricultural Conditions of Minnesota* (1915, 1916, 1918).

**LEVERMORE, CHARLES HERBERT** (1856-1927). An American educator and peace advocate, born at Mansfield, Conn. He was graduated from Yale in 1879, and after serving as teacher in history in several schools, he became professor of history at the Massachusetts Institute of Technology in 1888, serving until 1893. From 1896 to 1912, he was president of Adelphi College, Brooklyn, and from 1913 to 1917, director of the College and University Bureau of the World Peace Foundation. He was a member and official in many other peace organizations and lectured much on subjects relating to peace. In 1924 he was awarded the Bok Peace Prize of \$100,000 for the best plan for insuring peace among the nations. He was the author of *The Republic of New Haven* (1886); *Forerunners and Competition of the Pilgrim and Puritan* (1912); series *Year Books of the League of Nations* (1919-22); *Life of Samuel T. Dutton* (1922); and the compiler of several students' song books.

**LÉVI, lāv', SYLVAIN** (1863- ). A French Orientalist (see VOL. XIV). In 1921 he lectured at Tagore's University in Santiniketan, Bengal, India. He was a contributor to periodicals devoted to Orientalism and the author of a number of books, among them: *Literary History of Sanskrit Buddhism*, with Winternitz and Huber (1920); a translation and introduction to *La Légende de Nala et Damayanti* (1920); a preface and vocabulary for E. Chavannes' *Contes et Légendes du Bouddhisme Chinois* (1921); *Dans l'Inde* (1925), and *L'Inde et le Monde* (1926).

**LEVINSON, SALMON OLIVER** (1865- ). An American lawyer and peace advocate, who was born at Noblesville, Ind., and graduated at Yale (1888). He studied law at Lake Forest University and was admitted to the Illinois bar in 1891. He has since practiced at Chicago, specializing in the reorganization of railroads and industrials. Mr. Levinson is chairman of the American Committee for Outlawing War. He is the author of the Levinson Plan for readjustment of German reparations, allied and inter-allied debts, European appeasement, and world peace, issued in 1927.

**LEVINTHAL, BERNARD LOUIS** (1866- ). An American rabbi, born at Vilna, Russia. He was educated in the schools of Russia and came to the United States in 1891. Since that year, he has been minister of the United Orthodox

Hebrew Congregation of Philadelphia, and was the founder and president of the Orthodox Rabbinical Association of America. He was a member of the delegation of the American Jewish Congress to the Peace Conference in Paris in 1919 and a member of the faculty of the Rabbinical College of America in New York.

**LEVITZKI, MISCHA** (1898- ). A Russian pianist, born at Kremenetschug. Having begun his musical studies under A. Michailovskii in Warsaw, he continued under S. Stojovski at the Institute of Musical Art in New York (1907-11). For the next four years, he studied, at irregular intervals, with E. Dohnányi at the Königl. Hochschule in Berlin, winning the coveted Mendelssohn Prize. Although he had played in public as an infant prodigy, his career as a full-fledged pianist dates from his début at Antwerp (1912). He then made tours of Belgium, Germany, Austria, Hungary, and Scandinavia. His American début took place in New York (Oct. 17, 1916). In 1921 he made a tour of Australia and in 1925, of the Orient. He is recognized as one of the masters of the keyboard.

**LÉVY-BRUHL, LUCIEN** (1857- ). One of the leading French philosophers of the sociological school. He was born in Paris, was educated at the École Normale Supérieure, in 1899 was called to the faculty of the Sorbonne, and in 1918 was elected to the Institute (Académie des Sciences Morales et Politiques). Originally attracted in the direction of idealistic metaphysics, Professor Lévy-Bruhl transferred to the sociological and objective study of the moral sciences. The publication of his book, *La Morale et la Science des Mœurs* (1903) created a philosophic furor, owing to the boldness with which he attacked all attempts to rest ethics on metaphysics. He pleaded for the recognition of the relativity of moral laws and customs to the structure of societies. In pursuit of the sociological programme, Dr. Lévy-Bruhl undertook an interpretation of the mental life of primitive peoples, and published three important works on that subject: *Les Fonctions Mentales dans les Sociétés Inférieures* (1910); *La Mentalité Primitive* (1922, Eng. trans., 1923); and *L'Âme primitive* (1927, Eng. trans., 1928). His other works are *L'idée de responsabilité* (1884); *L'Allemagne depuis Leibniz* (1890); *La Philosophie de Jacobi* (1894); *Lettres Inédites de John Stuart Mill à Auguste Comte* (1899); *History of Modern Philosophy in France* (1899); *La Philosophie d'Auguste Comte* (1900); and *Jean Jaures; esquisses biographiques* (1924).

**LEWIS, GILBERT NEWTON** (1875- ). An American chemist, born at Weymouth, Mass. He was graduated from Harvard University and studied at Leipzig and Göttingen. He taught chemistry at Phillips Academy and was instructor at Harvard during 1899-1900 and 1901-06, being on leave during 1904-05 to take charge of weights and measures at the government laboratories in the Philippines. In 1907 he became connected with the physical chemistry research work of the Massachusetts Institute of Technology, where in 1911 he was made professor. In 1912 he became professor of physical chemistry and dean of the School of Chemistry at the University of California. During the World War, Professor Lewis was chief of the defense division of the Gas Service with the rank of lieutenant colonel, and chief of the training division of the Chemical Warfare Service. He

published papers resulting from his studies on the thermodynamic theory and its application to chemistry, electric potentials of the common elements, specific heat of electrons, the structure of the atom and the molecule, and the theory of valence. The French government conferred on him the Legion of Honor. He is the author of *Thermodynamics and the Free Energy of Chemical Substances* (with M. Randall, 1923); *Valence and the Structure of Atoms and Molecules* (1923); *The Anatomy of Science* (1926).

**LEWIS, ISAAC NEWTON** (1858- ). An American soldier and inventor born at New Salem, Pa. He was graduated from the United States Military Academy in 1884 and was commissioned second lieutenant in the 2d Artillery. By successive promotions, he rose to the rank of colonel in 1913, and was retired in that year for disability incurred in line of duty. He early made himself an authority on ordnance and was sent to Europe in 1900 to study that subject, his report resulting in the re-armament of the field artillery. The machine gun bearing his name was invented by him and after its rejection by the United States was accepted by the British government. During the World War, it was used by the Allied Armies, by the United States Navy and the airplanes of the United States and the Allies. The royalties, amounting to at least \$1,000,000 on guns made for the United States after it entered the War, were declined by him. His other inventions have included a time-interval clock and bell system of signals, a replottting and relocating system for coast batteries, an automatic sight, quick-reading mechanical verniers for use in coast defenses, electric car lighting, and windmill electric lighting systems.

**LEWIS, JAMES HAMILTON** (1866- ). An American legislator (see VOL. XIV). He served as United States Senator from Illinois from 1913 to 1919, as a Democrat. He was candidate for (Governor of Illinois in 1920 but was defeated. In 1914 he served as United States Commissioner at London to execute treaty laws for safety at sea. He wrote *The Two Great Republics: Rome and the United States* (1913) and *History of International Law*. In 1918 he was engaged in special work in France.

**LEWIS, PAUL A.** (1879-1929). An American research pathologist who was associated with the Rockefeller Institute for Medical Research. Born in Chicago, he received his preliminary education at the University of Wisconsin and graduated in Medicine at the University of Pennsylvania in 1904. He was an associate in pathology at the Rockefeller Institute (1908-10), director of the laboratory of the Phipps Institute, University of Pennsylvania (1910-23), and professor of pathology at the university (1921-23). He was summoned to New York City in 1916 as one of a commission to fight infantile paralysis and from 1917 to 1921 was a commander of the U. S. Naval Reserve. In 1923 he returned to the Rockefeller Institute's animal pathology division at Princeton and in 1925 became allied with the research committee of the National Tuberculosis Association. Upon the outbreak of yellow fever in Brazil in 1928, he was sent by the Rockefeller Institute to Bahia, Brazil, to study the disease, which he contracted. He died June 30, 1929.

**LEWIS, SINCLAIR** (1885- ). An American author born at Sauk Center, Minn. He received his bachelor's degree from Yale Univer-

sity in 1907 and worked on newspapers in New Haven, San Francisco, and other cities. He was successively assistant editor of the *Transatlantic Tales*, *Volta Review*, *Adventure*, Publishers' Newspaper Syndicate, and editor with the Geo. H. Doran Company to 1916. He became universally known in 1920 through his novel *Main Street*, which for the first time in the history of the novel in the United States treated with utter seriousness and perspicuity life in a small town in the Middle West. This was the manifesto for a new school of Western writers which had been growing since shortly before the World War, and the Middle West assumed a dignified and assured place in the literature of this country. His *Babbitt* (1922) treats of the development of a man's bourgeois soul in the Middle West, his one attempt at revolt, and his subsequent return to the respectable fold. Other novels are *Our Mr. Wren* (1914); *The Trail of the Hawk* (1915); *The Job* (1917); *The Innocents* (1917); *Free Air* (1919); *Dr. Arrow-smith* (1924); *Mantrap* (1926); *Elmer Gantry* (1927); *Dodsworth* (1929). He wrote a play, *Hobohemia*, produced in New York City in 1919, and he has contributed short stories to magazines.

**LEWIS, SIR THOMAS** (1881- ). A British physician specializing in heart diseases. Born in Cardiff, Wales, he was educated in the local university, and received the degree of M.B. in 1905 from the University of London. He subsequently lectured on cardiac pathology there and when the periodical *Heart* was established, became its editor. He was knighted in 1921. Lewis has written much on the heart, his major publications comprising *The Mechanism of the Heart Beat* (1911); *Clinical Disorders of the Heart Beat* (1912); *Clinical Electrocardiography* (1913); *Lectures on the Heart* (1915); *The Soldier's Heart and the Effort Syndrome* (1919); *The Mechanism and Graphic Representation of the Heart Beat* (1921).

**LEWIS, WARREN KENDALL** (1882- ). An American chemist, born at Laurel, Del. He was graduated in 1905 from the Massachusetts Institute of Technology, and in 1908 received his Ph.D. degree at Breslau. In 1908 he became a research associate in the laboratory of applied chemistry at the Massachusetts Institute of Technology, where in 1915 he became professor of chemical engineering. During the World War, he was an assistant in charge of defensive problems of the research division of the Chemical Warfare Service. Dr. Lewis contributed articles on chemical technology to Thorp's *Outlines of Industrial Chemistry* and also to various scientific journals.

**LEWIS, WILLIAM MATHER** (1878- ). An American college president, who was born at Howell, Mich., and graduated at Lake Forest (Ill.) College (1900). He was instructor in Illinois College (1900-03) and in Lake Forest College (1903-06). For seven years, he was head master of Lake Forest Academy and was president of the Lake Forest Board of Education (1911-13). He later served as mayor (1915-17) and as member of the Board of Review. During the World War, he was executive secretary of the National Committee of Patriotic Societies. In 1919-21 he was director of the Savings Division of the U. S. Treasury Department. He acted as chief of the education service maintained by the Chamber of Commerce, U. S. A., in 1921-23, was president of George

Washington University (1923-27), and since 1927 has been president of Lafayette College, Easton, Pa. He edited *Selected Readings from the Most Popular Novels* (1904); *The Voices of Our Leaders* (1917); and *Liberity Loan Speakers' Hand Books* (1918).

**LEWISOHN, LUDWIG** (1882- ). A German-American author, born in Berlin. He was taken to the United States in 1890, and received his education in the public schools and at Columbia University. He taught German in the University of Wisconsin (1910-11) and at Ohio State University (1911-19). During his teaching years, he devoted much time to writing and in 1919 was dramatic editor for the *Nation*, becoming associate editor of that magazine in 1920. He made several translations from the German, chief among which are the dramatic works of Gehart Hauptmann (1912-17). His best-known book is *Upstream* (1922), an autobiography in which is set forth a searching criticism of the intellectual and artistic life of this country. His novel, *Don Juan*, which appeared in 1923, deals with the problem of divorce. Other of his works are *An Introduction to the Study of German* (1910); *The Modern Drama* (1915); *The Spirit of Modern German Literature* (1919); *Poets of Modern France* (1918); *The Drama and the Stage* (1922); *The Creative Life* (1924); *Israel* (1925); *Cities and Men* (1927); *Roman Summer* (1927); *The Island Within* (1928).

**LEXER, ERICH** (1867- ). A German surgeon, known especially for his efforts in transplanting joint surfaces and other plastic work of the same kind. Born in Würzburg, he received his medical degree from the university of that city in 1890 and was made professor of surgery at the University of Jena in 1910, at Freiburg in 1920, and at Munich in 1927. His first work on surgery was his *Lehrbuch der Allgemeinen Chirurgie* (2 vols., 1904-05, 17th ed., 1928). At a later period, with Garré and Küttner, he brought out the *Handbuch der Praktischen Chirurgie*, which was reissued in six volumes, 1921-23. He also summed up his World War and post-war experiences in his *Wiederherstellungschirurgie* (1920).

**LEYEN, FRIEDRICH VON DER** (1873- ). A German writer, professor of Old German philology at the University of Cologne since 1920. He was born at Bremen and studied at Marburg, Leipzig, and Berlin. Included among the many works he published are *Indische Märchen* (1898); *Das Märchen in der Göttersage der Edda* (1899); *Götter und Göttersagen der Germanen* (1909); *Das Märchen* (1911); *Die Deutschen Heldensagen* (1912); *Das Studium der Deutschen Philologie* (1913); *Das Deutsche Märchen* (1917); *Die Deutsche Dichtung* (1918); *Deutsche Dichtung in Neuer Zeit* (1922, 2d ed., 1927); *Geschichte der Deutschen Dichtung* (1926). He also edited works of Herber, Schlegel, Wackenroder, Hertz, and others.

**LIBERIA.** A Negro republic on the west coast of Africa. The area is estimated at 43,000 square miles. The population is estimated at 2,500,000, of which American Liberians numbered 20,000; the capital, Monrovia, has 10,000. In 1927 the enrollment in all the Liberian schools was placed at only 3000. Agricultural methods are still primitive and the country's economic resources, e.g., minerals, ivory, hardwoods, have hardly been tapped. Leading products include cocoa, cotton, coffee,

piassaba fibre, and palm oil and kernels. Imports are rice, gin, tobacco, cotton piece goods, building materials. Trade is mainly with the United Kingdom, Liberian exports in 1913, 1920, and 1925 being £56,709, £537,362, and £382,211, and imports for the same years, £90,258, £271,992, and £423,004. Trade with the United States in 1916 was \$263,717. In 1912-13 revenues were \$618,800 and expenditures \$529,548. In 1917-18 these had dropped to \$273,000 and \$255,700. For 1925-26 revenues totaled \$962,570 and expenditures \$939,978. In 1918 customs duties brought in \$162,120; in 1920, \$314,690; in 1926, \$518,504. The customs office is administered by an official appointed by the United States. The police force, maintained for the security of the revenue, cost \$120,000 in 1925. The only means of inland communication is a motor road 24 miles long. There are no railways or telegraphs. There are two wireless stations at Monrovia and cable lines from there to Europe and New York.

The entry of the United States into the World War paved the way for Liberian participation. In August, 1917, Liberia declared war on Germany and seized the opportunity to eject the Germans, who up to that time had controlled more than 75 per cent of Liberia's trade. In 1918 a German submarine, in retaliation for the seizure of German property, shelled Monrovia and sank the single vessel which constituted the country's navy. Beginning with 1920, the United States began to occupy the leading rôle in Liberia's affairs. The direct occasion for this move was the fact that, in 1918, the United States had placed to the credit of Liberia for war expenditures the sum of \$5,000,000. Only \$26,000 was used before the War terminated, with the result that a proposal was made that the whole be carried as a government loan to Liberia. The Senate of the United States failed to approve the loan, however, and Liberian finances are in a precarious position. The President for 1916-20 was Daniel E. Howard; for 1920-24, 1924-28, and 1928-32, C. D. B. King.

**LIBERTY BONDS.** See FINANCE AND BANKING.

**LIBERTY TUNNEL, PITTSBURGH.** See TUNNELS; PITTSBURGH.

**LIBRARY ASSOCIATION, AMERICAN.** The growth of the Association since 1914 has gone hand in hand with the growth of American libraries during that time. During the World War, the Association organized and administered library service for the Army, Navy, and Marine Corps at the request of the United States government. Five million dollars and several million books and magazines were collected. Fully equipped libraries were maintained in the principal camps and stations, collections of books and magazines were sent to small camps and posts, and service was rendered to the overseas troops. Hospital library service was an important feature in 1929-30. At the end of the War, the War and Navy Departments took over the service, and later, the Veterans' Bureau took over the library service for men in hospitals.

For 1919-30, the Association prepared a great extension programme, but the financial campaign was not fully organized and resulted in donations of less than \$100,000 for the new work. Some increase in the Association's extension service was made possible, however, and the publicity for the campaign greatly stimulated interest in the development of libraries.

Recognizing the need for trained librarians and standards for library training, the Council of the Association in 1924 created a permanent Board of Education for Librarianship. Since that time, the board has made a survey of library schools; stimulated an interest in library training; endeavored to bring into the profession young people especially suited for it; and has acted as a clearing house for information about the library schools in operation throughout the country.

In 1923 the American Committee for Work in Devastated France founded the Paris Library School, conducted under the auspices of the American Library Association, to train librarians to carry on the libraries established by the committee after the War. The committee provided funds to carry on the school for two years, and at the end of the second year, a gift of \$37,500 was received from John D. Rockefeller for the year 1926-27. Since that time, it has been supported by internationally minded friends. It is hoped that an American university will take over the responsibility for the School in the fall of 1929, otherwise it will be forced to go out of existence.

The Committee on Library Extension reported the findings of a survey in *Library Extension*. (See LIBRARY PROGRESS.) The publication brought to the attention of the members of the Association the need for libraries among rural people. The goal of the committee is to provide adequate library service within easy reach of every one in the United States and Canada. There were 50,000,000 people without such service, most of whom are in the rural districts. The survey indicated that the county library system is the most efficacious and economical way known at present to get books to rural people, and the committee is bending its efforts to bring about the establishment of county libraries throughout the country.

A Commission on the Library and Adult Education was appointed in 1924 to study the relation of libraries to adult education. The study resulted in the publication of a report, *Libraries and Adult Education*. On the completion of the report, a Board on the Library and Adult Education was established and has since that time been engaged in gathering material and serving as an information centre. The board publishes a quarterly, *Adult Education and the Library*. An adult-education venture in which the board has been particularly interested is the "Reading with a Purpose" series. This is a series of reading courses, published by the Association, on different subjects, each one written by an authority. The courses are distributed chiefly through libraries. The first courses were mainly of a cultural nature, typical examples being *French Literature*, by Irving Babbitt, and *Psychology*, by Everett Dean Martin. Recently, practical courses on such subjects as *Salesmanship* and *Advertising* have been added. Over half a million of the courses have been sold. There were in 1920 41 titles in the series.

In addition to issuing the reading courses, the Association publishes books and pamphlets on library work, buying-lists for libraries, etc. Over one million copies of American Library Association publications were distributed during 1928. Most of them were sold. Typical publications are *Public Library Administration*, by John Adams Lowe, the *Manuals of Library Economy*, *A Survey of Libraries in the United States*, and *The Hospital Library*, edited by Edith Kathleen Jones. The *Booklist*, a guide to new books,

is issued monthly, except in July and August.

A large part of the work of the Association is done by its 64 voluntary committees. Some of the activities of the committees during the past few years have been the publication of the *Children's Library Year-Book*, by the Committee on Library Work with children; the "brailing" of a number of books through the efforts of the Committee on Work with the Blind; the publication of the report, *Reading Interests and Habits of Adults*, in coöperation with the American Association for Adult Education, through the Committee on the Study of the Development of Reading Habits; and the compilation of the *Union List of Serials* through the coöperation of the Committee on the Union List of Serials.

Beginning in 1922, the Children's Librarians' Section of the Association has awarded the Newbery Medal annually for the most distinguished children's book published in America during the year. The medal is the gift of Frederick Melcher. It has been won by the following authors: Hendrik Willem Van Loon, for *The Story of Man-kind*; Hugh Lofting, for *The Voyages of Dr. Dolittle*; Charles Boardmann Hawes, for *The Dark Frigate*; Charles J. Finger, for *Tales from Silver Lands*; Arthur Bowie Chrisman, for *Shen of the Sea*; Will James, for *Smoky*; Dhan Gopal Mukerji, for *Gay Neck*; and Eric P. Kelly, for *The Trumpeter of Kratow*.

The membership of the Association has increased from 2905 in 1914 to over 11,000 in 1929. Annual conferences have been held in different parts of the country. In 1926 the fiftieth anniversary conference was held in Atlantic City. Librarians from many foreign countries attended this conference as the guests of the Carnegie Endowment for International Peace and of the Association. The Association derives its revenues from membership dues, *Booklist* subscriptions, sales of publications, endowment funds, and grants for special projects.

**LIBRARY PROGRESS.** The development of school libraries throughout the United States has been the outstanding feature in the library world since 1914. Although the movement for libraries in schools had been under way before 1917, the matter was given new impetus at that time by the adoption by the National Education Association and the American Library Association of the report of a joint committee on library organization on "Standard library organization and equipment for secondary schools of different sizes." Many accredited library schools have established courses for the training of school librarians, and standards for such courses have been fixed. A number of research studies have been under way—notable among them the study of the North Central Association of Colleges and Secondary Schools and Lucile Fargo's *The Library in the School*, one of a series of textbooks prepared by the American Library Association curriculum study. Excellent buying-lists of literature suitable for use in school libraries also have been published. Close coöperation has been maintained between the national educational and library associations and has resulted in raising the standards of school libraries and in establishing libraries, not only in high schools but in elementary and junior high schools. School boards and public-library boards are becoming convinced of the need for school libraries and appropriations for them are increasing year after year. Several States have appointed State school-library supervisors.

The success of library service for soldiers during the World War turned the minds of librarians to the possibilities of the library as a factor in adult education. The Chicago Public Library in 1923 created a Readers' Service Bureau, the particular function of which was to increase the usefulness of the library to men and women who wished to continue their education after their formal training was over. Since 1923, 27 libraries in 18 States have established readers' bureaus similar to the one in Chicago. Round-table discussions for readers' advisers were held as a part of the American Library Association conferences in 1927 and 1928, and in 1929 a two-day institute was held. A Commission on the Library and Adult Education was appointed in 1924 by the American Library Association to study the relation of adult education to libraries. The study resulted in the publication of a report, *Libraries and Adult Education*, in 1926. The report was included in a series of Studies in Adult Education, sponsored by the Carnegie Corporation. In this same series, two other volumes of value to the library world appeared, *The Reading Interests and Habits of Adults*, by Dean W. S. Gray and Ruth Muroe, and *Adult Learning*, by E. L. Thorndike.

Since 1926 the work of the American Library Association Commission on the Library and Adult Education has been carried on by the Board on the Library and Adult Education. One of the important projects of the Commission, and later of the Board, has been the publication of the "Reading with a Purpose" series of reading courses. Forty-seven of these courses have been issued. Each course is prepared by a specialist and contains a short essay, followed by four or five books recommended by the author, in the event the reader wishes to pursue the study of the subject further. A study by Emma Felsen-thal which resulted in the publication of *Readable Books in Many Subjects* in 1929 is proving valuable to libraries with and without readers' advisory service.

Several important conferences, which called forth an international exchange of ideas, have been held since 1914. In 1926 the American Library Association held its Fiftieth Anniversary Conference which was attended by delegates from many foreign countries, through the generosity of the Carnegie Endowment for International Peace. In 1927 the British Library Association celebrated its fiftieth anniversary with the Jubilee Conference which was attended by a number of delegates from the United States. At this conference, the International Library and Bibliographical Committee was formed. Several Americans were on the Committee. In 1929 this Committee called the first world's Library and Bibliographical Congress in Rome and Venice. Sixty-seven librarians from the United States attended the congress and a number of them contributed to the programme. In response to an invitation tendered personally by delegates of the American Library Association to the Mexican Library Association, six delegates appointed by the Minister of Education of Mexico were present at the Fiftieth Annual Conference of the American Library Association as guests of the Carnegie Endowment for International Peace and the American Library Association. The meeting was made the occasion for a discussion of Mexican Library affairs and resulted in an interchange of bibliographical information between the United States and Mexico.

A number of American librarians have been called upon to help solve the library problems of other countries. W. W. Bishop, librarian of the University of Michigan Library, J. C. M. Hanson, of the University of Chicago Libraries, and Charles Martel, chief of the Cataloging Division of the Library of Congress, at the request of Vatican authorities and by means of a grant from the Carnegie Endowment for International Peace, spent several months in the Vatican Library making suggestions for the revision and enlargement of the catalogue and conferring with Vatican authorities about the collection of printed books and incunabula. Milton Ferguson, of the California State Library, and S. A. Pitt, of the Glasgow, Scotland, Library made a survey of library conditions in South Africa for the Carnegie Corporation.

The number of students attending library schools has been steadily increasing until in 1928-29 there were over 1000 students enrolled in the schools. There are now fifteen schools accredited by the Board of Education for Librarianship of the American Library Association which are offering courses for graduate and undergraduate study. In addition to these schools, there are at least six or eight other schools, some of them only recently opened, which are offering a full year's curriculum in library science for school-library work. Every summer, many of the accredited schools and a number of universities are offering summer courses in library science. The first school to be devoted exclusively to graduate work in library science was established at the University of Chicago in the fall of 1928.

Probably the most notable bibliography ever sponsored by American librarians, the *Union List of Serials*, was published in 1927. It includes entries for over 75,000 titles of serials and locates holdings in over 225 American libraries. The volume involved nearly six years of labor.

Over 60,000,000 people in the United States, that is, 57 per cent of the population, have public-library service, according to the report on library extension published in 1926 by the American Library Association Committee on Library Extension. Whereas only 7 per cent of the urban population is unserved, this report disclosed that 82 per cent of the rural population is without adequate library service. A nation-wide effort is being made to provide books for rural people through tax-supported county libraries. Most States have laws permitting the establishment of such libraries and State-library-extension agencies which foster their growth. There were in 1929 206 county libraries in 33 States and the number is increasing rapidly.

The field of special library work has developed to an extraordinary degree since 1914. The library has become an important factor in many business concerns. Membership in the Special Libraries Association numbers over 1000. Financial, insurance, museum, newspaper, commercial, and technical librarians, together with librarians of public libraries, make up the membership of the Association.

Other important developments of the past few years are an increase in library service to the blind, both to adults and children; a tendency to cooperate with moving-picture and other industries to promote education through visual aids; an experiment being carried on in Massachusetts where a young man librarian is living among prisoners working with prison officials in an attempt to solve prison-library problems of long

standing; greater emphasis on library publicity; more attention to work with the foreign-born.

There were in 1929 over 12,000 library buildings in the United States. Among the large libraries built since 1914 are the Widener Library, Harvard University; University of California Library; University of Minnesota Library; and the Sterling Memorial Library at Yale University; the Public Libraries at Detroit, Mich.; Wilmington, Del.; Cleveland, Ohio; Los Angeles, Calif.; Philadelphia, Pa. and Queens Borough, N. Y.; and the California State Library, at Sacramento. A number of gifts have been made for erecting library buildings and for building up special collections of books. The Carnegie Corporation discontinued the giving of money for library buildings "in the belief that so many of these have been provided, and so many communities have received the impulse for library facilities, that the purpose which Mr. Carnegie had in view has been in large measure accomplished."

**LIBYA.** An Italian colony on the north coast of Africa, between Tunis and Egypt. It consists of the two provinces of Tripolitania and Cyrenaica. Its area is estimated at 406,000 square miles; its native population (census of Dec. 1, 1921) was 569,093. The total estimated population was put at 1,000,000 divided racially into 30 per cent Arabs, 40 per cent Negroes, 23 per cent Jews, 7 per cent Europeans. The civil European population in 1921 numbered 28,304, made up mostly of Italians and Maltese. Tripoli, the capital of Tripolitania, had 73,000 inhabitants; Benghazi, capital of Cyrenaica, 35,000. The country is largely desert, but in the coastal region and in the highlands, agricultural and pastoral activities are carried on. Barley is chiefly grown, but henna and dates also are cultivated. Other articles of trade consist of sponges, tunny fish, ostrich feathers, potatoes, matting, fats, honey, and hides of camels, oxen, sheep, and goats. For want of irrigation, agriculture is necessarily restricted. The caravan trade into the Sudan, formerly very important, is being diminished because of the French occupation of Timbuktu and the presence of the Kano-Lagos Railway in British Nigeria. Principal exports into Sudan are cotton and woolen goods, blankets, rugs, tea, coffee, sugar, and paper. Imports from the Sudan are ivory, ostrich feathers, hides, skins and leather objects. Imports by sea into the colony include wines and liquors, oils, sweetmeats, chemical products, cotton, woolen, and silk yarns, iron and steel manufactures, tobacco, and matches. Total exports in 1927 for Tripolitania were 24,259,201 lire; imports, 240,056,377 lire; revenue and expenditure for 1928-29, 233,719,250 lire. The exports of Cyrenaica in 1927 were 14,008,800 lire; imports 178,238,195 lire; revenue and expenditures for 1928-29, 205,496,250 lire. The Italian government maintains 19,680 men in Tripolitania and 18,600 men in Cyrenaica for defense purposes. There are in all 189 miles of railway in operation to supplement the principal means of communication, i.e., caravan routes. By the Treaty of Lausanne (Oct. 18, 1912), the Turkish evacuation of Libya paved the way for Italian occupation. The pacification of Tripolitania proceeded without difficulty, so that by 1915 the coastal region was well under Italian control. In Cyrenaica, however, great difficulties were encountered. The Senussi continued in possession of the interior and stubbornly contested the scheme of Italianization. Fighting

went on during 1914 and 1915 and so successful were the insurgents that the inland garrisons had all to be abandoned and Italy was once more reduced to her coastal possessions. In 1916, with Turkish aid, the Senussi brought the fighting into the coastal region, and but for the failure to unite all the insurgent forces, might have succeeded in expelling the Italians entirely. The end of the War found the local chieftains unable to effect a common understanding among themselves. To gain over the local tribes, the Italians, after the War, deemed it necessary to grant autonomy. A parliament was set up, and as a result of peace being established with the Senussi in November, 1920, the Italians were able to resume once more their penetration with only occasional molestation. By arrangement with France in 1919, the western frontier of Tripoli was laid out to extend in a curve from west of Ghadames to south of Tummoo. Similarly, as a result of an understanding with Great Britain, Jarabab, on the Egyptian frontier, was ceded to Italy. In 1928 the territory in effective occupation was extended to the southward and a number of important oases were occupied.

**LICHNOWSKY, KARL MAX, PRINCE** (1860-1928). A German diplomat. He served in important capacities in several embassies, and at the outbreak of the World War was German Ambassador in London. He endeavored, by every means in his power, to prevent the outbreak of War, and afterward went into retirement. Here he wrote an account of his "mission to London," which was privately circulated. Extracts appeared in a Swedish newspaper, in March, 1918, and shortly afterward were published in book form under the title *Heading Towards the Abyss*. In this, he brought serious charges against the German government for its pre-war policies. The book made a great sensation and General Erich Ludendorff urged that proceedings be taken against Lichnowsky, but nothing was done.

**LIE, JONAS** (1880- ). An American landscape and figure painter (see Vol. XIV). He won the silver medal of the San Francisco Exposition in 1915, the Greenough Memorial Prize at Newport, R. I., in 1916, and the gold medal, Art Week, at Philadelphia in 1925. Mr. Lie became a member of the National Academy in 1925. He is secretary of the New Society of Artists (New York).

**LIEBERMANN, lē'bēr-mān, MAX** (1847- ). A German painter who was born in Berlin, and studied at the University of Berlin, the Art Academy of Weimar and with Munkacsy in Paris, Millet in Barbizon, in Holland, and in Munich. He was professor at the Academy of Berlin (1898- ). He is highly valued for groups like "Potato Harvest," "Darning Women," "Peasants Saying Grace," "Old Men's Home in Amsterdam," and also for portraits, best known among which are those of Gerhart Hauptmann, Virchow, and his "Self-portrait." He received medals in Berlin, Munich, Dresden, Venice, and in Paris, and also the ribbon of the Legion of Honor. He was president of the Academy of Arts in Berlin, was recognized as leader of the North German Secession and was honorary member of numerous foreign art academies and societies.

**LIEBKNECHT, lēp'knēkt, KARL** (1871-1919): A German Socialist leader (see Vol. XIII). Called to the army in 1915, he served

on the western front, which brought upon him violent censure from his party. Attacking the militarism of the Government in open session of the Diet in 1916, he was expelled and soon after convicted of high treason for participation in a Socialist May Day celebration. He was sentenced to four years of penal servitude and loss of civil rights, but was released in October, 1918. Engaging at once in revolutionary activities, he was killed by the Nationalists in the Berlin revolt of Jan. 16, 1919. Among his later works are *Gegen den Bürgerlichen Militarismus* (1920); *Politische Aufsätze aus Seinem Nachlasse* (1921); *Reden und Aufsätze* (1921); *Studien über die Bewegungsgesetze der Gesellschaftlichen Entwicklung* (1922). See GERMANY, under *History*.

**LIECHTENSTEIN.** One of the smallest independent European states lying between the Austrian province of Vorarlberg and the Swiss cantons of St. Gallen and Graubünden. Its area is 65 square miles; its population (1912), 10,716. The revenue for 1926 was 685,651 francs and the expenditure 552,555 francs. In October, 1921, a new constitution providing for a Diet of 15 members, elected by direct vote on the basis of universal suffrage and proportional representation, was adopted. In 1924 the principality, heretofore the ward of Austria, joined the Swiss Customs Union and turned the administration of its posts and telegraphs over to Switzerland, besides using the Swiss currency since 1921. On Feb. 11, 1929, Prince Johann II, who had ruled Liechtenstein for more than 70 years died at the age of 88 and was succeeded by his brother, Prince Frances I, born Aug. 28, 1853.

**LIEFMANN, ROBERT** (1874— ). A German political economist, born at Hamburg. A professor of economics at the University of Freiburg since 1904, he has written *Die Unternehmerverbände* (1897); *Schutzzoll und Kartelle* (1903); *Kartelle und Trusts* (1905, 4th ed., 1920); *Ertrag und Einkommen auf der Grundlage einer rein subjektiven Wertlehre* (1907); *Beteiligungs und Finanzierungsgesellschaften* (1909); *Die Unternehmungsformen* (1912); *Grundsätze der Volkswirtschaftslehre* (1917, 3d ed., 1923); *Allgemein Volkswirtschaftslehre* (1924).

**LIENHARD, IEN'HÄRT, FRIEDRICH** (1865–1929). A German poet and novelist (see VOL. XIV). After 1925 he was doctor of theology at the University of Münster. His later works included *Der Einsiedler und Sein Volk* (1914), a volume of short stories; *Lebensfrucht*, his collected verse (1915); *Jugendjahre*, recollections of his youth (1918); *Westmark*, a novel (1919); *Der Meister der Menschheit* (1919); *Wer Zuletzt Licht* (1921); *Aus Taulers Tagen* (1924); the novels *Unter dem Rosenkreuz* (1925) and *Des Meisters Vermögen* (1927); and a volume of causeries, *Das Plauderbuch* (1927). He edited *Der Türmer*, a magazine published in Weimar.

**LIGGETT, HUNTER** (1857— ). An American army officer, born at Reading, Pa. He was graduated at the United States Military Academy in 1879 and was made a second lieutenant in the 5th Infantry. By successive promotions, he reached the rank of major general in 1917 and was retired in 1921. He served in campaigns against the Indians and during the War with Spain was in Cuba, with the rank of major of volunteers. Later, he was in the Philippines, and subsequent to his return to the

United States, after various duties, he was sent to the Army War College, where he was graduated in 1910 and of which he was president in 1913. In 1914 he served on the Mexican border and in 1917 commanded the Department of the Philippines. During the World War, he was in France as commander of the 41st Division (1917–18) and then with the 1st Army Corps (1918–19) with the rank of lieutenant general. Later, he was on the Rhine in command of the 3d Army (1919). He took part in the second Battle of the Marne and participated in the engagement at St. Mihiel and in the Meuse-Argonne campaign. On his return to the United States, he was assigned to the command of the Western Department with San Francisco as his headquarters. In 1921 he was retired from active service with the rank of major general. For his services in the War, he received the Distinguished Service Medal of the United States, the decorations of the Legion of Honor from France, the Order of Leopold from Belgium. General Liggett wrote *Commanding an American Army; Recollections of the World War* (1925).

**LIGHT.** See PHYSICS.

**LIGHT, MEASUREMENT OF.** See ELECTRIC LIGHTING.

**LIGHTHOUSES, AND OTHER AIDS TO NAVIGATION.** After the restoration of normal conditions following the World War, there came important developments in lighthouses and their equipment, as well as in other aids to navigation in most of the countries of the world. Such developments are mainly in the provision of improved illuminants and signaling devices, in increasing the number of such marks as gas buoys, and particularly in installing radio apparatus for signals and for communications. In the construction of notable light towers or other structures, not much of importance was done between 1914 and 1928, but the improvement of equipment in the interest of better navigation, as well as general efficiency and economy, was significant. Thus, in the United States, the improvement of lights on rivers and bays was marked and the placing of acetylene buoys to mark the Ambrose Channel of the New York Harbor in 1920 was a distinct advance. On the Mississippi and Hudson rivers also there was a marked improvement in the lights. With the extensive development of aeronautics, lighthouse authorities were giving consideration to the utilization of coast lighthouses in aerial navigation, but little had been done in determining modifications needed for existing equipment. For the American Transcontinental Mail and other routes, elaborate systems of illumination and light marks were devised. At the end of the fiscal year 1927–28, 5877 miles of airways were lighted, with 1275 lights in operation. The number of lights was constantly being increased as new airways were provided for night flying. See AERONAUTICS.

**Automatic Lighting.** In the period following the War, automatic lighting was a leading consideration for the lighthouse service of the various countries of the World. It was extensively introduced, even at the more important stations, although in the latter instances one keeper usually was retained, and the installation was quite costly. Such lights for the most part employed dissolved acetylene, and for the higher illuminating power, there was a lens revolved by the gas pressure, while the flame was produced by the combustion of a mixture of acetylene and air

under an incandescent mantle, with automatic mantle exchanger. European automatic lights and light sectors were in many cases more complicated than those employed in the United States. Automatic lighting by incandescent electric lamps had been extensively developed in some countries for unwatched or semi-watched stations, even those of primary importance. Here were often employed large light bulbs approximating 1 foot in diameter, with spirally wound filaments in gas-filled bulbs. The large current required was supplied from commercial sources or by automatic power units at the station. In some of the apparatus, particularly that for the coast of Holland, where this system was extensively introduced, the electric light had a reserve gas light which was automatically set in operation on the failure of the electric light.

The United States Lighthouse Service in 1928 had in commission more automatic apparatus than similar services in any other country in the world. Of 6761 coast and lake lights, 2210, or 33 per cent, were automatic, doing the work of many lighthouse keepers and assistants. This includes 893 lighted buoys, which could not be maintained by human attendance and which were invaluable aids to mariners, were automatically operated, and aided night navigation on many important rivers and channels. This tendency to provide automatic installations is indicated by the fact that during the fiscal year 1928, 158 stations were put on an automatic basis, with an annual saving estimated at three-quarters the cost of the changes. Thus, in addition to many automatic gas buoys, new automatic lighthouses were installed at important points.

**Fog Signals.** A most important development in the way of improving coastwise navigation was fog signals which by the use of radio were to send out from transmitting stations signals appropriate to the locality. These could be detected on vessels equipped with ordinary receiving apparatus. The first radio fog signals in the United States were placed May 1, 1921, on the Ambrose Channel light vessels at the entrance to New York Harbor, on the Fire Island light vessel, and on the Sea Girt (N. J.) lighthouse, all in the vicinity of New York Harbor. By 1928 there were 55 radio beacons in operation, most of the important light stations and lightships being thus equipped. These instruments furnish, with proper precautions, bearings approaching the accuracy of visual bearings, and were available at greater distances. See RADIO TELEGRAPHY.

In 1924 a power-tube radio fog signal transmitter was placed in commission on Ambrose Channel lightship. This was the first tube transmitter used in the United States for fog signal purposes. This transmitter was installed by the United States Lighthouse Service after extensive tests indicating freedom from directional distortion, lessened interference, and increased efficiency. Installations of radio fog signals had been provided in France, Spain, Norway, Scotland, England, and Holland, though less extensively than in the United States. It was universally recognized that instruments for determining the radio bearing should be located on shipboard, and the radio compass (see NAVIGATION) a simple means of securing direction and position, is rapidly becoming standard ship equipment. Aside from the use of radio, the principal advance noted in fog signals was the further introduction of automatic apparatus for minor signals, such as bells, along the lines described or similar.

**United States Lighthouse Service.** On June 30, 1928, there were maintained by the United States Lighthouse Service, which is by far the largest lighthouse organization in the world, 18,007 aids to navigation, including 6761 lights of all classes and 1313 fog signals of which 55 were radio signals and only 36 were submarine signals. The accompanying table gives a summary of the aids to navigation under each class in commission at the end of the fiscal years 1914 and 1928.

Class	June 30, 1914	Total, June 30, 1928
<b>Lighted aids:</b>		
Lights (other than minor)	1,588	2,248
Light-vessel stations	52	46
Gas buoys	453	554
Gas buoys with whistles and bells *	....	334
Minor lights	2,798	3,392
Float lights	118	187
Total lighted aids	5,004	6,761
<b>Fog signals:</b>		
Radio	....	55
Sound fog signals (air)	519	558
Submarine fog signals	48	87
Gas buoys, with whistles and bells *	....	334
Whistling buoys, unlighted	86	81
Bell buoys, unlighted	233	258
Total fog signals	886	1,313
<b>Unlighted aids:</b>		
Buoys	6,330	7,664
Day beacons	1,978	3,203
Total	8,308	10,867
Grand total	14,198	18,007
* Gas buoys with whistles and bells are counted only once in the grand total.		

In the period between 1910 and 1920, there was a net increase of 4611 in the total number of aids to navigation in the United States. The number of gas buoys increased two and one-half times and the number of lighthouses, equipped with brilliant oil-vapor lights, increased four times. The number of automatic gas lights ashore increased nearly seven times, effecting an important economy in the cost of attendance. By 1928 radio equipment had been placed on more than half of the tenders and telephone communications between shore stations. Acetylene buoys were in standard use and were placed at important channels.

In Alaska during the period from 1914 to 1928, many new aids to navigation were established, so that on June 30, 1928, there had been provided a total of 779 aids to navigation in this Territory. This was a steady growth from 1910, when there were but 160 such aids. In 1928 there were 284 lights, 26 gas buoys, 16 fog signals, 283 buoys, 170 day marks, and 2 radio beacons. The United States Lighthouse Service had been active in the other Territories and outlying districts, where increased commerce rendered additional aids to navigation essential. Thus, in 1921 there was built a new light station and buildings at Point Borinquen, at the northwestern extremity of Porto Rico, at a location where the necessity of a landfall light was emphasized by the opening of the Panama Canal and its increasing use. This new light was placed on a reinforced concrete structure of cylindrical form located 233 feet above sea level. It was simple in design and heavy and strong enough to resist earthquake shocks. It was built on a concrete foundation 25 feet square by six feet deep, and the main tower was 15 feet in diameter with walls 15 inches thick and rising to a height of 46 feet; above it was a service room and a standard helical bar lantern. The illuminating apparatus consisted of a third-

order 12-panel flashing lens on a mercury float with a 55-mm. type-A incandescent oil-vapor lamp. This light shows a group of four white flashes of 32,000 candle power every 30 seconds and is visible 24 miles. At Guam, a valuable new light was installed at Hole-in-the-Wall in 1923 by the United States Lighthouse Service. Lights also were maintained at both Guantanamo and Samoa.

At these last three points, the aids to navigation are maintained under the direction of the Naval Commandant by means of allotments from the appropriations for the Lighthouse Service. Also in 1928 an important new light was completed by the Government of the Philippine Islands on Tubbataba Reef in the centre of the Sulu Sea about 90 miles from the nearest land. In this construction, a light steel tower about 120 feet high carries the light, and concrete buildings at the base are provided for the three keepers and two boatmen and their families.

The coastwise light and aids to navigation in Great Britain are under the control of Trinity House, the oldest brotherhood of seamen in Great Britain, incorporated under Henry VIII in 1514. This organization in 1920 administered 64 large and 27 minor lighthouses; two fog signal stations; 46 manned and two unmanned lightships; 130 lighted and 479 unlighted buoys; and 55 beacons. There are nine lighthouse tenders which steam upward of 100,000 miles a year. Trinity House is constantly conducting experiments in lighting and fog signaling, and many of the lightships are fitted with wireless telephony for communication with the shore.

**LIGHTNING ARRESTER.** See ELECTRIC POWER TRANSMISSION AND DISTRIBUTION.

**LIGHTSHIPS.** See LIGHTHOUSES.

**LIGNE, lè'ny', ALBERT ÉDOUARD EUGÈNE LAMORAL, PRINCE DE (1874- ).** A Belgian diplomat, Ambassador to the United States (since 1927). He started his career as an attaché in Vienna (1896), was posted at Berlin (1898-1903) and Lisbon, and then served under the Secretary of State for Foreign Affairs of the Congo State until that was made a Belgian colony (1908). He then entered the Colonial Office, but in 1911 returned to the diplomatic service, going to Holland as counselor of the Belgian Legation, to Luxemburg as chargé, and returning to Holland as Minister (1920-28).

**LILLENFEIN, lè'l'en-fîn, HEINRICH (1870- )** A German dramatist and novelist. He was born at Stuttgart and studied history and philosophy at the universities of Tübingen and Heidelberg. He became general secretary of the *Deutsche Schillerstiftung* at Weimar in 1920. His principal works were the dramas *Maria Friedhammer* (1903); *Der Herrgottswarter* (1906); *Der Stier von Olivera* (1910); *Der Tyrann* (1913); *Hildebrand* (1918); *Cagliostro* (1922); *Der Erlösung des Johannes Parrocida* (1925); and *Theater* (1927); and the novels *Ein Spiel im Wind* (1916); *Die feurige Wolke* (1919); *Das Trunkene Jahr* (1923); and *Die Welt ohne Seele* (1927).

**LILLIE, RALPH STAYNER (1875- ).** An American physiologist, born at Toronto, Ont., Canada. He was educated at Toronto University, at the University of Michigan, and at the University of Chicago (Ph.D., 1901). He was instructor in physiology and histology (1902-03) and adjunct professor (1903-05) at the University of Nebraska; instructor in phys-

iology at Harvard (1905-06); instructor in physiology and zoölogy (1907-11) and assistant professor (1911-13) at the University of Pennsylvania; professor of biology at Clark University (1913-20); biologist at the Nela Research Laboratory, Cleveland, Ohio (1920-24); professor of general physiology at the University of Chicago since 1924; and instructor in physiology at Woods Hole, Mass., from 1902. He published extensively in scientific journals on osmotic pressure of colloids, physiology of growth processes, and articles on protoplasmic transmission.

**LIMBURG.** Upon the region of South Limburg, in southeastern Holland, centred the chief Belgian demand for territorial compensations after the World War. This Dutch province, with an area of 847 square miles and a population (Dec. 31, 1927) of 521,002, had been given to Holland by the Treaty of 1839, against the protests of the Belgians. At the Versailles Conference, Belgium once more pressed her claims, not on grounds of ethnography, for the people are plainly Dutch, but for historical, strategic, and economic reasons. Limburg had taken part in the Belgian Revolution of 1830. It was vitally necessary for the protection of the Belgian frontiers, for it dipped south to touch Belgium on the east and thus controlled the defense of the Meuse. The position of the Meuse in the disputed district was perhaps the most serious of the Belgian grievances, for the Dutch possession of this waterway, with its important bridgehead at Maastricht, imposed an effective check on the progress of Belgian commerce. Similarly, Limburg seemed vitally necessary to Belgium if the Rhine-Scheldt Canal, which was guaranteed by the Peace of Versailles, was ever to become a reality. Limburg, formerly neglected by the Dutch, became a source of real interest during the War; the lignite mines opened up there were producing 1,425,617 tons in 1918 and some 9,323,012 tons in 1927. The Peace Conference, however, refused to countenance the transfer of the territory; the only step it would take was the establishment of an international commission to investigate the matter of the Treaty of 1839. Territorial compensation was thus out of the question. Only after lengthy negotiations was it possible for the two disputants to come to terms on the matter of waterways. In 1920 an agreement was reached on the administration of the Scheldt, the Antwerp-Meuse-Rhine Canal, and two other water systems; with this, Belgium had to remain content.

**LIME.** The number of plants engaged in the production of lime in the United States decreased from 530 in 1922, to 430 in 1928. Keener competition in recent years has featured the lime industry and numerous consolidations, with elimination of the less efficient producers, has resulted. The more important producing districts are in southern Pennsylvania, the Toledo district of Ohio, and the Shenandoah districts of Virginia and West Virginia. In 1922 a total of 3,639,617 short tons of lime was produced. The value of this production was \$33,255,039, or \$9.14 per ton. In 1928 production had increased to 4,458,412 tons, valued at \$36,449,635, or a value of \$8.40 per ton. About one-half of the lime produced is used in the building trades. The consumption of agricultural lime has not shown a relative increase in recent years, being about 7.5 per cent of the total.

In addition to the important and essential use of lime in building and agriculture, various chemical industries, such as paper mills, glass works, tanneries, metallurgical plants, sugar factories, and various other chemical and semi-chemical industries are important consumers of lime. By means of the air separation process, a very pure lime product is secured that is easily handled and shipped, all of which aids in the development of new markets, and the extension of old markets for lime products in the chemical manufacturing industries. Recent developments in the technology of lime production indicate a trend toward more general adoption of the rotary-type kiln, and a more general tendency to seek a market for the waste-rock products and spalls that must be handled in connection with the production of lime.

**LIMING.** See FERTILIZERS.

**LINCOLN, JOSEPH CROSBY (1870- )**. An American story writer (see VOL. XIV). To his list of tales of the Cape Cod region, he has added: *Thankful's Inheritance* (1915); *Mary 'Gusta* (1916); *Electrifying Obadiah* (1917); *Shavings* (1918); *The Portygee* (1919); *Galusha the Magnificent* (1921); *Fair Harbor* (1922); *Doctor Nyc* (1923); *Ragged Water* (1924); *The Big Mogul* (1926); *The Aristocratic Miss Brewster* (1927); *Silas Bradford's Boy* (1928); and (with Freeman Lincoln) *Blair's Attie* (1929).

**LIND, SAMUEL COLVILLE (1879- )**. An American chemist, born at McMinnville, Tenn. He was graduated at Washington and Lee University in 1899 and the Massachusetts Institute of Technology and received his Ph.D. at Leipzig, Germany. He was assistant in chemistry at the Massachusetts Institute of Technology and assistant professor of general and physical chemistry at Michigan (1905-15). Meanwhile, he became interested in radioactivity and studied in Paris (1910) and at the Radium Institute in Vienna (1911). In 1913 he was appointed chemist for the United States Bureau of Mines in charge of radioactivity, and in 1918 he became physical chemist for that bureau. He was associate director of the Fixed Nitrogen Research Laboratory at Washington, 1925-26, and since 1926 he has been director of the school of chemistry at the University of Minnesota. Dr. Lind published papers on radium extraction and measurement, on the influence of radiation on chemical action, and relation of gaseous ionization to chemical action; he is also the inventor of the Lind interchangeable electroscope for making radium measurements.

**LINDBERGH, CHARLES AUGUSTUS (1902- )**. An American aviator. He was born at Detroit, Mich., graduated from the high school at Little Falls, Mich., and studied mechanical engineering at the University of Wisconsin (1920-22). At the age of twenty, he enrolled in an aviation school at Lincoln, Nebr., and there took his first airplane flight (April, 1922). In 1924 he enrolled as a flying cadet in the U. S. Air Service Reserve at Brooks Field, San Antonio, Tex. (He was later advanced to captain, and then to colonel, of the Air Corps Reserve). In 1925 he was commissioned first lieutenant of the Missouri National Guard and later was promoted to colonel. In 1926 he entered the Air Mail Service as pilot from Chicago to St. Louis. On May 11, 1927, he took off from San Diego, Calif., in an airplane made to his order

and called the *Spirit of St. Louis*. Stopping 25 minutes at St. Louis, he landed at Curtiss Field, N. Y., on the following day (flying time, 21 hours and 20 minutes). On May 20, he took off alone in the same plane on a non-stop transatlantic flight from Roosevelt Field, N. Y., to Paris, France, covering an estimated distance of 3600 miles in 33½ hours. His reception at Paris and later at London and Brussels was unprecedented for cordiality. After his return to the United States and an official welcome from President Coolidge, he made an air tour in the *Spirit of St. Louis* to 75 cities in the interest of commercial aviation. On the invitation of President Calles of Mexico, he made a non-stop flight of 2100 miles from Washington, D. C., to Mexico City in 27 hours and 10 minutes. He later visited Central America and the West Indies. He was awarded the Congressional Medal of Honor (U. S.), the Distinguished Flying Cross, the Distinguished Service Cross, the Woodrow Wilson Medal and \$25,000 for the good-will flight to Mexico, Central America, and the West Indies, the Roosevelt Medal of Honor (1928), the Langley Medal of the Smithsonian Institution, the Hubbard Medal of the National Geographic Society, the French Legion of Honor, and many other decorations. He was the winner of the Orteig \$25,000 prize for the first New York to Paris non-stop flight. Colonel Lindbergh was made chairman of the technical committee of the Transcontinental Air Transport, and in this capacity has given much attention to the planning and location of commercial air routes throughout the United States and Latin America. In 1929 he married Anne S., daughter of Dwight W. Morrow, then American Ambassador to Mexico. He wrote *We* (1927), the story of his transatlantic flight.

**LINDMAN, S. ARVID ACHATES (1862- )**. A Swedish admiral and Prime Minister, born at Osterby. He served in the navy from 1882 to 1891, when he entered business. Elected to Parliament in 1905, he became Minister for Navy the same year, and Prime Minister (1906-11). He was Minister for Foreign Affairs in 1917 and then was leader of the Conservative Party in the Second Chamber until called to head the Conservative cabinet formed Oct. 1, 1928.

**LINDSAY, (NICHOLAS) VACHEL (1879- )**. An American poet and artist (see VOL. XIV). In 1910, when he published the *Village Magazine*, he was almost unknown, but since then, he has been recognized as one of the main hopes of American poetry. Technically and aesthetically, he is full of inaccuracies, but his poetry is strong and vital and many of his poems have the true ballad ring. He is one of the strongest forces in the development of the epic of the West in the United States. He has recited before many school audiences in this country and in England. His chief works are *Handy Guide for Beggars* (1910); *The Art of the Moving Picture* (1915); and the volumes of poems entitled *General Booth enters Heaven* (1913); *Congo and Other Poems* (1914); *The Chinese Nightingale and Other Poems* (1917); *The Golden Whales of California and Other Poems* (1920); *The Golden Book of Springfield* (1920); *Going to the Sun* (1923); *Collected Poems* (illustrated by himself, 1925); *Going to the Stars* (1926); *The Candle in the Cabin* (1926); *The Litany of Washington Street* (1928); *Johnny Applesseed and Other Poems*; *Every Soul is a Circus*, poems (1929).

**LINDSAY, WALLACE MARTIN** (1858- ). A Scottish classicist (see VOL. XIV). His more recent publications include *Notae Latinae* (1915); edition of the *Corpus Glossary* (1921); *Corpus, Epinal, Erfurt, and Leyden Glossaries* (1921); *Ancient Lore in Medieval Latin Glossaries* (1922); *Early Latin Verse* (1922); *Julian of Toledo* (1922); *Glossaria Latina*, vols. 1-3 (1926); edition of *Terence* (1926).

**LINDSEY, BEN (JAMIN) B(ARR)** (1869- ). An American purist and reformer (see VOL. XIV). He was active in the organization of the Progressive Party and was a member of its National Committee in 1912. Judge Lindsey served in the Juvenile Court of Denver until July 1, 1927. He lectured much throughout the country on children's problems. He was the author of *The Rule of Plutocracy in Colorado*; *The Doughboys' Religion* (1919); *Pan-Germanism in America* (1919); *The Revolt of Modern Youth* (1925); and *The House of Human Welfare: The Companionate Marriage* (1927).

**LIPPMANN, WALTER** (1889- ). An American writer (see VOL. XIV). He resigned as a member of the staff of the *New Republic*, in 1915, to become assistant to the Secretary of War. He served also as secretary for the organization directed by E. M. House to prepare data for the Peace Conference. During the World War, he served as captain of the Department of Military Intelligence. He was attached to the 2d Section of the General Staff at General Headquarters in France. He served also in Paris during the Peace Conference. His later books include *The Political Scene* (1919); *Liberty and the News* (1920); *Public Opinion* (1922); *The Phantom Public* (1925); and *Men of Destiny* (1927); *A Preface to Morals* (1929). He joined the editorial staff of the *New York World* and in 1924 became its chief editorial writer.

**LISSAUER, ERNST** (1882- ). A German poet. He was born in Berlin and studied at Leipzig and Munich. He first attracted attention by his lyric volume, *Der Acker* (1907), which was followed by *Der Strom* (1912), a tribute to the centenary of the Wars of Liberation, entitled *1813*, and *Zyklus* (1913). At the outbreak of the World War, he published a series of pamphlets, *Worte an die Zeit* (1914), and attained notoriety by his *Hymn of Hate*. He later wrote two dramas, *Eckermann* and *York* (1921); a series of one-act plays, *Gesichte* (1922); the essays, *Von der Sendung des Dichters* (1922) and *Festlicher Werktag* (1922); *Flammen und Winde*, poems (1922); *Gewalt*, a comedy (1924); *Die dritte Tafel*, a legend (1927). He edited an anthology *Deutsche Balladen* (1923) and works of Mörike, Kopisch, Lingg, and others.

**LITCHFIELD, ELECTUS DARWIN** (1872- ). An American architect, born in New York City. He was graduated from the Brooklyn Polytechnic Institute in 1889 and from the Stevens Institute of Technology in 1892. He began his professional work with Carrère & Hastings in New York and was afterward associated with several other architectural firms in that city. In 1919-26 he was a member of the firm of Electus D. Litchfield & Rogers. Since 1926 he has been in practice under his own name. He designed the United States Post Office and Courthouse in Denver; the St. Paul Public Library; the James J. Hill Reference Library in St. Paul; and many important buildings in Washington, Brooklyn, and other cities. He was archi-

tect and town planner for Yorkship Village, a permanent industrial town of 1700 houses built during the World War for the Emergency Fleet Corporation and the New York Shipbuilding Company. He is a member of several architectural and other societies.

**LITERATURE.** See FRENCH LITERATURE; GERMAN LITERATURE; HUNGARIAN LITERATURE; ITALIAN LITERATURE; ROMANIAN LITERATURE; RUSSIAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE; SLAVONIC LITERATURE; and LITERATURE, ENGLISH AND AMERICAN.

**LITERATURE, ENGLISH AND AMERICAN.** Any survey of English and American literature from the outbreak of the World War must necessarily take count of the fact that for the first four years of the period the world was in arms. No less must it premise discussion on the statement that though the stream of letters was stirred to its depths by the contest, it has followed since the conclusion of the struggle the direction in which it was setting when war broke. The War stimulated the revolt which was under way against established conventions of thought and action; it crystallized discontent, fructified emotion, and unfettered expression, but it marks no watershed in literary annals. Its results to the present have been rather to nurture seriousness than to transform letters.

Viewed in the perspective of today, the literature of the war years themselves appears, for the most part, ephemeral. Of that vast mass of publications which, as the struggle progressed, ranged from inquiry into its causes to description of the manner and incidents of its waging and eventually to discussion of the peace, few have had currency beyond the lustrum that called them forth. Even the correspondence from the men at war, which derived so moving a quality from the idealism which tempered its grim chronicle, and which, at its best, as in the letters of Victor Chapman, Alan Seeger, Rupert Brooke, or Donald Hankey, had so impressive an eloquence, has passed to the limbo of topical literature. Into similar oblivion has gone the great part of the narratives of the war correspondents, the travelers beleaguered in Europe, and unofficial observers, records whose precarious popularity must henceforth rest upon their value as secondary sources of history. A few exceptions there are to this rule. In Masfeld's *Gallipoli*, an imagination capable of conveying the epic nature of the drama unfolding before it transmuted a recital of events into literature that still has power to stir. T. E. Lawrence, in the remarkable *Revolt in the Desert*, furnished a chronicle of experience that stands as one of the most effective as well as one of the most fascinating works born of the War. In H. W. Nevins's *The Dardanelles Campaign*, Philip Gibbs's *The Battles of the Somme*, and the reports of Richard Harding Davis and Frederic Palmer, there was sufficient of literary effectiveness to attach to them a degree of permanence.

It is, however, to other sources we must look for the war literature that must be history. So long as the conflict was in progress, the necessities of the situation imposed an obligation to silence; but the conclusion of peace released the pens of the diplomats, and lifted the embargo on the utterances of military leaders. From the United States in 1918 came Brand Whitlock's *Belgium*, one of the most notable books produced by the conflict, a work of importance historically and possessing no little literary qual-

ity. Vivid and revealing as it was, the outstanding diplomatic memoir of the war period was not, however, that of Mr. Whitlock, but *The Life and Letters of Walter Hines Page*, by Burton Hendrick, a collection of letters impressive for their recital of Anglo-American relations during the war epoch and for the mellow personality and grace of style that invested their record with abiding interest. Together with these reminiscences may be placed as of lesser but nevertheless high interest Ambassador Gerard's *My Four Years in Germany and Face to Face with Kaiserism*, Ambassador Morgenthau's *Story*, Lewis D. Einstein's *Inside Constantinople*, and Hugh Gibson's *A Journal from Our Legation in Belgium*.

Close upon the end of the conflict, the military leaders entered the literary lists, some of them to combat criticism, others merely to tell the story of their experiences. Viscount French, Sir Frederick Maurice, Julian Corbett, Admiral Jellicoe, Field Marshal Haig, Commander Belaire, Admiral Fisher, Admiral Sims, Sir Ian Hamilton, and others of their associates on land and sea published narratives that must hold permanent place as history. Supplementing these more personal chronicles and of hardly less value as source books of the future, there appeared a stream of works of which some of the most notable were Winston Churchill's *The World Crisis*; *The Economic and Social History of the War*, edited by James T. Shotwell; Charles Seymour's *A Diplomatic Background of the War and Woodrow Wilson and the World War*; Charles G. Dawes's *A Journal of the Great War*; Lord Beaverbrook's *Politicians and the War*; H. W. V. Temperley's *A History of the Peace Conference at Paris*; Ray Stannard Baker's *Woodrow Wilson and the World Settlement and Life and Letters of Woodrow Wilson*; and Robert Lansing's *The Peace Negotiations, a Personal Narrative*. Of the first importance, *The Intimate Papers of Colonel House*, edited by Charles Seymour, reveals a remarkable personality at the same time furnishing a rich quarry for future history. Valuable also for the light it sheds upon his associates of the war years is the Earl of Oxford and Asquith's *Memories and Reflections*.

Definite histories of the war it is too soon to expect, but several preliminary treatises presenting panoramic surveys of the contest have made their appearance. Such are *Nelson's History of the War*, by John Buchan; Buchan's *History of the Great War*; Conan Doyle's *History of the Great War*; and Frank Simond's *The Great War*. While giving rise to a vivid curiosity as to the period immediately antecedent to its outbreak, the War at the same time directed attention to the more distant past. Specialized fields of interest came suddenly to the fore, as when the doctrine of self-determination brought the smaller nationalities into prominence, or discussion of a league of nations threw emphasis on earlier experiments in restraint of war.

On the other hand, the entire pageant of history assumed a new significance and, subjected to painstaking research, was made to yield fresh import as its data were interpreted not as by the older historians, through the medium of personal or national prejudice, but with the detachment of scientific investigation. Ancient times, as well as modern, were tapped at their sources, with the result that the recent

years have seen a steadily growing body of authoritative history. The important series of Cambridge histories—the *Cambridge Medieval History*, the *Cambridge History of Modern Times*, the *Cambridge History of India*, the *Cambridge History of the British Empire*; the series entitled *The Legacy of Greece and Rome and Our Debt to Greece and Rome*; the *Chronicles of America*, edited by Allen Johnson; *The Second Empire*, by Philip Guedalla; *The Evolution of Parliament*, by A. F. Pollard; *The Age of the Reformation*, by Preserved Smith; *Modern Democracies*, by Viscount Bryce; *The History of British Civilization*, by Esme Wingfield Stratford; *The History of the United States since the Civil War*, by Ellis Paxson Oberholtzer; *The McKinley and Roosevelt Administrations*, by James Ford Rhodes; *The Declaration of Independence*, by Carl Becker; *The History of Modern Europe*, by G. P. Gooch; *The Beginnings of New England, Revolutionary New England, and New England in the Republic*, by James Truslow Adams; *The Supreme Court in United States History*, by Charles Warren; *The Rise of American Civilization*, by Charles A. and Mary R. Beard; *The Turn of the Century*, by Mark Sullivan; *The History of American Life*, edited by Arthur Schlesinger and Dixon Ryan Fox; and *The Origins of the War*, by Sidney B. Fay—are works representative of the range and character of historical research during the period under consideration.

That in an age of specialization, and at a period when history more uniformly than ever before had become categorical and documentary, the "outline" should spring to such wide popularity as it has attained in the recent past in H. G. Wells's *The Outline of History*, Hendrik Van Loon's *The History of Mankind*, and the books in related fields that followed their fashion, may at first glance seem an anomaly. Yet it is in truth but the logical result of the scientific development of historical study. For history has grown too complex in the light of contemporary research, and in its conjunction with economic, social, and environmental factors, to be followed in detail by any but the scholar. The outline, with its swift portrayal of the march of mankind from primitive beginnings to the highly organized society of today, provides the means to that bird's-eye view of human history which is a minimum essential to the understanding of the present; and when invested with the dramatic quality which the daring of a Wells bestowed upon it, the success of the epitome of history is easily comprehensible.

If history has flourished in the period under consideration, biography has had no less robust a growth. No longer ago than when he finished the preface to *Eminent Victorians*, Lytton Strachey could bemoan the fact that the writing of biography had fallen upon evil days in England; and not much later Philip Guedalla leveled the shafts of his wit upon the "historians' English" which was not "a style but an industrial disease," and which was at its unhappiest to his mind when it dealt with character. Both Mr. Strachey and Mr. Guedalla, however, were writing before themselves; since their emergence, pungency and Freud have lent an enormous vogue to biography. More than any field of literature except fiction it has responded to the interest in the new psychology which has been the dominant preoccupation. Biographical writing has advanced far indeed from its old conception of

a life as a mere succession of incidents to the analysis of such a book as Van Wyck Brooks's *The Ordeal of Mark Twain*. Under the handling of writers who, like Brooks, Lytton Strachey, and Gamaliel Bradford, apply though in differing fashion and degree the psychological method to career and personality, it has become an essay in interpretation rather than a chronicle. As a result, it has gained brilliance and suggestiveness and grown in favor, but it has laid itself open to the charge of eccentricity when written by the less scientific and to the danger of being considered an argument to a thesis even when practiced by the ablest of its exponents. Mr. Strachey, whose *Eminent Victorians* and *Queen Victoria* have not only brought biography but almost the Victorian age into favor, achieved equal success with *Elizabeth and Essex* now bids fair to win similar interest for a more distant period, and Francis Hackett, whose *Henry the Eighth*, is a biography in which accurate historical detail bears all the picturesqueness of romance, applies impressionism to an epoch as well as to personalities, while Mr. Bradford in *American Portraits, Damaged Souls, and Bare Souls*, uses a psychological, as Mr. Brooks does a psychoanalytical, method in his characterization. As a result, biography as it is being written today by its most brilliant popular exponents represents not detached description and appraisal but an evaluation in which the personality of the author inevitably fastens its stamp upon that of the hero.

Curiously enough, in a period which began in violent reaction against its philosophy and practice, much of the biographical writing since the War has dealt with the Victorian era. Victorian gods may be dethroned, but their shadow is still mighty in the land. From the painstaking research of Monypenny and Buckle's monumental life of Disraeli and the informed chronicle of Lady Gwendolen Cecil's *Life of Robert Marquis of Salisbury*, through the audacious egoteries of *Margot Asquith: An Autobiography* with her recollections of artists, actors, and musicians, Victorian reminiscence has run the gamut of politics and the arts. Government and diplomacy, Victorian and later, have found spirited reflection in such works as *The Private Diaries of the Rt. Hon. Sir Algernon West*, edited by Horace G. Hutchinson; the *Diaries of Wilfred Scawen Blunt*; *The Letters of Lord and Lady Wolseley*, edited by Sir George Arthur; *Lady Paget's Embassies of Other Days*; A. G. Gardiner's *The Life of Sir William Harcourt*; Lord Frederic Hamilton's *The Day before Yesterday*; Sir Harry Johnston's *The Story of My Life*; Viscount Morley's *Recollections*; Lord Asquith's *Fifty Years of British Parliament*; Viscount Grey's *Twenty-five Years*; J. A. Spender's *Life, Journalism, and Politics*, and the Earl of Birkenhead's *Law, Life, and Letters*. Literature and art are represented in biographical or autobiographical form in *Unpublished Letters of Matthew Arnold*, by Arnold Whitridge (a book written and originally published in America); the three-volume life, *Carlyle*, by Davis Alec Wilson; *Letters of Thomas Carlyle to John Stuart Mill, John Sterling, and Robert Browning*, edited by Alec Carlyle; *Thackeray and His Daughter*, edited by Hester Thackeray Ritchie; the *Life of Shelley*, by Walter Edwin Peck; *W. S. Gilbert, His Life and Letters*, by Sidney Dark and Rowland Grey; *Changes and Chances, and More Changes, More Chances*, by H. W.

Nevinson; *The Adventure of Living*, by J. St. Loe Strachey; *My Life and Some Letters*, by Mrs. Patrick Campbell; *Letters and Papers of John Addington Symonds*, edited by Horatio F. Brown; *John Ruskin's Letters to William Ward*, and *The Early Life of Thomas Hardy*, by Florence Emily Hardy.

American personal history since 1914 has in some of its most important expressions been autobiographical. Close to the opening of the period, Thayer's *Life and Letters of John Hay* wove into a rich pattern achievement and literary accomplishment, furnishing interesting commentary on contemporary political annals. Few biographies of recent years have equalled in interest, from the point of view of psychology, *The Education of Henry Adams*, a remarkable human document, in which the author depicts the play of quintessentially New England influences upon a sensitive nature. Like the *Life and Letters of John Hay* and *The Education of Henry Adams*, the volumes of letters by William and Henry James constitute permanent contributions to literature, one portraying a mind of widest philosophic scope, sturdy in its Americanism, and the other, a personality finding fulfillment possible only outside its native land, but for all its cosmopolitan overlay, essentially of its nation. Racy of the American background, though in widely variant fashion, are Hamlin Garland's *A Son of the Middle Border*, *A Daughter of the Middle Border*, and *Backtrailers of the Middle Border*, with their vivid depiction, in the earlier volumes, of pioneer life and the reflection of a literary career in the last. Theodore Dreiser's *A Book about Myself*; Theodore Roosevelt's *Letters to His Children* and *Diaries of Boyhood and Youth*; Robert Underwood Johnson's *Remembered Yesterdays*; William Dean Howells's *My Life in Letters*, edited by his daughter, Mildred Howells; Booth Tarkington's *The World Does Move*; George W. Cable: *His Life and Letters*, by Lucy Leffingwell Bikle; M. T. Werner's *Barnum*, the record of a career unthinkable outside of America, and his *Brigham Young*; Royal Cortissoz's *Life of Whitelaw Reid*; Henry Watterson's *Recollections*; Kate Douglas Wiggin's *My Garden of Memories*; the *Life of E. H. Harriman*; *The Americanization of Edward Bok*; Michael I. Pupin's *From Immigrant to Inventor*; Jim Tully's *Beggars of Life and Shanty Irish*; Robert H. Fuller's *Jubilee Jim*; Sherwood Anderson's *A Story-Teller's Story*; and Paxton Hibben's *Henry Ward Beecher*.

Since the War, American political biography has added to its credit Joseph Bucklin Bishop's *Life of Roosevelt*; the authorized biography, *Grover Cleveland*, by Robert McElroy; *Samuel Adams, Promoter of the American Revolution*, by Ralph Harlow; *Lives of Washington* by W. E. Woodward and Rupert Hughes; *Claude Bowers's Jefferson and Hamilton*; W. E. Woodward's *Meet General Grant*; Allan Nevins's *Frémont, Trail Blazer*; *The Life of Roger Brooke Taney, Chief Justice of the United States Supreme Court*, by Bernard C. Steiner; and Beveridge's exhaustive life of Chief Justice Marshall, indispensable to the student of his period. Quite as indispensable, though unfortunately left uncompleted by the death of the author, is Beveridge's *Life of Lincoln*, a work projected on a comprehensive scale and exhaustive in its research into the career of Lincoln as a legislator. Less animated in style and with nothing of the poetic sentiment that

lent so much of its appeal to Carl Sandburg's *Abraham Lincoln: The Prairie Years*, Senator Beveridge's work is a work far more scholarly and notable.

One of the fruits of the new biography, so far as America is concerned, is an enormous interest in some of the minor figures of the country's history. The annals of crime, of business, of adventure, even of love, have been combed with the result that there has been an outcropping of melodramatic chronicles. Such books as *The Saga of Billy the Kid and Tombstone*, by Walter Noble Burns, *The Making of Buffalo Bill*, by Richard J. Walsh and Milton S. Salisbury; *Calamity Jane*, by Duncan Aikman; *The Terrible Siren*, by Emanie Sachs, a biography of Victoria Woodhull, are indicative of the types of character which have been exploited. Some of these many studies are of distinct historic value.

Perhaps of all forms of literature, the essay most demands for its fertilization the quiet and contemplative mind. War and the aftermath of war in radical thought and propaganda were little conducive to armchair philosophy, and the dearth of outstanding work in the field of the essay during the years following it is easily explicable in view of the prevailing turmoil. Both in England and America, however, the essay and the essay in criticism have increasingly been coming into their own. In the United States, indeed, criticism has had a development which is one of the most striking features of contemporary American literature. Never before in this country has there been so widespread a public for critical writing or so many organs devoted partially or predominantly to its uses. The late Stuart P. Sherman, Paul Elmer More, H. L. Mencken, Henry S. Canby, Joseph Wood Krutch, Mary Colum, Carl Van Doren, Van Wyck Brooks, and a goodly fellowship of able if less noted critics have produced works of genuine distinction.

In the former country, J. B. Priestley, Virginia Woolf, Rebecca West, Edmund Gosse, who up to his death continued to practice an art that had long been notable for its learning, its grace, and its nice discrimination, Arnold Bennett, Frank Swinnerton, and Wyndham Lewis, to name but a few of many, have lent vigor and interest to critical writing. In the United States, such writers as Lewis Mumford, with his *Sticks and Stones* and *The Golden Day*, Elmer Davis with *Show Window*, Simeon Strunsky, with his journalistic and literary essays, and Lee Wilson Dodd, with the *Golden Complex*, have turned acute intelligence and active pens to the depiction of contemporary events and culture, while in numerous essays Christopher Morley has carried on the tradition of the English essay at its most graceful and mellow period. To America may be accredited two of the outstanding studies in literary interpretation of recent years—Amy Lowell's *John Keats*, an exhaustive and painstaking biography and analysis of the poet, and John Livingston Lowes's *The Road to Xanadu*, a life of Coleridge which is primarily a discussion of the genesis and operation of the poetic imagination. In a work of distinguished merit Lewis Mumford presents the most searching and illuminating study of Herman Melville yet to have made its appearance.

Since 1914, especially during and immediately following the War, except for the development of fiction, the period has been most striking for the renaissance of interest in poetry; and in poetry, as in fiction, it has been the American

contribution which has been of peculiar interest. When the War broke in 1914, it found America riding on the crest of a wave of poetical experimentation which derived primarily from France, but which struck its roots deep into American soil, and drew from it sinews and strength. Free verse, as the new poetry was termed, and as it was expounded by Amy Lowell and practiced by Edgar Lee Masters, Carl Sandburg, Vachel Lindsay, and other of its serious exponents, is "a verse form based on cadence." It eliminates the recurrent rhythm of the line, and regards the group of lines as the unit of verse. It claims thereby to attain a flexibility and compass impossible to poetry in traditional meters. "Free verse," said Miss Lowell, "within its own law of cadence has no absolute rules; it would not be 'free' if it had." Nor has it regard for the restrictions imposed in the past on the content of poetry. It holds to a belief in "exteriority" or "objectivity," rejecting the traditional abstractions of poetry for the concrete and the scientifically accurate. And it strives to convey its meaning through a clear-cut imagery which, in the hands of an essential classicist like H. D. or an artist with the craftsmanship of Miss Lowell, produces poetry of genuine beauty and, in those of a Carl Sandburg or an Edgar Lee Masters, verse of rugged power; but free verse has not been consistently at ease in the house of its friends; it has been torn and tortured by the wilder experimenters like Kreymer and Pound, and it has been the excuse for the entrance into the lists of poetry of numbers of persons whose only qualification for its writing is the ability to shuffle off conventional forms. Nevertheless, it has been a vigorously fruitifying force in American literature, and though it is safe to say that a reaction has set in against it, there is no doubt that it has to its credit not only new valuable metrical achievements but the sudden outcropping of magazines of verse and poetical criticism that have both reflected and stimulated the growth of interest in poetry.

That the Imagist precision of diction and sharpness of impression are capable of attainment without sacrifice of traditional metrical forms, the work of Edwin Arlington Robinson, by many critics adjudged the greatest contemporary American poet, and of Robert Frost abundantly prove. Robinson's ironical and analytical intelligence, playing upon rustic characters and scenes, has produced poetry of highly realistic power in his portrayal of New England life. His method, however, which is indirect, and the frequently difficult texture of his thought, have prevented his works from capturing the popular fancy as did the grim realism of Edgar Lee Masters's epitaphs in the *Spoon River Anthology*. Robert Frost, on the other hand, who wraps the commonplaces of New England life in a kindly irony, has won popular favor as well as critical approval with *North of Boston*, *Mountain Interval*, and *West-Running Brook*. Amy Lowell herself, *vers librist*, imagist, and originator of what she termed polyphonic prose, showed herself competent to produce as admirable effects in conventional meters as in the new. Hers was a versatile talent, at its prime when cut off by death. Most of the American poets of standing, Conrad Aiken, Witter Bynner, William Rose Benét, Stephen Vincent Benét, Louis Untermeyer, to mention but a few, have written at times in free verse, though perhaps their best expression is found in the old forms. An interest-

ing experimenter of a different sort has been Vachel Lindsay, who first in the *Congo and Other Poems* and later in other interesting narrative poems, attempted to approximate his lyrics to a chant, employing various typographical devices to develop his effects.

Perhaps the most significant single contribution to American poetry of recent years has been Stephen Vincent Benét's *John Brown's Body*, a long narrative poem of the Civil War. In intrinsic interest of subject matter, in variety and flexibility of metrical forms, in high quality of imagination and the glow and range of its emotion, it takes rank as poetical work of unusual calibre. Here is a poem racy of the land from which it sprang, surprising in its virtuosity, stirring in its content. Together with another outstanding narrative poem of 1928, Edwin Arlington Robinson's *Tristram*, it makes that year a notable one in American poetry.

Some of the most distinguished poetical work since 1919 in America has been done by two women, Elinor Wylie, whose *Nets to Catch the Wind* and *Black Armour* preceded a succession of novels as striking in execution as her verse, and Edna St. Vincent Millay, whose *Second April*, *Renaissance*, *Harp Weaver*, and *Figs from Thistles* were followed by the lyrics for an opera composed by Deems Taylor. Miss Millay's strength lies in the abundant lyric beauty of her lines, in a sort of naïveté combined with passion, and in a technical proficiency that cloaks the cleverness of its performance in the ease of its accomplishment. Mrs. Wylie's work, cut short by death on what seemed to be the threshold of its highest achievement, had a remarkable precision and chastity of outline, perfection of form and brilliance of execution, an emotion that, as one of her critics said, "burns with cold fire," and more depth of thought than Miss Millay displays. If in the last volume of poems issued before her death, *Trivial Breath*, there appeared to be a tendency toward more abstruseness than in her earlier books, the posthumous *Angels and Earthly Creatures* revealed hers as a talent of the first order.

No survey of recent American poetry would be complete that failed to take notice of Robinson Jeffers, whose *Roan Stallion* and *Cawdor* are regarded by some as works of genius and by others as beyond the bounds of legitimate poetry; nor should it omit mention of William Ellery Leonard's *Two Lives*, a sonnet sequence of indisputable poetical merit, conceived in agony of spirit and born in bitterness, or of the remarkable work of the child poet, Nathalia Crane, or the genuine gift of George Dillon, whose *Boy Against the Wind* marks him out as the most promising talent at the moment rising above the horizon.

The English poets have in the main been less influenced by the new verse forms than their American fellows, and have correspondingly less sought their subjects in the commonplaces of life. Imagism under the influence of the transplanted Americans, H. D., Ezra Pound, and T. S. Eliot, has been productive of interesting results and, in the case of H. D., of its most perfect expression; but in England, as in America, a reaction against it is under way.

English poetry more than American has sought its interest in narrative themes, having achieved in the work of John Masefield probably the most significant poetic output of the Anglo-Saxon world during the decade. The sea and

the English countryside have engaged Masefield's efforts, and an intense concern for man at his coarsest and most humble has lent an imaginative and moving quality to verse of often noble diction. Had he survived, Rupert Brooke, whose war sonnets gave evidence of growing beauty and power, might have written his name large in the annals of English poetry. The War, indeed, developed a notable output of verse, the most able of its exponents being James Elroy Flecker, "the last of the Parnassians," Robert Graves, Robert Nichols, Wilfred Owen, Siegfried Sassoon, Edmund Blunden, Isaac Rosenberg, and Richard Aldington.

In striking contrast to the bitter mood of the war period is the pastoral character of the work that men like Graves and Blunden have been doing. The lyric tradition of British poetry has further been carried on by Wilfred Wilson Gibson, John Drinkwater, Ralph Hodgson, and Walter de la Mare. Some of the most considerable contemporary poetical work has come from Humbert Wolfe, whose poems have excited an interest in England rarely equalled since Tennyson's day. Hardy, until his death, and Bridges and Kipling have continued to write and A. E. Housman in *Last Poems*, published 28 years after his previous volume of verse, *A Shropshire Lad*, has added a permanent contribution to the poetical literature of England. At the other extreme from these poets stand the Sitwells, the representatives of the most revolutionary poetical doctrine.

Interesting as has been the course of poetry during recent years, the developments in fiction and, more recently perhaps, in biography, have held the centre of the stage. Again in fiction, as in poetry, it is in America that the most striking evolution has taken place. The War found the English realists in command of the field and the post-war period has seen the continuance of their sway. Sex and, more latterly, psychology have supplanted the interest in social problems and injustices which were so dominantly the preoccupation of the closing period of the Victorian era and the opening years of the twentieth century; yet such writers as H. G. Wells and John Galsworthy still continue the sociological tradition. Wells, with his exuberant fancy, his perennial zeal for reform, his distinguished didacticism, and his daring in applying scientific doctrine to romance, has produced a series of novels which, like the plays of the no less ardent moralist, Bernard Shaw, are the vehicle for the promulgation of the author's social and spiritual gospel. *Mr. Britling Sees It Through*, the most successful war novel of the Anglo-Saxon world, no less than *Joan and Peter*, *The Secret Places of the Heart*, *William Clissold*, *Meanwhile*, or *Mr. Bletsworthy on Rampole Island*, revealed Mr. Wells himself. Mr. Galsworthy's preoccupation has remained predominantly social, even where, as in his war novel, *Saint's Progress*, he has become immersed in an emotional situation. In his *Forsyte Saga*, an analysis of the possessive instinct as exemplified in an English family, both his art and his social outlook have found expression in a series of novels that take rank with Arnold Bennett's studies of the English countryside as among the most notable contributions to Anglo-Saxon fiction of the century. From *Old Wives Tales* to *Riceyman's Steps*, despite several insignificant novels, Bennett's realism has translated the commonplace from dullness to dignity by lifting it to

the plane of the universal and thereby investing it with poignance lacking to such work, for instance, as the quiet annals of Archibald Marshall.

If social relationships have continued primarily to interest certain of the English novelists, it is the pastures of the soul that have captured the interest of more of them. J. D. Beresford, May Sinclair, Compton Mackenzie, Rebecca West, Frank Swinnerton, Dorothy Richardson, Sheila Kaye-Smith, H. G. Wells, and Aldous Huxley all have set themselves to its exploration with the result that the psychological novel, now frequently the psychoanalytical novel, has become the most conspicuous type in English fiction today. In such novels as May Sinclair's *Mr. Waddington of Wyck*, Rebecca West's *The Return of the Soldier*, Sheila Kaye-Smith's *Joanna Godden*, or H. G. Wells's *Secret Places of the Heart*, it differentiates itself sharply from the specifically sex novel as written by George Moore and in its extreme form exemplified by D. H. Lawrence, while in the work of an author such as Aldous Huxley, it becomes naturalism. Indeed, in such a work as his most recent novel, *Point Counter Point*, it becomes a philosophy of despair.

A remarkable example of the psychological novel is to be found in James Joyce's *Ulysses*, the hundreds of pages of which chronicle the stream of consciousness as it passes through one man's mind over a period of 24 hours. Various considered a work of genius and a dull abnormality, it is at least important in its influence on the development of expressionism. So, too, both puzzling and impressive is Wyndham Lewis's *Childermass* a cross between a novel, a satire, and a philosophical treatise.

The largest figure of contemporary English fiction was undoubtedly Joseph Conrad, whose novels of the sea and adventure draw their deepest interest not from their incident but from their splendid projection of the conflict of human emotions under the play of forces extraneous to themselves as well as inherent. It is a noble psychology which Conrad has outlined, moving, pregnant, and touched by a profound compassion, presented in rich and virile manner, and transfused by a high imagination. Work that stands out by reason of its singular subtlety is that of *The Garden Party* and *The Dove's Nest*, by Katherine Mansfield, whose delicate art was ripening into fuller achievement at the moment of her untimely death. In their ability to suggest the shifting play of mood and feeling, and their clear-sighted understanding of human reactions, her short stories gave promise of a genuinely high talent.

Despite the predominance of the interest in psychology, the purely romantic and the fantastic still hold their own in English fiction. In the case of Walter de la Mare, a gifted and richly endowed poetic fancy in combination with broad human sympathy have produced in *The Memoirs of a Midget* a work which, easily capable of grotesquerie, is in actuality a tender and convincing characterization. So, too, in David Garnett's *Lady into Fox* and *A Man in the Zoo*, the improbable and the fantastic are welded into harmony with a conceivable reality through a singularly unified conception and execution. Sylvia Townsend Warner in her *Lolly Willows* and Mr. Fortune's *Maggot* has used the fantastic as a vehicle for searching criticism; while Edith Olivier in the *Love Child* demonstrates the charm

of her delicate medium when adroitly used. In a *tour de force* of quite remarkable character, *Orlando*, Virginia Woolf uses the fantastic as a means of portraying the entrance into English literature of the feminine influence.

In Anne Douglas Sedgwick's *The Little French Girl*, Elizabeth's *Vera* and *Expiation*, Virginia Woolf's *Jacob's Room* and *Mrs. Dalloway*, Rose Macaulay's *Potterism* and *Dangerous Ages*, E. M. Delafeld's *The Way Things Are*, and G. B. Stern's *Matriarch*, it handled the stuff of contemporary life with a discernment that eschewed all sentimentality and that projected the social scene through the medium of a delicate satire. Like a breath of fresh air through the field of fiction came Margaret Kennedy's *The Constant Nymph*, one of the few novels really to strike an original note in literature, remarkable for the vigor and vivacity of its character drawing, the freshness of its situations, and the animation of its narrative. Miss Kennedy's *Red Sky at Morning* followed the earlier book and while not as striking a performance, nevertheless proved hers an art worth the watching. Like *The Constant Nymph*, the romances of Michael Arlen, *Those Charming People*, *The Green Hat*, and *Lily Christine*, stories and novels which depicted a society more or less prurient, created considerable of a sensation, as did also the *Dusty Answer* of Rosamund Lehmann. In *The Good Companions*, J. B. Priestley by returning to the ample scene and varied characters in which Dickens might have delighted produced a novel at once robust and interesting.

The War etched its mark deep into English fiction despite the fact that during its progress the novel, to a great extent, eschewed description of its horrors. The impress of battle was nevertheless upon it in the background and mood, if not in the incidents, of its narrative. Once the conflict was over, the inhibition to discussion of its various aspects was removed, and a succession of novels began to appear in which the agony of spirit that had so lately held the world in sway was translated into terms of romance. The more important part of this fiction grist was animated by an intense hatred of war and a resolute determination to strip it of what glamor might yet remain. In such trilogies as Ford Madox Ford's *No More Parades* and R. J. Mottram's *Spanish Farm*, realistic interpretation spoke with impressive accent, while in a work such as S. E. Montague's *Right off the Map*, the last to come from the pen of its author before his death, a profound and moving conviction and an eloquent pen combined through the medium of imaginative romance to point the manner in which nations are plunged into war and public opinion manipulated for its support.

Noteworthy as a large part of contemporary British fiction has been, and distinguished as is its craftsmanship, on the whole, the English novel has been flat in comparison with the American; for in America, forces that were stirring before the War, and that were brought to full growth in the heat of battle, resulted in the years immediately succeeding the struggle in a literature of revolt remarkable alike for its vigor and its vehemence. A generation after the influence of Zolaism had passed in France and England, the novel in America arrived at naturalism. It no longer acquiescently accepted the world, and especially its particular corner of it, at its own valuation, but it took to investigating it for itself scientifically; and great was its disillusion-

ment. What formerly it deemed fair it now discovered to be at bottom ugly and binding. The ease of American life it read as stultification, its uniformity as desperate monotony, and its complaisance as promise of disaster. It set itself to the high task of saving America from itself by joining battle with the dullness, the restrictions, the narrowness, of its life. Especially against the village did it turn the power of it attacks, and in its efforts to come to grips with realities, it introduced into American literature an acerbity completely foreign to its past. Sinclair Lewis's *Main Street*, *Babbitt*, and *Elmer Gantry*, Sherwood Anderson's *Winesburg, Ohio*, and *Poor White*, Zona Gale's *Miss Lulu Bett*, and Floyd Dell's *Moon-Calf* burned with a passion of indignation. They were tracts as much as novels—tracts against monotony, against convention, against rigid social codes. Their propagandism was their limitation as well as their strength.

Embittered by the same sudden awareness of the ugliness of life were the works of the writers of the more extreme expressionist school, Evelyn Brown, Carl Van Vechten, Waldo Frank, Ben Hecht, and a group of lesser novelists whose concentration on the abnormalities of life converts their fiction into pathology. No less a challenge to existing conditions was the attitude of the "younger generation" to whom Scott Fitzgerald's *This Side of Paradise* set a model for depicting the breakdown of decorum and convention, and Dos Passos's *Three Soldiers* established a norm for frank speaking.

Side by side with the naturalistic movement has continued a milder realistic stream, as evidenced in the work of Booth Tarkington, Edith Wharton, whose *Age of Innocence* with its acid delineation of a New York that had not yet acquired self-consciousness confirmed her position in the forefront of American novelists, Joseph Hergesheimer, Willa Cather, Edna Ferber, and Ellen Glasgow, whose delineation of American life displayed its nature without the social criticism implicit in the work of Sinclair Lewis, Dorothy Canfield, Fannie Hurst, Robert Herrick, Charles G. Norris, and Louis Bromfield, who have proved the virility and closeness to life of fiction in America. Playing on another plane is the unique talent of James Branch Cabell, whose theory that art should be based on a dream of life as it should be and not as it is, and that it must therefore tend "to become more or less of an allegory," has resulted in a richly tapestried series of romances of the Middle Ages and of present-day Virginia. Christopher Morley's realism and fancy produced *Where the Blue Begins* and *Thunder on the Left*, novels of distinction that veil a barbed criticism of life under a gay good humor. In Robert Nathan's *Jonah* and *The Bishop's Wife*, a mordant wit plays through succinct and tender sentiment. A very genuine gift for fiction showed itself in Elinor Wylie's *Jenifer Lorn*, a "sedate extravaganza" that sustained the manner and style of the eighteenth century with amazing success throughout its fantastic course and in her later novels, *The Venetian Glass Nephew*, *The Orphan Angel*, and *Mr. Hodge and Mr. Hazard*. An iridescent and highly charged style, an amazing erudition, and a fertile fancy gave distinction to Mrs. Wylie's work.

The South within the past decade has sprung to prominence in American literature, some of the most notable work of recent years having gone to the portrayal of its poor white folk

and its Negroes. Elizabeth Madox Roberts's *Time of Man*, Maristan Chapman's *Happy Mountain*, and T. S. Stribling's *Teefallow* have painted realistic yet sympathetic pictures of the mountain folk of Kentucky and Tennessee, while Du Bose Heywood's *Porgy* and Julia Peterkin's *Black April* and *Scarlet Sister Mary* are but outstanding examples of novels projecting the Southern Negro against the background of his native scene. The Negro, indeed, has come to the forefront of literature both as writer and subject, the march of interest sweeping on from the plantation Negro to the resident of Harlem, and holding a new focus of interest in American letters.

Despite the seriousness which has become the most marked characteristic of American fiction, and despite its absorption in the commonplace, the story of mystery, of adventure, the society novel, and the love story pure and simple continue to flourish. In both England and America, there has been an amazing output of mystery and detective tales, and in both countries the most wretched sensationalism attains commercial success.

Briefly to summarize Anglo-Saxon fiction, while it has produced no masterpiece, it has shown a sturdy development and a constantly closer approximation to the problems and interests of everyday life. In America, the trend to naturalism, and, on both sides of the Atlantic, the application of the findings of science and especially of the new psychology to the interpretation of life have been the outstanding developments of the period. While the British novelists have displayed a surer and more accomplished craftsmanship, the Americans have shown more ruggedness and intensity and a more bitter attack upon the strongholds of custom.

In drama, the notable fact has been the passing of the closet play, and the concern with the interests and problems of the day. Bernard Shaw has remained the outstanding satirist and moralist of his time, while Galsworthy has continued to use the stage as a means for protest against social abuses and injustices. Barrie, Lord Dunsany, and Lady Gregory have produced work of delightful whimsy and fancy, while Drinkwater with his *Abraham Lincoln*, Clemence Dane with her *Will Shakespeare*, and Bernard Shaw with *Saint Joan* have brought the historical play into favor. Shaw's amazing *tour de force*, *Back to Methuselah*, should have special mention. In the opinion of many critics, the most considerable dramatic work of the decade in America has been that of Eugene O'Neill whose work, *Strange Interlude*, has furnished the American stage with a powerful and morbid psychological study. For discussion of the drama in detail, see the article, THEATRE.

It is interesting to note that economic and social science has much advanced in public interest under the handling of such writers as Graham Wallas, R. H. Tawney, John Maynard Keynes, and other writers whose scientific accuracy is in no way impaired by their ability to write for the lay reader. Their work, however, falls without the scope of an article on literature.

In concluding a survey of the period begun by the War, attention must be drawn to the increase of interest in foreign literature which followed in the wake of the conflict. International-mindedness indeed is one of the most strongly marked trends of the time. The fiction

of Spain, Scandinavia, Holland, and Russia, as well as that of France and, lately, of Germany, has been translated and widely read. The criticism and art discussion of foreign lands has had broad currency, and the war memoirs and older biographies of the European nations have taken place beside similar chronicles in the English tongue. America, at least, has broadened its horizons in these years as never before in a century and in that fact, as well as in its sudden waking to self-realization, lies rich augury of future achievement.

No survey of contemporary literature in England and America would be encompassing if it omitted mention of the completion of the *Oxford English Dictionary* in the former country and of the issuance of the first volume of the *Dictionary of American Biography* in the latter. These works, while not in themselves literature in the usual interpretation of the term, are of such inestimable value to it as to demand recognition in any consideration of Anglo-Saxon letters.

No record of literary developments in America would be inclusive which failed to take account of the rise of the book clubs, such as the Book-of-the-Month Club, the Literary Guild, and the Book League of America. These organizations, purely commercial in origin, through enlisting the support of the leading critics of the country on their selecting committees, and through the influence exerted by their sending the chosen books to tens of thousands of subscribers, are exerting a constantly growing influence upon the taste of the public. Through a disagreement arising over the choice of a book by one of the clubs for June, 1929, one firm of publishers withdrew their coöperation from all book clubs and made public criticisms which resulted in a libel suit. Other publishers have followed this lead and have declined to submit manuscripts to the clubs in future, claiming that the clubs make profits only for themselves and cause losses to publishers and booksellers.

**LITERATURE, PRIMITIVE.** See ETHNOLOGY.

**LITHUANIA, Lith'á-ni-á.** One of the new Succession States, created out of the former Russian Empire after the World War. The claims of the Lithuanian government included: the whole of the former Russian province of Kovno; the Province of Vilna, minus the districts of Disna and Vileika; a part of the Province of Grodno north of the Niemen River; the Province of Suvalki; part of the Province of Courland; the Memel district. According to 1914 figures, this territory had an area of 151,491 square kilometres (59,633 square miles) and 4,800,000 inhabitants. The eastern frontier was defined in the Russo-Lithuanian Treaty of July 12, 1920; the fixing of the northern frontier was provided for in a convention with Latvia on Sept. 28, 1920, by which the line was to be laid down by an English arbiter. To the south, however, no agreement was reached by 1929 (see below). Both Poland and Lithuania laid claim to part of the Province of Suvalki, the Province of Vilna, and Grodno Province. The actual area under the control of the Lithuanian government is only 31,652 square miles, and the population (1928 estimate) 286,368, of which about 86.7 per cent was rural. Ethnographical Lithuania, i.e., the territory included in the claims of the Government, is comprised of 73.5 per cent Lithuanians, 12 per cent Jews, 4.3 per cent Poles, 2.5 per cent White Russians, 1.5 per cent each Germans and Russians. Vilna, the capital, claimed by Lithuania,

had in 1914, a population of 214,600; other large towns are Kovno, the temporary seat of government (95,771), Grodno (61,600), Memel (38,454), Suvalki (31,600), Shavli (21,878). These towns are in both political and ethnographical Lithuania.

**Religion and Education.** In the most important provinces, Vilna, Kovno, and Suvalki, Roman Catholics form 85 per cent of the population; Jews, 7.7 per cent; Greek Orthodox, 2.7 per cent; Protestants, 4 per cent. In the Memel Territory, Protestants form 90 per cent and Roman Catholics, 5 per cent, of the population. In 1928 there were 2401 primary schools with 124,578 pupils and 159 secondary schools with 23,112 pupils. The University of Kovno was opened in 1922 and in 1928 had 258 professors and teachers and 3580 students.

**Industry and Trade.** The population is preponderantly rural in character. Of the total area, it is computed that 49 per cent is arable land, 26 per cent meadow and pasture land, 17 per cent forest, and the rest unproductive and waste. In 1927, 1,240,000 acres were under rye and 297,000 acres, under wheat. Principal crops in 1928 yielded, in metric tons: rye, 483,500; wheat, 198,000; barley, 160,300; oats, 401,900; potatoes, 1,220,000; peas, 64,400; flax fibre, 35,000; flaxseed, 34,960. In 1928 there were 611,400 horses, 1,199,300 cattle, 1,467,800 sheep, and 1,060,400 pigs. Poultry farming and bee keeping also are important. Forests cover 1,956,000 acres. By the treaty with Russia, Lithuania received 247,000 hectares of forests as compensation for damages. The leading internal question was the distribution of the large landed estates and by 1922 it was evident that expropriation was to be the plan adopted, without compensation. The agrarian law of February, 1922, provided for the expropriation of all holdings in excess of 80 hectares. The want of capital and the unsettled conditions of Central Europe made the reversion to an exclusive agricultural economy the only means for the maintenance of an ordered national life. The Government applied itself to this purpose, adopting the following measures: the teaching of the principles of scientific agriculture, the replenishment of the herds, the increasing of the arable area, in order to make possible greater export of agricultural products. These plans met with success, for by 1920-21, 10 per cent of the barley, rye, and wheat, half of the flax, and a good deal of the poultry were exported.

Immediately after the War, there was no revival of industry, the destruction caused by belligerent armies and the lack of raw materials, together with the dismantling of the larger plants, being insuperable obstacles in the way of a resumption of activities. What commercial intercourse there was partook of the nature of an exchange of agricultural products for finished manufactured articles. The trade for 1922, 1924, and 1928 was:

	1922	1924	1928
Exports	\$7,690,000	\$26,658,360	\$25,688,130
Imports	7,490,000	20,653,380	29,109,140

Chief exports are corn, cattle, hams, dairy products, flax, linseed, timber, hides, and wool. Chief imports are manufactured articles, agricultural machinery, fertilizers. In 1927, 53 per cent of the imports came from Germany; England supplied 7 per cent; the United States, 2

per cent. Principal countries of destination of exports were Germany, 51 per cent; England, 25 per cent; Latvia, 9 per cent.

**Communications.** There are about 25,461 miles of road in the country. There were 958 miles of railway in 1927. The most important lines are the Wirballen-Kovno-Koszedari line; the Janov-Shavli; and the Koszedari-Jewie. Also 364 miles of waterway are navigable for steamboats, and 1242 miles for smaller craft. The most important, the Niemen River, was internationalized by the Treaty of Versailles. See MEMEL.

**Finance.** In 1921 the revenues were 672,582,658 Lithuanian marks and the expenditures 885,725,375 marks. For 1922 the budget estimates balanced at 4,312,280,089 marks (roughly, \$7,000,000). In 1927 the actual receipts were \$26,936,000 and the actual expenditures, \$23,090,000. Estimated receipts and expenditures for 1928 balanced at \$26,322,000 and those for 1929 balanced at \$25,996,620. Up to 1923, the depressions of the German mark seriously affected the Lithuanian currency because much of the discounting business was done in Germany. On Oct. 1, 1922, a new currency law provided for the creation of a national currency based on the gold standard, with the *lit* (equal to one-tenth of the American gold dollar) as unit. Paper currency in circulation on Dec. 31, 1927, totaled 96,608,000 litas backed by gold reserve of 84,764,000 litas. The Lithuanian debt, on Dec. 31, 1927, was \$8,897,200, of which \$6,207,132 was due the United States government, \$1,846,350 to Lithuanians in the United States, and the rest was mainly internal.

**Government.** After working for two years, a constituent assembly finally promulgated a constitution on Aug. 1, 1922. This provided for the nationally elected Parliament, chosen every three years on the basis of universal suffrage and the proportional system, to make the laws, ratify treaties, approve the budget, and choose the state President. The ministry was to be selected by the President but was to be held responsible to the Diet. Cultural autonomy was provided for national minorities, viz., Jews, White Russians, and Poles, and religion and education were to be unhampered. The economic clauses provided for state regulation of lands and estates; state insurance for the aged, infirm, and unemployed; freedom of organization, and the right to strike.

**History.** In 1915 Russia's grip over Lithuania was loosened and replaced by German control. For the next three years, a German Army held the land, and impoverished it by exploiting its resources and scrapping its factories. Nevertheless, a Lithuanian National Council, the Taryba, was set up in 1917, and Lithuanian independence, as proclaimed on Feb. 16, 1918, was finally recognized by Germany on Mar. 23, 1918. German administration, however, continued for sometime longer, and Prince von Urach of Württemberg was nominated as the future King. While the outcome of the World War put an end to these intrigues, Bolshevik forces soon succeeded the German, and fighting was sporadic throughout the whole of 1919. Meanwhile, in January, 1919, a conference of Lithuanian patriots reestablished the Taryba which proceeded to organize a cabinet, and then, on April 4, made Antonas Smetona President of a provisional government. This government, however, was driven from Vilna, its capital, to Kovno, which in turn

was soon threatened by Bolshevik invaders. At the same time, the Bermond branch of Von der Goltz's army had to be beaten off, while Polish troops were continually being engaged in 1919-20.

By the spring of 1920, the situation had improved to such an extent that a constituent assembly could be convened, to reiterate the declaration of independence, begin work on a constitution, and open negotiations with Russia. The first ray of hope for the young nation appeared in July, 1920, when Russia came to terms with its succession state on a remarkably liberal basis. Lithuania was freed of its share of the Russian state debt; was compensated with 3,000,000 gold rubles; received 100,000 hectares of forest land; and had its ethnographic frontiers recognized, including the right to Vilna and Grodno.

A Constituent Assembly met on May 15, 1920, and on Aug. 1, 1922, it adopted a constitution which, as amended on May 26, 1928, provided for responsible government, with a Parliament or *Seimas* elected for five years on a universal suffrage basis, and a President elected for seven years. On Dec. 17, 1920, however, the Socialist government of President Grinius and Premier Slezevicius was overthrown by a military Nationalist *coup d'état*, and Parliament, in an emergency session, reflected former President Smetona for a three-year term. Prof. Augustinas Valdemaras became Premier.

Although Lithuania's northern boundary was fixed by agreement with Latvia in 1921, it took much longer to come to terms with Germany over the disposition of the Memel district, comprising about 650 square miles. By the Treaty of Versailles, the district north of the Memel River, including the port of Memel, was turned over to an Allied commission presumably in trust for Lithuania. In 1922 a movement for a free state, encouraged by Poland, was under way with the result that the French in charge refused to cede the district to Lithuania. Not until the Memel Convention of May 8, 1924, did the former Allies definitely settle the question by creating an autonomous Memel under Lithuanian sovereignty.

Even more difficult of settlement was a dispute with Poland over the Vilna territory. Vilna was occupied by a free-lance Polish Army in October, 1920, with the result that recourse had to be taken to the League of Nations. Though the Polish government disavowed the raid, the insurgent army could not be dislodged and it was necessary late in 1920 to dispatch an international force into Lithuania to end the conflict. Nothing was accomplished and it was not until November, 1921, that the rebel leader, Zeligowski, voluntarily withdrew. Throughout the years 1921-23, all attempts to adjudicate the Vilna controversy were fruitless. The plebiscite plan first broached by the League of Nations had to be abandoned in 1921 in favor of direct negotiations between Lithuania and Poland but, these proving unsuccessful, was adopted again. Finally on Jan. 8, 1922, an election was held in the Vilna district and Parliament thus chosen decided on February 20, by a vote of 96 to 6, for union with Poland. Lithuania refused to accept the result on the ground of irregularities and in this was upheld by the League of Nations Council; but on July 18, Vilna was incorporated into the Polish nation, and the League of Nations, accepting the *fait accompli*, appointed a commission to fix the boundary line. On Mar. 16, 1923, the Council of Ambassadors, in laying out the eastern and northern Polish boundaries included

the Vilna district, despite the still strenuous objections of the Lithuanian government. See LEAGUE OF NATIONS.

A technical state of war, with the frontiers closed, continued between the two countries for four more years, coming to a head on Oct. 4 and 5, 1927, when the Polish authorities, to avenge the alleged mistreatment of Poles in Lithuania, arrested 20 Lithuanians and closed 43 Lithuanian schools in Vilna. On October 19, Lithuania appealed to the League, claiming that Poland was acting in violation of the minority treaty that she had signed in 1920. At the December meeting of the League Council, both Valdemaras and Pilsudski were present. The Council unanimously adopted a resolution on December 10, ending the state of "peaceful war" which had endured for seven full years; but the Council said nothing about recognizing Poland's claims to Vilna, and so conditions remained unsettled. Indeed, Lithuania's amended constitution of 1928 referred to Vilna as the capital of the Republic, thus increasing the ill will in Poland.

The two countries next attempted to reach an agreement at Königsberg in the spring and summer of 1928, but Lithuania rejected a Polish nonaggression treaty, and in November, Poland rejected a Lithuanian proposal to put Vilna under an international administration. Finally, at the meeting of the League Assembly at Lugano in the fall of 1928, both parties agreed that the Vilna question should cease to be a political issue between them, though it remained as a "moral" issue.

In the winter of 1928-29, plots were discovered for the overthrow of Valdemaras because of his alleged subservience to Russia and Poland and because of a recently signed trade treaty with Germany. On May 6, 1929, an attempt was made to assassinate the Premier, with the result that martial law was established. In July, 1929, Lithuania, in a second note to the League of Nations, charged Poland with fomenting trouble in Lithuania. In September, Valdemaras was forced to resign and prospects for an agreement with Poland on Vilna appeared even more remote. Lithuania was admitted into the League of Nations on Sept. 21, 1921. She signed commercial treaties with Great Britain in May, 1922, and with Germany in June, 1923, and in 1928. On Sept. 28, 1926, a nonaggression pact was signed with Russia, and on Sept. 18, 1927, a treaty of friendship and conciliation was signed with Italy. Lithuania also adhered to the Kellogg Pact. See VILNA DISTRICT.

**LITTLE, ARTHUR W.** (1873- ). An American printer and publisher, born in New York City. He was educated in private schools and in 1891 joined the company of his father, J. J. Little & Co., printers. He served in the State Guard in New York from 1891 to 1912. In the World War, he served in France with the 369th United States Infantry, colored, as regimental adjutant and major, and took part in all actions with Gouraud's 4th Army. He was wounded in action Sept. 12, 1918. He was made a Chevalier of the Legion of Honor and received the Croix de Guerre with two palms and two stars.

**LITTLE ENTENTE.** The series of agreements and treaties entered into by Czechoslovakia, Yugoslavia, Rumania, and on occasions Poland, for the protection of their mutual interests, was commonly called the Little Entente. It was ostensibly an alliance for de-

fensive purposes in case of an unprovoked attack from Hungary, but in reality it embodied an all-embracing policy aiming at the maintenance of the *status quo* on the European continent resulting from the Peace Treaties of Versailles, St. Germain, and the Trianon. In her desire for security, France became at the Peace Conference the sponsor of the most extreme claims of the Czechs, the Poles, the Serbs, and the Rumanians, in order to make the new states formed by these peoples as strong as possible and to create out of them a bloc as France's ally against Germany. Hence, the new states were given contiguous frontiers and direct railroad communications and practically no regard was shown for the wishes and the economic necessities of the inhabitants of the border districts. The Succession States, on the other hand, when they found themselves so generously endowed, were quite ready to fall in line. The result of the settlement was a patchwork of new states saddled with alien minorities counting many millions and faced with political unrest and economic chaos. This being the situation, security for France and the Succession States lay only in the closest coöperation toward a continuation and consolidation of the existing status by military effort.

The most essential prerequisite for the success of this policy was the conclusion of a definite alliance between the Succession States based on community of interests and the coöperation of this compact group with the French policy. On Aug. 13, 1920, a convention was signed between Czechoslovakia and Yugoslavia which provided for mutual help in case of unprovoked attack. When the efficacy of this alliance for the maintenance of the *status quo* had been sufficiently demonstrated on the occasion of the prevention of the restoration of Emperor Charles to the throne of Hungary, Rumania joined on Apr. 23, 1921. The immediate concern of this tripartite defensive alliance, or Little Entente, was the consolidation of its position, which was successfully carried out during the following years. Its intervention frustrated, in September, 1921, a second Hapsburg Putsch in Hungary, and it coöperated with France in blocking the union of Austria with Germany. By means of a coercive policy, Austria and Hungary were subsequently compelled to submit in every respect to the wishes of the Little Entente and to seek a closer accord with it.

The Italians were not without justification in sensing in the formation of the Little Entente a veiled threat against their interests in central Europe and the Adriatic. Although some of the difficulties between the Little Entente and Italy were subsequently ironed out by the Treaty of Rapallo between Italy and Yugoslavia and by the Fiume settlement on Jan. 27, 1924, it remained an open question how far these and other pacts had actually removed the deep-rooted friction between the Little Entente and Italy. Absolute accord seemed impossible so long as the Little Entente remained the guardian of French interests. Poland never joined the Little Entente officially. She did, however, on all important matters coöperate with the latter to an extent which made her an unofficial fourth member of the alliance. Czechoslovakia, in particular, was active in maintaining and strengthening the Little Entente in order to stabilize conditions in the Danube area and a number of conferences were held in 1927 at

Jochymov and Geneva. The solidarity of the Little Entente was even more manifest in 1928 when a Little Entente Inter-Parliamentary Association was established. See CZECHOSLOVAKIA; FRANCE; ITALY; JUGOSLAVIA; POLAND; and RUMANIA.

**LITTLETON, MARTIN WILLIE** (1872- ). An American lawyer, born in Tennessee. He was self-educated and after studying law was admitted to the bar in 1891. For several years, he practiced in Dallas, Tex., and then removed to New York, where he at once took a prominent place in legal circles. Becoming active in politics, he was assistant district attorney of Kings County from 1900 to 1904, and president of Brooklyn Borough in 1904-05. He served as delegate from New York to the Democratic National Convention in 1904 and presented the name of Alton B. Parker for President. From 1911 to 1913, he was a member of Congress for New York.

**LITTMANN, Lit'man, MAX** (1862- ). A German architect who was born in Chemnitz and studied there and in Dresden. He traveled in Italy and after 1888 was a resident of Munich. He was the designer of the new Schack Gallery, the Hofbrauhaus, the new Psychiatric Clinic, and the Prince Regent Theatre at Munich, the Court Theatre at Stuttgart, and the Schiller Theatre at Charlottenburg. He was Privy Councilor and professor, and received silver medals in Paris and St. Louis.

**LITVINOV, MAXIM MAXIMOVITCH** (1875- ). A Russian Communist, Assistant People's Commissar for Foreign Affairs since 1921. He joined the Russian Social-Democratic Party in 1893 and lived many years in exile, mainly in Great Britain. In 1918 he was Soviet representative in Great Britain, in 1920 he was appointed Minister to Estonia, and in 1922 he was Russian delegate to the Genoa Conference. He presided over the Moscow Disarmament Conference of 1923 and in 1928 was head of the Soviet delegation sent to the Preparatory Disarmament Conference.

**LIVERPOOL.** The principal seaport of England for the Atlantic trade and one of the greatest trading centres in the world. The population at the census of 1921 was 802,940; in 1927 it was estimated to be 872,900. The municipal area is 24,102 acres (about 33 square miles). The net tonnage of British and foreign ships engaged in ocean trade arriving in the port during 1926 was 14,033,955 and of those departing, 13,297,474. In 1927 there were 87 docks and basins and 22 dry docks with an area of 1925 acres and a linear quayside on both sides of the Mersey of 39 miles. In that year on July 19, the new Gladstone Dock was opened by King George. This dock has a total water area of 58 acres, including the Gladstone Dry Dock which was completed in 1913 and which it encloses. In 1928 an 80-foot river entrance lock was constructed at the Alfred Dock, Birkenhead, so as to provide increased facilities for ships of deep draught engaged in trade with the Near East. The lock provides a depth of 48 feet 4 inches at high-water ordinary spring tides and of 42 feet 9 inches at high-water neap tides, thus enabling the largest ships afloat to go in and out on every tide of the year. A new landing stage also has been constructed, consisting of a floating structure 2534 feet long supported on 200 iron pontoons and connected with the shore by bridges. The total cost of these new works was approximately £8,000,000.

Overlooking the harbor are three new large office buildings: the Royal Liver Building, a skyscraper containing the offices of the Royal Liver Friendly Society with two towers, 295 feet high, crowned with figures of the liver bird; the Cunard Building; and the Dock Board Offices with a dome 230 feet high. In front of the Cunard Building is a bronze equestrian statue of Edward VII, by Sir W. Goscombe John, which was unveiled in 1921. The Liverpool subway crosses under the Mersey by tunnel and traverses the territory on the south side of the river. It was originally constructed for steam railroad service, but was subsequently electrified. The Mersey Road Tunnel has been under construction since 1925. When completed, it will be the largest vehicular tunnel in the world—44 feet in diameter and 2 miles long—with room for four lines of traffic. The volume of water which can be drawn from Lake Vyrnwy, the city's main reservoir, has been increased by construction of the Aber Tunnel.

On July 19, 1924, the first portion of the Liverpool (Church of England) Cathedral, consisting of the chancel, east transepts, and chapter house, was consecrated. The cathedral, situated on St. James's Mount, was begun in 1904 and, when completed, will be the largest ecclesiastical structure in England. The architect is Sir Giles Gilbert Scott, whose designs were accepted when he was only 21 years of age and who is responsible also for almost every detail of the interior. In composition, the building is classical and symmetrical, the conditions of the site calling for a structure which would be sufficiently solid in mass and strong in outline to contrast with the great rectangular blocks of office buildings in the business section. The style is Gothic, though freely interpreted. When finished, the cathedral will have a total area of 100,000 square feet with an external length of 619 feet.

**LIVE STOCK.** Conditions in the live-stock industry have fluctuated considerably since 1914. Prior to the World War, there was an increasing tendency toward a reduction in the per-capita consumption and production of meat in the United States and in the world in general. The War, however, acted as a great stimulus to meat production in the United States. At first, the effects of rising feed prices tended to start a temporary liquidation of animals in 1915 and 1916, but as the world's shortage of meat became evident, prices of meat animals increased. As early as 1913, the dwindling per-capita production of meat also stimulated production in the more remote and thinly populated areas of the world, where previous evidence had indicated that beef production might thrive. Consequently, the United States packers began to establish plants in South America. In the United States, the calculated per-capita consumption of meats, including lard, amounted to 168 pounds in 1907, dropping off gradually to 132 pounds in 1917, and increasing again to 165 pounds in 1924, since which time there has been a gradual decrease to 153 pounds per year. The annual per-capita consumption of beef was rather stable at 65 to 70 pounds from 1917 to 1927. Pork consumption rose from 50 pounds in 1917 to 75 pounds in 1923.

A peak of meat prices was reached in 1919 with practically all classes of animals, and live-stock producers were enjoying a more prosperous position probably than ever before, although a severe drought in the Southwest, ending in 1918 and followed by one in the Northwest, tended to

handicap feeders and breeders alike in those sections. Following the prosperous conditions of 1919, there was an irregular decline in both pork and beef prices during 1920. The situation became critical for beef and hog producers, but the outlook for the sheep breeders was even more demoralizing. Wool dropped from \$0.72 on the range to a condition where no market at all existed. The prices of live stock continued to fall through 1921, reaching low levels at the end of the year. Although the European countries were still suffering from the loss of many of their animals during the War, they were unable, due to poor exchange rates and a lack of credit facilities, to purchase any great amounts of meat. At the end of 1921, however, conditions began to show more promise, and some meat products, especially pork, were exported to western Europe.

Conditions in 1922 were somewhat better, especially for the sheep raiser, and the passage of the McCumber-Fordney Tariff Bill placed a heavy duty on all mutton, lamb, and wool imported. During 1923 a peculiar situation existed which apparently was unexpected, resulting in an unprecedented slaughtering of hogs and a reduction of hog prices to low levels of less than \$7 per 100 pounds in December. There was a steady annual reduction in the number of beef cattle in the United States from 1922 to 1928, with a steady increase in the price of beef. A general complaint about the high price and lack of quality in beef culminated in the latter part of 1927 in a recommendation by certain Eastern hotels and restaurants that their patrons eat meats other than beef. Swine production fluctuates more rapidly than beef production, so that the number of hogs on farms, following the record slaughtering of 1923, reached a low point in 1925. A stimulation in the prices again resulted in a heavy production in 1927, with a lowered foreign demand. The numbers of sheep have increased each year since 1922. The accompanying table indicates the annual fluctuations in the numbers of animals slaughtered under Federal inspection in the United States from 1913 to 1928.

during the War finally resulted in the passage of the Packers and Stockyards Act by Congress, which became a law in August, 1921. This act provided for the supervision of public stockyards, live-stock market agencies, and dealers in live stock and live-stock products, to prevent misleading or illegitimate practices, and to encourage fair competition.

**International Conditions.** There were many changes in the live-stock situation in the different countries of the world following the War. The beef industry developed rapidly in Argentina, New Zealand, Australia, and South Africa. New Zealand and Australia were also the world's largest exporters of lamb and mutton. The development in these countries was rendered possible by the rapid improvements in methods of refrigeration and cold storage of meat products and by the opening of large slaughtering plants. Much of the Australian and New Zealand products was shipped to England and Europe, though considerable New Zealand lamb, coming to the United States prior to and after the War, met with much favor. Since 1922 and the passage of the McCumber-Fordney Tariff Bill, imports of lamb and mutton have been less than 5,000,000 pounds, though there were more than 25,000,000 pounds imported in 1921. The extreme depression in the beef-cattle market which began in 1921 and continued through 1923 was keenly felt in several of the beef-exporting countries.

In Argentina, where cattle raising for export is the main industry, the situation became so acute in 1923 that the cattle men organized and were instrumental in having a law passed on October 15 to set a minimum price for beef in the export trade. The fallacy of such procedure was evident when the law began to operate and the British and American packing companies in Argentina refused to buy cattle. For the relief of similar situations in Australia and South Africa, the respective governments offered bounties on export beef of  $\frac{1}{4}$ d. (\$.005) and  $\frac{1}{2}$ d. (\$.01) per pound. Bounties also were offered for live cattle exported. Conditions were much improved in 1927 and 1928.

MEAT ANIMALS SLAUGHTERED ANNUALLY IN THE UNITED STATES UNDER FEDERAL INSPECTION AND PER-CAPITA CONSUMPTION OF MEAT

Year	Cattle Number	Calves Number	Sheep Number	Goats Number	Swine Number	Horses Number	Per capita consumption of meats and lard Number
1913	7,155,839	2,098,484	14,724,465	56,556	32,287,538	....	147.6
1914	6,724,117	1,814,904	14,058,834	121,827	33,289,705	....	145.0
1915	6,964,502	1,735,902	12,009,089	165,533	36,247,858	....	137.5
1916	7,404,288	2,048,022	11,985,926	180,356	40,482,799	....	141.1
1917	9,299,489	2,679,745	11,343,418	174,649	40,210,847	....	131.6
1918	10,938,287	3,323,077	8,769,498	149,503	35,449,247	....	143.2
1919	11,241,991	3,674,227	11,268,370	125,660	44,398,389	....	142.2
1920	9,709,819	4,227,558	12,374,827	77,270	38,981,014	1,089	150.0
1921	8,179,572	3,896,207	12,452,435	20,027	37,702,866	1,335	144.6
1922	7,871,457	3,924,255	11,968,484	13,758	39,416,439	1,888	153.0

1924	9,188,652	4,667,948	11,505,001	31,279	54,416,481	4,699	165.1
1925	9,773,883	5,185,316	12,203,159	26,570	48,459,608	11,909	156.9
1926	10,098,121	5,311,774	12,354,225	42,774	40,442,730	39,668	156.5
1927	10,049,589	5,080,062	12,894,016	30,437	42,050,443	42,635	153.5
1928	8,467,808	4,679,922	13,488,171	18,819	49,795,408	127,066	152.7

Conditions in pork production were complicated in 1926 by the heaviest outbreak of hog cholera that had occurred in many years. Outbreaks of foot-and-mouth disease in 1924 and 1925 seriously threatened the live-stock industry in certain sections of the Far West. The supervision of the packers and stockyard agencies

Concurrent with development of the beef-cattle and sheep industries in the Southern Hemisphere, the European countries were rebuilding their live-stock industries which were largely demoralized during the War. To complicate somewhat the European situation in 1926, Great Britain prohibited imports of fresh meats

from continental Europe, due to foot-and-mouth disease. This made necessary the curing of about 92,000,000 pounds of fresh and frozen pork ordinarily shipped from the Netherlands alone.

Canadian stock raisers were somewhat affected by the United States tariff and by the raising of the embargo on Canadian cattle by Great Britain in 1923. Most significant in the meat export trade of the United States was the reaction to the European demand for meat during the War. In 1916 and 1919, the exports of both beef and pork reached the largest amounts in history, although the United States has long been the leading exporter of pork. In 1914 less than 400,000,000 pounds of pork products, exclusive of lard, were exported, but this amount was more than doubled in 1915 and continued to increase to nearly 1,750,000,000 pounds in 1918. From a similar figure in 1919, the pork exports of the United States, exclusive of lard, declined irregularly until they were less than 300,000,000 pounds in 1928.

The major part of the pork exported consisted of bacon, which was over 1,000,000,000 pounds in both 1918 and 1919. Over 50 per cent of the bacon and about 75 per cent of the ham and shoulder exports were to the United Kingdom. The lard exports were close to 500,000,000 pounds up to 1919, when they were 750,000,000. This amount was steadily maintained through 1922, but in 1923 and 1924 over 1,000,000,000 pounds were exported, since which time the lard exports have been maintained rather constantly at about 700,000,000 pounds. The exportation of lard to Germany, which was entirely stopped from 1915 to 1918, was resumed in 1919, with gradual increases in the amount exported each year to nearly 377,000,000 pounds in 1923, followed by a decline to approximately 180,000,000 pounds in 1928. There was a remarkable increase in the fresh beef exports of the United States from less than 7,000,000 pounds in 1913 to 514,000,000 in 1918, with a gradual decline to 2,000,000 pounds in 1928.

**Trends in Research.** Experimental inquiry indicated a more complete realization of the importance of fundamental research. Notable advances were made in the physiology of nutrition and knowledge of qualities which influence the value of feeding stuffs. A better understanding of the importance of vitamins, minerals, and the different kinds of proteins in the rations for live stock tended to explain why certain feeds and feed combinations produced unsatisfactory growth or gains. The relation of sunlight and ultra-violet radiation to mineral metabolism also was brought out during this period. Undoubtedly, one of the most extensive coöperative projects ever undertaken was initiated in 1925 for a study of the factors influencing the quality and palatability of meat. This study increased in popular, as well as scientific, interest and in 1928 there were more than 20 of the State agricultural experiment stations and the U. S. Department of Agriculture engaged in studies of the effect of feeding, breeding, age, and sex on the quality of the meat of the various classes of animals.

The attainment of results in breeding experiments with the live stock of more economic importance is necessarily a slow process, and the expense of such investigations is often prohibitive. Much progress in breeding has been made through the use of the smaller experi-

mental animals such as the rat and the guinea pig, with sufficient comparisons with larger animals to make it evident that the same fundamental principles of inheritance are operative. Fundamental investigations of much practical value on the effect of inbreeding in rats and inbreeding and crossbreeding in guinea pigs were carried on at the Wistar Institute and the U. S. Department of Agriculture, respectively. Both studies indicated that inbreeding tends to increase the percentage of homozygosity of the stock. The latter study dealing with the effect on fertility and vigor showed that such conditions seem to depend mainly on dominant factors and that crossbreeding brings together a greater variety of dominant factors and thus results in increased vigor. In less extensive experiments with swine and poultry, these results were largely confirmed.

Interesting studies of sex determination in animals have indicated that sex is not only due to differences in the sex-determining power of chromosomes, but that the sex also may be modified by other factors which tend toward the production of intersexuality in certain cases. R. Goldschmidt in Germany, working with gipsy moths, has carried this analogy further than other investigators, although recent results with goats, pigs, chickens, and pigeons in Scotland and the United States have partially, at least, corroborated his results. Theoretical studies of growth, senescence, and production in dairy cattle and hens indicated that the curves of milk production, egg production, and growth and senescence in dairy cattle and senescence in fowls tend to follow the course of a monomolecular chemical reaction. It is thus concluded that these physiological operations are limited by chemical reactions.

Events of outstanding interest were the Second and Third World's Poultry Congresses held at Barcelona, Spain, and Ottawa, Canada, in 1924 and 1927, which were attended by representatives from about 40 foreign countries. Problems of poultry marketing, nutrition, breeding, and diseases were discussed from the practical and scientific points of view. See VETERINARY MEDICINE.

**LIVONIA.** See BALTIC PROVINCES.

**LLEWELLYN, SIR WILLIAM** (1863- ). A British painter. He studied at South Kensington under Sir Edward J. Poynter and in Paris under Cormon, Lefebvre, and Ferrier. He became an associate of the Royal Academy in 1912 and an Academician in 1920. He has painted many portraits, including several of Queen Mary besides the State Portrait of her made in 1910. Field Marshal Sir George White, Sir Francis Hopwood, and Lord Colville of Culross were other subjects. He was knighted in 1918 and was made President of the Royal Academy in 1928.

**LOYD GEORGE, Rt. Hon. DAVID** (1863- ). A British statesman and reformer (see VOL. XIV). At the outbreak of the World War, as Chancellor of the Exchequer, he took measures which enabled British credit to withstand the immediate needs brought about by the beginning of the struggle. Early in 1914, he was appointed Minister of Munitions, in which office he displayed ceaseless energy and remarkable ability for organization. Following the death of Earl Kitchener, in 1916, he was appointed Secretary of State for War. He proposed the limiting of the War cabinet to a smaller membership, but failing to bring this about, he resigned, and as he was supported by the Unionist leaders, Mr. Asquith, the Prime Minister, retired, and Lloyd George became Premier and First Lord of the Treasury. From 1917 to the conclusion of peace, he was practically dictator of government policies. Following the Armistice, he called for a general election, and on being returned to power by an immense majority, he was one of the leading figures at the Peace Conference. In 1920 he introduced the Home Rule Bill, and largely through his efforts the Irish Free State was established. His aggressive support of Greece in 1922, and the success of the Turkish Armies in that year, brought about his defeat, together with that of the Coalition cabinet. He was, however, returned to Parliament and was leader of the Liberal policy in the House of Commons until 1923 and again after 1925. He visited the United States in 1923. After September, 1925, he talked continually, and with detriment to the Liberal Party funds, for his new land policy. Lloyd George proposed that the Government buy out the landlords, and act as the necessary capitalist in financing the farmers. In 1927 Lloyd George's offer to put the old Coalition funds under his control at the unconditional disposal of the Liberal Party was accepted, but not without dissension. Later in the year, the party was reunited under Sir Herbert Samuel, who worked in accord with Lloyd George. The latter wrote *The Great Crusade; Extracts from Speeches Delivered during the War*, arranged by F. L. Stevenson (1918); *Where are We Going?* (1923); *Slings and Arrows* (1929). Consult *Mr. Lloyd George*, by E. T. Raymond (1922); *David Lloyd George, War Minister*, by J. S. Mills (1924); *Lloyd George*, by H. Spender (1924), and *David Lloyd George*, by J. Hugh Edwards (1929). See GREAT BRITAIN, under *History*.

**LOYD OF DOLOBRAN, GEORGE AMBROSE** LLOYD, FIRST BARON (1879- ). A British administrator, who was born at Dolobran, Mont-

gomeryshire, Wales, and educated at Eton and Cambridge. He became a student of Oriental politics, traveling widely in Burma, India, Little Tibet, the Himalayas, Egypt, Morocco, and Asia Minor. Having served as attaché at the British Embassy at Constantinople, in 1908 he acted as special commissioner for Great Britain on British trade in Turkey, Mesopotamia, and on the Persian Gulf. During the World War, he served in Egypt, Gallipoli, Mesopotamia, and the Hedjaz. He won the D.S.O. in 1917. From 1910 to 1918, he was a Member of Parliament (Unionist) for West Staffordshire. He was Governor of Bombay from 1918 to 1923, was elected to Parliament for Eastbourne in 1924, and in 1925 was appointed High Commissioner for Egypt and the Sudan—a post that he retained until 1929. He resigned at the request of the Secretary of State for Foreign Affairs in the MacDonald ministry.

**LOANS, INTERNAL AND EXTERNAL.** See FINANCE AND BANKING.

**LOCARNO CONFERENCE.** See GERMANY, under HISTORY; LEAGUE OF NATIONS.

**LOCKE, WILLIAM JOHN** (1863- ). An English novelist (see VOL. XIV). His later works include: *Far Away Stories* (1916); *The Wonderful Year* (1917); *The Rough Road* (1918); *The House of Baltazar* (1920); *The Mountebank* (1921); *The Tale of Triona* (1922); *The Kingdom of Theophilus* (1927); *Joshua's Vision* (1928); *Perella* (1928).

**LODER, B. C. J.** (1849- ). A Dutch jurist, who practiced law from 1873 to 1908, when he became a justice of the Supreme Court of the Netherlands, serving until 1921. He was president of the Confederation of Scandinavian States, Switzerland, and Holland in 1920 and, in 1922-24, of the Permanent Court of International Justice, of which he is still a member. He was a founder of the International Maritime Commission (1896), and of the International Intermediary Institute at The Hague (1918).

**LODGE, HENRY CABOT** (1850-1924). An American legislator and historical writer (see VOL. XIV). He was reelected to the Senate in 1910. In the same year, he served as chairman of the Committee on Resolutions at the Republican National Convention in Chicago. He was the leader in the Senate in opposition to the Versailles Treaty and the Covenant of the League of Nations in the form in which they were presented for ratification. He proposed reservations and amendments which President Wilson refused to accept (see UNITED STATES). He served as temporary and permanent chairman of the Republican National Convention of 1920, and in the same year was chairman of the United States Pilgrim Tercentenary Commission. In the Sixty-seventh and Sixty-eighth Congresses, he was chairman of the Committee on Foreign Relations and was the Republican leader of the Senate. He was appointed, by President Harding, delegate and special ambassador to the Conference on the Limitation of Armaments, 1921-22. In 1922, he was again reelected to the Senate, though by a greatly reduced majority. His opposition to several of the important policies advocated by President Coolidge in 1924 caused him to be severely criticized. His later books include *Democracy of the Constitution and other Essays* (1915); *War Addresses* (1917).

**LODGE, SIR OLIVER (JOSEPH)** (1851- ). A British physicist, philosopher, and student of psychical phenomena (see VOL. XIV). In 1919

he was made Albert Medalist of the Royal Society of Arts as a pioneer in wireless telegraphy. In the same year, he resigned his position as principal of the University of Birmingham. In 1926 he was the Halley Stewart Trust lecturer, his talks being published in the next year as *Science and Human Progress*. His publications immediately after the World War were devoted exclusively to psychical research. *Raymond* (1916) purports to reveal communications between Sir Oliver and his son who was killed in the War. *Christopher* (1919) is a study in human personality on the spiritistic hypothesis. Besides contributing a number of articles to journals on psychical phenomena, he wrote *Making of Man* (1924); *Atoms and Rays* (1924); *Either or Reality* (1925); *Relativity* (1925); *Electrical Precipitation* (1925); *Talks about Wireless* (1925); *Evolution and Creation* (1927); *Modern Scientific Ideas* (1927); *The Natural History of a Savant* (translated from Charles Richet, 1927); *Science and Human Progress* (1928).

LOEB, JACQUES (1859-1924). An American physiologist and experimental biologist (see Vol. XIV). His later major works were *The Organism as a Whole, from the Physicochemical Viewpoint* (1916); *Forced Movements, Tropisms and Animal Conduct* (1918); and *Proteins and the Theory of Colloidal Behavior* (1922).

LOEB CLASSICAL LIBRARY. See PHR-  
 LOLOGY, CLASSICAL.

LOENING, GROVER C. (1888- ). An American aeronautical engineer born in Bremen, Germany, and educated in New York. He is best known for his invention of the first flying boat, the monoplane flying boat, and the first American short-hull flying boat. He introduced steel construction in the Sturtevant biplane (1916) and the next year began the designing and development of the Loening monoplane and seaplane. In 1922 the Collier Trophy was awarded him for the Loening air-yacht. Among his books are *Monoplanes and Biplanes* (1917); *Military Aeroplanes* (9th ed., 1916-18); *Revel of the Monoplane* and many papers and articles.

LOESCH, FRANK JOSEPH (1852- ). An American lawyer. He was born at Buffalo, N. Y. and received the degree of LL.B. from the Union College of Law, Northwestern University (Chicago) in 1874. After admission to the bar, he practiced at Chicago, specializing in estate and corporation law. Since 1886 he has been counsel at Chicago for the Pennsylvania Railroad. From 1898 to 1902, he was a member of the Chicago Board of Education. In connection with the first direct primary (1908), he served as special State's attorney to investigate and prosecute frauds. He was vice president of the Chicago Crime Commission in 1928. In May, 1929, President Hoover appointed him as one of the ten members of the National Law Enforcement Commission.

LOGUE, MICHAEL (1540-1924). A Roman Catholic cardinal, born in County Donegal, Ireland. He was consecrated Bishop of Raphoe in 1879 and in 1887 was made Roman Catholic Primate of all Ireland. He was created Roman Catholic Archbishop of Armagh in 1888 and Cardinal in 1893. He took an active part in bringing about settlement between the opposing parties in Ireland prior to the formation of the Irish Free State, and his influence was constantly exerted against violence and bloodshed.

LONDON. The capital of England, centre of the government and commerce of the British Empire, and largest city in the world. The population at the census of 1921 was 7,476,168; in 1927 it was estimated to be 7,796,353. The area comprises 700 square miles and consists of the City of London and 28 metropolitan boroughs. The growth of London has never been more rapid than since the World War. Old landmarks, such as Charing Cross Station and Little Britain and Bartholomew Close, are disappearing before demands for space to relieve traffic congestion or for the erection of new buildings and extensions to existing buildings. Typical of this new era in London's architecture are Bush House, an international sales building erected in 1920, and the new Lloyds' Building. Other important buildings which have been erected since the World War are Australia House, India House, the Canadian Government House, and the House of the British Medical Association.

The relief of traffic congestion is one of London's most pressing problems. One step in meeting this is the construction of new bridges and the widening of existing ones. In 1929 a new bridge was erected across the Thames to take the place of the Lambeth Suspension Bridge built in 1862. Plans call for the construction of a new bridge to take the place of the Charing Cross Railway Bridge and the Hungerford Foot Bridge, which together adorn the finest bridge site in London. This bridge, a two-story structure, will tap Waterloo Road on the south side of Thames, discharging part of its traffic into the Strand on the north side and carrying another part overhead across the Strand to be discharged farther north at the foot of Charing Cross Road. Waterloo Bridge is to be widened so as to accommodate four lines of traffic. Another scheme to relieve traffic has been the construction of a series of circular roads. The most important of these is the North Circular Road which rounds the north of London from the docks at Woolwich on the lower Thames to Kew Bridge on the upper Thames. The most difficult engineering feat in constructing this road was the building of a half-mile viaduct over the Lea marshes. This viaduct, which was completed in January, 1927, at a cost of £120,000, carries a 40-ft. roadway with 10-ft. sidewalks on either side. The embankment on the south side of the Thames is to be developed and a boulevard constructed as fine as the one on the north side. This embankment will begin at Westminster Bridge, where the Albert Embankment ends, and will run round the great bulge on the south side of the river to Blackfriars Bridge.

London's housing problem is receiving a happy solution through the establishment of garden cities, such as Letchworth, Welwyn, and Hampstead, and the adoption of slum-clearance schemes. Since 1919 the London County Council has undertaken and partly completed schemes for the clearance of 92 acres of slums which will displace about 25,000 persons, rehousing 18,189 of them within the same area and 5089 elsewhere. The cost of clearance and roadwork is estimated at £1,145,200 and the cost of rehousing at £2,000,000. One of the most important features of the council's work is the development of suburban estates. At Becontree, 6000 houses are being erected for the accommodation of 25,000 to 30,000 persons. On the Bellingham estate, 2090 working-class houses and flats, with

accommodation for 10,000 persons, have been built. In 1923 the London County Council and the Minister of Health reached an agreement which is considered the greatest definite legislative advance ever made by any public authority toward slum clearance in London. Under it, the Government contracted to pay pound for pound with the Council to a total annual loss of £100,000, the programme to continue for 60 years.

London retains its title of first commercial port in the world. During 1928 the net tonnage of ships entered and cleared was 52,500,000, an increase of more than 3,000,000 tons over the preceding year. In 1926 the net tonnage of ships engaged in foreign trade was 21,110,101 for arrivals and 19,832,850 for departures. In 1929 the port improvements at Tilbury and Millwall, begun in 1926, were completed at a cost of more than £5,000,000. The new Tilbury Dry Dock, with a width of 110 feet at the entrance and a depth over the sill of 36 feet 6 inches at high tide, is the largest dock in the port of London and is surpassed in size only by the Gladstone Dry Dock at Liverpool. Although at present only 750 feet long internally, this dock can be lengthened in the future to 1000 feet. At the Millwall docks, the last of the three communication passages linking the West Indian dock system and the Millwall docks was completed in 1928. A new entrance lock, forming the main approach to all the docks in the Isle of Dogs, has been constructed at Blackwall. Other improvements include the construction of a floating passenger landing stage and the new riverside station at Tilbury and the construction of a new entrance to the Southwest India Dock, which is 550 feet long, 80 feet wide, and 35 feet deep at high water.

Along with the improvement of the port of London has been the development of its airport. The Croydon Airdrome is gradually being transformed into one of the finest and best-equipped airports in the world. The principal features are the large main building housing the Air Ministry's administrative offices and the offices of various British and foreign companies using the airdrome; the two large hangars, each covering an area of 300 feet by 150 feet and accommodating 35 of the largest passenger planes; and the new hotel which has been constructed for the use of air passengers. The airdrome, comprising landing field and buildings, occupies an area of nearly 400 acres.

London's rapid-transit system has played an important part in the development of the metropolis. On Dec. 10, 1928, the new underground station at Piccadilly Circus was opened. The platforms at three different levels have been rearranged, and a new booking-hall has been provided on the street level. The cost of the work, which was started in 1925, was £500,000. The original station was opened in 1906 and was designed to serve both the Bakerloo and Piccadilly tubes. Its annual traffic then was approximately 1,500,000 passengers. By 1928 this figure had reached 25,000,000, owing to the development of the Piccadilly Circus district as a theatrical centre.

In 1928 a subway for carrying mail between Whitechapel in the eastern part of the city and Paddington in the western part was inaugurated. The tunnel is 50 to 90 feet below the street and has a total length of six and one-half miles. Each station has spiral chutes for carrying the

mail down and elevators for carrying it up. The automatic cars are each capable of carrying 1120 pounds. A saving of about £40,000 annually is expected through the use of this system, which ultimately will form a network throughout the city.

Another important transit development has been the electrification of all suburban railways south of the Thames. In 1925 a new electric railway from Baker Street to Watford was constructed, and in 1926 the extensions of the City and South London Railway from Clapham to Morden and of the London Electric Railway from Charing Cross to Kennington were opened to traffic. In 1925 the metropolitan water system was considerably augmented by the opening of the Queen Mary Reservoir at Littleton. It is the largest entirely artificial reservoir of its kind and contains, when full, 6,750,000,000 gallons of water. The water surface at top water level is 723 acres.

Since 1925 St. Paul's Cathedral has been under restoration. The work is expected to be completed in June, 1930. The vast weight of the cathedral—60,000 tons or more—rests upon eight massive piers. On account of the construction of water mains, sewers, etc., the strata of sand and clay upon which the cathedral is built have shifted and the massive piers wrenched away so that the dome was no longer level. The work of restoration has consisted of grouting the main piers that support the dome and placing a chain of steel around the dome as an added precaution, thus adding, it is estimated, 200 or 300 years to the life of the structure. For this work, a sum of about £400,000 was raised by contributions from all parts of the Empire.

In 1920 a replica of Augustus Saint-Gaudens's statue of Lincoln in Lincoln Park, Chicago, was erected in the grassy enclosure of the Houses of Parliament. Among the many war memorials which have been erected in London, the most impressive is the Cenotaph, commemorating in dignified simplicity the Glorious Dead of the World War. The monument, designed by Sir Edwin Lutyens, was first erected in plaster at a saluting point for the Allied Victory March of Nov. 11, 1919, and was rebuilt in stone and unveiled by the King on Nov. 11, 1920. The tomb of Britain's Unknown Warrior is in Westminster Abbey. The body was brought from Flanders and interred in the Abbey on Nov. 11, 1920, as representative of all the nameless British dead of the World War.

**LONDON, TREATY OF.** See FIUME-ADRIATIC CONTROVERSY; ITALY; REPARATIONS; TYROL, GERMAN SOUTH; WORLD WAR, DIPLOMACY OF.

**LONDON CONFERENCES.** See REPARATIONS.

**LONE SCOUTS OF AMERICA.** An organization for boys, incorporated in Washington in 1915, and merged with the Boy Scouts of America as a separate division in 1924. Since its organization, there had been 563,000 members, about 90,000 of whom were active at the end of 1924. With only two adult leaders, the Lone Scouts had developed a national organization. In addition to its official magazine, the *Lone Scout*, discontinued after the merger, there were 40 amateur publications. The Lone Scouts of America now provides an opportunity for boys to whom troops are inaccessible to join the Boy Scouts organization. Headquarters are in New York City. See BOY SCOUTS.

**LONGFELLOW, ALEXANDER WADSWORTH** (1854- ). An American architect, born at Portland, Me. He was graduated from Harvard in 1886 and studied architecture at the Massachusetts Institute of Technology and at the École des Beaux Arts. He began the practice of his profession in Pittsburgh and Boston in 1887, forming the firm of Longfellow, Alden & Harlow. This firm designed the Carnegie Library at Pittsburgh and the City Hall at Cambridge. In 1895 he formed a partnership with his brother, R. K. Longfellow. He designed Phillips Brooks House and other buildings for Harvard University and several buildings for Radcliffe College. He was the designer of the original Boston elevated railway stations.

**LONGLEY, HARRY SHERMAN** (1868- ). An American Protestant Episcopal bishop, born at Cohoes, N. Y. He was graduated from St. Stephen's College in 1891 and from the General Theological Seminary in 1894, was ordained in 1895 and served as rector in churches in Massachusetts, New York, and Illinois. In 1912 he was consecrated suffragan Bishop of Iowa. He was elected coadjutor bishop in 1917, and in 1920 became presiding bishop of the Province of the Northwest.

**LONGMAN, (MARY) EVELYN BEATRICE** (Mrs. Nathaniel Horton Batchelder) (1874- ). An American sculptor (see Vol. XIV). Among her later awards were the French Gold Medal from the Art Institute of Chicago, 1920; the Widener Gold Medal from the Pennsylvania Academy of Fine Arts, 1921; the Watrous Gold Medal from the National Academy of Design, 1923; the Charles Noel Flagg Prize, Connecticut Academy, 1925, and the Shaw Memorial Prize, National Academy of Design, 1926. She became a National Academician in 1919.

**LONG RANGE GUNS.** See ARTILLERY.

**LONGWORTH, NICHOLAS** (1869- ). An American public official, born at Cincinnati, Ohio, and educated at Harvard. He was admitted to the bar in 1894, and served in the State Legislature of Ohio from 1899 to 1903. During 1903-13 he was a member of the United States Congress and was reelected for the 64th-71st Congresses (1915-31) as representative from the First Ohio District. He was floor leader of the House of Representatives, 1923-25, and speaker of the 69th and 70th Congresses (1925-29). In 1906 he married Alice, daughter of President Theodore Roosevelt.

**LONGSDALE, FREDERICK** (1881- ). A British dramatic author, who, besides being a librettist and adaptor of stories for musical comedies, wrote many successful plays of his own, most of them light comedies. His plays, with the dates of production, include *The Best People*; *Aren't We All?* (1923); *The Fake* (1924); *The Street Singer* (1924); *Spring Cleaning* (1925); *The Last of Mrs. Cheyney* (1926); *On Approval* (1927); *The High Road* (1927).

**LOOS, ADOLF** (1870- ). An Austrian architect who has successfully attempted to introduce a modern style of architecture in Vienna. He was educated at the State Industrial School at Brunn, and the Technical High School at Dresden, and spent three years in America and some eight years in Paris.

**LOPEZ PINILLOS, JOSÉ** (1875-1922). See under SPANISH LITERATURE.

**LORD, HERBERT MAYHEW** (1859- ). An American army officer and budget director. He was born at Rockland, Me., and graduated at

Colby College, Waterville, Me. (1884). He engaged in newspaper work and served as clerk of the ways and means committee of the House of Representatives at Washington until 1898. He was appointed major and paymaster of volunteers in the Spanish-American War, and captain, U. S. Army, in 1901. He was promoted through the grades to brigadier general (1919). In 1918 he was made assistant to General Goethals, with the title of director of finance, and became chief of finance, U. S. Army, 1920. During the World War, he served as army liberty loan officer. In 1922 he was retired from the Army and succeeded Gen. Charles G. Dawes as director of the budget. He resigned that office in May, 1929.

**LORD, ROBERT HOWARD** (1885- ). An American educator, born at Plano, Ill. He was graduated from Harvard University in 1906 and took post-graduate courses in Austria, Germany, and Russia. He was successively instructor, assistant, and associate professor of modern European history at Harvard, and in 1924 became full professor of the same subject. He resigned in 1927 following his conversion to Roman Catholicism and in April, 1929, was ordained a priest of the Roman Church. In 1918-19 he was Harvard technical expert on Polish affairs with the American Commission to Negotiate Peace in Paris, and a member of the American Inter-Allied Commission to Poland (1919). He wrote *The Second Partition of Poland* (1915) and, with Prof. C. H. Haskins, *Some Problems of the Peace Conference* (1920).

**LORENTZ, LÖRÉNTS, HENDRIK ANTOON** (1853-1928). A Dutch physicist (see Vol. XIV). He was awarded the Copley Medal of the British Royal Society in 1918, was the second chairman of the League of Nations Committee of Intellectual Coöperation, and in 1923 lectured in English universities as an exchange professor of the Anglo-Batavian Society, receiving the honorary degree of D.Sc. from Cambridge.

**LORENZ, ADOLF** (1854- ). An Austrian orthopedic surgeon (see Vol. XIV) who has received unusual publicity in the United States and elsewhere, because identified with a successful method of bloodless treatment for a special deformity—congenital dislocation of the hip. At the close of the World War, Lorenz divided his practice between the United States and his home city of Vienna. His free orthopedic clinics were held in some of the large cities of the United States.

**LORENZEN, ERNEST GUSTAV** (1876- ). A German-American lawyer and educator, born at Russee-Kiel, Germany. He came to the United States in 1892 and studied law at Cornell University, taking post-graduate studies in France and Germany. After practicing law in New York City from 1901 to 1903, he was appointed professor of law at the University of Maine. In 1904 he became professor of law and in 1910, dean of the Law School at George Washington University. From 1911 to 1914, he was professor of law at the University of Wisconsin, and from 1914 to 1917, at the University of Minnesota. In the latter year, he was appointed to a similar chair at Yale. He was the author of several books on legal subjects and contributed articles to American and European reviews.

**LOS ANGELES, lōs āng'hā-lās.** The largest city of California. The population rose from 319,198 in 1910 to 576,673 in 1920 and to 1,427,-

480 in 1929, according to local estimate. The area was 441.23 square miles. In May, 1924, a new city charter was adopted, the outstanding features of which were the enlisting of citizen service on a great number of administrative boards, with boards of expert administrators attached, and the intrusting of large administrative powers to responsible executives, subject to these citizen boards. The following departments, each administered by a board of five salaried commissioners, were created: building and safety; city planning; efficiency and personnel; finance; harbor; health and sanitation; parks and playgrounds; county affairs; police and fire; public utilities; public welfare; public works; street opening and widening; traffic and lighting; tunnels, bridges, and viaducts; water and power. The mayor, the city attorney, controller, and members of the council and of the board of education were to be elected by popular vote. Provision also was made for the creation of boroughs within the city, whereby any annexed section, not a part of the original central city, of 4000 acres or 40,000 population, might become a borough by action of the city council and a vote of the residents of the proposed borough territory.

In 1928 the new Los Angeles City Hall was dedicated. The building consisting of a large lower portion, rectangular in plan, with a high, central tower for the municipal offices, was erected upon a site planned as a Civic Centre at a cost of approximately \$7,000,000. The Hall of Justice, built by Los Angeles County, is another important new building that houses a number of the county government offices, the sheriff's department, jail, etc. In 1926 the new central public library was opened. Several viaducts and bridges over the Los Angeles River, carrying the city's main thoroughfares to the east, have been built since 1920. A major traffic plan also was adopted for relieving the congestion of these thoroughfares, a special feature being the construction (under a \$350,000 bond issue) of 44 pedestrian subways at the most dangerous crossings and near school buildings. In 1925 the first subway was opened from the junction of First and Glendale Boulevard through the hills to Hill Street between Fourth and Fifth streets, where the Subway Terminal Building was erected. This subway provides easy access to the business section for Hollywood, Glendale, Burbank, and other suburbs in the San Fernando Valley.

During 1922 and 1923, \$6,900,000 was spent on harbor improvements, and Los Angeles became a regular port of call for 61 different freight and passenger lines and five tank lines. In 1929 the main channel was widened and a second breakwater was built from the Long Beach end of the harbor so as to meet the needs of 157 lines that served the port regularly. The cost of these improvements was estimated at \$18,000,000, part of which was to be met by the Federal government. Imports increased in value from \$1,942,647 in 1910 to \$9,897,336 in 1920 and to \$40,388,142 in 1927, while exports showed an even more remarkable climb from \$135,911 in 1910 to \$18,606,121 in 1920 and to \$110,991,047 in 1927. In 1924 bonds were voted by the city for the following purposes: \$34,600,000 for school sites, buildings, and equipment; \$8,000,000 for waterworks; \$1,600,000 for police stations and signal system; \$1,000,000 for bridges; \$600,000 for incinerators; and \$400,000 for fire boats. In addition, \$35,000,000 was voted by the

county for flood control. The total cost of all public works constructed during 1927 was \$27,537,920; of this amount \$17,019,688 was spent for street improvements, \$4,445,707 for sewers, \$5,052,137 for storm drains, \$74,590 for pedestrian subways, and \$945,796 for bridges.

In 1927 Los Angeles ranked eleventh among the manufacturing cities of the United States. Approximately 66,500 persons were employed in its 2961 industrial establishments and received \$99,746,854 in wages; the value of products manufactured was \$610,166,093. The manufacture of aircraft is an important industry which has followed in the wake of Los Angeles' development as an air centre. In 1928 planes, motors, and accessories to the value of \$4,000,000 were produced in Los Angeles County. The city of Los Angeles has a Department of Aviation, the director of which has jurisdiction over the three airports located at the harbor, at Griffith Park, and at Mines Field. Through the financing of the Daniel Guggenheim Fund for the Promotion of Aeronautics, a model air line was established between Los Angeles and San Francisco in May, 1928. Its primary purpose was to prove that an air line, carrying only passengers and express, could be financially successful and could maintain reliable schedules. Another use of the Guggenheim Fund was the establishment of a weather service, consisting of 39 reporting stations, between the two cities. In 1929 Los Angeles County had 27 schools of aviation with a student enrollment of approximately 1500. It is estimated that 30 per cent of the total air-mail traffic of the United States flies in and out of Los Angeles County's 50 airports. Bank clearings in Los Angeles increased from \$1,145,167,110 in 1914 to \$7,024,888,783 in 1923 and to \$10,825,705,000 in 1928; building permits increased in value from \$21,684,100 in 1910 to \$60,023,600 in 1920 and to \$123,027,139 in 1927. The assessed valuation of property in 1928 was \$1,723,154,405; the net debt was \$203,403,399.

**LOTTI.** *lô'tê* PIERRE (JULIEN VIAUD) (1850-1923). A French novelist (see VOL. XIV). In 1914 he reëntered the service of his country, being appointed to the General Staff of the Armies of the East as inspector of the defense against airplanes. Resulting from his war experiences were numerous articles, published in the following collections: *La hygiène enragée* (1916); *Quelques aspects du verlige mondial* (1917); *L'horreur allemande* (1918); *La mort de notre chère France en Orient* (1920). During these latter years, he also published several autobiographical works, continuations of his earlier ones: *Prime jeunesse* (1919); *Suprêmes visions d'Orient* (1922); and *Un jeune officier pauvre* (1923). The last two works were revised and published by his son Samuel. Consult *Pierre Loti*; the *Romanesque of a Great Writer*, by Edmund B. D'Auvergne (1926).

**LOUCHEUR,** Louis (1872- ). A French industrialist and politician, born at Roubaix, and educated at the lycée of Lille and the École Polytechnique in Paris. Graduating as an engineer, he was interested in industrial enterprises, and did not come to the fore until the World War, when he became Under-Secretary of State for war industries (December, 1916), and for coal supply (March, 1917), Minister of Armaments (September, 1917), and for industrial reconstruction after the Armistice. He tried unsuccessfully to bring French and German industrialists to-

gether on a programme of mutual interest, was active in drafting the economic sections of the Versailles Treaty of 1919, and in that year he entered the Chambre as a member of the radical left, becoming one of its leaders. He again became Minister for Reconstruction of the devastated regions, under Briand (January, 1921–January, 1922), signing the Wiesbaden agreement. He was Minister of Trade in Poincaré's cabinet of March to June, 1924, represented France at the League of Nations Assembly (since 1924), was Minister of Finance in Briand's cabinet (November, 1925–March, 1926), Minister of Trade in Herriot's three-day cabinet in July, 1926, and represented France at the World Economic Conference held in 1927. He was proprietor of *Le Petit Journal*, a Parisian daily paper.

**LOUDERBACK, GEORGE DAVIS (1874–).**

An American geologist, born at San Francisco, Calif. He studied at the University of California, receiving the Ph.D. degree in 1900. He became professor of geology at the University of Nevada in 1903. In 1906 he returned to California, where after 1917 he was professor of geology and in 1920–22, dean of the college of letters and science. During 1914–15 he was consulting engineer of the Standard Oil Geological Expedition to China and in 1918–19 he held consulting relations with the United States Bureau of Mines and the United States Geological Survey. During the World War, he was a member of the Pacific coast committee on geology of the National Research Council. Dr. Louderback made a specialty of the basin range structure and west coast stratigraphy and was the discoverer of several new minerals, including benitoite. He was president of the Seismological Society of America in 1914.

**LOUIS III, LEOPOLD JOSEF MARIA ALOYS ALFRED, last KING OF BAVARIA (1845–1921).** (See Vol. XIV.) He was forced to abdicate in November, 1918, when the people of Bavaria inaugurated the Bavarian Free State.

**LOUISIANA** The thirtieth State in size (48,506 square miles) and the twenty-second in population; capital, Baton Rouge. The population increased from 1,656,388 in 1910 to 1,798,509 in 1920, a gain of 8.6 per cent; estimated population, 1928, 1,950,000. The white population increased from 941,086 (1910) to 1,096,611 (1920); the native white from 889,304 to 1,051,740. Foreign-born whites decreased in number from 51,782 to 44,871; Negroes, from 713,874 in 1910 to 700,257 in 1920. Both urban and rural populations increased: the former from 496,516 to 628,163; the latter from 1,159,872 to 1,170,346. The growth of the principal cities was as follows: New Orleans (q.v.), 339,075 (1910), 387,219 (1920); Shreveport, 28,015 to 43,874; Baton Rouge, 14,897 to 21,782.

**Agriculture.** Agricultural conditions in Louisiana have been affected, as in the case of the other Southern States, by the ravages of the boll weevil, which first became serious about 1905. The effect is apparent in the following comparison of the acreage and production of cotton for various years during the period. In 1904, the acreage was 1,745,865 and the production 1,089,526 bales; in 1908, 1,550,000 and 470,136; in 1921, 1,168,000 and 279,000; in 1922, 1,185,000 and 357,000; in 1928 (estimated), 1,985,000 and 685,000. In addition to the devastations of the boll weevil, army worms in many sections of the State have been prevalent in some seasons. See **BOLL WEEVIL** and **COTTON**.

The number of farms decreased from 135,463 in 1920 to 132,450 in 1925. The acreage of land in farms in 1920 was 10,019,822; but it fell by 11.8 per cent. The improved land in farms was 5,626,226 acres in 1920. Crop land acreage (1925) was 4,279,528. The total value of farm property rose from \$301,220,988 in 1910 to \$589,826,679 in 1920, but declined to \$385,910,844 in 1925; the average value per farm was \$2499 in 1910; \$4354 in 1920; and \$2914 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. The total percentage of land used for agricultural purposes decreased from 35.9 in 1910 to 34.5 in 1920, and 30.4 in 1925. Of the total number of farms in 1925, 52,386 were operated by owners; 503, by managers; 79,561, by tenants. The comparative figures for 1910 are 52,989,950, and 66,607. White farmers numbered 73,404 in 1920; 72,937 in 1925; the native white farmers (1920), 71,081; Negro farmers, 62,036. The 1.9 per cent decrease in Negro population, 1910–20, quite seriously affected the farm-labor situation. The farms reported as under mortgage numbered 11,783 in 1920; 14,424 in 1925. The number of dairy cows was 217,690 in 1920; 97,791 in 1925; "beef" cows, 316,518 in 1920 and 297,024 in 1925. The number of swine declined from 911,600 in 1920 to 517,551 in 1925. Mules numbered 180,115 in 1920; 173,458 in 1925; sheep, 129,816 in 1920 and 108,581 in 1925. The estimated production of the chief farm crops in 1928 was follows: Corn, 21,114,000 bushels; oats, 1,078,000; potatoes, 2,870,000; sweet potatoes, 6,600,000; rice, 18,392,000 bushels; peanuts, 8,100,000 pounds. Comparative figures for 1913 are corn, 41,800,000 bushels; oats, 990,000; rice, 11,760,000; potatoes, 1,750,000; hay, 240,000 tons; and cotton, 444,000 bales. Louisiana is the most important cane-sugar-producing State. In 1928 the crop of cane used for sugar making totaled 2,243,880 tons, grown on 138,000 acres, and produced 330,781,795 pounds of sugar and 14,600,927 gallons of molasses.

**Mining.** Louisiana is an important producer of minerals, especially of petroleum, sulphur, and natural gas. There is no metal mining in the State. The petroleum industry is most important. Its progress during the period from 1914 on is indicated by the following figures: In 1914 there were produced 14,309,435 barrels, valued at \$12,886,897; 1915, 18,191,539, \$10,804,653; 1917, 11,392,201, \$17,224,602; 1918, 16,042,600, \$27,535,060; 1920, 35,714,000, \$112,600,000; 1921, 27,103,000, \$42,469,000; 1926, 23,201,000, \$38,200,000; 1927, 21,061,000, \$38,700,000 (estimated). The increased production in the years 1920–22 indicated the discovery and development of new oil fields. In the production of sulphur, Louisiana has led the list of States. Production figures are 1914, 374,470 tons; 1918, 918,700; 1920, 37,635; 1921, 795,980; and 1922, 1,146,860. The chief sulphur mine shut down in 1924, but continued shipments from a large stock. The production of natural gas also is of great importance. In 1915, 25,540,392 M. cubic feet were produced; 1918, 36,094,132; 1920, 58,274,000; 1926, 157,423,000. The output of natural-gas gasoline has increased steadily, rising from 2,113,159 gallons in 1916 to 10,809,629 gallons in 1920; 15,340,374 gallons in 1921; and 46,200,000 gallons in 1927. In addition to the minerals mentioned above, the State produces clay products, salt, and sand and gravel.

The total value of the mineral products in 1926 was \$62,203,543, as compared with \$138,745,725 in 1920; \$38,851,509 in 1919, \$54,769,225 in 1918, and \$21,890,025 in 1914.

**Manufactures.** While Louisiana is not one of the chief manufacturing States, its industrial progress, in the past 20 years, has been great. Six cities in the State had in 1920 populations of more than 10,000 each. These in 1919 contained 27.6 per cent of the total population and produced 32 per cent of the total value of the manufactured products. In 1909, there were in the State 2516 manufacturing establishments; 2617 in 1919, 1742 in 1925, and 1625 in 1927. Persons engaged in manufactories numbered 86,563, 112,523, 88,058, and 82,415. Capital invested amounted to \$221,816,398 (1909), and \$462,209,056 (1919). The value of the products in 1909 amounted to \$233,948,638; in 1919, \$676,189,770; in 1925, to \$710,050,000; and in 1927, \$638,361,215. The increase in value of the products about 1919 was due largely to changes in industrial conditions brought about by the War, and therefore cannot be properly used to measure the growth of manufactures during the census period of 1914-19; but the increase shown in the number of wage earners clearly indicates a growth in the State's manufacturing activities. A leading industry in importance in point of value of products is the refining of sugar. This, in 1909, amounted to \$63,775,000; in 1914, to \$57,948,000, and in 1919, to \$141,843,000. The manufacture of lumber and timber products is important; in 1909 such products were valued at \$62,838,000; in 1919, at \$130,521,000; and in 1925, at \$121,896,611. Since 1914, when there were 21 refineries, the refining of petroleum has become one of the great industries of the State. The value of the product in 1919 was \$75,023,726. The manufacture of cottonseed oil and cake has diminished in point of value: in 1909, \$13,085,000; in 1919, \$57,162,000; in 1925, \$7,762,000. The chief manufacturing cities are New Orleans (q.v.), Shreveport, and Lake Charles. In 1909 there were in New Orleans 848 manufacturing establishments, with a product valued at \$78,794,000; 873 in 1919, with a product of \$182,790,000; and in 1925 the manufactured product was \$155,106,000.

**Education.** Educational progress from 1914 on has been well maintained in Louisiana. The Legislature of 1914 passed, among other important measures, a compulsory-education law affecting all cities of over 25,000 inhabitants. In 1916, measures were passed authorizing the acceptance of the terms and provisions of the Smith-Hughes Bill providing for vocational education. The State colony and training school for feeble-minded was created in 1918. In 1920 parish school boards were authorized to create school districts at any time. The Legislature of 1922 passed an act providing for the State Board of Education and parish school boards, defining their powers and providing for the administration and supervision of the public schools of the State; the board to include 11 members, three appointed by the governor, and eight elected for terms of eight years. In the same year, an inclusive compulsory-attendance measure was passed, providing for the attendance in school of every child in the State between the ages of 7 and 14; and the Legislature also provided for the promotion of vocational rehabilitation. In 1914 the total enrollment in the schools was 288,972, including both white

and colored pupils; in 1925-26, the number enrolled had increased to 395,007; of whom 264,129 were white and 130,878 were colored; the total enrollment of elementary colored pupils was 126,993; of secondary colored pupils, 3885. The expenditure for day public schools in 1925-26 was: current, \$15,548,612; outlays for new buildings, etc., \$4,192,556. The percentage of illiteracy in the State decreased from 31.1 in 1910 to 24.9 in 1920: among the native whites, from 16.8 per cent to 13.5; among the foreign-born whites, from 23.2 to 22.6; among the colored, from 52.2 to 43.8 per cent.

**Finance.** State expenditures in the year ending Dec. 31, 1927, as reported by the U. S. Department of Commerce were: for maintenance and operation of departments, \$19,663,230 (of which \$5,420,558 was for local education); for conducting public-service enterprises, \$58,832; for interest on debt, \$723,400; for permanent improvements, \$8,981,125; total, \$29,426,135 (of which \$10,812,821 was for highways, \$3,469,605 being for maintenance and \$7,343,216 for construction). Revenues were \$28,126,095; of this, property and special taxes formed 35.9 per cent, departmental earnings, 4.4 per cent; and trade licenses, severance tax, and gasoline tax, 41.5 per cent. Assessed property valuation was \$1,724,954,042; State taxation thereon, \$9,918,486. Net State debt on Dec. 31, 1927, was \$16,459,287.

**Legislation.** In 1916 a State Board of Education was created. In 1918 the Legislature ratified a State prohibition amendment and the Federal Woman-suffrage Amendment. Cities were authorized to adopt the commission form of government when their population exceeded 5000. Laws were passed regulating the sale of narcotics, and the child-labor laws also were amended. A law requiring instruction in the common schools to be conducted only in the English language was enacted. The Legislature of 1924 enacted a measure prohibiting the wearing of masks by members of secret societies. The Legislature of 1926 provided for revision of the criminal code.

**Political and Other Events.** Louisiana was one of the States in which, after the War, the Ku Klux Klan was active; repeated attempts to control and regulate members of this body were made by the governor and other State authorities. In 1914, though Democrats were successful in other Congressional districts, one elected a Progressive candidate. In 1915 over \$4,500,000 was expended in New Orleans to rid the city of rats in order to prevent the reappearance of the bubonic plague. In 1916, R. G. Pleasant, Democratic candidate, was elected governor. In the presidential voting in this year, President Wilson received 79,875 votes; Charles E. Hughes, 6466. In 1920 E. S. Broussard, Democratic candidate, was elected Senator; for President, J. M. Cox received 87,354 votes; W. G. Harding, 38,538. On Dec. 21, 1922, the bodies of two men were found in a lake in Morehouse Parish. It was alleged that these men had been flogged by members of the Ku Klux Klan and their bodies thrown into the lake. Owing to lack of evidence, the grand jury then failed to bring indictments against them; but on Apr. 18, 1923, the district attorney of Morehouse Parish lodged 30 informations against prominent citizens for the alleged participation in the murder. Four members of the Ku Klux Klan were found guilty of "carrying firearms on the premises of another." In

May, 1924, J. M. Fuqua was inaugurated governor. The vote for President in 1924 was: Davis, 93,218; Coolidge, 24,670. Governor Fuqua died in office Oct. 11, 1927, and Lieut. Gov. O. H. Simpson succeeded. The presidential vote of 1928 was: Smith, 164,655; Hoover, 51,160; Huey P. Long was elected governor. The criminal law of the State was recodified in 1928 and a measure to prepare the way for a \$30,000,000 bond issue was voted upon favorably.

**LOUISVILLE.** The largest city of Kentucky and the second most populous south of the Ohio and the Potomac rivers. The population rose from 223,928 in 1910 to 329,400 in 1928, by estimate of the U. S. Bureau of Census. The incorporated area of the city was increased to 25,101 acres by the annexation of Highland Park and Oakdale in 1922. The cities of New Albany, Ind., and Jeffersonville, Ind., with an additional population of 45,000 are immediately across the Ohio River. In point of value of manufactures, the city is shown by the U. S. Census of Manufactures to be the most important industrial centre in the South. The value of its manufactured products increased from \$200,566,000 in 1919 to \$263,693,000 in 1925, and in 1927 the Louisville Industrial Foundation estimated the value of its industrial output at \$364,257,894. Louisville is supplied with transportation service by nine trunk-line railways, eight interurban electric railways, and the Ohio River. In connection with the Ohio River development by the U. S. Government, a dam, with a lock for navigation and affording a maximum head of 37 feet, was completed in 1927. This also contained a power station of the Louisville Gas & Electric Co. In 1929 a new highway bridge over the Ohio River was completed. Bank clearings increased from \$1,153,048,000 in 1920 to \$1,936,031,000 in 1928 and the assessed valuation of property from \$207,000,000 in 1914 to \$600,000,000 in 1928, according to local estimate. The net debt in 1927 was \$21,171,000.

**LOUVAIN LIBRARY.** A famous institution connected with the University of Louvain in Belgium. During the German invasion of 1914, the university together with its library, which contained 120,000 volumes and 250 incunabula, was ruthlessly destroyed. When Cardinal Mercier, its head, visited the United States in 1919, he was asked of what particular aid Americans could be in the work of Belgian reconstruction; he suggested that the schools, colleges, and universities of the younger and larger country should join in the restoration or rather rebuilding of this monument of the smaller and older land. Under the terms of the Versailles Treaty, Germany was to return as many volumes as the old library contained. Whitney Warren was the architect of the new building, erected through public subscription at a cost of more than \$500,000. On July 4, 1928, the library was opened with appropriate ceremonies by Mgr. Ladeuze, rector of the university, despite the attitude of the architect on account of the omission of the Latin inscription, "Furore Teutonico Diruta: Dono Americano Restituta," which he desired. A suit to enforce the use of the original inscription was decided in favor of the architect by a Belgian court in October, 1929. Germany replaced 300,000 volumes, including a number of rare manuscripts and fifteenth-century prints. The combined international contribution added 350,000 volumes to the German contribution. The British dona-

tion of about 55,000 books was the largest. The Japanese section, which was given by the Mikado himself, contained manuscripts dating back to the ninth century. France contributed 33,000 volumes. The only reminder of the tragedy to which the new building owed its existence is a small bas-relief above Our Lady of Victory depicting the burning of the old library. See BELGIUM, under *History*.

**LOVEJOY, ARTHUR ONCKEN** (1873- ). An American philosopher (see Vol. XIV). In 1920 he collaborated with a group of other American philosophers in the publication of *Essays on Critical Realism*. The common ground of the authors is the distinction between essence and existence, which is not usually stressed by the so-called naïve realists. During the World War, Professor Lovejoy was an active propagandist for liberal ideals. He collaborated with Prof. Albert Bushnell Hart in the publication of *Handbook for the War* for *Public Speakers* (1917).

**LOVETT, ROBERT MORSS** (1870- ). An American editor and teacher, born in Boston, Mass. He was graduated from Harvard in 1892 and in the same year became assistant in English at that university. He served as assistant professor of English from 1896 to 1904; as associate professor from 1901 to 1909, and after 1909 as full professor at the University of Chicago. From 1907 to 1920, he was dean of junior colleges. He was a member of the National Institute of Arts and Letters and was the author of *The History of English Literature*, with W. V. Moody (1902); *Richard Iresham*, a novel (1904); *The First View of English Literature*, with W. V. Moody (1905); *A Winged Victory*, a novel (1907); *Concords*, a play (1914); *Edith Wharton*, a criticism (1925). He served as editor of the *Dial* in 1919 and joined the editorial board of the *New Republic* in 1921.

**LOVETT, ROBERT SCOTT** (1860- ). An American railway president (see Vol. XIV). During the World War, he filled important positions in the management of railroads and was chosen president (1919-20) and chairman (1920) of the Board of Directors of the Union Pacific System.

**LOWDEN, FRANK ORREN** (1861- ). An American public official, born in Sunrise City, Minn. He was graduated from the Iowa State University in 1885 and studied law at the Union College of Law in Chicago. He began practice in that city in 1887, continuing until 1906. He took an active part in politics and was a member of the Republican National Committee, from 1904 to 1912. In 1906 he was elected a Representative in Congress and was twice reelected. In 1917 he was elected Governor of Illinois, serving until 1924. He was one of the prominent candidates at the Republican National Convention in 1920 and in 1924 refused the nomination for Vice President. He was candidate for the presidential nomination before the Republican National Convention of 1928, but withdrew his name.

**LOWELL.** A manufacturing city of Massachusetts. The population rose from 106,294 in 1910 to 112,759 in 1920, but decreased to 110,296 in 1925. A memorial auditorium costing \$1,000,000 was erected in 1921 in memory of the Lowell men and women who took part in the wars in which the United States has been engaged. In the same year, after 10 years of the commission form of government, the city

The Principal Façade from the Drawing of the Architects, Warren & Wetmore

returned to the mayor-and-council form. A \$2,000,000 high school was completed in 1922. In 1927 there were approximately 240 manufacturing establishments in the city, employing 18,787 persons who received \$18,888,518 in wages; the value of products manufactured was \$69,171,107. Since 1925 Lowell has changed from a cotton textile centre to a city of diversified industries. In 1927-28, 27 new industries were established, replacing the cotton textile plants which liquidated or removed to the South following the slump in the textile business of New England. The assessed valuation of property increased from \$87,277,643 in 1913 to \$136,492,851 in 1923; in 1927 it was estimated to be \$141,759,000. The net debt in 1927 was \$5,100,000. Bank clearings in 1928 amounted to \$62,881,000.

**LOWELL, AMY** (1874-1925). An American poet and critic, born at Brookline, Mass., and educated in private schools. In 1917-18 she gave lecture courses at the Brooklyn Institute of Arts and Sciences; in 1921 she was the Francis Bergen Foundation lecturer at Yale and Marshall Woods lecturer at Brown University. As a champion of free verse, as well as one of its foremost writers, her influence in this movement in the United States was of great importance. (See LITERATURE, ENGLISH AND AMERICAN.) Her published works during the post-war period were *Sword Blades and Poppy Seed* (1914); *Six French Poets* (1915); *Men, Women, and Ghosts* (1916); *Tendencies in Modern American Poetry* (1917); *Can Grande's Castle* (1918); *Pictures of the Floating World* (1919); *Legends* (1921); *Pir-Flower Tablets—Poems Translated from the Chinese*, with Florence Ayescough (1921); *A Critical Fable* (1922); and *John Keats* (1925).

**LOWELL, GUY** (1870-1927). An American architect (see Vol. XIV). His design for a new municipal courthouse in New York was accepted in 1919. From 1917 to 1919, he was director of the Department of Military Affairs for the American Red Cross in Italy and received several decorations from the Italian government. He was the author of various books on architecture.

**LOWES, JOHN LIVINGSTON** (1867- ). An American educator, born at Decatur, Ind. He was graduated from Washington and Jefferson College in 1888 and took post-graduate courses in Germany and at Harvard University. After serving on the faculties of several colleges, he was appointed, in 1909, professor of English at Washington University, St. Louis, serving until 1918. In that year, he became professor of English at Harvard University, serving as dean of the graduate school in 1924-25. He was Lowell Institute lecturer in 1919 and was the author of *Convention and Revolt in Poetry* (1919), and *The Road to Xanadu* (1927). He edited, both alone and with others, several texts of Shakespeare.

**LOWIE, ROBERT HEINRICH** (1883- ). An American anthropologist (see Vol. XIV). Since 1921 he has been, successively, associate professor and professor of anthropology at the University of California. His principal works include: *Societies of the Arikara Indians* (1914); *Dances and Societies of the Plains Shoshones* (1915); *Notes on the Social Organization and Customs of the Mandan, Hidatsa, and Crow Indians* (1917); *Culture and Ethnology* (1917); *Plains Indian Age Societies* (1917); *Myths and*

*Traditions of the Crow Indians* (1918); *The Matrilineal Complex* (1919); *Primitive Society* (1919); *The Religion of the Crow Indian* (1922); *The Material Culture of the Crow Indians* (1922); *Crow Indian Art* (1922); *Psychology and Anthropology of Raccs* (1923); *Primitive Religion* (1924); and *The Origin of the State* (1927).

**LUBARSCH, OTTO** (1860- ). A German pathologist and writer who was born in Berlin and educated at the universities of Leipzig, Heidelberg, Jena, Strassburg, and Berlin. He was professor of pathology and director of the Pathological Institute at the University of Berlin (since 1917). He wrote *Untersuchungen über die Ursachen der . . . Immunität* (1891); and *Zur Lehre von den Geschwülsten und Infektionskrankheiten* (1899). He is best known as the editor of the great work *Ergebnisse der allgemeinen Pathologie und pathologischen Anatomie*, which, begun in 1895, has now run through 30 large volumes and has also furnished a model for numerous other works of the same type.

**LUBIN, DAVID** (1840-1919). American agricultural specialist and merchant. He was for many years in business at Sacramento, Calif., but interested himself in improving the system of marketing agricultural products, promotion of complete and systematic statistical information, and development of rural credits, national marketing, etc. He succeeded in bringing before Congress a proposal for an international convention for the establishment of the International Commerce Commission on Merchant Marine (the measure passed Sept. 1, 1914); and he also secured the introduction of a measure for improving the parcel post service, facilitating direct dealing between producers and consumers (1916). His proposals for the International Institute of Agriculture were embodied in that institution, which has since supplied world crop, import, and export reports, etc., and to which he was the American delegate. Mr. Lubin died at Rome, Italy, Jan. 1, 1919. See AGRICULTURE, INTERNATIONAL INSTITUTE OF.

**LUCAS, EDWARD VERRILL** (1868- ). An English essayist, biographer, writer on travel, and publisher (see Vol. XIV). His later volumes of essays include: *Cloud and Silver* (1910); *Twist Eagle and Dove* (1918); *Mixed Vintages* (1919); *Adventures and Enthusiasms* (1920); *Giving and Receiving* (1922); *Encounters and Diversions* (1924); *Events and Embroideries* (1926); and *A Fringed Isle* (1927). His later travel books were: *London Revisited* (1910); *Roving East and Roving West*, in India, Japan, and America (1921); *Ziggags in France* (1925); *Introducing London* (1925); *A Wanderer in Rome* (1926); and *Introducing Paris* (1928). On art, besides brief sketches in *The Great Masters Series*, he wrote *Vermeer of Delft* (1922); *A Wanderer Among Pictures* (1924); and *John Constable, the Painter* (1925). Other later works include: *Quoth the Raven: An Unofficial History of the War* (with G. Morrow, 1919); *London Lavender* (1919); *Vereina in the Midst* (1920), the last two being fiction; and *The Colvins and their Friends* (1928). Consult F. V. Lucas: *Appreciations*, by John Farrar, R. E. Sherwood, Grant Overton, and Llewellyn Jones (1925).

**LUDENDORFF, ERICH** (1865- ). A Prussian general, born at Kruszevnia, near

Posen. He worked out the last great German Army Bill passed by the Reichstag in 1913. On the outbreak of the World War, he was first sent to the western front, where he took the citadel at Liège. On Aug. 22, 1914, he was sent to the eastern front as chief of the General Staff and shared with Hindenburg the credit of the great victories at Tannenburg and the Masurian Lakes. During the progress of the War, his advance was rapid and constant. He organized the great German offensive of the spring and summer of 1918, whose final collapse led to the German defeat. After the War, he was a leader of those seeking the return of the monarchy. He published among other works *Meine Kriegserinnerungen* (1914-18); *Kriegsführung und Politik* (1919); *Die Verschiebung der Verantwortlichkeit* (1919); *Die Schuld der überstaatlichen Mächte am Zusammenbruch* (1927).

**LUDWIG, IOSTVÍK, EMIL** (1881- ). A German writer who was born at Breslau and studied at the university there. He wrote verse and prose, fiction, drama, essays, and biography. His plays include: *Napoleon* (1906); *Der Spiegel von Shalott* (1907); *Trilogie der Renaissance* (1904-20); *Atalante, Ariadne* (1914); *Friedrich von Preussen* (1914); *Bismarck*, a trilogy of plays (1923). His novels are *Manfred und Helene* (1911); *Diana* (1918); *Meeresstille und glückliche Fahrt* (1920). He is also the author of the essays, *Der Künstler; Bismarck, eine psychologische Studie* (1911); *Goethe, Geschichte eines Menschen* (1920); the lyric volume *Römische Sonette* (1921); *Genie und Charakter* (1925, English trans., 1927); *Bismarck*, a biography (1926, English trans., 1928); an English translation of *Goethe: the History of a Man* (1928); *Der Menschensohn* (1928), in English, *The Son of Man: The Story of Jesus* (1928); *Juli 14*, a study of the outbreak of the World War (1929); *Art and Destiny* (1929); and *Diana*, two volumes (1929).

**LUTHERANS.** The third Protestant church in size in the United States, established officially in America in 1648, historic records showing Lutherans in America as early as 1502. The congregations, the central units and seat of final authority, were organized in synods or general bodies. The Lutherans of the United States and Canada accept the Canonical Scriptures of the Old and New Testaments as the inspired Word of God and as the only infallible rule and standard of faith and practice. They accept and confess the three ecumenical creeds, namely, the Apostles, the Nicene, and the Athanasian. They accept and hold the Unaltered Augsburg Confession as the correct exhibition of the faith and doctrine of the Evangelical Lutheran Church, founded upon the Word of God. All accept and use Luther's Small Catechism. None reject any of the other Symbolical Books of the Evangelical Lutheran Church, namely, the Apology of the Augsburg Confession, the Smalkald Articles, the Large Catechism of Luther, and the Formula of Concord. Many accept all of these.

The following statistical table shows the totals of the parochial reports made in 1914 and 1928:

	1914	1928
Congregations	14,871	16,686
Ministers	9,407	11,234
Baptized Members	3,684,315	4,210,500
Confirmed Members	2,370,654	2,728,620
Congregational Expenses	\$10,275,269	\$45,467,848
Benevolent Contributions	3,214,644	11,969,677
Total Expenditures	13,489,913	57,262,521
Total Valuation of Property	99,019,621	324,690,685
Sunday Schools—Number	5,923	11,671
Officers and Teachers	76,112	125,497
Scholars	927,737	1,447,538

During the period, foreign mission and educational work was carried on extensively. After the World War, many mission fields which formerly had been supported by the Lutherans of Germany were aided through the National Lutheran Council.

The outstanding events of the period among the Lutherans of the United States and Canada were: the celebration in 1917 of the 400th anniversary of Luther's posting of the Ninety-Five Theses; the formation of the Norwegian Lutheran Church of America by the merging of three Lutheran organizations in 1917; the formation by the merging of several other bodies in 1918 of the United Lutheran Church in America, which included in its membership more than one-third of all the Lutherans in the United States and Canada; and the formation of the Evangelical Lutheran Joint Synod of Wisconsin and Other States; the appearance in 1917 of the Lutheran *Common Service Book*; the organization in the same year of the National Lutheran Commission for Soldiers' and Sailors' Welfare, which was supported by the various general bodies and churches; and the organization in 1918 of the National Lutheran Council, an agency for two-thirds of the Lutherans of the United States and Canada for carrying on the regular work of representation, statistics, reference, and publicity, and also emergency relief work. This latter agency gave at least \$6,500,000 including more than \$2,800,000 in the form of clothing, and over \$3,700,000 in the form of cash, for the relief of Lutherans in Europe. In 1927 at the World Conference on Faith and Order, the Lutheran representatives from all parts of the world united in their conservative views of faith and doctrine.

Among the celebrations of the period were: the 400th anniversaries of Luther's appearance before the Diet of Worms, of the appearance of Luther's translation of the New Testament, and of the introduction of congregational singing and the development of hymnology under the influence of the Reformation; and the anniversaries, 175th, 100th, 75th, and 50th, respectively, of the Pennsylvania Ministerium, the Maryland Synod, the Missouri Synod, and the Synodical Conference. The Muhlenberg Building was dedicated in 1924 by the United Lutheran Publication House. Led by the veteran, Dr. George U. Wenner, the Lutherans reemphasized religious education, especially promoting the idea of weekday religious instruction after school hours. Tens of millions of dollars were subscribed for endowments of Lutheran educational institutions, and millions of dollars were generously contributed to the Ministerial Relief and Pension Funds.

The Lutherans of America took part in the first Lutheran World Convention held at Eisenach, Germany, Aug. 19 to 26, 1928. There were 160 delegates and representatives from 22

or more nations of Europe, Asia, North America, and Australia. With the exception of the Synodical Conference of North America, with about 1,000,000 members, they represented the Lutherans of the world, or at that time about 80,000,000 members. Carefully prepared papers including doctrinal and practical themes of fundamental importance were presented, followed by free discussions. The Rt. Rev. Ludwig Ihmels, D.D., Bishop of Saxony, was made chairman of the convention. The following doctrinal statement was unanimously adopted: "The Lutheran World Convention acknowledges the Holy Scriptures of the Old and New Testaments as the only source and the infallible norm of all Church teaching and practice; and sees in the Lutheran Confessions, especially the Unaltered Augsburg Confession and Luther's Small Catechism, a pure exposition of the Word of God." Final preparations were made in 1928 for the Lutheran World Convention, to be held in June, 1929, the 400th anniversary of the year of the publication of Luther's Small Catechism. According to the statistics of the United Lutheran Church for 1929, there were 70,000 Lutheran congregations throughout the world, with 49,000 pastors, and 81,023,180 baptized members.

**LUTYENS**, SIR EDWIN L. (1869- ). A British architect, who was educated privately. He was architect for the Government House at Delhi, India, and designed the Whitehall Cenotaph; the British School of Art at Rome; the Picture Gallery and South African War Memorial, Johannesburg, and various other buildings. In 1929 he was selected as architect for the proposed Roman Catholic Cathedral in Liverpool. He was knighted in 1918 and made a member of the Royal Academy in 1920.

**LUXEMBURG**. This Grand Duchy, bounded by Germany, Belgium, and France, has an area of 999 square miles and population of 285,521 (1927). The population in 1910 was 259,899. The capital, Luxembourg, had 52,440 inhabitants in 1927, as compared with 20,848 in 1910. The activities of the population are equally divided between agriculture and industry. The principal crops are oats and potatoes, while the vine is cultivated in the Moselle Valley region. The economic wealth of the country is, however, centred in its iron fields which continue to average an annual yield of 7,000,000 tons (7,244,000 in 1927). The iron ore is employed in the manufacture of pig iron and steel by local works. In 1912 the production of pig iron was 2,252,229 tons; in 1918 it was only 1,226,671 tons; but after the War it recovered, reaching 3,704,390 tons in 1920 and 2,770,061 tons in 1928. The production of steel continued steadily to lose ground; 1,296,407 tons were produced in 1916; by 1920, only 602,935 tons. Starting with 1924, however, it exceeded pre-war production and reached 2,567,080 tons in 1928.

Although, in accordance with the Treaty of London (1867), Luxembourg, like Belgium, was permanently neutralized, and its integrity and independence guaranteed, nevertheless, like Belgium again, the grand duchy was invaded by German troops, Aug. 2, 1914, and occupied throughout the War. The conclusion of the War saw the appearance of a new independent spirit in the population. Agitation in particular was aimed at the severance of the economic union with Germany, in existence since 1842, as well as for the erection of a more liberal

frame of government. The result was the abdication of the Grand Duchess Marie Adelaide on Jan. 12, 1919, the ascension to the throne of the Princess Charlotte, and the holding of a plebiscite in September for the determination of the political and economic status of the country. The vote on the former indicated that the Luxemburgers preferred the continuance of the ruling dynasty to a republic; on the question of a new economic union, 60,133 votes were cast in favor of alliance with France against 22,242 in favor of a Belgian alliance. In 1921, however, France yielded up her rights to Belgium with the result that a treaty, completed on July 25, 1921, effected an agreement between Belgium and Luxembourg by which the two agreed to level their customs barriers for 50 years. The agreement went into effect May 1, 1922.

**LUXEMBURG**, lüks'em bürg, ROSA (1870-1919). A German-Jewish Socialist and revolutionary leader, born in Poland. She entered Germany in 1895 and after employment on various socialist newspapers, she went to Poland to aid the Russian revolutionary movement there in 1905, but soon returned to Germany and engaged in extreme propaganda. With Karl Liebknecht, she founded the Spartacus League. In 1914 at the outbreak of the World War, she was sentenced to a year's imprisonment for inciting insubordination. Throughout the War, she remained in preventive custody. When set at liberty again, she instigated street fighting in Berlin and was beaten by a mob and shot to death on Jan. 15, 1919.

**LUXURY TAXES**. See TAXATION IN THE UNITED STATES.

**LVOV**, l'vóf, GEORGE EUGENIEVITCH, PRINCE (1861-1925). A Russian statesman who received his law degree in 1885. He owned great estates and devoted much of his time to the organization and development of the Zemstvos, or agricultural cooperative societies. He was a member of the right wing of the Constitutional Democratic Party, and, in 1905, of the first Duma. During the Russo-Japanese War, he organized relief among the Zemstvos, and also carried on this work during the World War. In March, 1917, at the outbreak of the Russian Revolution, he was chosen Premier and Minister of the Interior in the provisional Government, but his opinions were so frequently at variance with those of the Socialists that he resigned in July. The Bolsheviks arrested him and took him to Ekaterinberg, but he escaped and finally settled in Paris, where he was a leader of the anti-Bolshevist movement.

**LYAUTEY**, li-ôté, LOUIS HUBERT GONZAGE (1854- ). A French soldier, administrator, and writer (see Vol. XIV), a member of the French Academy. In 1912 he was appointed resident Minister in Morocco, holding also the office of Minister of Foreign Affairs. He administered this office with great efficiency and was successful in promoting the agriculture and trade of the colony. In 1916-17 he served for a short time as War Minister in the cabinet of Briand, but on the fall of that cabinet he was reappointed to Morocco by Ribot and Poincaré. He was made a Marshal of France in 1920, the only one ever created who had not fought in France, and in 1928 he received the gold medal of the English African Society, the first recipient not an Englishman. He was recalled in October, 1925. His later publications include *Lettres de Tonkin et de Madagascar, 1894-99* (1920); *La réunion*

*de la Lorraine à la France* (1926); and *Paroles d'action, 1900-26* (1927). Consult *La France au Maroc. L'œuvre du général Lyautey*, by Gaulis (1919) and *Le maréchal Lyautey*, by Britsch (1921).

**LYDSTON, GEORGE FRANK** (1858-1923). An American surgeon and publicist born at Tuolumne, Calif., and educated in medicine in the New York University (M.D., 1879). After several years in New York, he settled in Chicago and was appointed professor of genito-urinary surgery and venereal diseases under the medical department of Illinois University. He was the first to write at length on the subject of sex gland-grafting in the male. His major writings comprise *Lectures on Syphilis* (1885); *Addresses and Essays* (1892); *Stricture of the Urethra* (1893); *Gonorrhea and Urethritis* (1892); *Surgical Diseases of the Genito-urinary Tract* (1899-1904); *The Diseases of Society* (1904); *Sex Hygiene for the Male* (1912); *Implantation of the Sex Glands* (1914); *Impotence and Sterility* (1917).

**LYMAN, EUGENE WILLIAM** (1872- ). An American theologian, born at Cummington, Mass. He was graduated from Amherst College in 1894 and took post-graduate courses at Yale and in Germany. After teaching in several schools, he was appointed professor of philosophy at Carleton College, Minn., in 1901, and was professor of theology at the Congregational College of Canada, Montreal, in 1904-05. From 1904 to 1913, he was a member of the faculty of Bangor Theological Seminary, and from 1913 to 1918, professor of the philosophy of religion and Christian ethics at Oberlin College. In 1918 he became professor of the philosophy of religion at the Union Theological Seminary in New York. He wrote *Theology and Human Problems* (1910); *God of the New Age* (1918); *Experience of God in Modern Life* (1918); *The Meaning of Selfhood and Faith in Immortality* (1928).

**LYMAN, THEODORE** (1874- ). An American physicist, born at Boston, Mass. He was graduated from Harvard in 1897, where he also received his Ph.D. in 1900. He became an assistant in physics at Harvard, where he remained, becoming full professor (1917-26), and where he was also director of the Jefferson Physical Laboratory (1908-17). He is now emeritus. Dr. Lyman made important studies on phenomena connected with diffraction gratings, on the wave lengths of extreme ultra-violet light discovered by Schumann and also on the properties of light of extremely short-wave length, on all of which he contributed valuable papers to the literature of physics in the proceedings of scientific societies. During the World War, he served in France with the American Expeditionary Forces, holding the rank of major of engineers. See **PHYSICS**.

**LYNCHINGS.** According to the department of records and research of the Tuskegee Institute, there was a total of 861 lynchings in the United States during the period 1914-28. Of the victims, 64 were whites and 597 were Negroes. The number of lynchings by years and the alleged causes for the perpetration of these crimes are shown in the accompanying tables.

The period 1914-28 was notable for (1) a growing sentiment against lynchings and (2) a large decrease in the number of lynchings. The growing sentiment against lynchings manifested

itself in (a) the attitude of the press of the country, particularly the editorial policy of the leading newspapers, in speaking strongly against it; (b) expressions of religious denominations, particularly through the Federal Council of Churches; (c) expressions of organizations of white women of the South; (d) agitation for the enactment of laws against lynchings; and (e) the passing of laws by a number of States for the suppression of lynching. The agitation for suppressive legislation had its strongest expression in the effort to have a Federal anti-lynching law enacted. This effort extended over the entire period, though after 1924 demands for it had become less insistent. In 1920 an anti-lynching measure, later known as the Dyer Anti-lynching Bill, was jointly introduced in the

Totals	230	63	110	55	29	27	137

House and Senate of the United States Congress. The press of the South strongly opposed the bill on the ground that it was an invasion of States' rights; and a Democratic filibuster in the House of Representatives in 1921 prevented its coming to a vote. On Jan. 26, 1922, however, the House passed the bill by a vote of 230 to 119. When the measure reached the Senate, the question of its constitutionality was brought forward. On July 28, 1922, the Senate Judiciary Committee ruled that it was constitutional. A well-organized filibuster by the Democratic members of the Senate prevented it, however, from coming to a vote and on Dec. 2, 1922, the Republican caucus agreed to drop the measure and not to call it up again during that session of Congress.

With the defeat of the Dyer Anti-lynching Bill, newspapers and women's organizations of the South urged that it was now up to the States to take preventive measures. Such action was taken by 10 States, either by the enactment of

new laws or the strengthening of existing legislation against lynching. These States were Alabama, Kansas, Kentucky, Minnesota, New Jersey, North Carolina, Pennsylvania, Tennessee, West Virginia, and Virginia. In 1928 Virginia, which had been particularly harsh against mob rule, passed a law making lynching a State offense. Prosecutions against persons involved in lynchings were to be handled by the attorney general or by special prosecutors appointed by the governor. In other States, notably Kentucky and Florida, law officers defended their prisoners against mobs with every effort in their power, sometimes calling out the State militia.

The decrease in lynchings over the period being reviewed is shown by the following table:

COMPARISON OF LYNCHINGS BY DECADES  
1884-1928

Decade	Number of Lynchings		Total
	White	Negroes	
1884-1893	751	990	1,741
1894-1903	322	1,020	1,342
1904-1913	63	673	736
1914-1923	56	517	573
(half-decade)			
1924-1928	8	80	88

A discussion of the entire subject is to be found in White, *Rope and Faggot* (New York, 1929). See RACE PROBLEMS, UNITED STATES.

**LYND, ROBERT** (1879- ). An Irish journalist, essayist, and literary critic. He was born in Belfast, educated at the Royal Academical Institution and Queen's College, Belfast, and then moved to England to live and work. His many publications, largely made up of essays, include *Irish and English: Portraits and Impressions* (1908); *Rambles in Ireland* (1912); *The Book of This and That* (1915); *If the Germans Conquered England, and Other Essays* (1917); *Ireland a Nation* (1919); *The Pleasure of Ignorance* (1921); *The Blue Lion* (1923); *The Money-Box* (1925); *The Little Angel* (1926); *Dr. Johnson and His World* (1927); *The Bunch of Grapes* (1927); *The Goldfish* (1928); and *Dr. Johnson and Company* (1928).

**LYNN.** A manufacturing city of Massachusetts. The population increased from 89,336 in 1910 to 99,148 in 1920 and to 105,500 in 1928, according to the estimate of the U.S. Bureau of the Census. In 1918 the city government was changed from the commission form, adopted in 1910, to the mayor-and-council form, with one councilor from each ward and four elected at large. In 1926-27 the city spent \$1,500,000 on sewer development; the school-building programme called for an expenditure of \$3,000,000. The value of boots and shoes manufactured in Lynn in 1927 was \$26,696,393; of leather, including tanned, curried, and finished products, \$9,133,033, and of allied manufactures, such as blacking, lasts, and boot and shoe findings, \$16,460,029. The city ranked fifth among the cities of the United States in value of boots and shoes manufactured, being surpassed by New York, St. Louis, Milwaukee, and Boston. The total value of all manufactures rose from \$95,031,943 in 1921 to \$100,863,774 in 1927. Of these the most important were automobile accessories, foundry products, wire goods, electrical machinery, high-frequency apparatus, incandescent lamps, are lamps, medicine, and soap. In 1927, 20,763 persons were employed in 358 industrial establishments and received \$28,516,520 in wages. Approximately 12,000 persons were employed in

two large plants of the General Electric Company. The assessed valuation of property in 1928 was \$137,259,350; the net debt was \$6,050,991.

**LYON, BETHUEL B. VINCENT** (1880- ). An American physician, gastroenterologist, who has introduced into clinical medicine a new method of diagnosis and treatment of gall-bladder disease, termed by him "nonsurgical drainage of the gall bladder"; which is secured through the introduction of the duodenal sound through the stomach. Dr. Lyon received the degree of M.D. from Johns Hopkins in 1907 and was appointed professor of clinical medicine in Jefferson Medical College, in the department of gastrointestinal diseases. He has done much original work in connection with the diagnostic and therapeutic use of the duodenal sound, collaborating for a time with the late Dr. Meltzer, and in 1923 first appeared his pioneer work, *Nonsurgical Drainage of the Gall Ducts*, which has given rise to much controversy.

**LYONS.** An important manufacturing city of France, capital of the Department of the Rhône, and 468 kilometers (290.8 miles) from Paris. The population at the census of 1926 was 570,840. Lyons is becoming an important inland shipping centre, the quays along the Rhône and Saône extending more than 30 kilometers (18.6 miles). The completion of the Marseilles-Rhône Canal has done much to increase the water traffic of Lyons, 1500-ton barges now being able to reach it from Mediterranean ports. See MARSEILLES. Since the World War, plans have been under way for the development of the water power of the Rhône River, which is estimated at 750,000 horse power, or the equivalent of 5,000,000 tons of coal, per annum.

The leading industries of Lyons are glassware, chemical products, perfumery, silks and artificial fabrics, glue, gelatines, shoe polish, fertilizers, dyes, plastic materials, iron and steel, brass articles, automobiles, furniture, gloves, embroidery, hats, wines, confectionery, biscuits, paper, and watches. As the centre of the French silk trade, Lyons continues to wield an influence over the entire industry, although it is no longer most important from the standpoint of actual production. In the design of fabrics, in the regulation of their sale, and in relation to the silk consumption of the world, the leaders of the Lyons silk industry play a leading part. The production of silk fabrics in Lyons and vicinity reached a total value in 1927 of 4,586,000,000 francs which, converted to gold francs, amounted to 935,000,000 gold francs or \$180,000,000. The value of exports of silk fabrics was 2,200,000,000 francs. During the War, many industries from northern France established themselves in Lyons and vicinity. The most important of these were structural and mechanical steel plants, steam-engine and automobile factories. An annual International Manufacturers' Sample Fair was established in 1916 at Lyons, the total number of exhibitors at the 1928 fair being 3362. The largest number of foreign exhibitors were from Germany, the United States, Switzerland, England, Belgium, Italy, and Japan. A permanent exhibition building has been erected on the banks of the Rhône. The great volume of business transacted in Lyons is evidenced by the development of important financial institutions; of these, the *Crédit Lyonnais*, which has more than 1000 branches distributed throughout the world, is the best known.

Lyons was one of the first cities to take advantage of State aid in the building of moderate-priced houses, authorized under the so-called Loucheur project by the 1928 Act of the French Parliament. The municipal authorities arranged to construct 5000 dwellings at the rate of 1000 each year, the state furnishing 90 per cent of the total cost and the city supplying the remainder. The Wilson Bridge over the Rhône River, named in honor of the President of the United States, was dedicated on July 14, 1918. It consisted of four elliptical arches, 138 feet, 148 feet, 161 feet, and 148 feet in span, with an approach arch at each end, making the total length of the bridge 743 feet. The width was 66 feet, with provision for a roadway 36 feet wide for railway tracks and two sidewalks, each 15 feet wide. The unique feature of this bridge is that it combines the architectural features of the stone arch with the structural advantages of reinforced concrete. The total cost of construction was approximately \$430,000. The Monument aux Morts, a War Memorial erected in 1926, is one of the most impressive in France.
